Yes, John Wetherley, and now, with these thoughts teeming within thy brain, with thy lips seeking to utter words which should bear them glowing to the silly little heart of thy goddess, much gratitude dost thou owe, although thou couldst not then acknowledge it, to thy Nemesis, who approaches through the bowery garden in the guise of Phœbe Dale, the sister of thy divinity, or *Il Penseroso*, as she is called familiarly. "Tea awaits us within the honeysuckle bower," with melancholy air says Il Penseroso, closing a large book which she has been perusing, and smiling faintly at the romantic pair; and the glowing words rush back to John's heart; and, blessed interference of Nemesis, oh, John Wetherley, thou art rescued from bondage for life to an empty, pretty face, with, either for thyself miserable mental deterioration, or for thy idol of clay bitter misery and injustice!

Slowly, very slowly, the three walked towards the bower, John silently and looking very pale, his eyes fixed upon the mossy turf, which yielded to the dainty footsteps of his divinity—he was jealous even of the happy moss which dared to kiss the tender soles of her dear little shoes! The large and handsomely bound volume, in which Il Penseroso had been reading studiously all that cloudless June afternoon, was her common-place book, and into it she copied, as she informed inquirers, "All the most melancholy passages from the most melancholy poets." Apparently she had this afternoon been perusing the most melancholy of all her extracts, for her countenance wore a pensiveness more striking than even that depicted in Strudwicke's celebrated "Poetical Portrait" of herself and Emma, from which the two sisters had derived their cognomens of Il Penseroso, and L'Allegro. Il Penseroso clapped her volume to her breast with nun-like air, her small head sunk upon it, her eyes resting on the earth,

THE LOVERS IN THE GARDEN.

and thus she walked to the left hand of our unhappy lover—Emma danced along upon his right—now she had flitted off like a butterfly to gather a rose, now she had stuck it into John's button-hole, looking up into his face with such arch smiles, that had not the melancholy figure been at his side—and Isaac Strudwicke and his worthy wife been seated beneath the bower in full view of the approaching trio—he must infallibly have seized upon that terribly beautiful little face, and pressed it to his heart instead of the rose. And then she chirped around him like a merry bird, and everywhere sunshine fell upon her—and he was bewildered—distracted—Alas! poor Johnny, thou wast in a deplorable condition! But kind irrevocable fate was saving thee from the syren. Yes, although the withered remains of the rose which she had

given thee for long months were cherished by thee as the most sacred relic of a saint; although in fantastic, heavenly dreams that divine face haunted thee nightly with a pertinacious madness for a long space; although with burning, passionate, and earnest heart, thou hadst implored from heaven the possession of her love through the long night of thy journey up to London, sitting upon the top of the coach, and gazing up into the calm sky, and towards the stern, indifferent stars—thou wast only learning one of the very earliest lessons in life's school—poor Johnny!—Heaven's wisdom in turning a deaf ear to many a mortal's prayer.

But spite of our friend's heart being tossed to and fro by the billows of love's ocean, and by the billows also of jealousy—for Mrs. Strudwicke, during the meal within the honeysuckle bower, with cold cruelty lacerated John's heart, intruding within its sensitive core the thorn of jealousy by lavishing, as she did, unbounded praise upon "that delightful Mr. Ellis Stamboyse, whose appreciation of her Strudwicke's genius was undisguised, and who having been so greatly struck by that lovely picture of her Strudwicke's, Il Penseroso and L'Allegro, was himself going to sit immediately,"—yes, spite of these tides of agitating love and jealousy, and of the self-condemnation also called forth by the cold and silent expression of good old Strudwicke's countenance, John Wetherley had much to arrange and think of this evening before his departure with the coach at nine o'clock.

He had to bid adieu to the kind but awe-inspiring Pierrpoints, now staying for a few days at their stately mansion in the town, Pierrpoint House, one of those handsome and dignified old houses belonging to old county families, of which Nottingham is—or was, perhaps more correctly speaking—very rich.

John, his senses in a feverish delirium, passed through the familiar streets, along which, bathed in the quiet golden light of evening, people moved gaily or loiteringly. Happy people, John thought, who to-morrow, and the next day, and the next after that, would wake up within the familiar town, and who would, lying down to rest or wakening, breath the same air as his beloved! That stately, gloomy mansion of the Pierrpoints, divided from the street by its court-yard, where grew the tall poplars which shivered in the breeze of this balmy June evening, as though Pierrpoint atmosphere even to them were chilling; and where the formal grass-plats, divided at right-angles by hard straight gravel-walks, were yielding as softest velvet to any insanely erratic footstep which should dare to cross them—and where the jessamine, festooning the rich iron-balustrade running up either hand of the stone steps leading to the tall portal of the mansion, gleamed forth in cold white stars from darkest hued leaves—all smote this night on John's burning breast, like ice upon a volcano.

The tall portal swinging back, whilst still the voice of the deep-toned bell vibrated through the air, and a grave, sable-clad servant replying to John's somewhat abashed inquiries, he was speedily ushered across the gleaming black and white marble floor of the hall—grim portraits of departed Pierrpoints and antlered heads frowning down upon him from the dark wainscoted walls.

And now he stood in the large dining-room. More generations of stately Pierrpoints gazed around upon him from the walls, also of dark, gleaming wainscot; and that extraordinarily beautiful, but bold-looking, Lady de Callis, whose face was Honoria's, and yet *not* Honoria's, looked forth from among the knots and festoons of carved flowers and fruits above the high mantel-piece. The slender, aristocratic, large blue-eyed boy, whose arm encircled her proud neck, seemed jealously to frown away all gazers upon his mother's strange, beautiful face, and that face seemed heartily to invite John's approach, then to repel him with a marvellous, enigmatical expression on her lips.

No sunlight was in the spacious room; and, though June, a fire burned upon the low, broad hearth beneath that heavily carved mantel-piece. But no fire-rays could warm up either the cold gleamings from the pictured faces, from the polished walls, from the polished Indian cabinets standing here and there, or from the polished oaken floor, which revealed itself where it ceased to be covered by thick and richly-tinted Turkey carpet.

Sunlight had also passed away from the square of stately garden which was seen through the broad plate-glass windows lying beyond a low terrace with stone balustrades crowned with balls. Sunlight streaked the cloudlets with rose and orange in the pearly sky which hung above the garden, but within it all was cold and duskily green; a chillness hung around the sun-dial that rose in the centre of the garden; it hung among the tall, dark cypresses, upon the thick tapestry of jessamine and ivy which clothed the high walls surrounding the garden, and crept over the soft velvety turf. A deep hush brooded over the whole place without, only rendered more perceptible by the chirp of noisy town sparrows,—within, by the loud ticking of an ancient time-piece all gold and enamel, and by the startling fall of cinders from the fire upon the polished steel hearth.

The remains of a rich dessert were standing upon a small table drawn up near to the fire-place. There were delicious hot-house fruits heaped up in rich silver and china baskets, and rendered yet more lovely from being wreathed with leaves and flowers; and through the crystal sides of antiquely-formed decanters shone golden and ruddy wine. In that chair, with its ebony back and crimson-cushioned seat, must that cold, awful Mr. Pierrpoint have sate, and there at his feet, upon that crimson velvet ottoman, must Honoria have nestled up to her father's knee. Could even a daughter, John thought, cling to so cold, so awful a being as Mr. Pierrpoint? or could words so cold and keen as his ever soften into love, even to this daughter?

But John was not long allowed to ponder upon the frigid Honoria, or the glowing Emma—a much more dangerous theme,—for in a moment more the grave servant was conducting him into a smaller adjoining room, lined with books up to the ceiling. Seated beside the fire was Mr. Pierrpoint, sipping coffee out of a tiny cup of daintiest china. Honoria, attired in a grey silk—now silvery as a gleam of moonlight—now dusky as a rain-cloud—and with her marvellously beautiful hair gleaming in the light, as if her head were surrounded with a golden glory, stood before a little table with quaintly-carved legs, pouring out coffee from a massive silver coffee-pot for an elderly lady, dressed in black, who sate beside her.

But neither the most courteous reception from this group, nor warm coffee poured from this quaint coffee-pot, worthy to have been designed by Benvenuto Cellini, and presented in a Sevrès cup by the fair hands of Honoria,—nor yet Mr. Pierrpoint's wise advice to John upon this, the new chapter in his art-life commencing for him,—could set the poor youth at ease, or thaw the ice within him;—no, not even Mr. Pierrpoint's parting gift of "Gilpin's Forest Scenery," nor yet, much more, the parting words and action of Honoria.

With a sudden glow, as of a reflected sunset upon her white brow and among her crisp golden hair,—"Father," said she, slightly turning towards Mr. Pierrpoint, "remember that our copy of Albinus, which Mr. Wetherley was so much interested in the other night, is to be lent to him, until he is rich enough to purchase one for himself. It is already packed; shall I order it to be carried to the coach-office?" and turning towards John with a certain swan-like action, as she drew up her noble figure—"Mr. Wetherley," she pursued, "my father imagines that Mr. Strudwicke has given you no anatomical instruction; now you must earnestly begin to study anatomy. Without such knowledge you can be no artist, and were I one, or wishing to become one, I would never rest until Science had yielded to me her strength, as Poetry should yield to me her beauty. Let '*thorough*' be your motto in art and in life. Old Albinus shall aid you. Neither books nor human beings have a right to waste their lives—both should ever be in useful activity; Albinus will be doing his duty more by accompanying you to London than by stopping to moulder in a rich binding upon our shelves. *You* do *your* duty by him. But

remember, he is only *lent*, not given. Take care of him, both because he is a loan and because he is an excellent work, worthy of respect from you. And now, Mr. Wetherley, good bye, we must not detain you!"

About an hour and a half later, the London coach rolling, along with Johnny and Albinus upon its top, was stopped by a little cart standing at the corner of a lane in the gathering twilight. An old voice cried out from the little cart, "Good bye, my dear lad—again, good bye! Samiwel brought me for a last word. Bless thee, my lad!—and here's a nice pasty for thee, poor chap!" And then a warm packet, wrapt up in a spotlessly clean blue and white checked handkerchief, was handed up to Johnny by the laughing guard. Away rolled the coach towards London, but the little cart stood in the dust until the last sound of this hurrying horses and wheels was heard. But neither Albinus, Honoria, nor the pasty, nor yet its giver occupied the thoughts of John, as he sped along towards London.

THE LAKES OF KILLARNEY.

We have met gentlemen in the south of Ireland who had never seen Killarney. They had visited the Lakes of Cumberland and of Scotland, had taken the grand tour of the continent, and had expatiated amidst the Alpine sublimities of Switzerland, but they were blind to the attractions of scenery in their native land, which for the exquisite combination and variety of its charms, is not surpassed in Europe. But that scenery was in *Ireland*, and it was a mark of high breeding among Irish gentlemen to despise everything Irish. But our good Queen, however, has graciously turned the tide of fashion in favour of that country. It is true she has not yet visited Killarney, or the Shannon, or the Blackwater, or Wicklow, or Roystrevor, or the Giant's Causeway, or Lough Erne, or the wild western coast, where stupendous cliffs roll back the proud impetuous billows of the Atlantic. But she has been to Cork, whither troops of tourists have followed in the train of majesty, and have then pushed into the country and revelled amidst the beauties and wild grandeur of the long-neglected scenery of Ireland.

Before visiting Killarney, we had met in the Highlands of Scotland gentlemen who were still under the excitement produced by Loch Lomond and the Trossachs, and who had been recently at the Cumberland Lakes; and, though Englishmen, they frankly acknowledged that Killarney, as a whole, surpassed them all in its magical effect on the mind of the beholder. We visited it under a promise to a fair lady to write a description of the scenery, but it so far surpassed expectation, and so intoxicated and bewildered the mind by its endless variety, that we gave up the task in despair.

Nor is this to be wondered at, when we find an eminent artist like Mr. Richard Colt Hoare writing in the following terms:—"What pencil can give an adequate idea of the supereminent beauties of the mountain and rockery scenery of Glena and Cromaglan—can express the transient and fleeting effects of the clouds upon them, or have their transparent reflections in the waters beneath? What pencil can imitate the various tints of the numerous lichens, shrubs, and plants that deck the rocky boundaries of these lakes, or give a faithful representation of the fantastic forms that these rocks assume? In the name of my brother artists, I will answer, None. The powers of the pen will fail equally in description; for when I say that the mountains of Toomies, Glena, and Torc are finely wooded down to the water's edge; that the river abounds with every variety that rocks, trees, and water can produce; that the eagle's nest towers up most majestically from its banks; that the surface of the Upper Lake is broken by numerous rocky islands and boldly indented shores; that it is backed by an almost endless range of the most picturesque mountains; that the rocks which bound the Lake of Mukross and the Lower Lake, have by continued beating of the waters assumed the most singular and fantastic forms, added to the most harmonious colouring, and that they are covered with arbutus, heath, and the greatest variety of plants imaginable—shall I convey any idea of this enchanting scenery? I answer, No. The collected beauties of this favoured spot are so great, and varied, and *superior to everything I have yet seen, either in Italy, Switzerland, or England*, that they can neither be delineated nor described,—to be understood they must be seen."

To the same effect is the language of Lady Chatterson, who exclaims: "A region of enchantments—a hundred descriptions of it have been written, thousands of sketches of it have been made, but no description that I have read, or sketch that I have seen, made me familiar with Killarney. The Upper Lake and the Lower Lake, Mukross and Innisfallen, must be seen to be understood. It is the colouring the gleam of sunshine, the cloud, the tone, the effect—what, in short, cannot be conveyed with the pen without the cant of art, and is beyond the power of the pencil, that gives a magic to the scenery of Killarney." The graphic pen of Mrs. S. C. Hall thus sketches the general effect: "The charm of the Killarney Lakes, however, does not consist in the varied graces of the foliage, the number of green or rocky islands, the singularly fantastic character of the island rocks, the delicate elegance of the shores, the perpetual occurrence of bays; but in the wonderful variety produced by the combination of their attractions, which together give the scenery a character inconceivably fascinating, such as the pen and pencil are utterly incompetent to describe. The shadows from the mountains perpetually changing, produce a variety of which there can be no adequate conception, insomuch that the very same spot will produce a different aspect twenty times within a day. Assuredly," she continues, "they far surpass in natural beauty aught that nature has supplied elsewhere in Great Britain; for with scarcely an exception the devoted worshippers of Loch Katrine, and the fervent admirers of the northern English lakes, have yielded the palm to those of Killarney."

Mr. and Mrs. Hall, in their "Week at Killarney," quote the following from Sir David Wilkie:—"I have more than once expressed my opinion, that the county of Kerry, so nobly indented with the bays of the Atlantic Ocean, and possessing a climate so favourable for vegetation, along with its mountains and inland waters, might without impropriety be pronounced, in point of scenery, *the finest portion of the British Islands*." When he visited the lakes in 1835, he said that for "beauty and grandeur" he had never seen them surpassed.

A century ago, Arthur Young, the celebrated traveller, summed up his impressions of Killarney thus:—"Upon the whole, Killarney, among the lakes that I have seen, can scarcely be said to have a rival; the extent of water in Lough Erne is much greater, the islands more numerous, and some scenes near Castle Caldwell of as great magnificence; the rocks at Keswick are more sublime, and other lakes may have mountains in which they are superior: but when we consider the prodigious woods of Killarney, the immensity of the mountains, the wondrous beauty of the promontory of Mukross, and the Isle of Innisfallen, the character of the islands, the singular circumstance of the arbutus, and the numerous echoes, it will appear upon the whole to be in reality superior to all comparison."

Mr. Inglis, who was no enthusiast, institutes a comparison between the English lakes and those of Killarney. After a particular description of the mountain scenery, he proceeds:—"Although the Lakes of Killarney are three in number, yet they are all contained in one mountain hollow; and certainly there is not within the same compass anything in England presenting the same concentration of charms. There is infinitely greater variety at Killarney. In form, and in the outline of its mountain boundaries, the Lower Lake of Killarney

is decidedly superior to Windermere; and although the head of Ulleswater presents a bolder outline than is anywhere to be found in Killarney, yet it is upon this outline alone that the reputation of Ulleswater depends. Elsewhere than at Patterdale the lake scenery is tame, and the same may be said of Windermere, which, towards its lower extremity, is almost devoid of attraction. On the contrary, throughout the whole chain of lakes, there is variety at Killarney; tameness is nowhere to be found; and I cannot think that the somewhat nearer approach to sublimity which is found at the head of Ulleswater, can weigh in the balance against the far greater variety in the picturesque and the beautiful which Killarney affords. It would be unfair to compare the Lakes of Killarney with Windermere, Keswick, and Ulleswater, for these are spread over a great extent of country, whereas the lakes of former being 3,414 feet, and the latter 3,200 feet, above the level of the sea; and Mangerton, which is 2,756 feet. On this there is a small lake, called the "Devil's Punch Bowl," 2,206 feet high. The other mountains are, Torc, Purple Mountain, Toomies, Eagle's Nest. The echoes of these mountains are most extraordinary. A gun fired under the Eagle's Nest will reverberate from mountain to mountain like responsive peals of thunder, and a tune played upon a bugle will be distinctly repeated till the softening notes die away in the distances, as if prolonged by aerial voices. The vast tracts of indigenous wood, among which the *arbutus*, peculiar to this region, flourishes with marvellous luxuriance, serve as cover for wild deer; and when the hounds are in pursuit of these the clamour of echoes they awaken is most exciting.

Among these mountains wind the three lakes, studded with

LOWER LAKE OF KILLARNEY; SHOWING INNISFALLEN, THE ROCK OF O'DONAGHUE, AND ROSS CASTLE.

Killarney are all contained within a smaller circumference than Windermere. But even if such a comparison were to be admitted, Killarney would outvie the English lakes in one charm, in which they are essentially deficient—I mean the exuberance and variety of foliage which adorns both the banks and the islands of the Killarney Lakes. Such islands as Ronayne's Island, Dak Island, Dinish Island, and Innisfallen, covered with magnificent timber and gigantic evergreens, are nowhere to be found among the English lakes. I think it will be gathered from what I have said, that I award the preference to Killarney."

The mountains in which the lakes are embosomed form part of the lofty range which occupied nearly the whole of the peninsula formed by the deeply-penetrating bays of Dingle and Kenmare. Among these are M'Gillacaddy's Keeks,—namely, Carran Tual and Caher, the highest in Ireland, the no less than forty-two islands, which are masses of mingled rock and foliage, all being covered with the most beautiful and luxuriant wood, while four cascades add to the charms of the scenery. There was great destruction of timber in this region sixty years ago, but Killarney still presents the largest extent of natural forest now remaining in Ireland. For many minds these vast primeval woods have a most refreshing charm, and it is gratifying to find that they are now carefully preserved by the Earl of Kenmare, Mr. Herbert, and other proprietors, who have added to them by fresh plantations of oak and fir.

Ross Castle, which is on Lord Kenmare's demesne, is famous in Irish history; and far more celebrated is the island of Innisfallen, in extent about twenty-one acres, and containing the ruins of an abbey founded in the year 600. Here the "Annals of Innisfallen" were composed, and preserved in the

abbey as amongst the most prized of the early historical memorials of Ireland. The original, the first portion of which

UPPER LAKE OF KILLARNEY.

is written over 600 years, is now preserved in the Bodleian Library. "From the paths which meander along the diversified outlines of this interesting island," remarks Mr. Frazer, in his valuable "Handbook," "the most lovely and ever-changing views are obtained, by the varied surface, and the alternation of the forest glades and thickets, of the Lower Lake, its magnificent shores, and surrounding mountains. From its situation, variety, beauty of surface, its magnificent single trees and shrubs, this is one of the most interesting of the numerous objects which this region of wonder and beauty

BAY OF GLENGARIFF, NEAR THE ROAD TO BEERHAVEN.

affords; it is the most delightful of islands, and, like Ross, forms an adjunct to the demesne of the noble proprietor."

It is a glorious thing to ascend one of M'Gillacuddy's Reeks, or Mangerton. Never shall we forget the sensation we felt when, after climbing the mountain heights under a melting sun, and then piercing a cloud that hid it from the view, we reached the summit and emerged into sunlight again, looking far down upon the heavenward side of the same cloud which cast its shadows upon the lakes, but shone towards us in the most gorgeous colours. After a while, the magnificent panorama was dispersed like a dissolving view, revealing an unrivalled prospect—

"Sweet interchange
Of hill and valley, rivers, woods, and plains,
Now land, now sea, and shores with forests crowned."

The view from the mountain top is most enrapturing when the sun is setting—

"When many coloured evening
Lurks behind the purple woods and hills."

Then are seen to perfection all the wondrous varieties of light and shade and magical reflections:—

"The horizontal clouds,
With purple dyes, and fissures edged with gold
Streak the calm ether, while through the sparkling haze,
The faint hills glimmer."

THE PAINTER OF PISA.

IN THREE PARTS.—PART THE FIRST.

The chapel of the convent of St. Augustine at Pisa had lately been decorated and repaired, till it now rivalled in magnificence the splendours of the cathedral itself. In place of the simple rails which had surrounded the great altar, there rose a costly screen around the sanctuary; pillars of variegated marbles, sculptured friezes instinct with noble forms, graceful columns, solemn monuments laden with the pride of heraldry, silver lamps, and all that art and wealth could devise to subdue the mind and enthrall the senses, was there lavished in full pomp and panoply.

It was mid-day. The chapel was deserted,—the air was yet heavy with perfumed incense,—the last tones of the organ vibrated through the aisles,—the echoing footfall of the latest loiterer had scarcely died in the distance,—then silence and solitude alone remained.

Yet one man was there. He was standing behind a pillar, occupied upon a fresco. His dress was of the humblest, and his work of the most unambitious description, yet there was a power in his face, and a dignity in his appearance that promised something higher than the serge doublet and ill-paid drudgery of the inferior workman; poverty, toil and discontent were written on that pale and thoughtful brow. He stopped frequently at his work, and seemed wrapt in gloomy thought—he resumed his pencil again and again with desperate resolution, and as often threw it down again with impatient scorn,—at last, as if overcome by his emotions, he descended hastily from the scaffolding, and paced rapidly the centre of the church. Then the agitation which possessed him appeared gradually to become quieted, his steps calmer, his brow clearer, and finally he sat down beside the reading desk, and laid his burning forehead upon the Bible which laid open before him. When he raised it the whole expression of his countenance had become changed, his cheeks glowed, his eyes seemed inspired with an unearthly brightness:—"Father!" he exclaimed, "I thank thee! Thou hast breathed Thy spirit into mine. Thou wilt aid me to portray Thy glory upon earth: the Bible in all its majesty, in all its power, shall be the subject of my labour: angels and demons in countless multitudes, heaven and earth, punishment and reward. Thy glory and the life eternal shall speak Thy praise from the canvas of Thy servant! I feel it—my hand will not fail me—the past shall be forgotten—poverty, neglect, fatigue shall not be remembered—envy and injustice shall touch my soul no more, in the brightness of the coming fame!"

A deep sigh near him roused Marcello from his golden dream, and, turning with alarm, he saw a brother of the convent standing by his side. This old man, austere and venerable, was regarding the painter with a look full of compassionate benevolence. "My son," said he, "I have heard you, and you are suffering."

"More than I know how to tell you, father."

"And yet you have invoked the aid of God? you have faith?"

"Faith, but not hope, my father," said the painter, "and without hope life is a long and weary day—a sterile land—an accursed tree whose fruits are dust and ashes when we gather them!"

"Alas! my son, you are young," said the monk, kindly, "and but a few moments since you dreamt of a future full of divine glory and prosperity! Dream and hope again."

"You mistake me—I am no longer young. Time writes the age of man upon his heart. I have desired, and it has been denied unto me; I have tasted of anguish and bitterness; my soul is worn with hope, as the lute of the minstrel is worn with age, and whose strings at length give forth but harsh and broken sounds. I have dreamed of a work which shall immortalise my name, but have I courage to undertake all that I design? Oh that, like my father, I had remained an humble fisher, casting my nets upon the ocean for my daily bread! Father, while yet a child, there came a painter to my lowly home; that man recognised in the rude outlines which the fisher-boy had traced with charcoal on the walls the germs of natural genius, and offered to become my protector. I fell at his knees—I kissed the hem of his garment—I worshipped him as a divinity, and prayed, with all the eloquence of passion, for the permission of my father. It was granted; sublime was the concession of that poor fisherman: he deprived himself of the active arms that aided him in his employ, that mended his nets, and cultivated his scanty garden. He had but one son, and he loved him well enough to part with him. But ere I went, my master said to me,—'Boy, hast thou courage and constancy?—canst thou endure hunger and cold, and vow thy youth to a martyrdom without rest or reward?—canst thou venture all for the love of thy divine art and the future glory? The bread of the artist is watered with tears.' And I have found it so. He died, and from an artist I became an artizan. The world believed me not when I sought to justify my claims. All that I had done had gone forth with the name of my master. I was branded as an ignorant pretender, when I pointed out to them my share in his paintings. Obstacles surrounded, disappointments met me at every turn, and the flower of hope withered in my heart. Still I have faith—still I believe in glory, and believe that it may yet be mine!"

"Glory!" repeated the monk, in a tone of sorrowful pity; and, without combatting the fatal delusions of that word, pointed solemnly to a grave-stone on which the painter was standing, and which bore this inscription:—

"HIC JACET CAPPERONI, PICTOR."

The characters were well nigh obliterated; soon they would be distinguishable no longer, and the spot would be forgotten. Marcello looked down upon them mechanically; but he was wrapt once more in his dream, and he comprehended them not.

PART THE SECOND.

Two years had passed away: the glorious luxuriance of an Italian summer clothed the earth with a gorgeous mantle of verdure and flowers. Pisa had all the appearance of a festival. Perfumes floated on the air; noble lords and ladies thronged the public walks; others, followed by their retainers, with falcons on their wrists, went forth to the chase; nobles and commoners, soldiers and peasantry, gave themselves up to pleasure and idleness. Every palace blazed with light in the calm evenings, and sounds of lute and serenade came wandering by on every gentle breath of air that stirred the orange blossoms in the moonlight.

The senate was assembled at the justice-hall to regulate the interests of the province, and all the wealth and hospitality of Pisa was employed to do honour to their visit.

During one of the sittings of the court, a letter was laid before them, written by a trembling hand, and signed *Marcello*. Its purport was as follows:—

"Illustrious Lords,—An humble and unknown painter, at the hour of his death, entreats your attention. For more than two years he has lived in solitude, alone with art and his own soul: he has sought to combat enmity and unjust criticism; and, in dying, he has no wish beyond the pardon of his God and the glory of his work. His hand, he believes, has not proved unfaithful to his thought; but, broken down with labour and sorrow, and the desire of fame, he feels that rest is near at hand. The prayer of the dying is sacred—deign, then, to send some members of the senate to judge his picture, and to declare if it be worthy of a space in the chapel of St. Augustine, to which he bequeaths it."

This strange missive became at once the subject of deep interest to all in the assembly. On the previous evening the artist was unknown, or, if known, despised; now he was reverenced and esteemed by all. Some of the senators who patronised the convent declared that they had observed the frescoes of Marcello, in which, despite many errors, they had recognised the hand of a master. These eulogiums produced a great effect upon the public mind. Within an hour the home of the artist was approached by a brilliant company, who descended from their equipages at the door, where they were met by a procession of monks, coming at the same moment to view the picture given to their convent. The friars passed in first, chanting a mournful hymn; the noble signors followed them in silence.

There was a poetic calm brooding over the death-chamber, which impressed the visitors with reverent awe. Stern busts, and silent forms of sculptured loveliness stood around; an ample drapery at the farthest extremity concealed the picture, and the daylight fell in rose and azure chequers through the stained glass of the lofty casement, and cast uncertain splendour on the bed where laid the dying painter, worn and wan, yet still with some appearances of life in the wildly brilliant eye and quivering lip. He strove to speak, but he could only point feebly to the curtain; then, supported by the aged monk in whom he had confided at the chapel, he raised himself on the couch, seized a cord beside his bed, and in a moment drew the drapery aside, and exposed the picture. One only word escaped from every lip: "Admirable!"

And admirable it was. In this narrow space of canvas the mind of the painter had assembled all ideas that are most noble and sublime in man. Religion was there; religion with all its heavenly aspirations and its heavenly glories. There he had represented in one part the heavens, in another the earth—here the dreadful judgment, there the eternal happiness. Now, upon an arid and stony soil, the Solitaries occupied in the austere labours of their lives—one excavating a cell in the hard rock, another digging his grave, a third in meditation before a cross and a skull—all inspired with the double activity of the soul and body, where all around is silence and desolation. Angels with glorious wings hover over the Fathers of the desert, and seem to guard their sanctity. Here is the Evil Genius presiding above the ruins of Pagan worship; and, in the empyrean heaven, above all, in the centre of Light and Peace, God himself was dimly shadowed forth, as if in a radiance whose beams enveloped him from the too daring gaze of mortal eyes. Above and around seraphic legions hovered, hymning praise in song. Such was the work before which the Pisan senate stood in breathless awe and wonder—such the triumph of the artist, to whom they turned with one accord, and cried, "Glory to thee, Marcello!"

The painter raised his head, and turned to them a countenance now paler than before; his lips trembled, his breath came quick and short—"Glory!" he murmured, and so died.

The next day Pisa was the scene of a solemn and touching event. Amid the deep clamour of the death-bells from every church around, an immense procession wound slowly towards the chapel of the Augustines. The whole city rendered homage to a painter. In life they had denied him every merit; in death they deemed no honours and no funeral pomp too great to glorify a sublime labour and a saintly death. Arrived at the chapel, the picture was installed above the great altar, and the corpse deposited on a magnificent bier, surrounded with lighted tapers. Clouds of incense float into the vaulted roof; the solemn chant swells and falls; the organ's noble voice rolls round in rich resounding harmonies; all the wealthy and noble of the land kneel there in prayer, and the light vapours of the incense curling up around the altar-piece invest the painted legions with strange life. The Solitaries seem to have new meaning in their stern features; the ministering angels appear descending to do homage to their Creator, and the ineffable glory shines forth more etherial and divine than before. On the morrow, Marcello is to receive the last sepulchral honours. Night clothed the city in its solemn mantle. Festivity for a brief space was suspended. The chapel, now empty and silent, was at length free from every curious visitant; by degrees the lights were extinguished, and, save the wax tapers around the bier, a profound darkness brooded in the aisles and galleries. Near the corpse a monk was watching. It was Friar Eusebius, the same who had two years before pointed to the gravestone over which Marcello's coffin rested: he had solicited this pious vigil, and, kneeling there, with his face buried in his hands, the good monk reflected bitterly upon the fate of the man whose thirst of fame had brough him misery and death, and of the homage which had been accorded only to his remains. While absorbed in these reflections, a light sound, almost resembling a sigh, attracted his attention. He rose and looked around—no creature was visible. He was too wise to be influenced by any dread of supernatural agency, and so, reassured, knelt down again and commenced his fervent prayers for the soul's repose of the only man in whom he had taken an earthly interest. At length the old monk's words came indistinctly, his head drooped on his breast, he was asleep.

ART INDUSTRY—ORNAMENTATION.

It has been well said, that "the scope of the ornamentist should come as nearly to the aim of the artist as it is possible for the work of one man's hand to approach the conception of another's mind;" or, to put the phrase into somewhat simpler language, it is desirable that the working-hand and the artist-mind should be united in one person. Having recently made a few brief remarks on the subject of taste in works of art and manufacture, we may well be excused if we speak a little more in detail on its immediate manifestation—ornament.

Now, it must be conceded, that nearly all kinds of ornamentation is necessarily traditionary;—from the acanthus-covered basket came the beautiful Corinthian capital, and from the bent branches of the peasant's hut proceeded the first notion of the Gothic arch. But the traditions of the past, good, bad, and indifferent, should not be allowed to influence either artists or manufacturers at the expense of truth and good taste. It unfortunately happens, however, that the indiscriminate use of traditionary ornament has led to the frequent abuse of beautiful forms: as when the sacred vessels used in the services of religion are imitated in utensils for domestic use, the funeral urns of the Greeks revived as drinking vessels, the columns of a temple turned into candlesticks, and sarcophagi into wine-coolers, while the decoration of ceilings are applied to carpets, and the carved friezes of Ionic churches made to ornament muslin curtains! all these errors arising from an indiscriminate use of ancient, though beautiful forms. The constant search after novelty,—says Mr. Redgrave in his Report on Design—is one of the sources of bad taste in modern ornamentation. The ornament of past ages was chiefly the offspring of handicraft labour, that of the present age is of the engine and the machine. This great difference in the mode of production causes a like difference in the results. In old times the artist was at once designer, ornamentist, and craftsman, and to him was indifferent the use of the pencil or the

brush, of the hammer, the chisel, or the punch; his hand and his mind wrought together, not only in the design, but in every stage of its completion, and thus there entered a portion of that mind into every minute detail, and into every stage of finish, and many a beautiful after-thought was embodied by the hand of the "cunning artificer," many a grace added to the work by his mastery and skill. He worked, not to produce a rigid monotony, a tiresome sameness, unknown in the works of nature, and peculiar to these artificial works of man; the varying mind has no share in their production, and man himself becomes only the servant of the machine.

Moreover, the old ornamentist worked generally from feelings of piety, from love of his labours, or from the desire of fame, motives hardly known to the artist of this class in

VASE IN PORCELAIN—FROM THE ROYAL MANUFACTORY AT MEISSEN.

sameness, but as Nature works: — she produces nothing exactly similar to its fellow, in every turn of every stage of growth, in every flower, and in every leaf, adding a changing grace, a differing beauty; so he varied his labours with every feeling of his overflowing mind. But this is not possible with the stamp, the mould, the press, and the die, the ornamental agents of our days; after the type or model is made, all the products are rigidly the same, whence arises a sickening our days, at least in this country. Who seeks fame from the ephemera of a season? Who loves a labour that is so soon to pass away? Who cares for a work that is not to be the child of his own hand, but to be produced in thousands by the aid of machinery? The toil of him of old times was spent upon the thing itself, and not upon a mere model for it: the chalice, the cup, the lock and key, the reliquary, were to be without repetition and without rivals: he sought to give them their

highest excellence, and labouring from one of the feelings we have described, threw his whole soul into his work, so that it became a thing for future ages to look upon and to prize. Not that handicraft or art-workmanship is utterly excluded from our manufactures; it is only partially so, making more painfully evident how greatly ornamental art has suffered from its new union with machinery. Wherever ornament is wholly

CENTRE-PIECE IN SILVER—WAGNER AND SON, BERLIN.

effected by machinery, it is certainly the most degraded in style and execution; and the best workmanship and the best taste are to be found in those manufactures and fabrics wherein handicraft is entirely or partially the means of producing the ornament, as in china and glass, in works in the precious metals, carving, &c. This partly arises from the facilities which machinery gives to the manufacturer, enabling him to produce the florid and overloaded as cheaply as the simple forms, and thus to satisfy the larger market for the multitude, who desire quantity rather than quality, and value a thing the more, the more it is ornamented. This state of modern manufacture, whereby ornament is multiplied without limit from a given model, by the machine or the mould, ought at least to awaken in the manufacturer a sense of the importance of the first design. One would think that what was to be produced by thousands and tens of thousands should at least be a work of beauty, and no pains be spared to ensure its excellence.

We have here introduced two designs illustrative of the good taste which seeks to embody natural forms and artistic treatment in the production of articles of every day use. The originals are to be seen, we understand, in the Irish Industrial Exhibition.

POPULAR ERRORS, PREJUDICES, AND SUPERSTITIONS.

ERRORS IN CONNEXION WITH MEDICINE.

Under the head of errors relative to medicine we cannot omit noticing those various books on medicine for popular use which, it has been well remarked, are written by mediocrity for the use of ignorance. We feel called upon to put our readers on their guard against these works. If the science of medicine is so complicated that many people cannot help believing that even those who have devoted years to the study of it, know but little about it after all, what possible good can be expected from the perusal of those books which profess to teach medicine as they would teach domestic cookery, by a series of recipes. Were these books written even by men of real talent, which, by-the-by, is a rare case, they could only in any case give very incomplete, and consequently dangerous, information to the generality of readers. In this case truly "a little learning is a dangerous thing."

PREVENTIVE MEDICINE.

It is a very common and erroneous practice for persons to undergo medical treatment while in a state of health, to guard against sickness which may come. Some persons take purgative medicines, which, by irritating the intestinal tube, increase the secretion of the mucosities which cover it, and, by ulcerating the digestive tube by the use of this unnecessary and injurious course of medicine, they produce in the body various noxious matters, upon the discharge of which they congratulate themselves, when in reality these matters would never have existed but for the physicking undergone. Other persons, preferring bleeding as a preventive against coming sickness, by this means deprive themselves unnecessarily of strength, and, if they are advanced in years, render themselves liable to dropsy. All, in a word, by this mistaken practice, contract a habit which it is equally dangerous to continue or to suppress. It is time enough to think of medicine when attacked by illness. The only safe and unfailing preventive medicine consists of abstemious and regular living, and temperate habits.

POISON.

It is not unfrequently believed that a coin or other piece of copper if swallowed is poisonous. This is not the case. The moisture of the stomach does not convert copper into verdegris. Neither is pounded glass poisonous, as it is said to be. Numerous experiments have proved that glass reduced to a very fine powder has no hurtful qualities; it is capable of irritating the stomach when in a coarser form, and when the stomach is empty; and if the pieces of glass are of any considerable size, they are liable to get stuck in the sides of the stomach, and cause first an acute pain, and afterwards more serious results; still, as we said before, the belief that powdered glass is poisonous is an error. We mention this, because cases have been known in which people have been, before now, suspected by their ignorant neighbours of poisoning others by means of glass-powder. Having spoken of a false poison, let us say a few words about a false antidote. It is generally supposed that milk is an excellent antidote against all kinds of poison; but we would not advise any one to trust to it, if they have taken any poison more dangerous than glass-powder. Milk, it is true, has been, and may be usefully, employed as an emollient; but before all things, a person having swallowed poison must be made to vomit, to free the stomach of the venomous substance; if there be no more efficacious emetic immediately at hand, the best method of producing vomiting is to tickle the throat with a feather. These remarks, however, will no doubt be more for the benefit of dogs and other animals than of mankind, for when a human being is poisoned, a doctor is always immediately sent for. Still, until the doctor arrives, the method we have mentioned should at once be resorted to. But the unfortunate dumb animals have no other doctor than their masters; and many a valuable dog, which has been accidentally poisoned, has been lost by the belief entertained by his master in the efficacy of milk as an antidote. And this belief still exists, although the animals to whom it has been given have constantly died, whereas they might have been saved by the timely use of an emetic.

SCURVY, KING'S EVIL, DYSENTERY.

It is a fact now established in medical science, that scurvy is not contagious; and, if it sometimes attacks a whole crew, it is because all the sailors are equally exposed to the effects of fatigue, damp, bad food, and bad water, which are the real causes of scurvy; for it is an error to attribute this disease to the sea-air and the use of salted provisions. Scurvy is found as much on land as upon the sea, in hospitals, prisons, camps, wherever there exist the causes we have just pointed out. King's evil is not contagious any more than scurvy. If we see several cases of it in the same family, it is because it is almost always the result of a hereditary defect. As for the mode of treatment, it is the same for scorbutic and scrofulous patients—pure food and drink, and bracing air; and not, as is too often supposed, under a groundless fear of inflammation, a weakening diet, and even issues applied to a body already covered with wounds.* There is another disease which is supposed to be contagious, with no greater degree of truth than the two preceding ones. We allude to dysentery. The causes producing this are often the same as those inducing scurvy—bad food, excessive fatigue, and the dampness of night. Soldiers, who are much subject to this complaint, almost invariably resort to brandy or other stimulants for a remedy. This is a most hazardous proceeding, it being entirely a matter of chance which way they may be affected by it. If the relaxation of the bowels proceeds from weakness, they may be benefitted by it; but if it is real dysentery, the result of the treatment will be the mortification of the stomach, and the consequent death of the patient. Surgeons are appointed in every regiment, and to their aid recourse should always be had.

SOMNAMBULISM.

It is not our intention here to enter into the question of mesmerism. All we would do, is to point out an error very commonly believed in. It is, that sleep-walkers are endowed with some superhuman faculty, by means of which they are enabled to walk, without danger of falling, along the steepest roofs or the narrowest parapets. The fact is, that they do indeed possess the confidence which springs from an ignorance of danger, and being free from giddiness and vertigo, they have thus less chance of falling than if they could see their peril; but if their senses do not lead them astray, neither do they guide them; therefore, it not unfrequently happens that the somnambulist walks right over the end of his path out into space, and falls.

SPITTING.

This filthy habit is no less injurious than it is offensive. In the normal state, the saliva, which is a fluid prepared by the glands which surround the jaws, is carried involuntarily into the stomach by the act of swallowing, and in regard to abundance it does not exceed the quantity necessary for the action which the food has to undergo before it is converted into blood; so that there is seldom any excretion of saliva. There are, however, some persons with whom the saliva is so abundantly secreted that it becomes a necessity for them to get rid of a portion of it. These, however, are an exception. Certain habits also excite the secretion of saliva, such as

* The supposed efficacy of the touch of a reigning monarch to cure this disease—from which it has derived its name of king's evil—we have not alluded to, for happily this absurd superstition is exploded. This practice was prevalent in England for many centuries, and a regular office for the ceremony was contained in the "Book of Common Prayer." The last English sovereign who "touched for the evil" was Queen Anne. Dr. Johnson said he had an indistinct recollection of having been touched by that monarch. Since her death, the prayers appointed for the ceremony have been silently allowed to drop out of the Prayer-book.

chewing tobacco or other irritating substances and smoking. Very often the excessive secretion is only a result of habits of this description. Now a very prevalent error amongst people who are ignorant of medicine is to suppose that the matters which are spit out whilst smoking, existed in the throat before the smoking commenced—and thus we hear of persons taking a pipe for the sake of "clearing their throat." They suppose, in a word, that the act of smoking, which is the most active cause of the formation of this saliva, has no other result than that of getting rid of it. The fact cannot be too strongly insisted upon, that the over-abundant excretion of the saliva is attended with injurious results, and, in consequence, that the substances which provoke this excretion are bad. By continually exciting the salival glands, the habit of smoking or chewing tobacco occasions a useless secretion beyond that which goes on during the time of mastication, and, in consequence, a loss of saliva, which we repeat cannot be without injurious results. This habit, also, in time renders the salival glands less susceptible of the stimulating action of the food, which, to be properly digested, must undergo the action of the saliva.

STAYS.

Of all the prejudices by which human nature suffers, there is scarcely any one which is more extensively injurious, more firmly rooted, or more dangerous than the use of stays. Spite of all that has been said and written upon the subject, women will wear these supposed helps to beauty with an infatuation that can only be likened to that which makes the Chinese ladies cripple themselves for life in order to have fashionable feet. We all are ready to abuse and ridicule the absurdity of this latter practice, and yet it may well be questioned, whether it be not better even to lose the use of the feet, than to suffer the serious derangements of the most important vital organs which are brought about by wearing tight stays.

Everybody knows that the natural shape of a woman's chest is conical, the smallest part being uppermost and the base lowest. Now the effect of stays is exactly to reverse this figure, compressing the base of the cone, the part which nature requires to be the largest, and thereby *improving* (!) nature's handiwork. The effect of this is, that the principal organs of the body are compressed and deranged, the parts which ought to occupy this restricted space being forced upwards into the chest, or downward into the abdomen. In the former case, the organs thus displaced crowd upon and interfere with the proper action of the liver, the spleen, and the stomach, pushing the diaphragm towards the chest. On the other hand, the parts which are forced downwards compress the no less important organs situated in the lower part of the body. The result of the compression of these different organs is, that all the functions of the body are seriously interfered with. Respiration is impeded by the pressure of the short ribs and the driving back of the diaphragm upon the lungs; the circulation of the blood is deranged, both by the restricted respiration, and by the compression of the heart and the great vessels. The blood is then retained in too great quantities in the vessels of the chest, the head, and other parts; and the result of this is, an overflow of blood, which, according to individual temperament, occasions palpitations, oppression, phthisis, vertigo, and even true apoplexy, hysterical affections, &c. &c. It is, however, especially to young girls that the use of stays is pernicious. It frequently happens, that with a view to rendering the figure beautiful (?) their body is entirely deformed, the growth impeded or fettered, and the seeds sown of those diseases to which must be attributed so many premature deaths. The effect of stays upon young girls is to prevent the development of the osseous framework of the chest, and the free exercise of the viscera enclosed within it. The lungs and heart are impeded in their action, and from this fact result pectoral irritations, which seriously affect the health, and frequently even cause death. The compression of the body, independently of the effects we have just pointed out, is very frequently the most active cause of spinal distortion, by compressing the muscles of the trunk, and consequently preventing their development; the result is, that these muscles have not then sufficient strength to hold up the spine in its natural vertical position. Many other evils connected with the use of stays might be pointed out, but surely we have said enough. And yet, we fear, it will be in vain. Would that women could be convinced that the most natural is ever the most beautiful; then, perhaps, would the compressed waist of the Englishwoman be looked upon in the same light as the crippled foot of the Chinese—not as a physical good sacrificed to beauty, but as, in itself, an absolute deformity.

VACCINATION.

Although a hacknied subject, it is impossible to omit vaccination in an article upon popular prejudices. How many times must it be repeated to certain obstinately ignorant minds that vaccination introduces no unhealthy germ into the human system; and that, if any diseases other than the small-pox make their appearance after vaccination, it is ridiculous to charge vaccination with them; for it is incontestably proved that it produces no evil effects of any sort, nor makes us in any manner pay for the inestimable service it renders in freeing us from the abominable scourge of humanity which either kills or disfigures for life.

VINEGAR.

An ancient historian has informed us, that Hannibal, wishing to cross the Alps, dissolved them by means of vinegar. This is too absurd to look upon in a serious light, and yet there are some readers, even in the present day, who are inclined to admit the fact. If, however, vinegar is not capable of dissolving the Alpine peaks, it is at any rate quite capable of destroying the strongest stomach, and of opening the way to the hostile armies of disease and death. Warning to ladies, who drink vinegar to make themselves thin and fashionably shaped!

WHITLOW.

As this species of inflammation is one to which the poorer classes, who only consult a doctor at the last extremity, are most exposed, and as it may be attended with very serious results, we invite their earnest attention to this article. We would impress upon them that they should not wait for a whitlow to come to a head before opening it. The pus once formed, it is useless to apply laxatives to the part affected; the dense and close structure of the fingers not allowing sufficient space for the inflammatory swelling, this swelling extends to the palm of the hand, then to the arm, and afterwards to the arm-pit, and causes enormous suppurations, which may bring on mortification and death. If the evil does not attain this alarming extent, it is at least to be feared that when the pus is formed and the skin broken, the tendons of the fingers in the bottom of the abscess may be gradually destroyed, and the part remain for the future rigid and immoveable. As soon, therefore, as the inflammation takes place, it should be rendered harmless by opening the swollen finger. Only blood will flow out, but this means will prevent suppuration, and, in consequence, will prevent the evil effects of it pointed out above.

WOUNDS FROM A SHARP INSTRUMENT.

Every wound has a tendency to heal itself. Like the spear of Achilles, which healed the wounds it caused, any instrument or weapon cutting or piercing into the flesh produces, by the very fact of penetrating it, a sufficient action of nature to form a cicatrice either immediately or by the intervention of suppuration. Therefore, when a wound is newly made and still bleeds, and the sides are not too much inflamed, beware of using any kind of balsam, which, rendering suppuration inevitable, prevents the sides of the wound from re-uniting. The use of such balsams is a popular error, and farriers, when a nail has entered a horse's foot, pour into the wound an irritating liquid, which causes the foot to swell, and changes an insignificant hurt into a very serious malady.

CHURCH OF THE KNIGHTS TEMPLARS.

Dotted about here and there in the world, are evidences, various and unique, of the religious feeling of the past. And particularly observable is the fact, that what we call the middle ages of the world was a church-building and good-work-consecrating period. Between the eleventh and sixteenth centuries were built most of those venerable village edifices, ivy-crowned and grey, which are to be found in almost every town and village in Europe. To the first mentioned period the Church of the Templars at Luz is ascribed. It is now a mere ruin, or at best but an ill-kept building—half church half fortress, such as the military orders of ecclesiastics were in the habit of erecting in troublous times to defend the frontiers of France against the encroachments of the Moors. The time was, however, when to the duties of the priest the Templars in the church of Luz added the sterner offices of skirmishes, and a belief that through a single doorway, now walled up, the proscribed race of the Cagots were alone allowed to enter the edifice, where they occupied a space apart from the rest of the congregation. The Knights of the Temple spread themselves all over civilised Europe, and their deeds of prowess in the Holy Land are the themes of many a song and romance trolled forth even now by the simple peasantry.

Luz, the village in which the church was planted by the Templars, is poor and thinly inhabited; but it is surrounded by a highly cultivated and delightful district of France, in the South Pyrenees, near the town of Barrege. The only manufacture of importance carried on in the district is that of the crape or gauzy material for ladies' wear called, after the name of the district, *barege*. The little river Gave pursues its

CHURCH OF THE KNIGHTS TEMPLARS, AT LUZ, IN THE FRENCH PYRENEES.

the warrior, and thus the edifice, even now, partakes rather more of the nature of a fortress than of a church. Situated in the centre of the village of Luz, on the confines of the French Pyrenees, it was doubtless a place both of refuge and defence in the days when the swarthy Moors, having already overrun and taken possession of the peninsula of Spain, began to look with eager eyes upon the smiling fields of France that lay just beyond the mountains.

A relic of the past, the Church of the Templars is a highly interesting building, both with regard to its architecture and its associations. The former is of that mixed character common to the period—pointed windows, turreted walls, a square projecting tower, carved doorways, and so forth—and known to the scientific as the Romanesque; the latter consists of numerous historical and traditional stories of battles and meandering course through the village, and it is said that tourists commonly find a good day's fishing in its waters.

Behind the village, on a high grassy knoll, are the ruins of an ancient hermitage, from which a pleasant view of the valley on either side may be obtained. About half a mile from Luz is the little town of St. Sauveur, containing the most celebrated and best frequented baths in the Pyrenees. The name of St. Sauveur is said to have been derived from an inscription set up over the medicinal spring which supplies the baths. "Vos haurietes aquas de fontibus Salvatoris." This legend is ascribed to a bishop of Tarbes, but the period when it was set up is not known.

Behind the towns of Luz and St. Sauveur is situated one of the highest hills of the Pyrenees, the *Pic de Bergons*, the summit of which is 6,117 feet above the level of the sea.

WORKS OF THE GREAT MASTERS.

DAVID TENIERS THE YOUNGER.

"To contain all the pictures I have painted, it would be necessary to have a gallery two leagues long," Teniers used to observe.

"*Qu'on enlève tous ces magots!*" exclaimed Louis XIV., on perceiving at Versailles some *Bambocciate*, by Teniers.

Two leagues of grotesque figures!—'tis an entire nation; and yet there they are, the whole Flemish people, upon that

canvas. There they are smoking, throwing dice, and drinking beer. See them chatting within the taverns or at the doorways; see them dancing in the open air. Grotesque figures, quoth the king of gentlemen;—grotesque certainly in one point of view: dress one of them out, if you can, in the silken doublet of a great lord! It would be as impossible as to put a peasant's smockfrock on the aristocracy of Vandyck. The people at the public-house, or in the full swing of their fairs, the pipe and the pot, the cask and the clarionet, these are what David Teniers has represented, and all touched, by his pencil, are admirable; and yet how singular the subjects must appear to those who are acquainted with the life of this intellectual, opulent, and famous painter. Teniers lived in grand style. His château, between Antwerp and Mechlin, known as the Château of the Three Towers, had not only Three Towers, but pieces of water upon which floated swans and wherries, feudal avenues,* a bridge over a moat, a hillock for an observatory; and for a landscape the plain dotted with villages. It was, in sooth, an abode of so much pretension as to have filled the proprietor's breast with such honest pride, that he has embalmed it in his pictures upwards of twenty times, depicting it by turns in full front, three-quarter view, profile, in the foreground, in the distance; everywhere, in short, without omitting a single weathercock. Teniers at length even twisted his castle into a signature. That at home he led a life of elegance and ease, we may judge from one of his pictures, in which he is represented surrounded by his family, figuring in a satin vest, embroidered ruff, the majestic periwig and cavalier boots of the day, with his moustache curling

* See the *Catalogue raisonné* of M. de Julienne's pictures, by Pierre Rémy, 1768. Dutch School.

upward in the newest fashion. He holds a double-bass between his legs, upon which he is accompanying his son, who stands behind him with his mouth open, singing as doubtless was becoming in a young country gentleman. Madame Teniers, blooming in all her fresh and Flemish beauty, in a dress of Mechlin lace, holds the music-book, and a page is preparing to pour out a glass of cordial. A monkey perched on a piece of furniture, and the majordomo motionless in the doorway of the saloon, constitute to all appearance a highly gratified audience.

Such was the domestic establishment of Teniers. Thither flocked from all parts, attracted by the fame of the painter, and retained by the brilliant hospitality of the proprietor, the loftiest dignitaries of the age, whose names are for us at this day stars in the night of time. Amongst others, Don John of Austria, governor of the Low Countries, the same who carried off from Naples the daughter of Ribera, thereby causing the death of the Spanish painter through agonising grief. Don John, it is said, attempted, under the eye of Teniers, to paint the Flemish rustics, but found them still more rebellious to his pencil than to his sword. The Archduke Leopold, who had the honour of first bestowing on Teniers that courtly patronage he subsequently so universally enjoyed, saw his example followed by the Bishop of Ghent and by all the nobility who loved the arts. Christina, of Sweden, who had drawn Descartes to her court, was herself desirous of belonging to the court of David Teniers, and sent him her portrait with a gold chain. Finally, the King of Spain, Philip IV., the friend of Velasquez, caused a gallery to be constructed in the Escurial, specially designed for the *kermesses* of Teniers,—as if, after having lost his Flemish people, he at least wished to possess them in pictures. Teniers thus led a lordly life, with princes for pupils, kings for flatterers, and nevertheless, strange to say, his pictures represented nothing but peasants, and through the people alone he succeeded. If such a taste for exhibitions of the familiar life of the lower orders was singular in a painter, who was so courtly in his own person, it was still more singular and surprising in his royal patrons; for all these dancers, smokers, and gamblers of Teniers, what were they but those illustrious "*gueux*" of the Seven United Provinces who waged so fierce a war against the Spaniards? They were the *beggars of the woods*, the *beggars of the fens*, and the *beggars of the towns*, as they were called at that time; and the feeling that made them so joyous, that made them toss their glasses so high in their drinking, their feet so high in the dance, may not, after all, have been inspired by another pitcher of malt, but by the elation of victory. And young Teniers himself, commanding the admiration of the kings of Europe, is he not in a manner the William of Orange of his art? Both one and the other triumphed through the aid of the *beggars*.

David Teniers was born in 1610, the year in which Henry IV. of France was murdered. His father, David Teniers the elder, was a painter before him, the friend of Elzheimer and of Rubens. The first plaything of the child was a pencil, and like Blaise Pascal, his French contemporary, he daubed with precocious lines the walls of his paternal mansion. His native city was Antwerp, the cradle of Rubens, of Vandyck, of Jordaens, of Gaspard de Crayer, and of Porbus—the country of colour. David Teniers the younger was to enjoy the destiny of becoming greater than his father—a fate rare indeed amongst the sons of celebrated men.

In the early years of the seventeenth century, the Teniers family were far from being lords. Old Teniers, who then painted rustic figures, led pretty much the same life as his models. Tradition represents him as going with his son to market to sell his pictures, which were packed on the back of a donkey. The painter, his son, and his ass, went thus from Antwerp to Brussels, offering their merchandise for sale, and more than once they had the mortification of finding no purchasers. Probably the taste for painting small figures and popular scenes was imbibed by young Teniers from his daily studies in this humble species of commerce even more than from the example set by his father; great compositions, poetry, thought, and style, are rarely to be acquired at market. The donkey brought home the capital productions, and was only relieved of the inferior commodities. Thus Teniers was all his life addicted to traffic, for he wished his mode of existence to be as rich as his palette, and as easy as his talent, and we shall see that in this line of ambition he succeeded quite as well as in any other. He is, in painting, the creator of that extempore labour which bestows on all hands châteaus and footmen, satin vests, fine chests of carved wood, lustres of polished copper, and noble sideboards loaded with brilliant plate of gold.

One day, Teniers, then about fifteen years old, was painting in his father's studio, when Rubens unexpectedly entered. Everything was confusion at the sudden appearance of the great painter, and the young man trembled, not with fear but with enthusiasm. Rubens stopped before the easel of the student, and fixed upon the picture just commenced that eye which could frame a composition at a glance; then, taking the pencil of young Teniers, and instructing him at once with hand and voice, he gave him in a few moments a lesson and a picture. Would not that be a subject to paint? Teniers the student, Rubens the master, and the traditions of genius thus verbally transmitted. No doubt great artists convey their experiences to each other from age to age; thus serving as professors by the transfusion of thought, and though the tomb may separate, still their works connect them; but when a living lesson is imparted, this visible transmission is an additional emotion for posterity. We love these greetings in the past, amongst those who are to meet again in the future.

Enthusiastic imitation of the works of great masters is almost always the first form of inspiration visible in youth. To recognise the talent of others is the first intimation of that which the student may himself possess: but in the youthful labours of Teniers, imitation offers this peculiarity, that it is in truth originality. A copy made by Teniers is not a copy, but another specimen by the master. He does not, for instance, imitate Titian, or Paul Veronese, or Rubens, he renews them; and it certainly is not to Teniers that we can apply the remarks of the Chevalier de Jaucourt:* "Counterfeit painters more easily imitate those works which do not require much invention, than those which display the whole imagination of the artist. Painters of *pasticcios* † cannot counterfeit either the composition, the colouring, or the expression of the great masters. The hand of another may be imitated, but not his genius." "The power of his pencil was incredible; he knew how to adapt it to a variety of eminent artists, whose touch and colouring were exceedingly different; and yet he gave to his imitations so strong a character of originality, as to leave it doubtful whether they were not really painted by the very artists whose manner of thinking, composing, and pencilling they were only an imitation, or what the Italians call *pasticcios*." ‡

Teniers had the power of appropriating everything. His assimilation did not stop at the manner of handling the pencil, of laying on the colours, or of putting in the touches; so deeply did he enter into the mind of the painter, so profoundly did he imbibe his temper, that he reproduced at will the grave firmness of Titian, the fiery richness of Rubens, the luxury of

* Vide old "Encyclopédie," article *Pastiche*.

† The Italians apply this word, which signifies a pie, to a description of pictures which are neither entirely originals nor copies, and which are sometimes made up of different parts, taken from other paintings, as a *pâté* is composed of various kinds of meat. This appellation is likewise extended to such productions as are entirely the invention of the artist, but in which he has imitated the style of another master, in composition, design, and colouring. These imitations are usually confined to simple and limited compositions, and are seldom successful except in ordinary subjects. It would be necessary for an artist to draw like Raphael to be able to counterfeit his design. He must possess his mind, before he can imitate his expression, and be endowed with his genius, before he can equal the grandeur of his composition.

‡ Pilkington's "Dictionary of Painters."

his fresh carnations, the air of his heads, and the apparent motion remarkable in his compositions. To such a degree is this the case, that Teniers, this child of the city of Antwerp, may be regarded as the representative of the national spirit of imitation,—he a Fleming so excelling in counterfeiting Flemings as to deceive all Belgium. Rubens especially, who did not expect to make so faithful a pupil, was astonished at this unforeseen competition which thus translated him, as it were, in his own language; and truly the deception is most complete. Bryan relates "that he was present at the sale of one of the principal collections at Brussels, in which was a picture of Mary Magdalene kneeling in a grot, the figure as large as life, which had been regarded for many years by the most experienced judges as an admirable production of Rubens; some difference of opinion arising, the picture was taken out of the frame, when the name of 'David Teniers, jun.', with the date, was discovered at the bottom of the picture, which had been concealed by the border of the frame."* The cabinet of the Archduke Leopold was full of these original copies. Triest, Bishop of Ghent, the Queen of Sweden, and the King of Spain commissioned Teniers to paint several for them; and some amateurs, amusing to relate, in their delighted surprise, even manifested a preference for them over their originals. Is he not doubly fortunate who possesses a Rubens and a Teniers in one and the same picture?

It is to David the younger that we owe the celebrated collection of the Archduke Leopold, which was published for the first time in 1685, by Abraham Teniers, David's brother, who was a printseller at Antwerp. This publication having first appeard in separate plates, Abraham's successor made a volume of them, which he published under the title of "Theatre of the Paintings of David Teniers," with a preface, which in some copies was in French, in others in Spanish, and in the greater number in Latin. The pictures of the Archduke having been subsequently removed to Vienna, an engraving, which represented a perspective view of these pictures arranged in the imperial gallery, was added to the subsequent editions. But in the last reprint that was published of it, in 1775, and which is known under the title of "The Grand Cabinet of Pictures of the Archduke Leopold William, painted by the Italian masters, and drawn by David Teniers," the editors made a mistake in naming David Teniers the elder instead of David Teniers the younger. The learned Heinecken has noticed this error in his precious work.†

David Teniers treated nature with as much familiarity as he did the great masters. He counterfeited her also, and stole from her, not only her outward forms, but her secrets,—not only her accidents, but her spirit, with a mechanical facility and power of adaptation of no ordinary kind. "It was not, however, to his imitative faculties that Teniers was indebted for his greatest celebrity. He was a constant and faithful observer of nature, and in his favourite subjects, representing village festivals and merry-makings, Flemish fairs and *kermesses*, gipsies and incantations, he has displayed a characteristic originality, and a *naiveté* of expression, in which he is unrivalled. That he might have an opportunity of studying from life the rustic character of the peasantry, their rural sports and rejoicings, their quarrels and their combats, he established himself in a retired situation in the village of Perck, between Antwerp and Mechlin, where he could mingle with their pastimes, and observe with a painter's eye their character under the impulse of the various passions; and it is surprising that he has been able to give such an admirable variety to representations which in their nature appear confined and uniform."‡

A story is told of Teniers, that he arrived one day at the village of Oyssel, with his pencils and box of colours, returning doubtless from some sketching tour in the country. He was hungry, but without money; entering a tavern, however, he breakfasted with perfect confidence. When the bill was presented for payment, he took up his brushes, and in a very little time he transferred from the street to a canvas a beggarman who was quietly playing on the bagpipe, little dreaming that he was about to become a *chef-d'œuvre*. Lord Falston, an English nobleman, who was also breakfasting near Teniers, probably with not so good an appetite, though his pockets were full of guineas, approached the young Fleming, and seemed greatly surprised to see a meal thus provided for in painter's coin. At sight of the beggarman, who on the canvas no longer claimed pity, but admiration, the rich amateur gave the young artist the alms of enthusiasm in pieces of gold, and hastened to carry off the copy, whilst Teniers, in his turn, gave a breakfast to the original, and paid the astonished innkeeper munificently for both repasts.

This adventure of paying for a breakfast with a picture, repeated every day in various forms, must have constituted the whole life of Teniers. When his fame had increased, he made a luxury of it, and every picture paid for the whim of the day. Young, brilliant, and admired, certain of having his pencil always dipped in golden colour, Teniers the younger purchased the Château of the Three Towers, to entertain the princes his friends, and began to expend in hospitality the daily produce of his imagination. Two of his pictures, which only resemble each other by their talent, may perfectly represent the history of Teniers, his life of luxury, and his life of toil, the one supported by the other. The first of these represents the "Prodigal Son," not that of the Evangelist, but the "Prodigal Son" of the seventeenth century; that is to say, dressed as a gentleman of fashion, his hair falling in curls upon his lace collar, a waving plume upon his hat, and his heels decorated with spurs. His hat, his short mantle, and his sword and shoulder-belt are deposited on a seat. The scene is near the door of a tavern, in the open air, the sky is bright and the landscape serene. A table, surrounded by footmen and served by a page, indicates the luxury of the joyous feast, whilst in the foreground, upon the sand, two crystal flagons, full of liqueurs of golden hue, sparkle and are kept cool in a large copper basin artistically wrought. The Prodigal Son is seated between two ladies in silken dresses, fair, smiling, and formed for love; his hand clasping that of one fair dame. Her rival is seated on the opposite side of the table, and though her back is turned towards us, her beauty is still evident. We fancy she must have a clear fresh complexion and great sweetness of expression, judging only by the grace, the roundness, and the fairness of the neck, and also by that faint tint at the nape, which marks the commencement of the hair. Pleasure abounds, as it does in all Teniers's pictures, but on this occasion it is the gaiety of elegance and high life, in which delicate beauty mingles. As to the gentleman who does the honours of the feast, if it be not Teniers himself, it is perhaps his brilliant friend, that other prodigal son of glory, Don John of Austria.

Such is the expenditure. Let us now look at the receipts. In a gloomy cabinet is seen an alchymist bending over his mysterious work. The furnaces are lit, the retorts extend along the walls their cabalistic forms, the Gothic scrolls of science are unrolled, and the symbolical owl dozes in his corner. What is the learned doctor under his furred cap in search of? Gold, gold, and the "great secret." Pluck from this seeker of transmutation, from this wrinkled old man, bearded and blear-eyed, his spectacles,—take off his cap, and see if it is not Teniers the younger transmuting his colours into gold. Happy alchymist, whose alembic is a palette, whose "great secret" is a master-piece, and whose laboratory lies in the verdant plains of Flanders!

This, in fact, was his life—prodigality and toil; the two trays of a balance which did not always maintain a just equilibrium; and thus it was, that by these daily efforts of invention, he imperceptibly accomplished those two leagues of pictures, which have wearied no one, not even their author. We can now understand why a great number of these pictures have been called by amateurs the *after-dinner pieces* of Teniers,

* Bryan's "Dictionary of Painters and Engravers."

† The Latin title was "Davidis Teniers Antuerpiensis Pictoris, etc. Theatrum Pictuarum, 1660. Antuerpiæ apud Henricum Ametsens," in folio.

‡ Bryan's "Dictionary of Painters and Engravers."

a name which at once explains the time they cost him and the motive for which they were painted. The *after-dinner pieces* of Teniers are therefore the "quart d'heure" of Rabelais. Drinking-songs and joyous scenes at dessert constitute the subjects of these small easel pictures, which cost the painter so little trouble, and now sell at such high prices. To be properly judged of, they should be looked at on rising from table; then is the time for seeing them in their proper light.

"Show me a pipe," said Greuze, "and I will tell you if it belongs to one of Teniers's figures." What character! what delicacy of observation does not this imply in a painter! Thus to individualise everything, to fix his name on the minutest details, to be recognised in a pipe! Teniers, so clever in imitating his predecessors and friends, in purloining their peculiarities, the airs of their heads, their handling, their touch, their mind, himself possesses a personality so decided that his manner cannot be confounded with that of any other! Yes, this adroit robber is, when he chooses, the most secure and confident of proprietors. Just now he was the Proteus of painting: gliding into all studios, seizing upon all pencils, one after another, and even, if need be, that illustrious and redoubtable pencil of Titian's which an emperor had condescended to pick up; in his pictures he rivalled the Venetian colourists, he gave a satin texture to his flesh-tints with the brush of a Rubens; he was by turns Dutch or Spanish, German or Fleming; and yet when intrenched in his public house he is perfect master of all around him; not an artist shall design a jug, touch the light of a pipe-stem, but shall be immediately told, "This is not by David Teniers; I do not recognise in that his touch, at once so light, so intelligent, and so decided." No, in the whole history of painting amongst the moderns, we shall not find a painter of *pasticcios* so original, an imitator so completely inimitable.

"The fantastic tendency of Teniers has produced some very amusing scenes of 'diablerie' which claim the more observation, since all his strange hobgoblins have the same clumsy, stupid character as the crowds of boors in his pictures of a different class, and thus appear to carry with them a sort of ironical commentary on their own existence. Such pictures occur in many places. In the Schleissheim gallery there is one of a witch, who appears to be in the act of completing some magic spell. She kneels before a lamp, and ties up the throat of a little monster like a fish; wild goblins of the most fantastic forms have collected themselves round her, but at the horrid threats of the witch scamper away in grotesque hurry."*

How many painters of the Low Countries have devoted themselves to *bamboccíate!* † The two Van Ostades, Brauwer, Cornelius Bega, and many others, have made their names famous with the same subjects, and almost with the same personages that served as models for Teniers. But amongst so many masters, we can immediately distinguish a drinker, a smoker, or a beer-shop by Teniers. And these are at once easily known by the nature of the sentiment of *gaiety* alone which the painter has infused into them. David Teniers the younger is beyond everything a laughing philosopher, an arch observer, a painter full of mind, and in the most magnificent of his *after-dinner* pieces, we have a glimpse at the bottom of some intentional touch of familiar irony. Introduce into the same smoking-room, for instance, Adrian Ostade, Teniers, and Brauwer. None of them will view it with the same eyes, or under the same colours. Nor will they see the same faces. Adrian Brauwer will wait to study physiognomy for the moment of battle. He will take up his pencils when the

RETURN OF THE PRODIGAL SON.

* Kugler's "Handbook of the History of Painting."

† The Italians call by this name subjects representing fairs, drolleries, and village feasts. This appellation appears to have originated in the admiration excited at Rome by the works of Peter van Laer, a Dutch painter, who treated those subjects with great success, and who was nicknamed Tamboccio, on account of the extraordinary deformity of his body.

drinkers, heated with liquor, seize upon the pitchers, the benches, the chairs, and the brooms, to fling them at each other's heads. Adrian van Ostade will be struck by some artless position, by the quietude of a smoker, or by his silence. He will paint him peaceful, serious, meditative, taciturn, and in the fulness of his ugliness; whilst Teniers at the first glance will seize on the jovial side, the bantering smile; he will select the moment when his actors begin to chat on the prowess and adventures of the burgomaster of their locality. Here they are playing at tric-trac at a round table covered with a rug. The hostess makes one of the party, throws out a broad jest to excite laughter, and willingly allows herself to be taken round the waist, whilst the husband is scoring on a board the beer that he is serving. In another place they are toasting a village bride. Her father is cutting slices of ham, while the bridegroom is smiling with a silly air without observing that his friends are kissing the plump and rosy cheeks of his young wife. Five or six peasants

THE DRUNKEN PHILOSOPHER.

form the wedding party; one raises his glass, another cries out a toast, then they laugh, but above all they drink. Every body is satisfied; Teniers is delighted, for none of the details of the scene have escaped him, not an expression of the countenance, however fleeting it might be, has evaded his pencil or deceived his eye.

Touch and expression are the two great qualities in which Teniers the younger shines. The more grotesque the expression, the more pleased he is to work it out, and the better able he is to depict it. In this respect he is the Scarron of painting, and it may be said that he has equalled the inexhaustible imagination of the author of *Ragotin*. If Teniers's figures resemble so closely the hero of the "Roman comique," if they are stooping, bent, crooked, cut out with a bill-hook as it were, what truth of expression does he not give them to make up for it! If they are ill-formed by nature, how well they are designed upon canvas! What truth in the *ensemble*, what delicacy in the tints! With Teniers the tavern waiter has not the gait of the peasant, the farmer of Perck does not dance like the cit of Mechlin, and the village pedant has a fashion peculiar to himself in the lighting of his pipe, the holding of his cards, in pouring out his faro,* and in drinking it. Should you chance to recognise the "Village Festival" in the shop window of a dealer in old engravings, stop for a moment to study the expression of the old players at bowls. You will find in it a mind, a keenness of observation, a feeling for the burlesque, to which nothing is perhaps superior in this style. A king who is setting his crown on the hazard of a die, a lover who risks the loss of an adored mistress, a miser who is on the point of adventuring his treasure, are not more attentive, more fidgety, more anxious, nor on sharper thorns, or more burning coals, than this crafty bowler at the moment that he launches the long-poised bowl from his cunning hands. As it rolls along he will not suffer any one to speak to him, or rather to speak to his bowl, for he maintains that the breathing of a single hostile word might turn aside or arrest its course; —but for his own part he follows it with look and gesture, encourages it with his voice, scolds it if it deviates, caresses it with a few praises charily bestowed, until, avoiding the direction it was nearly receiving from the collision of a pebble, it reaches its destination, after having borne the cross-fire of a hundred eyes which had been levelled at it.

To express with so much nature and so much art these simple scenes, these pleasures of veteran pensioners, of gray-beard villagers in Sunday finery, was to the younger Teniers only one out of a hundred methods of evincing his talent. Sometimes he indulges in dignity, and elevates himself to the noblest expression. A picture of his was much admired at the sale of the pictures which belonged to Cardinal Fesch, at Rome, a "Crowning of Thorns," in which Jesus, half divested of his raiment, is represented within a military guard-house. He is seated on a stone, and bound with cords. "His long

* A description of Flemish beer.

hair falls in disorder upon his shoulders, his head sinking upon his breast, slightly inclines to the right, and his looks cast down towards the earth, express, like every feature of his face, a deep and resigned sorrow. All the patience of an insulted God, all the courageous tenderness of a man, breathe in that fine countenance profoundly impressed with a mysterious melancholy in which the suffering soul is all poured out." Thus speaks of this picture of Teniers an appreciator whose word may be taken on the subject.* The pliability, however, which Teniers the younger has evinced in this, and which he had already displayed in his *pasticcios*, does not prevent him from having a character which is perfectly his own, and which is easily recognised, not only by the shape of one of his pipes, according to Greuze, but in the generally inartificial composition of his subjects, and amongst amateurs by his touch.

The touch of Teniers is very remarkable, and it is perhaps of all his qualities the most characteristic. His delicate, transparent, and agreeable colouring, and his silvery tones, would alone be no doubt sufficient to distinguish him from other painters; but in addition to those excellences, his handling is so free, so light, and so easy, that it is by it that he is principally known. His manner, moreover, appears so natural that we can scarcely suppose at first sight that there is any other mode of painting than his. The common and academical method, which consists in rubbing in the shadows and laying on the lights with a solid *impasto*, is nowhere practised so simply, so clearly, and with less trouble than in the pictures of Teniers, which constitute true models of manipulation. Endowed with a sure judgment and a delicate feeling, David Teniers knew always, while preserving his individuality of method, how to so vary his touch according to the objects he represented as to give them solidity and reality when painting objects of still life, and the actual appearance of vitality when painting animated beings. His touch is therefore intelligent in the highest degree; and if we find it so firm and applied with so much decision and so free a hand, it is because he had reflected deeply, and that his pencil was guided not by routine, but by an exquisite feeling of form, of colour, and of the picturesque. He knows that the ivory of a clarionet ought not to be touched like the glaze of a stoneware pot; that the polish of a cuirass or the reflections from kitchen utensils ought not to be treated like a pimpled nose on the expansive visage of a country fiddler.

But there is a still more important peculiarity to remark in Teniers, which is his feeling for aerial perspective. His eye was so true, that by the effect alone of the gradation or strength of his tints, of the softening or the firmness of his touch, calculated with rare precision, he made objects advance or retire; thus avoiding the necessity for a recurrence to those expedients, those decided sacrifices, those cutting contrasts of light and shade, which no true artist need employ unless, like Ribera, he reduces his artifices to such a system as to wear the aspect of genius itself. To throw back, for instance, a figure dressed in a gaudy colour, or to introduce a red drapery into his background, Teniers has no occasion to deaden it with a cloudy grey; it is enough for him to give a proper tint to this red,—that is, to mingle with it a just proportion of that general air tone which learned connoisseurs call the vanishing tint.†

But even in the absence of colour and of touch, and only looking at Teniers through the medium of Lebas's engravings, in which he is so delicately reproduced, this painter still continues one of the most expressive and intellectual of his own school and of many others. Doubtless if we could stand before the pictures of Teniers, as Louis XIV. did, surrounded by a brilliant court, with their love for and habits of grandeur, the effect produced would be infallibly disastrous. The hero who offered his arm to the haughty Athenaïs de Montespan, or who might hold the hand of the Duchess de la Vallière, could not take a lively interest in the representation of scenes so grossly trivial, and the term "*magots*" would be the instinctive cry of ideality startled by reality. A governor of the Low Countries alone could comprehend the most frequent episodes of Teniers's paintings. When we are occupied with our artist, we must not forget that we are wandering between Mechlin and Antwerp alone, and that from thence to the Parthenon there are some twelve or fifteen hundred leagues, and these leagues of Brabant too! We must therefore close the sacred gates of the beau-ideal, and enter with a good grace the alehouse of Teniers, where, instead of the intoxication of nectar, we must content ourselves with that of strong beer, and for want of poetry put up with reality.

"The subjects which Teniers executed with the greatest pleasure and the most complete success, are scenes of peasant life. There is nothing pastoral in his conception of such scenes; he even exaggerates and borders on caricature, but he exhibits at the same time great power of humour, and knows well how to stamp on his characters, even when occupied in the most commonplace employments, an expression of peculiar seriousness and importance, and thus he frequently introduces the happiest contrast. But he does not always keep up this feeling of humour; in several pictures, particularly those of great feasts, we seem to meet with a certain coldness of observation on the part of the artist, and a deliberate selection of common situations, which combine to produce a mannered character and convey the impression of studied and conscious attention to mere outward effect. In these pictures it appears to have been the main object of the artist to exhibit his brilliant technical skill and his power of imitating accessories (such as old casks, pots, baskets, and different utensils), together with his bold and effective touch, his juicy, transparent chiaro-oscuro, and others qualities of the same kind."*

What clouds of smoke! The pipe in every mouth, the cards in every hand, pots and pans shining against the wall, a housewife who makes the frying-pan hiss and sputter upon a bright fire which attracts the most greedy and gluttonous—such is the interior. But who are these men in the foreground? Sailors perhaps, just arrived from the East Indies. One of them is playing the ten of spades; another with his elbows raised, is drinking at pleasure from a pitcher; a third is hanging up at a window-shutter a carricature of the village schoolmaster, sketched with charcoal on a dirty sheet of paper; another is kissing the female servant of the tavern, without observing that the hostess has opened a window, looking from the steps outside into the tap-room, doubtless to watch with a jealous eye, and a scowling brow, the stolen kisses of the kitchen wench; but no, it was to furnish Teniers with a ray of light for which he had occasion in the angle of his picture.

It is remarked by Dr. Waagen that one of the works which shows Teniers as the greatest man in his line, is contained in the collection of His Grace the Duke of Bedford at Woburn Abbey. It represents a species of pic-nic. "In the foreground are seen the preparations for a rural festival. Four enormous kettles, six casks, and a quantity of provisions, are spread on the ground. The very numerous guests have already seated themselves in many picturesque groups, which extend to the background of the landscape, and are taking their morning beverage. In the whole there is extraordinary cheerfulness and freshness; the ordonnance manifests the consummate skill of the artist. Notwithstanding the variety and warmth of the several local tints, the whole is executed in a very delicate and harmonious silvery tone, and with a perfection of the aerial perspective in the gradations, a brightness and spirit in the touch, which are not common even with Teniers himself. The date, 1646, proves that it is of the best time of the master." †

* This picture, which would appear to be one of the capital works of Teniers, is minutely described by M. George, in his excellent *Catalogue raisonné* of the gallery of Cardinal Fesch. Rome, 1844.

† This also is the expression made use of by the learned M. Paillot, in his *Traité complet de la Peinture*, 10 vols. 8vo. with plates. Paris. 1825.

* Kugler's "Handbook of the History of Painting."

† "Works of Art and Artists in England," by G. T. Waagen.

Teniers had not only, in common with Molière, his contemporary, the title of gentleman of the bedchamber of a prince, he had also that comic imagination which irresistibly seizes on men and manners to transmit them living to the laughter of posterity. Gaiety never abandons either the author or his creations, but it is a true gaiety, internal, profound, and communicative. In the great village feast of Rubens, in the Louvre, his figures get drunk with passion, and embrace with fury; in those of Teniers they laugh, they drink, they dance, with an ease and freedom most perfectly natural. The gaiety of this painter is, however, always mingled with raillery and archness. If he paints a quack, who hawks his ratafia about the streets, if he represents a tooth-drawer advising his victim to ease with gin the dreadful pain he suffers from a grinder, which he assures his patient is to be extracted without pain, it is clear that the expression of his pencil will be that of caustic good-nature; but there is nothing even to heroism that Teniers does not seize upon its trivial side.

Here, for instance, is a picture bearing the title of "Military Preparations." What may we suppose that Teniers has introduced into it? A cavalier saddling his horse? No, that is the manner in which Wouvermans would have treated it. A nobleman seizing his helmet? That would have been the affair of Vandyck. Teniers, with a few strokes of his pencil, has painted an old woman dusting clothes. Dust is, in his eyes, the beginning and end of all human glory.

Gipsies telling fortunes in the fields and laughing at the credulity of their dupes; alchymists bending over their furnaces, and ridiculous in their "divine" science; apes dressed like gentlemen, with sword by side, and hat on head, standing before their master, like the grandees of Spain in the presence of the king, thus parodying human vanity; sorcerers preparing their cauldrons by moonlight; cats with open books before them reading music, and mimicking the gravity of virtuosos; these were the favourite subjects of Teniers—these were the scenes in which he embodied his caustic imagination; this was his comedy of life. Teniers, you will say, has also treated religious subjects? True; but in Catholic martyrology Saint Anthony has monopolised all his preference. What a happy opportunity for the painter's frolicsome fancy! Around this fervent hermit, absorbed in ecstasy, clinging to the ardours of mysticism, to spread the most irresistible distractions in order to disturb his attention and endanger his salvation, the most grotesque monsters, the most horned of nightmares, beasts that cannot be looked at without screaming; what a temptation for Teniers himself? And how often has he not renewed his onslaughts on the gravity of the saint. Kneeling in his grotto, the wrinkled and hoary recluse fervently clasps his hands, and fixes his eyes despairingly upon the books which sustain and save. Around him spring into life and swarm animals of the most unearthly anatomy. Flocking from every part, they climb the rocks by the shortest cuts. Those that cannot get in, poke through the fissures of the grotto the most incredible profiles, which sufficiently indicate their evil intentions. Owls with spectacles stand beside the sacred books, and read them with no less attention than the saint himself. Bats pinned against the sides of the cave in all directions leer down upon the hapless Christian, whilst pterodactyles and other impossible beasts, invented simultaneously by the fancy of Teniers and the imagination of Callot, before they had been reconstructed by the genius of Cuvier, are dragging behind at the robe of St. Anthony. Who would believe it? In the midst of this carnival the saint preserves his lenten visage, grimly illumined by that suppressed grin Teniers cannot help putting upon it.

The favourite "Temptation of Saint Anthony" was often painted by Teniers; the best of them all is in the Berlin Museum. The poor saint kneels full of anxiety before his stone altar, the corners of which are just shooting out into heads of monstrous beasts; besides him stands a devil in the shape of a Brabant beauty holding a goblet of wine; all kinds of imps, some in the shape of goats, others like apes or fishes, are twitching at his garments; others again form a circle round the picture, and appear to make the most horrible uproar by singing, screaming, or croaking! One blows a clarionet, which he has stuck into the hole for the nose in his skull. In the air above all is wild tumult. There are two knights who ride on fishes, and tilt with one another; one is a bird cased in an earthen mug for a coat of armour, and with a candlestick with a burning light stuck in it on his head instead of a helmet. He pierces the other combatant with a long hop-pole through the neck, and this knight, who resembles a dried-up frog, seems to set up a fearful scream, whilst he tosses his arms aloft. All kinds of reptiles are flying and creeping about. It would be difficult to match the mad conceits and the wild genius of this picture. In some of these works the humour of the artist breaks out with equal success, but in another form. Of this class there are some masterly specimens in the Schleissheim gallery, in which apes perform concerts, or sit at table dressed in all sorts of finery, and regale themselves with tobacco and beer." *

The Museum of Bordeaux possesses a fine picture by Teniers, and very rare for its unaccustomed vigour of effect. So lively an opposition of light and shade is remarkable in a painter who was in the habit, as Gersaint says, of producing his lights upon a light background.† This picture, which we reproduce here, bears the name of "The Incantation," but is it not rather some humorous new reading of "Saint Anthony?" It seems to us that we see some alehouse lout, with an otter-skin cap and a drunkard's nose, who has placed himself by stealth in the chair of the hermit, having at his feet the sacred books, and before him, on the table, the indispensable death's-head. On seeing himself surrounded by those cowled, winged, and inflamed monsters, who apparently mistake him for the cenobite, he laughs in his sleeve at the advances which the messengers of Satan are making to him, as if he did not already belong to them!

"The great secret of Teniers," very justly says M. Paillot de Montabert, in his "Treatise on Painting," "is his great knowledge of, and feeling for, perspective. This he possessed thoroughly, and applied it not only to his forms and lines, but to his tones, his tints, and his touch.‡ With this command of execution, the most indispensable in painting, Teniers understood the art of combining chiaro-oscuro, and, much better still in my opinion, the arts of blending his tints. Teniers's effects are never confused; they are simple, light, and airy. None of that haze which is only the resource of certain ignorant painters; none of that general darkness in the midst of which sparkles an acute point of light. His great art is to conceal art, to keep his secret. At the first glance, you observe no artifice; it seems as if any one might compose, dispose, and elucidate quite as well as he does, his system is so natural; but if we reflect for a time, we discover, in spite of his adroit good-nature, all the causes, all the calculations, all the artifices. Always sure of the result, or rather familiar with the principle of the unity of lights and shades, familiar also with the powers of opposition, able to interpose softness by half-luminous objects, or firmness by striking contrasts, sometimes he playfully paints a man dressed in white upon a white sky, sometimes he puts grey upon grey, and red upon red; nothing embarrasses him, and he amuses himself, so to speak, by diversifying his combinations."

"Teniers had a lively invention and ready execution; his pencil is free and delicate; the touching of his trees is light and firm; his skies are admirable, and, although not much varied, are clear and brilliant; and the expression of his figures, whether mirthful or grave, in anger or good humour, is uncommonly striking. His pictures are generally clear in all their parts, with a beautiful transparence; and he had the art of relieving his lights by the disposition of others, without employing deep shadows, which yet produced the intended

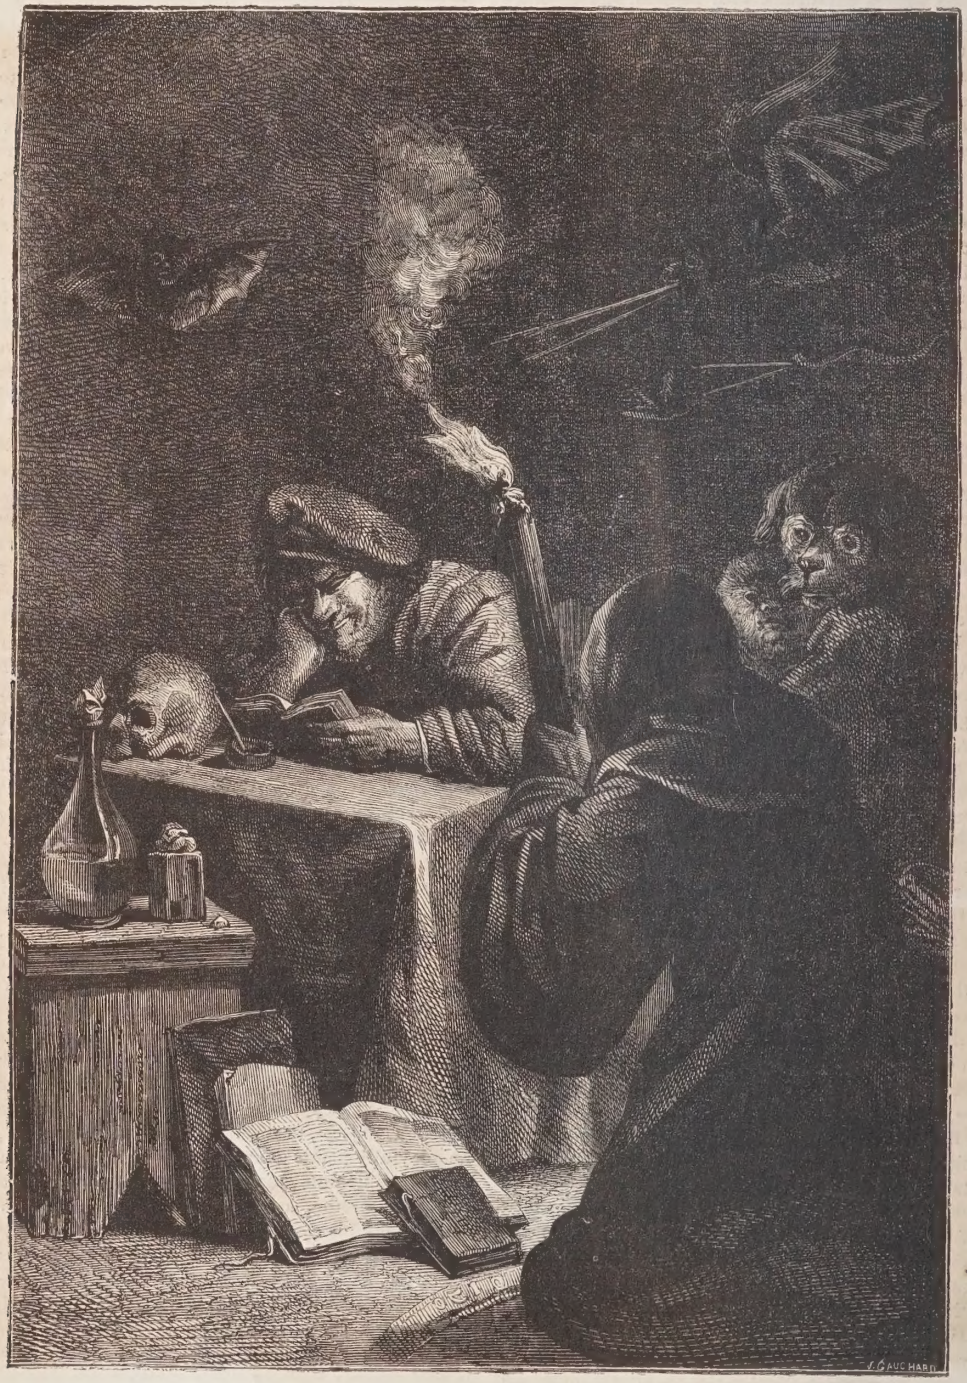
effect very happily. This practice he is supposed to have derived from Rubens, who remarked that strong oppositions were not always necessary to produce effect in a picture; which observation that great artist knew to be just, from his studying the colouring and tints of Titian."*

and in this way:—He had painted a picture of Hymen for a gentleman who was about to be married. In this work Hymen, full of roguery, as usual with the painter, seemed charming when seen at a distance, but morose when closely viewed. The Archduke Leopold had purchased this picture, and



THE INCANTATION.

It is desirable to know the opinion of Teniers, this practical philosopher, on the subject of marriage, and which in reality he followed of those two counsels proffered in turn by Panurge to his joyous friend Pantagruel. Teniers was twice married,

had placed it at the end of his gallery upon a sort of platform. To ascend this platform it was necessary to pass a very slippery step, on this side of which was the charming point of view, but as soon as the step was passed, the charms all vanished. Now, there was a young lady at Antwerp, Anne Breughel, daughter of the celebrated painter John Breughel

* Pilkington's "Dictionary of Painters."

surnamed Velvet Breughel:* when Teniers began to think that he could not thus continue single all his life, Anne Breughel was a minor, and had no less than three guardians, Cornelius Schut, Van Balen, and Rubens. Anne Breughel must have been an enchanting young lady and a precious treasure, if we may judge from these three illustrious painters whom the worthy magistrate had given her for guardians. One day when she paid a visit to the gallery of the Archduke Leopold, and was shown the painting of Teniers, the latter asked the young lady if she would *pass the step*. She laughed: the matter was referred to the guardians; and they thought proper to unite the beauty of their ward with the talent of their rival. And thus it was that Teniers became the husband of Anne Breughel.†

THE TEMPTATION OF ST. ANTHONY.

† The name of Velvet Breughel was given him on account of his being generally clothed in velvet, an expensive habit at that time. Some authorities deem it more likely that he was called *Brughel de Velours*, from being an eminent flower-painter.

It may be seen, with reference to Teniers, how rare good

* M. Arsène Houssaye has written on the subject of Teniers some fluent and charming pages, which in their nature are historical, though they border on romance by their fanciful development. —"*Histoire de la Peinture Flamande et Hollandaise.*" Paris, 1845. Vol. ii.

works on painting really are. Assuredly if there was any artist who might lay claim to a just appreciation by the clearness of his style, the decided character of his subjects and of their physiognomy, or rather by the truth of his expression, it was David Teniers the younger. Nevertheless, we may search through books on art, and especially historical works, and we shall not find a page of interest on a painter who had given interest to so many models. D'Argenville has scarcely devoted six lines to Teniers the younger in the biography of his father. Felibien does not say a word about him, not even in the edition published in 1706, sixteen years after the death of Teniers. De Piles, who has spoken so handsomely of Rubens, has bestowed upon Teniers only three or four insignificant lines.

Sir Joshua Reynolds, in his "Journey to Flanders and Holland in the year 1781," says, "The works of David Teniers, jun., are worthy the closest attention of a painter, who desires to excel in the mechanical knowledge of his art. His manner of touching, or what we call handling, has perhaps never been equalled: there is in his pictures that exact mixture of softness and sharpness which is difficult to execute."

In his "Observations on some Great Painters," Taillasson has ably drawn, in a few strokes, this portrait of Teniers the younger. "Teniers," says he, "paints the *morale* of his peasants as well as their *physique*. Their passions, in fact, should not have the same physiognomy as those of other men. In his pictures we hear them reason, discuss and talk politics. When he paints them playing at cards, with what justice and vigour he has seized on the expression proper to this description of gamblers! He knows how to distinguish the different conditions of the inhabitants of the country, and from the beggarman to the great man of the parish all the social grades are clearly marked. The tones of his colour are true and rich, vigorous and silvery; his compositions are always harmonious without the affectation of sacrificing anything. In his interiors, and in his open-air scenes, the light and shade seem to be so easily felt that we might almost deem the painter had not thought of them. Teniers's talent is especially characterised by a rapid and spiritual touch which playfully sheds on every part light, colour, life, and expression. His works, full of truth, appear to have been dashed off in a moment; nothing seems to be constrained, nothing servilely copied, all seems to be created." However, if a just appreciation is rarely to be found in books, tradition has made amends by preserving it amongst amateurs. Teniers, of all those painters whose pictures go through the ordeal of sales, is one of those in most esteem with true connoisseurs, but he is also one of those whom the half-learned have the pretension to know the best from having heard him cited at every turn, from having seen him figure at the theatre in vaudevilles, and in short from having seen a hundred imitations of him by Ashoven, Zorg, and others.

Mrs. Jameson, in her "Handbook to the Public Galleries of Art in and near London," thus characterises Teniers:—"In considering the works of Teniers, we are struck by an apparent contrast between the character of the man and the class of subjects he treated, and between the subjects themselves and the manner in which he treated them. Teniers was an accomplished gentleman, a chosen companion of princes, refined in his manners, dress, and personal appearance; yet as an artist his predilection was for the humorous and grotesque scenes of common life, the merrymakings and courtships of boors; the interior of surgeon's shops and guard-rooms. These, while he represented them with the utmost truth and spirit as regards character and expression, he touched with such an exquisite and felicitous pencil, so light, so airy, so silvery delicate, that the vulgarity of the subject is redeemed by the consummate elegance of the execution, and the *mind* everywhere displayed in the conception as well as the treatment. He had, however, three different *manners*. At first he began by imitating Brauwer (whose boor-subjects were then much in fashion), and painted forcibly in rather a brownish tone; this he softened into a golden tone, and at length adopted that sparkling transparent touch and cooler tone by which his best pictures are distinguished. This delicacy of colouring sometimes, in his later pictures, verged on coldness and flatness, particularly in his landscapes; but the finest of these are wonderful for their airy brilliance. * * * The Queen's private gallery, and the collection of Lord Ashburton, contain the finest specimens of his talent I have seen in England."

Teniers had one very remarkable talent rather essential to an artist's prosperity—that of selling his pictures. An anecdote which, if true, has perhaps inspired La Fontaine with his fable of the cat, which counterfeited death to catch the mice the better, would prove that the seventeenth century was in no respect behind our own. The paintings of Teniers, we have said, were eagerly sought for; but a period occurred when the supply was greater than the demand. They already occupied two leagues in Europe, but expences increased more rapidly even than the produce of his labours. Alarm appeared in the Château of the Three Towers. How to maintain the luxury and the generous hospitality to which the painter and his illustrious friends were accustomed, was now the question. To produce more, to produce incessantly, to gather up with rapid pencil all the peasants who pass, or who dance, all the smokers who drink, all the drinkers who smoke, and put them upon canvas, would be to lower their value and to glut the market. Teniers seeks a remedy, and sees no salvation but in death, which is a wind up to admiration. He dies accordingly! The sorrowful news is spread; this spiritual painter will paint no more, happy are they who possess any of his pictures. He has, however, left a few which are masterpieces. Every one runs to get them; gold pours in and the market rises. Meanwhile, secluded within his dwelling, pencil in hand, and a smile on his lips, the painter labours on at his posthumous works. People purchase, and are astonished at the supply, till at length Teniers comes to life, and the joy is universal, even amongst the amateurs, upon whom the contribution was levied. The living were fleeced by the dead.

"The dates on some of his best pictures are from 1643 to 1653, though there are many fine ones painted during the same period, and others ten years later that are not dated. Indeed, there are no dates between 1653 and 1665, when he was in his full vigour. The last that have been discovered are 1678-9; these are one or two small pictures not more than nine inches by eight. It is not likely that he studied under Brauwer, who was his senior by only two years, though he imitated that master's style in some of his pictures; nor is there any proof that he practised in the school of Rubens, though, no doubt, he profited by observing his principles of colouring and general arrangement. His outset was not so very flattering; for it is said that he had the mortification of seeing the works of Tilborgh, who was his pupil, and others preferred to his; it was not until he was patronised by the Archduke Leopold William that he became distinguished. With regard to his imitations of Italian masters, or what is termed *pasticci*, there is now very little danger of passing them but for what they are; some are very clever, and the best resemble Paul Veronese, or the Bassans, in little. His attempts at Rubens are failures; the monkey is always discoverable. The number of authentic pictures by him, of which there are records, may be fairly reckoned at 1000, and of spurious at least 500 more. Smith's "Catalogue raisonné of the Works of the Dutch and Flemish Masters" (vol. iii. and supplement), contains descriptions of 900, all of which may be considered as genuine. Add to these about 100 in the galleries at Schleissheim and Munich, sixty-five mentioned by Cumberland as being in the royal collection at Madrid, and nineteen spoken of by Descamps, and we have a total of 1,089, from which a few errors and repetitions may be excepted. Perhaps there are many more in existence of which there is yet no written account; if so, the enormous value his pictures now bear will be sure to bring them to light. Some of his pictures are of large dimensions; one at Schleissheim is 13 feet 6 inches by 10 feet, and contains 1,138 figures, those in the foreground being about 12 inches high; others also abound with figures, such as the 'Fair at Ghent,' No. 103 of Supplement, 340; a

Village Fête,' No. 104, 93; No. 137 of Vol. III., another Village Festival,' contains 150; and numerous others might be quoted. Many of his pictures have been sold in public sales at sums varying from 300 to 1,500 guineas, and some in royal and public collections have been estimated at 2,000 and upwards. It is certain that he etched, but so did his father; the difficulty is in distinguishing their several works in this way, and, as far as regards the merits of the etchings, it is of no importance. A French engraver, G. De Vivier, etched some imitations, after pictures by Teniers, and marked them with the monogram used by that artist, though he has in other instances attributed the subjects to Anton. Van Heuvel, a scholar of Gaspar de Crayer; others are the acknowledged work of Coryn Boel. They who are curious in the matter may see a collection in the British Museum. The best authorities concur in placing his death in 1690, at the age of eighty."*

After some years of happiness, Teniers lost Anne Breughel, and sold the Château of the Three Towers. This manor, which he had made illustrious, was purchased by John de Freme, a councillor of the parliament of Brabant. But Teniers had a prospect of recovering it, by marrying the daughter of the new proprietor. One of Teniers's sons entered the church, and has left us some writings on the life and death of his father,—the joyous painter of smoking-rooms and village feasts, of apes in doublets and storks in spectacles, monks under temptation and alchymists at the *great work*, who died this time in good earnest at the age of eighty.

The recital which the clerical Teniers has left of the death of his father is altogether lugubrious and fantastic. It would seem that the octogenarian painter died in the midst of visions, thus commencing as it were in this world a dream from which he only awoke in the other; but some have narrated in a more lively manner the death of our country-gentleman and philosopher. At the moment he had finished the portrait of a lawyer, he felt himself dying, and in allusion to the ivory black that is used in painting, he exclaimed, "I have burned my last tooth to paint my attorney!"

There is scarcely a gallery or a cabinet that does not contain some pictures by Teniers, and a collection without them would be justly deemed incomplete.

Independent of his beautiful *kermesses* and his animated village weddings, Teniers has treated with wonderful spirit and warmth of imagination interiors of *cabarets*, smoking-rooms, rustic subjects, alchymists, *diablerie*, apish subjects, battles, animals, subjects of profane and sacred history, landscapes, and still life; in all of these he has displayed that lightness of execution and that delicate and spiritual touch which has never been surpassed.

The best engravers of all countries have outvied each other in reproducing the compositions of Teniers. We shall mention Hollar, L. Surugue, T. Galle, P. Pontius, Philip Lebas, Tardieu, T. Major, an excellent engraver but little known, F. Basan, P. Chenu, J. Beauvarlet, F. Van Steen, Muller, Coryn-Boel, Van Bruggen, Alliamet, Aveline, Lépicié, Moitte, de La Barthe, Laurent, Truchy, N. Lemire, Daullé, Levasseur, Canot, Baron, Chedel, Schwab, F. Boëce, Couché, Boutrois, Guttenberg, Niquet, &c. &c.

Not one of them, however, has entered into the spirit of the painter like the celebrated Lebas, whose prints after Teniers are more than a hundred, and who has infused into them the delicacy of touch and the silvery tone of the pictures of the celebrated Fleming.

David Teniers himself etched several pieces, and he has left some black-lead pencil sketches, treated, like his pictures, with great delicacy and spirit.

In every country imbued with the love of painting we find pictures by Teniers the younger. Out of the proverbial "two leagues" we can do little more than enumerate some of the more striking ones in the public galleries of Europe.

The Imperial Gallery, in the Belvedere Palace at Vienna, contains not less than nineteen compositions of this master collected in the 6th room. Amongst these are comprised—"A Peasant's Marriage," signed and dated 1648. "Abraham and Isaac on the Mount." "A young Girl cleaning Kitchen Utensils." "The Sausage-maker." "A Village Fête:" figures of the painter and his family. "Interior of the Picture Gallery of the Archduke Leopold William at Brussels," of which Teniers was keeper. The pictures here represented are for the most part now in the Belvedere. It was this picture, in which he imitated the particular style of the most distinguished masters of the Italian as well as of the Flemish school to such perfection, that obtained for him the name of the Proteus of painting. "Shooting at the Popinjay" in the Place du Sablon, Brussels, 1652, Teniers himself in the foreground. "A Kermess," &c. &c.

The ancient and celebrated Dusseldorf gallery only contained one picture by Teniers—"A Village Festival."

The Pinakothek of Munich is very rich in compositions of this master, all of which are deserving of especial praise. We can only mention—"An Italian Fair." "Monkeys smoking," a very witty and amusing picture. "A Guard-room, Boors Merrymaking." "A Country Wedding." "Boors Smoking and playing at Cards." "Boors Quarrelling." "Monkeys engaged in Cooking, some of them are masked. "A Concert of Cats and Monkeys." The collection is only deficient in a "Temptation of Saint Anthony."

The Royal Gallery of Dresden possesses twenty-three paintings by Teniers, amongst which—"The Backgammon Party. "Flemish Kermess." "Boors playing at Cards." "An Old Woman to whom appear fantastical beings." "Saint Peter delivered from Prison." "A Guard-room." "Two Landscapes." "A Chemist." "Temptation of Saint Anthony." "Drinkers playing at Dice." "Boors Dancing." "Another Temptation of Saint Anthony." "An Old Dentist who has just drawn a Tooth. "A mountainous Landscape." In one of the two "Temptations of Saint Anthony," it is almost inconceivable, observes M. Viardot, that the animated egg should be wanting. This is the only instance, adds the amateur, to his knowledge, that Teniers has omitted his pleasant conceit.

The Royal Museum at Berlin has only four David Teniers's, none of which are very striking; the most noticeable are "An Alchymist" and a "Temptation of Saint Anthony," large, beautiful, and important amongst a hundred others.

In the Imperial Gallery, in the Palace of the Hermitage at St. Petersburg, amongst the forty-seven pictures forming the contingent of Teniers, are found every description of subject which he has treated; landscapes, *cabarets*, smoking-rooms, *kermesses*, guard-rooms, temptations of Saint Anthony, interiors, grotesque scenes, musicians, alchymists, fishermen, drunkards, smokers, and apes; amidst the small pictures which Teniers finished in an evening, and which have preserved the name of "After-dinner pictures," are seen some striking works, conspicuous among which are two "Village Festivals," formerly in the collection of Voyer d'Argenson; a very fine "Guard-room;" an "Interior of a Kitchen," full of game, fish, and vegetables; "The View of his House," in the village of Perck, between Antwerp and Mechlin; but Malmaison has given up to the Hermitage a matchless and priceless work; this is a great picture painted in 1643 for the fraternity of Crossbow-men, and which is called the "Sharpshooters of Antwerp," in which there are not less than forty-five small figures from 8 to 10 inches each. The arrangement of this crowd in perspective is marvellous, as is the rendering of all the details. Descamps justly describes it as Teniers's finest work. Nothing more striking or more perfect has issued from the pencil of this fertile master.

The Royal Museum at Madrid contains not less than seventy-six pictures by Teniers. A detailed enumeration of these would offer no interest; but we deem it useful to mention those which from their excellence or the nature of their subjects, are out of the ordinary way.

In both these respects we must first cite "A Picture Gallery visited by Gentlemen." In signing this picture, Teniers wrote, after his name, "Pintor de la camera" (instead of "camara") of His Serene Highness. The following is the explanation of this subject and the Spanish device:—The

* Bryan's "Dictionary of Painters and Engravers."

Archduke Albert, governor of the Netherlands, for Spain, had commissioned our painter to compose for him, not the cabinet of an amateur, but a princely gallery. When he had completed this delicate mission to the satisfaction of his patron, Teniers conceived the idea of perpetuating its recollection by a picture. In it are seen the Archduke accompanied by some gentlemen entering the gallery, where Teniers, who has also represented himself, presents to him designs spread out on a table. Along the walls are ranged pictures of his choice, faithfully copied and reduced to microscopic proportions, but in which, nevertheless, besides the subject, the touch of each master is very clearly distinguished.

We may further mention among the fancies of Teniers, an excellent animal painting, which would have excited the envy of Paul Potter, and "The King drinks," a charming representation of a scene at table of a frank and communicative joyousness.

The Museum of the Louvre contains fourteen pictures by Teniers, all of fine quality, and some of them capital works. Amongst these we may enumerate a "Temptation of Saint Anthony," a picture of admirable execution and delicacy of touch. "The Prodigal Son at table with courtezans." "The Seven Works of Mercy." "A Village Wedding." "The Interior of a Smoking-room." "The Knife-grinder;" and "A Heron Chase."

Numerous as are the specimens of our great master scattered through the private collections of England, our public collections are but scantily stored with them.

The National Gallery contains but three of his works. "The Misers" (or "Money-changers"), described by Mrs. Jameson to be "in point of execution, one of the most remarkable pictures of this versatile, lively, and most accomplished painter," "A Music Party," and its companion picture, "Dutch Boors regaling."

Dulwich Gallery is better provided, containing twenty-one of Teniers's works:—"A Winter Scene." "A Small Landscape with a Magdalen." "A Small Landscape with a Hermit." "An Innkeeper standing at his door." "A small Landscape." "Interior of a Guard-room. "A Cottage in a small Landscape." "A Village on Fire." "A Sow and Pigs, a Peasant standing by." "A Man seated opening Mussels." "An old Man." The companion, "An old Woman." "A Cottage with Figures." "A Landscape." "Brickmakers at work." "A Winter Scene." "A large Landscape." "A Landscape, with the Château of Teniers in the distance." "Head of an old Man." "Head of an old Woman." "A Landscape, with Gipsies." "The Chaff-cutter."

At Hampton Court there are three pictures by the younger Teniers: "Judith and Holofernes," a small copy after Paul Veronese; "Inside of a Farm-house;" and "St. Francis with a Skull" after an Italian picture.

At Windsor Castle there are four specimens of our great artist; viz.—"A Rocky Landscape with Figures." "A Virgin and Child," a small copy after Titian. "A Holy Family," likewise a small copy after Titian; and the "Interior of a Grange or Barn."

Notwithstanding the innumerable quantity of Teniers's works, the prices of his pictures have equalled those of the choicest productions.

In 1744, at the sale of M. de Lorangère made by Gersaint, several pictures by Teniers were put up.

"A Kitchen Subject," says the catalogue, was knocked down for £2 10s.; "A Smoking-room," for £5 10s.; "A Landscape," very fine, for £15. "The Studio of Teniers," adorned with several pictures, fetched as much as £13 5s. A year after, at the sale of the Chevalier La Roque, "A Smoking-room" only realised £4; and another picture of the same subject was driven up to £17 5s.; a beautiful "Landscape," engraved by Lebas, under the title of "The Rainbow," was knocked down at £6.

In 1767, at the celebrated sale of M. de Julienne, matters went differently: "A Village Dance" went up to £245; "A Village Wedding" fetched £300; "A Landscape with Figures," was sold for £64; "The Château of Teniers," which some years previous had been sold for £9 5s., now realised £37 10s.; "The Terrestrial Paradise" was sold for £33 5s.; "The Interior of a Kitchen" for £26 5s.; and "Card Players," containing fourteen figures, for £83. This upward movement was maintained. In 1770, at the sale of M. de la Live de Jully, "A Flemish Fête," from the gallery of the Countess de Verrue, was sold for £283; "A Chemist in his Laboratory," engraved by Lebas, fetched £145. At the sale of l'Empereur, in 1773, "A Flemish Fête," also from the collection of Madame de Verrue, was knocked down at £417; "A Flemish Tavern," at £335; and "A Marine Subject," engraved by Lebas, at £106.

At the sale of the Marquis de Brunoy, in 1776, "A Flemish Fête," engraved by Lebas, under the title of "The Environs of Antwerp," was sold for £250; two other pictures representing "Flemish Fêtes," likewise engraved by Lebas, under the title of "Flemish Concord, and the Day after the Wedding," reached the price of £458. At the sale of the Prince de Conty, in 1777, "The Seven Works of Mercy," the fine picture now in the Museum of the Louvre, and which had successively adorned the galleries of M. de Gaignat, and the Duke de Choiseul, was knocked down at £438. At the sale of M. Blondel de Gagny, in 1776, the magnificent composition of "The Prodigal Son," which now adorns the Museum of the Louvre, and of which every one knows the admirable engraving executed by Levas, was sold for £1,210. "A Village Fête," with upwards of fifty figures, realised £458; another picture, engraved by Lebas, under the title of "The Fishermen," fetched £200. "The Jealous Wife," engraved by the same, £48. "The View of Flanders," engraved by the same, £100. We must pass over several of the pictures of Teniers disposed of at this sale, of which there were not less than thirty-one.

In 1777, at the sale of M. Randon de Boisset, we find again ten pictures of Teniers, nearly all important ones, brought to the hammer. "A Farm-yard" fetched £462; "A Ham Breakfast" (in front is seen a table laid out, on which is a ham, around which are four figures, of which there are in all twenty-six in the picture) was sold for £835.

At the sale of M. de Choiseul-Praslin, in 1793, the pictures of Teniers, to the number of thirteen, realised tolerably high prices. "A Kermess," engraved by Philip Lebas, was knocked down at £1,220. This composition comprises four hundred figures, forming various groups of various attitudes. "The Small Flemish Tavern," a picture likewise engraved, was sold for £92 at the sale of Vincent Doujeux, in 1791, at which there were not less than nineteen pictures by Teniers; "The Five Senses," which had been knocked down at the sale of the Count Dubarry, in 1744, for £42 10s., went at this sale for £158. In 1802, at the sale of Robit, a picture of the highest merit, known to the curious under the title of "A Ham Breakfast," a capital composition of twenty-six figures, which had formed part of the collections of Randon de Boisset and l'Empereur, and previous to that of the collection of the Prince of Rupembré, was knocked down for £750; that which is called "The Fair of Ghent" realised the sum of £530; the other, "A Flemish Fête," fetched £188; "A Landscape," £230; and finally, "The Interior of a Smoking-room," £180.

At the sale of Lapérière, in April, 1817, at which four pictures by Teniers were put up, "A Village Fête" was sold for £296; and "An Interior of a Smoking-room" (two men playing at cards on a plank placed upon a cask, near them three spectators looking on; further, near a chimney, two peasants, one of whom is asleep) was sold for £271. At the sale of M. Robert de Saint-Victor, which comprised not less than thirty-one pictures by Teniers, "The Rainbow," engraved by Lebas, was sold for £122; "The Farm," engraved by the same, £116.

At the second sale of M. Lapérière, a "Temptation of St. Anthony," on copper, was sold for £365; "The Four Seasons," represented in four pictures, were driven up to £1,250; an "Interior of a Guard-room," on copper, reached

£540. At the sale of the Chevalier Erard, in 1832, there were twelve pictures by Teniers; "The Prodigal Son," on panel, fetched £712; "The Four Seasons," of the sale of M. de Lapérière, were withdrawn at £1,000.

£1,020 to M. Demidoff, who, for fourteen pictures which he purchased at this sale, expended the sum of £9,380. "The Man with the White Shirt" passed into the hands of Mr. Hope for the sum of £750; "The Rural Concert,"

THE JEALOUS WIFE.

At the sale of the Duke de Berry, in 1837, there were five of the choicest pictures of Teniers; "A Ham Breakfast," which, as we have seen at previous sales, had respectively realised the sums of £835 and £750, was knocked down for

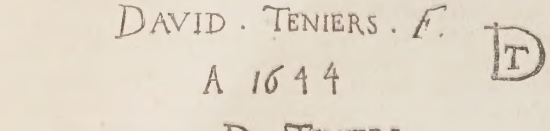
engraved by Lebas, fetched £252; "A Kermess," which at the sale of Robit had been sold for £325, at this sale went for £328.

M. de Las Marismas possessed a fine picture by Teniers,

representing "A Guard-room," which, at the sale of his gallery in 1843, was sold for £638.

We will close this long list with the sale of the extensive collection of Cardinal Fesch, which took place in Rome in 1845, and in which, out of the four pictures by Teniers, only one was worthy of arresting the attention of amateurs; this was a large religious composition, "The Crowning of Thorns," which was knocked down to the Prince of Canino for 4,500 scudi, somewhat more than £1,000.

D. Teniers has signed nearly all his pictures by the following marks, which were likewise those of his father:—



THE PAINTER OF PISA.

PART THE THIRD.

The night advanced, the old man slumbered profoundly; a second sigh echoed in the dim silence of the church. The coffin stirred—there was a movement within—can it be he who raises himself with a labouring effort as if chained down by a magnetic influence? Yes, he lives—he breathes—he feels! It is Marcello himself—a living corpse issuing from the tomb! For an instant he hesitated—he shuddered: the immensity of the church, and, by a fleeting comparison, the immensity of life weighed heavily upon him. He wished to extricate himself from the bier, but he wanted courage: at this fearful moment of resurrection, when he might, by a slight effort, free himself from the panoply of burial, he experienced so much difficulty in the passage from death to life, that a horrible foretaste of the transition from life to death seemed presented to his imagination.

"O God!" he murmured, "must I live?"

Unbroken silence laid on the monuments and columns—darkness and midnight chained all things in a solemn harmony—his courage returned, he raised himself softly, and extinguished all the lights but one which he retained in his hand.

Then he went towards his picture, his beloved picture, and gazed upon it in that high and holy station which he had dreamed and hoped for. Bewildered, weeping, joyful, yet sad, Marcello cast himself upon his knees, and prayed aloud in a voice broken with emotion.

"Merciful Father! an ardent desire of glory led me to employ deceit—led me to strive for pity when I deserved it not—led me to feign death, and mock Thine awful summons. Pardon, O Lord, pardon! I go to other lands, where, perhaps, I may never hear even the echo of my fame! I go to live a stranger and a pilgrim, to expiate my sin, and end my days in thanksgiving for all Thy mercies!"

Day dawned faintly at the windows—Marcello turned towards the door. The monk slept on. The picture was hidden in darkness—the morning came on apace, and with it would arrive the busy throng, the funeral rites, the priests and senators. He paused no longer, but unlocked the door. The morning air blew freshly on his brow; he wrapped himself closely in his mantle, and fled hastily away.

Still day crept slowly over the skies; the grey dawn came over the picture, and dimly revealed the angels and the evil spirits. The coffin was empty, and the monk slept on.

In a dark and meanly furnished room, in an obscure quarter of Amsterdam, an engraver was bending over his solitary work. A single lamp, by whose light he laboured, cast its rays upon his haggard countenance, his grizzled beard, his thin and trembling fingers, his attenuated form, his neglected dress, and the plate upon which he was employed with minute and laborious industry. It was a cold and wintry night. A thick fog pervaded the damp and narrow streets of the unwholesome city, and penetrating through door and window, hung a murky canopy around the ceiling of the fireless room, and filled it with damp and darkness. The engraver shuddered, coughed a hollow echoing cough, and then strove to warm his frozen fingers in the breast of his doublet.

"Cold!" he muttered, "cold and dreary, as my heart! Oh, Pisa! oh, my sunny Italy! why did thy son depart from thee? But the punishment of fraud has fallen upon him. Penury and sorrow cling to him to the last! Famous and unknown, honoured and neglected, reverenced and withal toiling and despised, he lives an exile in the dark land and chill servitude of the stranger. Lives, and is yet dead to thee and to his glory!"

Marcello rose abruptly and approached the casement. The faint beams of the oil-lamps in the street below struggled feebly through the dense atmosphere; not a star was to be seen in the black sky; not a footfall rung upon the pavement. Sounds of distant mirth came at intervals from the shipping in the neighbouring canal, and the great bell of the cathedral, with slow and solemn tongue, boomed forth its deep summons to the evening prayers. The Italian shuddered again, glanced round his cheerless apartment, drew his hat over his brows, extinguished his lamp, and descended rapidly into the street.

In a few moments he had entered the cathedral, and was crouching on a low seat in a dark corner near the stove. The worship there was not that of his native land, but he was nevertheless a frequent visitor in the Protestant temple. The curious and elaborate carvings in stone and wood, the stained heraldic windows, the bannered walls, the superb screen of Corinthian brass, the majestic monuments, and the wondrous organ with its almost human voices,* had a charm and a consolation for the unhappy painter, and inspired him with devotional awe. Soon the church became filled, the sonorous tones of the minister reverberated through the fretted roof; the simple psalmody of the Calvinistic service filled Marcello's soul with a glad hope; he listened no longer to the preacher, preaching in a foreign tongue; he pictured an angel-vision in his soul, and heart sweet angel-voices mingling with the deep music of the hymn.

"I will do it," he murmured to himself, while the large tears rolled down his cheeks, "I will do it. Another vast and holy painting shall crown the glory of my name. With it I will return to thee, O Pisa!—with it I will claim a renewal of those honours which thou didst render to my corpse—with it reveal the truth, and return, a living glory, to thy maternal bosom. Remorse and concealment have embittered my days: fame unenjoyed is fame no longer. I have no pleasure and no pride in laurels showered on my tomb. What is posthumous reputation to daily privation? If, in the stranger's land, I hear the distant rumour of my great triumph, I have no share in the splendour which is mine own, and no joy in its possession. Better that I had remained unknown, than have the weight of sin and sorrow for ever on my heart. I will return, and return with new claims upon the love and gratitude of my native land!"

He returned to his solitary lodging. The false dream once more controlled his being—once more he seized the palette and the brush—once more he devoted nights and days to a work which should surpass all former and all future glory. But the painter himself was not the same: penury and privation had done their utmost on his frame. His arm was weak, his eye dimmed with the minute labours of the graver, his hair was tinged with grey, his figure prematurely bowed and wasted. Even climate was against him: he no longer painted beneath the glorious sky of his native Italy; he was inspired no longer with the sublime enthusiasm of youth; his soul alone remained the same. But ambition is not all-sufficient: the picture, alas! betrays the physical debility of its creator; it wants the energy of genius, and it is impressed only with the fevered exaggeration of his brain.

* The organ of this cathedral has a row of pipes which represent a chorus of human voices. At the period of this tale it was the finest instrument in the world.

But Marcello knew not the change. The picture was completed, and with it he departed for Pisa.

His first care, on entering the city, was to inquire of a passer-by if the memory of Marcello was yet respected in the country. He was told, in reply, that his name was the glory of the province; that, so holy had been his life, that his body had been carried to heaven by angels on the night that it rested in the church; that the Pope had canonised him as a saint, in honour of the miracle; and that pilgrims from all quarters of Italy came daily to kneel before the shrine of the great picture.

"But supposing that he never died—that he lives? He may, perhaps, yet return to those who deplore his loss!"

The man smiled, shrugged his shoulders, and passed on.

The senate were seated in the justice-hall, when a stranger craved a hearing for a few moments on a matter of the highest import. It was granted; and Marcello, way-worn and travel-stained, appeared, trembling, before that powerful tribune which had consecrated his name, and from whom he now came to demand honour for his person. He leaned feebly against a column, and began:—

"My lords,—Once you beheld and honoured an artist named Marcello. He was humble, and you gave him greatness; he was unknown, and you made him famous. But he never tasted the delight of that fame; for, knowing the words of the Evangelist, that 'a prophet is not without honour, save in his own country,' he feigned to die, and, by drinking a soporific, deceived you with the appearance of death. He was borne in triumph with his picture before him, and left in the church by night. . . . With that night the painter departed, no man knew whither. Alas! his heart never departed—he returns living from the sepulchre—he is before you—do you not remember him?—it is I!"

And, casting his mantle on the ground, the painter raised his head and bared his brow.

There was but one cry:—"Down with the impostor! the impious impostor!" The senators, in their holy indignation, rose altogether; the crowd which thronged the court pressed forward, mocking and reviling; the halberdiers advanced to take the blasphemer of the new saint into custody. At length, when the tumult was somewhat hushed, one of the judges demanded of him on what title he grounded his pretensions.

"On a painting," said Marcello eagerly—"on a painting which is worthy of the artist's name, and of a station beside the other, in the chapel of St. Augustine."

This reply awoke a storm of exclamations. The senators descended, and approached the stranger, crying derisively,—"Where is this *chef-d'œuvre?* Produce it!"

"Willingly, but my canvas is rolled for travelling."

"Unrol it."

"Where, my lords?"

"On this very spot."

Marcello was forced to obey, and, with the aid of some standers-by, fixed his picture against a pillar.

Meanwhile the populace of Pisa, attracted by the quick report of some great impiety, came pouring in, and the senate crowded round the column. A smile of contemptuous indignation curled every patrician lip as they beheld this feeble and unworthy production of the painter's genius, and turned away, repeating the fatal word, "Impostor?" "Impostor!" echoed the crowd—the fickle crowd—so easily swayed to celebrate a victory or revenge a defeat! Angry faces glared upon Marcello from every side, oaths and rude laughter assailed his ears, menacing hands approached his picture and himself. He felt the gathering storm. Calm, pale, and motionless—with fixed brow and folded arms—he waited for its coming with the stony courage of despair.

The mass swayed from side to side. "Down with him!" "Down with the traitor!" "Impostor!" "Blasphemer!" "Down with him!" A hundred hands seized upon the picture—a picture no longer! Its fragments strew the floor, are trodden on by savage feet, and scattered to the winds!

The furious populace, not yet satisfied with the ravage of their hands, would have extended their vengeance to its author: pitiless faces press round him, mocking eyes glare into his—he will perish, and perish miserably;—when, suddenly, an aged monk steps forth and interposes his sacred person and the uplifted cross between the multitude and their intended victim.

The crowd fell back—the painter was saved!

That night beheld the wanderer and the monk in earnest converse within the convent chapel, where the great work looked down in glory from the altar.

Eusebius had just emerged, with his penitent, from the confessional, and was pointing once more to the grave-stone, whose inscription, worn by the passing footsteps of a few short years, was now wholly illegible.

"My son," said he, "behold the fame of the painter! he labours, he dies, he is forgotten."

"But his work," said Marcello, earnestly—"his work lives after him?"

"Yes," replied the monk; "his soul is immortal, and returns to the God who gave it, and the child of his soul is immortal upon earth. The name of the artist may pass away, but his Thought—his pure and Divine Thought—can never pass away. Such is the true fame for which the soul should aspire. Its work is a seed of lasting beauty, which bursts forth and blooms long after the hands which sowed it have returned to dust. It blooms and bears fruit in the hearts of the pure and the just; it breathes the love of art and imagination into the young; it is reproduced perpetually in the stone of the sculptor, on the canvas of the painter, in the glowing song of the poet. Artist, dream no more of the gross harvest of pride and pleasure upon earth; live only in the eternity of the future. MAN dies, and is forgotten; but THE BEAUTIFUL survives him, and is immortal!"

* * * * * *

On the following day the Convent of the Augustines received into its bosom a new brother. He was a silent and a gloomy man—solitary in the midst of society—sad and drooping among his brethren. Day by day, year by year, he languished and consumed with inward grief; and, after a brief interval of pain and weakness, they found him, one morning, lying at the foot of the great altar, cold and lifeless—his glazed and fixed eyes turned, even in death, towards the picture on which they had rested to the last.

THE DONKEY RACE.

WHAT an exciting scene is that which our engraving represents! By voice and gesture the rustic jockeys are urging on their donkeys—donkeys which seem to take as much interest in the sport as the youngsters on their backs. Surely the foremost one will win by something more than "a neck;" his rider snaps his fingers in anticipated triumph, and while the rival waves his bonnet in the air, and pats the neck of his almost exhausted animal, it is clear at a glance that victory is not for him. There is a crowd of people watching the race ready to shout a welcome to the winner, and to bestow on the successful candidate the promised reward.

What a struggle for victory! what painstaking for a triumph! it seems a matter of small importance who wins the race, but there is the same panting for success, the same strenuous exertion in the lads, as we notice in the higher and loftier struggle of life. In the same spirit men engaged of old in the Olympic games; to win applause gladiators fought within the Colosseum of proud Rome; the poet sings, the painter paints, the soldier faces danger and death. A palm of victory in the distance is the object ever kept in view, a goal starred and luminous to be attained. And the same spirit which animates and governs the world astir, is seen here in the donkey race.

Gainsborough, whose biography at some future period we intend presenting to our readers, has pictured a truly English scene, and has done so in his own inimitable style. Nature was his teacher, the woods were his academy, and he was an apt disciple, an ardent lover of art, a keen observer of all that

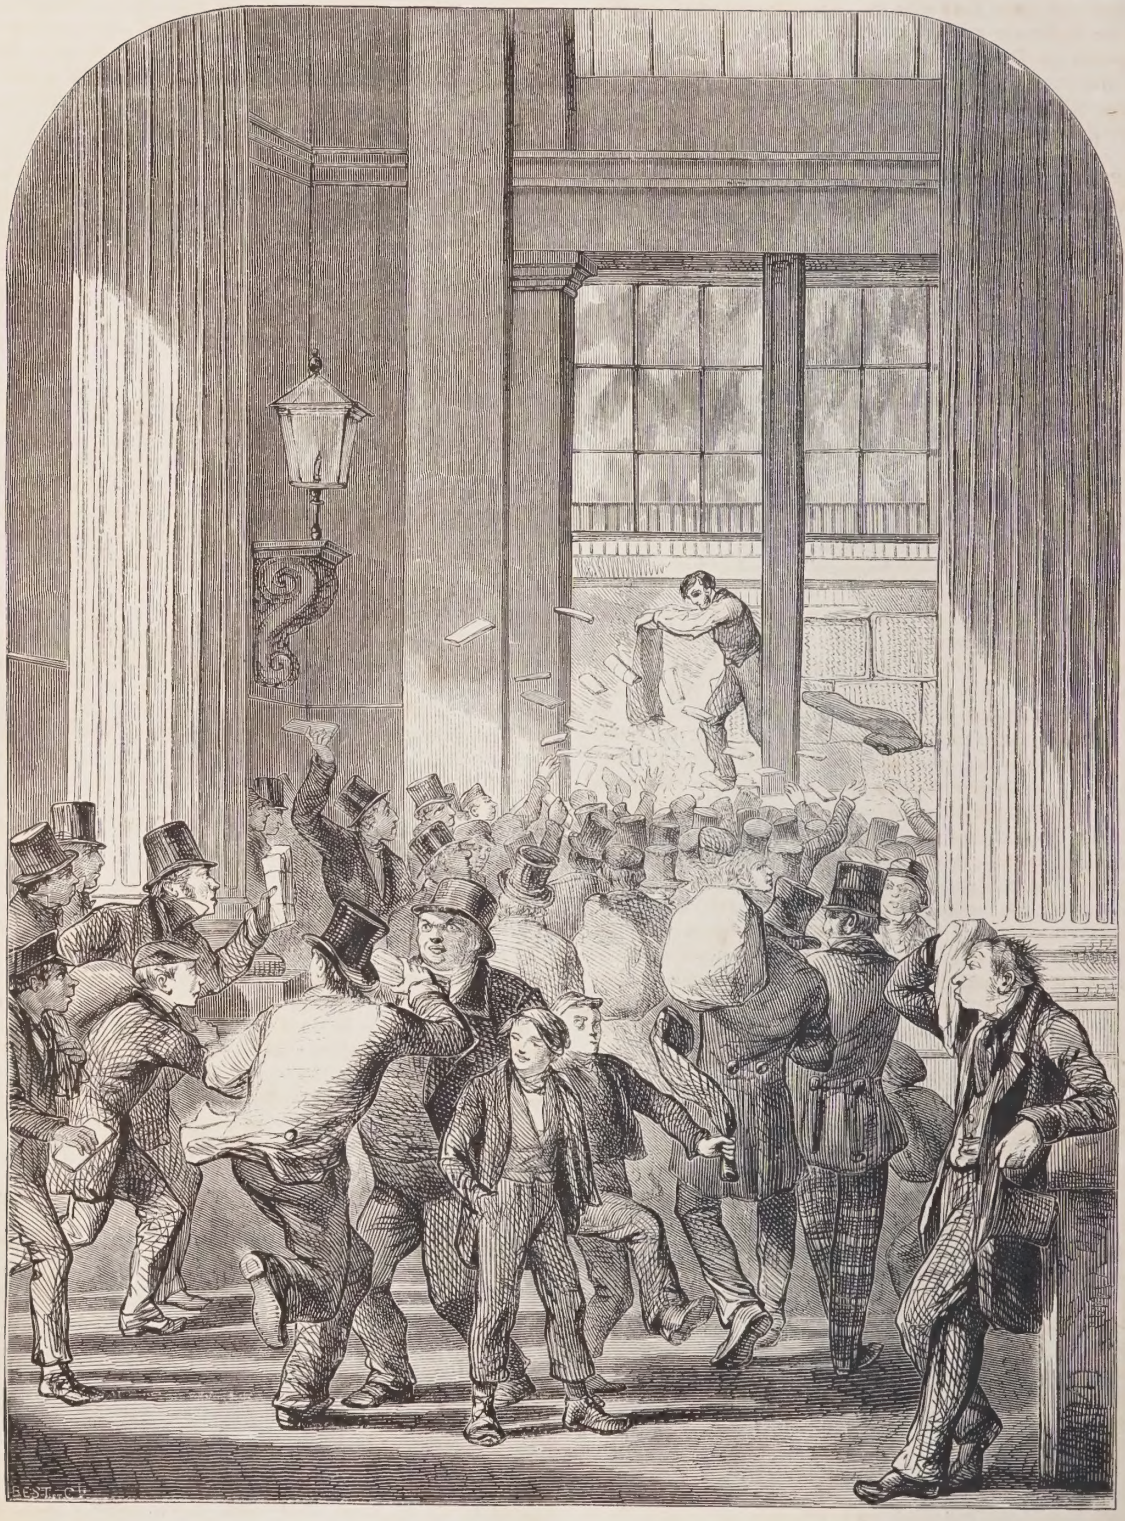
surrounded him, and an accurate copyist of his models. His models came not from the antique; they were found in villages, and fields, and poor men's homes. His excellence was his own, the result of his own particular observation. Whatever he undertook he executed in a manner peculiar to himself; and whatever might be the object of his study, whether diately from the objects. He even framed a kind of model of landscapes on his table, composed of broken stones, dried herbs, and pieces of looking-glass, which he magnified and improved into rocks, trees, and water; all exhibiting the solicitude and extreme activity that he had about everything relative to his heart, so that he wished to have everything

DONKEY RACE. FROM A PAINTING BY GAINSBOROUGH.

the form of a woodcutter, a peasant child, or a girl attending pigs, he did not attempt to raise the subject, nor did he lose any of that natural grace which was so eminently characteristic of his designs. If, in his excursions, he found a character that he liked, and whose attendance was to be obtained, he ordered him to his house; and from the fields he also brought into his painting-room stumps of trees, weeds, and animals of various kinds, and drew them, not from memory, but immembodied, as it were, and distinctly before him, neglecting nothing that could contribute to keep his faculties alive.*

He was ardently devoted to his pursuits: this feeling he cherished even to his dying day. Art and artists occupied his thoughts, and the last words he uttered were characteristic of this love:—"We are all going to heaven, and Vandyck is of the party."

* Pilkington.



GENERAL POST OFFICE, LONDON, AT SIX O'CLOCK, P.M.

THE GENERAL POST-OFFICE.

A REMINISCENCE OF TWO VISITS.

Two days in the month of March, in this year of grace, 1853, have been red-letter days with us. On the evening of the 9th being the fortunate possessors of an order addressed to the "Inspector on Duty," we paid our first visit to the Post-office, and on the morning of the 15th, at about ten minutes past five, while the lamps were yet alight in the streets, and the raw gusty breath of winter was abroad in the town, we found ourselves—in both cases the writer and a literary friend—at the door of the Inland-office, opposite Goldsmith's-hall, armed with written authority to inspect the various processes going on inside.

Now it must be understood that a personal inspection of the interior of a government office is no small matter—a favour not to be had for the mere asking, even by the "gentlemen of the press;" and that admission to the Post-office is accorded very charily even to the "upper ten thousand,"—five persons in one evening being the greatest number admitted. Our appreciation, therefore, of the favour will be readily understood. Everybody in London knows the appearance of the General Post-office in St. Martin's-le-Grand—a large building, divided into two halves by a wide public way, on either side of which are great slits and windows for the receipt of letters and newspapers, and at the south-east corner an office in connexion with the electric telegraph. The southern half of the building is devoted to the business of the London District Letters, and the northern to the "Inland Office," whence, in spite of its name, all foreign and colonial letters are received and despatched. Well, on the evening of Wednesday, the said 9th of March, we formed part of that "general public" inside the portico, whom Serjeant Activo and Police-constable Z 80 were vainly endeavouring to keep "moving on" through the building. But we didn't "move on," for we, together with some hundred other inquisitive people, had come expressly to witness the scene that is nightly enacted at about ten minutes before the Post-office clock strikes six.

A strange sight. As the hour of six draws near, men and boys, with great bags of newspapers upon their shoulders, come quickly in, and, passing onward to the wide open windows, deposit their bags upon the sill, whence they are taken by the men inside, and their contents are speedily shaken into a basket and carried into the interior of the office. Then for a minute or two there is a lull. A boy with a newspaper passes lazily to the window; then, perhaps, a well-dressed person or two go forward to the window for general post letters; then a man with a large bag of newspapers on his shoulders, and another boy and another man, and so on. Five minutes to six, and the excitement really becomes intense: cabs and light chaise-carts come driving wildly up, out of which hot, bustling men and boys drag huge bundles and bags of newspapers, which they bear rapidly onwards to the windows, and thrust bodily in. In a minute or two the crush of newsmen and boys becomes excessive, and the crowd about the windows get as excited as its better-dressed counterpart used to do at the pit doors of the Opera-house on a Jenny Lind night, only in rather a different way. Adventurous individuals, braving the crush and scorning the trouble, shoulder their way towards the windows, and deposit their loads of newspapers. The stream of coming and departing newsboys gets thicker and thicker, and the *mêlée* becomes more and more noisy and outrageous. Young men, and old men, and boys with bright laughing faces, fling single papers boldly through the window, as though they were aiming at the officials inside the windows, who, you may be certain, have their hands full. Bags of newspapers are received, and the bags turned out and thrown back empty to their possessors, with a celerity quite astonishing; and the stream of newspapers continues, without pause or lull. A moment more, and the long hand of the clock is on the first figure of the twelve; another, and the first stroke of the hammer falls upon the bell. As the sound booms through the building, the excitement reaches its height. Rush, push, drive, hurry on—there's yet a second's space. In go the full bags, and out come the empty ones: a shower of single papers obstructs the sight for a moment, and the post-office officials are up to their knees in news—*Times*, *Chronicles*, *Daily News*, *Advertisers*, *Posts*, and *Heralds*, with specimens of all the weeklies—literally overwhelmed in a deluge of news. Out booms the clock—one, two, three, four, five, six! and down go the remorseless windows with a crash, and shut out half a score of bags and parcels just arrived.

In another five minutes, the bearers of the news having wiped the perspiration off their faces, have departed; the public quickly disperse; Serjeant Activo and Policeman Z 80 shake themselves into their ordinary self-possessed, authoritative manner, and the place assumes its usual quiet, do-little-or-nothing aspect.

We now proceed about our proper business—the writer and literary friend aforesaid—our visit to the Inland Department of the General Post-office. So we inquire of one of the gentlemen with the gold-banded hats, where we shall present our credentials, and we are forthwith conducted to the back of the building, and introduced into an apartment—part office, part warehouse—with a little glass box in one corner. We address its occupant, and deliver to him our letter of introduction from Rowland Hill. Being politely received by the gentleman in the glass box, we take a seat while he goes into the office to deliver our credentials to the inspector on duty—who must by no means be confounded with an inspector of police, however. While we wait in the outer office, our conversation turns naturally on the scene we had just left, and on postal communication generally, when the literary friend observes that the idea of the penny post was not altogether original, there having been a private speculation for the delivery of penny letters in London established nearly two hundred years ago, in fact in 1680, by one Robert Murray, an exciseman, and William Dockwra, a custom-house searcher.

The relation of this fact leads, naturally too, to other conversation on the subject, which though not carried on in the little glass box in the outer office, may be repeated in substance in this place, as relevant to the matter in hand.

It appears, then, that previous to the year 1635 there was no regular Post-office in Great Britain, the carrying of letters before that period having been the speculation of private persons. About 1663, however, the government of Charles I. discovered a new source of revenue in the carriage of letters to and from London and the provinces; and one Thomas Withering, the first postmaster-general, had a receiving-house in Sherborne-lane—a narrow turning leading from Lombard-street to the river, and now the continuation of Abchurch-lane—where he initiated the system by which letters are now conveyed from London to all parts of the world. Of course, the mail of that day was rather a "slow coach;" but the merchants were not quite such "fast men" as they are now, and thus the government arrangements were thought quite improvements on what had gone before. In an account of London, written by Delaune five years later, the fact that a letter might be written to, and an answer obtained from, a place three hundred miles distant, in the short space of five days was considered amazing! For many years a single receiving-house was sufficient for all London—court, city, and suburbs; and only one really good channel of intelligence existed in all England—that from Dover and the adjacent towns to London, whence letters were received daily, to be despatched once a week to the other parts of the three kingdoms!

To trace the gradual rise of the great establishment called the Post-office would be a work of no small trouble, for no regular history of the system has as yet been attempted. It

was soon found, however, that one office or receiving-house was quite inadequate to the wants of London, a city growing daily in commercial and political importance; and, in 1680, a penny post was set on foot by the individual above named. The speculation succeeded immediately; "it being," says Roger North, "put in complete order, and used to the satisfaction of the public for a considerable time." The projectors, however, quarrelled—as all projectors and speculators seem to have a great aptness for doing—each setting up a post of his own; till the Duke of York, afterwards James II., to whom the revenues of the regular Post-office had been assigned, seized on the private speculation, and carried it on for his own benefit and advantage. Dockwra would not submit himself to the court, we are told, "but insisted on his right to the last; otherwise, it was thought he might have secured to himself a good office by being commissioner for life to manage that revenue." He was, however, appointed comptroller, but was dismissed from the office for alleged mismanagement, in 1698. Receiving-houses multiplied rapidly; and the London Penny Post continued in operation till 1801, when it was advanced to twopence,—the carriage of letters beyond London being extremely dear,—till January 10th, 1840, when the uniform penny rate of Mr. Rowland Hill was finally adopted, with what success we shall presently see. Dockwra was the first to stamp letters with the hour at which they left the office. The idea so widely disseminated was originated in the house of Dockwra, in Lime-street, Fenchurch-street, in which house he died, September 25th, 1716, being nearly a hundred years of age.

In the reign of King William III., the Post-office first began to be made a really national concern, and regular receiving-houses were appointed in London and the principal provincial towns; though as recently as 1826 there was only one office for letters in Pimlico, and only two in the large district of Stepney. In 1784, Mr. Palmer originated the system of mail coaches, by which a great impetus was given to postal communication; and at the present time the Post-office system is universal all over the three kingdoms—no village, however insignificant, being without its receiving-house.

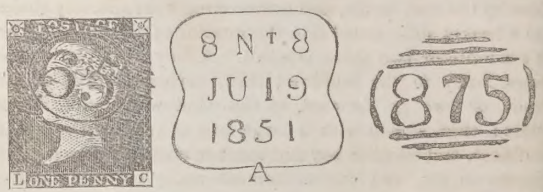
The present building, which stands on the site of the collegiate church of St. Martin's-le-Grand, was built between the years 1825 and 1829, from the designs of Sir Robert Smirke. When completed it was thought spacious enough for the public service for at least a century; but the business of the Post-office has already outgrown its splendid home; the money-order department has been for some time past conducted in a separate building on the opposite side of the street, and plans are under consideration for enlarging the present chief-office. The entire business of postal communication for London and the provinces is conducted by a Postmaster-general, two secretaries, an assistant secretary, a receiver-general, and a whole army of clerks, sorters, letter-carriers, &c.

It must not be supposed that we had time to make this long digression in the little glass office; for we had not sat there above two minutes before its occupant returned, and ushered us into the presence of the gentleman denominated the inspector on duty for the night. We take off our hats "in honour of the Queen," and in another instant find ourselves in a well-lighted apartment about as large as the great room at Exeter Hall, and in the midst of a scene of operations, the meaning of which we have yet to learn.

We can compare the scene before us to nothing better than a great bee-hive, in which we two are the only drones.

From end to end of this great room are ranged rows of tables, divided in the centre by an upright board; and at these are standing, side by side like soldiers on duty, scores upon scores of individuals engaged in the several occupations of stamping, sorting, counting, and dividing, the letters just arrived. We are rather late, or we should have witnessed the arrival of some thousand sheepskin bags, the products of the several metropolitan and district collections. As it is, we are conducted by our polite friend, the inspector on duty, to the top of the room, where on a great round table are piled apparently countless heaps of letters. Letters of all sizes, and shapes, and appearances, directed to all parts of the world, far and near—Kensington and Kamtschatka, Newington and Nepaul, the pestiferous courts and alleys of St. Giles's no less than to the splendid saloons of Paris and Berlin. These heaps of letters have all been received at the windows in the great hall within the last two hours. Standing round the table are some dozen officers, some in red coats and some in their own unofficial garments, engaged in the important business of facing; that is, bringing all the letters with their directions upwards into a condition fit for the next process. It is easy to distinguish the character of the various epistles from their outside appearances. There are the large, blue-paper, oblong, plainly-directed, and thickly-wafered letters from the government offices, bearing on their faces, some of them, the printed words, *On Her Majesty's Service;* the square, massive-looking missives from lawyers to clients and country attorneys; the ordinary enveloped letters of business from merchants and traders; the delicate cream-laid and wire-woven correspondence of the well-to-do; and the rough, cheap letters of the poor and ignorant, with here and there a specimen sealed with a thimble and covered with grease. Oh, what a heap of original writing from unknown authors! what secrets of business, and pleasure, and friendship, and love! what kind promises and cruel threatenings! what hopes, and fears, and heart-burnings, and nobilities, and littlenesses, are concealed within these fragile covers!

It must not be supposed that while we have been philosophising business has been standing still. Not a bit of it, as a rather fast young friend of ours would observe: on the contrary, it has been going on all the more quickly. At each of the little pigeon-hole departments of the butter-shop-looking counters, busy hands are plying the especial trade of the hour. Next the facing-table is a man stamping the letters with a block which shows the place and the hour at which they were received. Beside him is another, whose business is to separate the stamped from the unpaid letters—a very small proportion of which latter pass through the London post since the last regulation, which renders it compulsory that letters shall either be stamped or unpaid altogether. Then at an opposite table is an assistant going through the process of obliterating the queen's heads on the letters. The rapidity with which



this obliteration is performed—dab, dab, dab, thump, thump, thump, taking ink from a pad beside him—is quite astonishing. And as he obliterates he counts. Separating the letters, with a push of his stamper, into fifties, he makes a mark on a sheet of paper beside him, and the heads of the office are thus enabled to get at the number of stamped letters which pass through the Post-office by simply counting these marks. Thus on the evening we were present the number of letters which passed through the chief office on the inland side—the other side of the building being devoted exclusively to the London district, which comprises a circle of twelve miles round St. Paul's—were

Stamped letters	174,440
Paid do.	4,024
Unpaid do.	5,239
Letters from public offices	8,534
Making a total of	192,237;

while the number of newspapers was—a very small number compared with the Friday nights, for instance, when the weekly newspapers are published for the country—82,300.

On the night preceding our second visit, March 14, there were 256,945 letters and 105,000 newspapers sent by post. On the Friday nights there are generally about 100,000 extra newspapers. Of course, many London letters pass through the inland office by mistake; but the latter department includes all letters sent into the country, the colonies, and to foreign parts. In the process of stamping and obliterating, the quick eye of the official detects in an instant any letters which are insufficiently stamped. These are taken to another officer, who weighs them, and marks on them the deficiency of postage to be paid by the receiver—in all cases double the rate for stamped epistles.

In the little diagram in the previous page, we have first the queen's-head postage label obliterated, next the stamp on the face of the letter which shows the day and hour of its departure from the office, and then a specimen of the obliterating stamps. Each office and town whence letters are forwarded to their destinations without coming to London—as Edinburgh, Dublin, Liverpool, &c.,—is furnished with an obliterator of its own; and by that and other means it can always be discovered where and when a letter was posted, received, and finally sent from the office.

The next process is the sorting. Each department of each officer's table is divided into a number of pigeon-holes, with a special place for the main lines of roads, and a corner division for the blind letters, of which more hereafter. After being roughly sorted according to the lines of the several railroads, the letters are again divided into towns and districts, and again subdivided into bye-roads and villages. It may be noticed here that the business of the officials who accompany the railroad post-office is to receive the letters from the several stations they pass through, and either to sort them into the towns on their onward way, or to drop them into a bag for London, whence they are despatched in the ordinary course. An ingenious apparatus is brought into action during the process. The bags are exchanged by means of a joint lever projecting from the side of the post-office carriage, on which the bag to be left at the station is suspended, and which, on arriving at its destination, is caught in a net; while that to be sent forward by the train is caught in a similar manner in a net attached to the train.

Under the conduct of a polite official, we were next introduced to the superintendent of the foreign office. Here a superior set of officers are employed—young men of education and respectability; though every person employed, from the red-coated postman to the heads of the department, are necessarily acquainted with the entire routine pursued. Here we were inducted into the mysteries of French and German, Spanish and Austrian, Asiatic and colonial, correspondence, with their different modes of payment and repayment for the inland postage through the several countries. And here, for the first time, we examined the portrait of Louis Napoleon, Emperor of the French, on a postage label. Instead of being made the "ugly fellow" he was pronounced to be by the Parisian workman, his face looks rather handsome than otherwise, and essentially French. Most of the continental states have adopted the use of the postage label; and even Spain, the last country to succumb to an innovation, has a queen's head for her letters; though, by the way, only about one per cent. of the postage is so prepaid. In the foreign office all the letters are weighed, a ledger account being kept with each country in the currency common to each. This is a most troublesome and tedious duty, and it struck us that if an universal system of decimal coinage were adopted,—or even if all foreign letters were prepaid in the country in which they are posted, and the accounts were simply kept weight for weight,—the business of the Post-office would be greatly simplified. The recent determination of the government to reduce the postage between England and her numerous colonies to sixpence strikes us as one of the greatest reforms of modern times. We have all of us some relation or friend in India, America, or Australia, with whom we like to correspond occasionally; and, certainly, the fact that we shall soon be enabled to send a letter 16,000 miles or so, and obtain an answer in a few months, for "the small sum of one shilling," is a highly important one. Though the committee and members of the International Postage Association seem to think that anything less than ocean penny postage will not meet the requirements of the age, and inquire, reasonably enough, why a pound of letters should cost more in carriage than a pound of gold or a pound of silk, including the insurance on each article,—we see no cause to complain of the concession promised, feeling certain that the sixpenny rate must eventually be reduced to a penny one.

While in this office we were favoured with a sight of an actual letter sent by our gracious Queen to her mother, the Duchess of Kent. It was in a largish envelope of cream-laid paper, addressed in a good, bold, lady's hand, and stamped with a queen's head like any ordinary missive. The Royal Family, the cabinet ministers, and some other great personages, have their letters forwarded daily in special letter-bags.

But it is time that we should look to the newspaper department. We saw how the newspapers arrived in shoals at the window of the outer hall, where, at the same time, clerks were busy receiving foreign letters through half windows with moveable slides, like scenes in a pantomime, and where the public were dropping letters through slits in wooden windows as fast as they could get near enough,—those same newspapers have been carried meanwhile—whole packets of the news of the day—up a practicable lift, worked by machinery, to the room above, there to be sorted into districts, roads, &c., just as the letters have been in the room below. We step upon the moving platform and ascend too. A momentary glance at the busy scene as it appears below us is curious indeed. Every inch of space at the tables is occupied by a silent, though busy, crowd; and as we pass upward by the ascending and descending platform, we cannot help thinking that when folks complain of the remissness of Post-office officials they do so without much thought of the care and trouble taken for the public benefit.

We step off this novel staircase, which is simply an endless chain fitted with a series of wooden platforms, and a new sight presents itself. Like the apartment below, the newspaper room is partitioned off, as it were, into departments, with the names of certain great divisions, such as Edinburgh, Dublin, Manchester, Liverpool, &c., painted on the walls, and, like it, has several narrow sorting-tables running from end to end. From an apparently inextricable confusion,—masses of news upon counters and upon the floor, news in all shapes and sizes, news contained in the *Daily Thunderer* and in the little circular of the Society of Arts, news for all appetites and all ages, fresh and stale, good, bad, and indifferent,—order is eventually to arise. Nearly 190 tons of newspapers—190 tons of politics, religious controversy, crimes, railway accidents, police reports, shipwrecks, murders, births, marriages, and deaths,—to say nothing of the advertisements; in fact all the news of the time in almost every shape in which the English language can shape it—pass up and down the lift every week—to be thence transmitted to the remotest corners of the civilised globe.

Description fails—as penny-a-liners say when reporting a fire—when we attempt to deal with all the curiosities of this most busy of public offices *en masse*. In its details, however, the arrangements are simple enough, and as admirable as simple. For instance, we often hear complaints of newspapers not reaching their destination, and sometimes an irascible "Pater Familias" writes to the *Times* to say that the Post-office keeps back his copy of that famous journal for its own private reading. If, however, he were to witness the extreme care which is taken by the officials to forward each paper to its proper owner, he would not be disposed to complain quite so readily. The wrappers of newspapers will get off sometimes in spite of the most careful fastening, and newsvenders' boys *have* been known, sometimes, to *sell* the papers instead of posting them. In the latter case there is, of course, no remedy, as far as the Post-office is concerned; in the former, however, everything is done that care, intelligence, and a desire to act fairly and honestly can effect. If a newspaper comes out of its cover,—a nightly occurrence, by the way,—the cover is

brought to a gentleman, whose duty it is to enter the fact in a book and send a paper to the person indicated, and with the newspaper an intimation to this effect:—

"Several Newspapers having escaped from their Covers in the Newspaper Office this *Evening* from the imperfect manner in which they were inclosed in them, they have been replaced as correctly as possible; but as the accompanying Paper may not be the one originally intended for you, I beg to explain, that the inconvenience you may be subjected to, has not been occasioned by this Department. W. L. MABERLY, *Secretary*.

General Post-Office.

It is estimated that upwards of 80,000,000 stamps are issued yearly to the newspapers, and that at least 70,000,000 pass through the post. It must be recollected, however, that while many of the morning newspapers are made up into parcels and sent into the country by the early trains,—the post not being quick enough for them,—thousands of others pass and repass through the office many times; a fact which will account for the small excess of newspapers printed over those sent by post.

There is a peculiarity about this room which is quite a triumph of architectural skill. When the lofty apartment below was built, the addition of a story over was not anticipated. Business increased rapidly, and consequently more room was wanted; so it was determined to erect an apartment over the inland letter office. But how to accomplish the work without interfering with the over-busy folk below; how carry on the affairs of the office while the roof was off and the place was filled with bricklayers, and scaffold poles and carpenters, and dust and noise and dire confusion? It was a knotty problem, and many anxious hours were spent by the architect, surveyor, and builders ere it was solved. But it *was* solved at last, and satisfactorily too; for, finding they could not build another room over the roof of the lower one without injury to the public service, they resolved at last to *suspend it*. And so, by means of iron girders raised from the earth, and embracing the outer walls, the upper room is actually hung over the lower one.

As the time for making up the bags for the country draws near, we descend the practicable lift,—like the vampires in a pantomime—and again make our appearance in the rooms below. We are reminded that we have not yet visited the *blind clerk*, so we forthwith make his acquaintance. The business of this gentleman is to decipher those badly directed letters which carelessness and ignorance send through the Post-office. We find the blind clerk a gentleman with all his senses perfect, as will be evident when we see that he can decipher such an address as that of the Duke of Wellington's, which is a fac-simile of a direction in the undoubted autograph of the iron warrior (fig. 1).

Or of such an one as that depicted in the next page (fig. 2), which is addressed to "John Thorsell, near the Gashouse, in the County of Cheshire," or the *fac-simile* beneath it (fig. 3).

To say nothing of such a very plain direction as,

Mr. Taft
Nutefort Csecer

by which the writer meant — Knutsford, Cheshire. The two next specimens are evidently by one hand, and that a German's:—

M Konrad Laubach
Masieci
Brade Band in
Dambretschwelsh

A little improvement is observable in the next letter addressed to Mr. Laubach, Master of the Parade Band, though the way of spelling Tunbridge Wells is certainly peculiar:—

Au Conrad Laubach
Royal Barade Band
Dampridgewelt
Kent

Miss or Mrs. Eliza Clark, staying at the Saxon Hotel, St. Leonard-on-Sea, is thus addressed, in a by-no-means bad hand:—

elixa clarck
saxton hotel
saint lnord
hon se

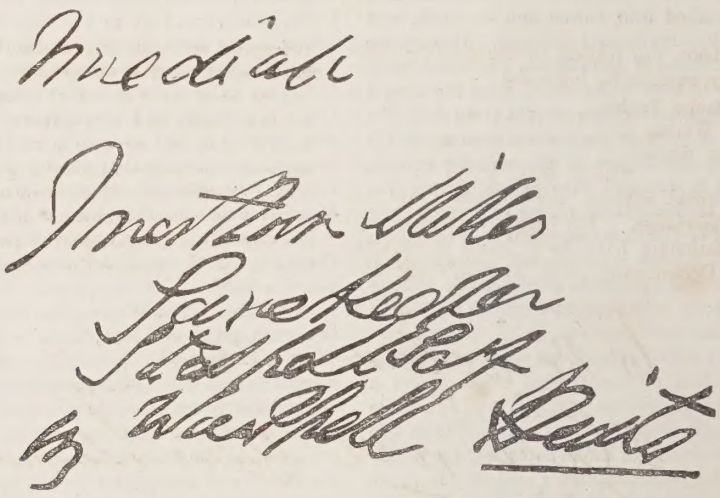


FIG. 1.

The next is curious, being a compound of English, Dutch, and some unknown language; but no tongue or style of writing, or outlandish place, is of any consequence to our friend the blind clerk, who, while we are looking over two or three curious addresses, is busily engaged in adding such matter to the letters before him as will render them intelligible to the less practised eye of the postman. For this purpose he has before him a small library of "Directories," "Guides," and such like books:—

Willem Lskern a malroos
oan boord op het Cook ship
de Sckelde Ka Pt Penduse
near Z Wax zie in de
briizons Kanaal

Who but the blind clerk would be able to discover that this letter was addressed to William Liskern, mate on board the good ship "Scheld," Capt. Penrose, near Swansea, in the Bristol Channel?

The two following will complete the list; we selected them from about a couple of dozen, the whole of which the gentleman of the blind letters had traced from actual letters which had come before him at different times—

to lackey igo of Sambige
Post office England
Shishere (Cheshire)
to be forwarded to
Francis Keaney

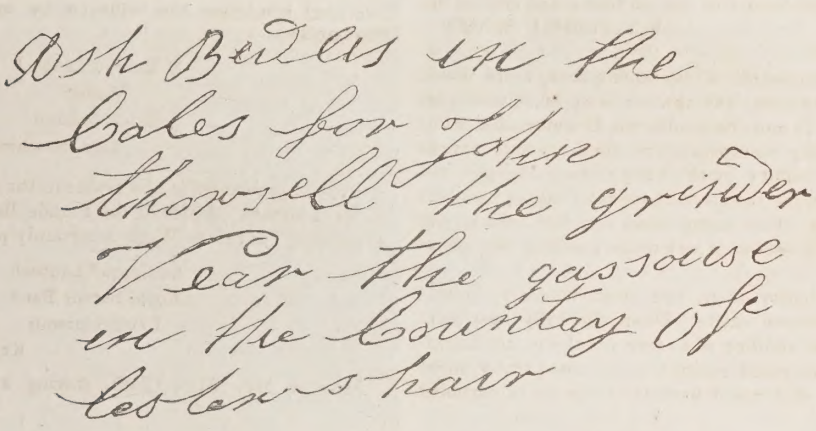

FIG. 2.

The lower one we leave our readers to translate for themselves; it is a complete exercise for ingenuity:—

Shu fauhe Taphe
Warkit ill
Wise Coruse
Wile of Witk

Sometimes letters come without any address at all, and sometimes without fastenings. The adhesive wafers and envelopes of the stationers have been found a constant source of trouble. Occasionally, nay, almost every day, in Town;" or when a young lady in America addresses "Thomas Smith in the town of England;" it can hardly be expected that the letter will reach the person intended.

While we have been amusing ourselves in the Blind Room, the business in the various large rooms beyond has gradually been drawing to a close, and is now going on at a rate perfectly furious. The letter-bags are presently made up, sealed and sent off; and in another half-hour, the place recently overwhelmed with letters and newspapers, is quite clear; the thumping, and stamping, and sorting, is all over, and by half-past eight the offices are deserted, and the clerks gone home—except such as stay for the night post, who are presently reading books and newspapers, or indulging in a kind of leisure quite at variance with their former occupation. So we wish our polite conductor good night, and go home too, highly pleased with all we have seen and heard.

We may, however, observe in this place that the processes peculiar to the London district post, carried on in the southern half of the building, differ in no material respect from those

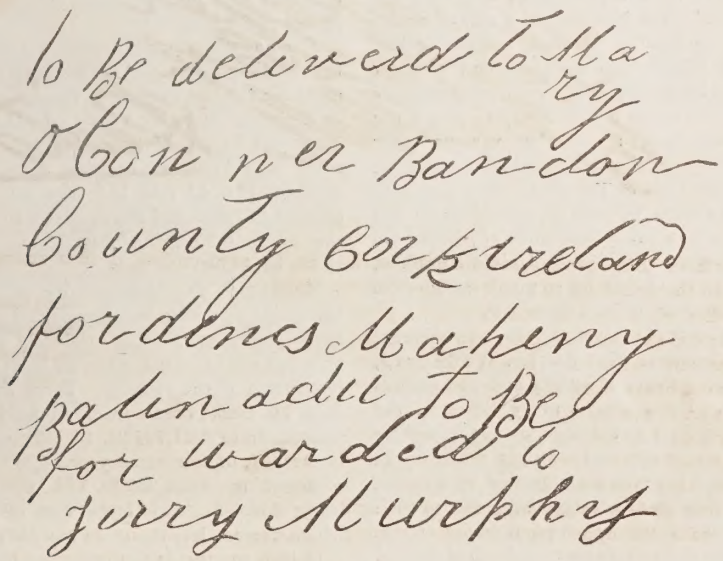

FIG. 3.

letters containing money are sent to the post so badly directed, that they cannot be forwarded, and in the Dead-Letter office thousands of pounds are annually discovered, most of which are eventually, though with infinite trouble, returned to their writers. More than £40,000 in Bills of Exchange were lying in the Dead-Letter office in 1847: many of the bills being probably the result of advertisements addressed "To Gentlemen in Difficulties." Ignorance, idleness, and simplicity find plenty of work for the eyes and hands of the blind-clerk. Of course, when a son in the country writes—"To his Father we have attempted to describe. The same order, regularity, and business-like arrangements are common to both. Each department is committed to the care of experienced gentlemen acting under the immediate direction of the two able secretaries, Colonel Maberly and Roland Hill, to the latter of whom we owe most of the modern improvements in postal communication.

But we have not seen or heard quite enough; so on the next Tuesday morning we rise from a restless, dreamy sort of sleep, in which we have been going up and down in the move-

able room, and have been sorting all sorts of letters to all sorts of places, and find ourselves in the star-lit streets by four in the morning. An hour's walk through the deserted town—our footsteps on the flagstones awakening the echoes far and wide, and the advent of a market-cart or the appearance of a policeman being quite an event—brings us again to the Inland Office. By the dim light of the grey morning, we see great bags brought into the front office from the mail-omnibuses outside. The correspondence of the United Kingdom and America—for the mail from the United States had arrived at Southampton only yesterday—is being carried on men's backs, and thrown bodily down upon the floor, and checked off by a clerk in waiting, and taken into inner offices, there to be opened and sorted and sent off everywhere—a process which is going on day after day, and week after week, and month after month, and year after year, continually—the number of letters and newspapers increasing beyond all hope or calculation.

We step inside, and are again politely received by the inspector on duty—not the same gentleman as before—and stand beside the "opener," and watch him as he receives bag after bag, and cuts the seals and fastenings with a sharp knife, and empties each one of its contents, turning it completely inside out—for a fine is enforced for every letter left in the bag; and we perceive that his first duty is to seek for the postmaster's letter of advice, which accompanies the registered and money letters; and we see how—this process going on in various parts of the crowded room—the letters and newspapers are again stamped, weighed, sorted, and finally taken by the letter-carriers to a gallery up stairs to be sub-sorted into walks, to suit their own convenience. We perceive that the parcels containing post-office orders are laid aside by themselves, and that the registered letters are taken at once to a glass-enclosed office at the other side of the room. We follow the latter. Here in various large parcels are sums of money from country bankers, amounting in the whole to an almost fabulous total. What a temptation to hardly-worked and poorly-paid postmen must it be to have constantly passing through their hands letters containing bank-notes and valuables, we observed. "Yes," said our conductor, "we have certainly frequent examples of men yielding to such temptations; and they are almost always found out." We had noticed a sort of architectural ornament high up against the wall, something like the front window of an Elizabethan mansion, and we now learnt for the first time an invisible pair of eyes were constantly looking down upon the busy scene below, ready to detect the slightest indication of dishonesty; and that various other points of observation were distributed about the building, quite unknown to the main body of the men. It is a painful thing to think that there should be such frequent lapses; but when we come to consider how many thousands of persons are employed in the various post-offices in the United Kingdom, our wonder is, not that there should be so many instances of want of principle, but that there should be so few.

On again entering the Foreign Department, we were inducted into the mysteries of the American Mail Service. We then saw, for the first time, how the parcels of letters and newspapers arrived in this country. From almost every State in the Union, but most from New York and Boston, come fortnightly parcels of letters. They are neatly and strongly made up in yellowish-brown paper, and are each accompanied by a sort of invoice, showing the proportions of postage chargeable to each country. The India-rubber mail—so called from its arrival in various large bags made of India-rubber cloth—had arrived the night before at Southampton. In the *Times* of the previous day—thanks to the persevering activity of its agents—the public were made acquainted with the principal news from America, and in about three or four hours hence, the multitude of letters comprising the mail would be in the hands of their several owners. The mail had come in an American vessel, and most of the letters were pre-paid — Brother Jonathan receiving by far the best half of the postage, of course, including the ocean carriage. Here again, we were impressed with the necessity of a further reform; for if the accounts were kept simply weight for weight, instead of money for money, much very troublesome book-keeping would be saved on both sides the Atlantic. But,—"There's a good time coming, Boys!"

After spending some three hours in the building, during which the morning mails had been made up and sent away, and in which we had witnessed some of the curious facts that are constantly coming before the officials, and in which we had seen specimens of the curious things which people send in letters—garments of various descriptions, gloves, boots, samples of tea, sugar, and various seeds, being the most common,—we again took our leave, and went home to breakfast. But not before we had had put into our hand a certain parliamentary return, from which we became acquainted with many interesting statistical facts relating to postal communication.

From this we learn, that in the last year previous to the reduction of the rate of postage the total number of letters delivered was 75,907,572, besides 6,563,024 franks; the next year, 1840, the penny rate came into operation, and the number increased immediately to 168,768,344. By the new regulation, all franks and free letters were abolished, except for those letters especially sent from the government offices. The *use* of franks had become an *abuse* of so alarming and increasing a nature, that Mr Rowland Hill's suggestion for their abolition was at once acceded to. But while the number of letters had increased more than 130 per cent., the net revenue had fallen in the first complete year from more than a million and a half to less than half a million. But both the number of letters and the gross revenue have gone on increasing—the former to 379,500,000 in 1852, and the latter to £2,422,168 4s. 1½d. for the same year—nearly £100,000 more than the gross revenue of 1839. But, while the money received has increased thus satisfactorily, the cost of management has increased in like proportion. In 1839 it was £686,768 3s. 6¾d.; in 1852 it amounted to £1,304,163 12s. 8¾d. In each case there is included, under the head of "cost management," £10,307 10s. for pensions and gratuities, which sum forms no part of the disbursements on account of the service of the Post-office. The increased accommodation to the public, consequent on the extension of the railway system, has of course been attended with much expense—the total payments to railways of late years having averaged nearly £300,000.

From another return ordered by the House of Commons, of the salaries, wages and allowances of the Post-office department for the last seventeen years, some interesting facts may be derived. Here are a few:—In 1835, the number of persons employed in the Metropolitan branch of the General Post-office was 1750, at salaries amounting in the whole to £113,052 13s. 4d.; in 1851 the number of *employés* had increased to 3,248, and the expenses to £283,360 15s. 5d. During the entire period the Post-Master-General has received a salary of £2,500 per annum.

Meanwhile, the Money-order office, which is year by year increasing in public importance and estimation, has risen from small beginnings, being originally only a private speculation of a few clerks in the office, to be at the present day quite an institution of the country. From January, 1839, to the same date in 1840, there were granted 188,615 money-orders, amounting to £311,727 9s. 1d.: from the 1st of January, 1851, to Dec. 31, of the same year, 4,657,443 orders were issued, representing £8,876,243 8s. 11d., the expenses of management being £69,992. This large sum of money is sent in orders which average less than two pounds each.

In fact, so great is the order, and so exact the arrangement of this immense establishment, that its extension seems a natural consequence; and the only wonder is, that with a system so perfect as that of the Money-order office, and a plan so secure as that of the registration of letters—every person through whose hands the registered letter passes giving a receipt for its delivery—there should be found folks so obstinate, or so ignorant, as to entrust coin to the tender mercies of strangers in no better purse than a paper envelope!

With this reflection, which is an important one, considering the temptations which money-letters put in the way of poor letter-sorters and carriers, we close our paper.

THE KING OF OUDE'S DINNER PARTY.

We had the satisfaction of waiting from half-past seven, the time appointed, to half-past eight, before the king sent to say he was ready—perhaps in revenge for our keeping him waiting in the morning. What we expected to have been a great bore, however, turned out one of the gayest and most amusing festivals I ever was at. We went as in the morning; and the procession with lighted torches, glittering arms, and prancing horses, through the illuminated streets; the arrival at the Durbar in a court crowded with people, and literally blazing with light from thousands of lamps; the dinner itself, with its accessories of jewelled orientals, evening-dressed ladies, officers in uniform, music and glitter; the fire-works, and illuminated court-yard with playing fountains, altogether made a scene such as I never saw before, and probably never shall see again. It was more like the last scene in the "Island of Jewels" than anything else that I can think of. The *fête* was in honour of the marriage of the king's youngest son, a boy of four or five years of age, to a daughter or niece of the prime minister; and the little imp of a bridegroom was brought out splendidly dressed, to be exhibited to the company. The dinner was given in the Durbar-room of the old palace, the red-hot verandah-like place we visited on the first day, and, thanks to the open sides of the building, and the coolness of the night air, the temperature was very agreeable. The king, his brother, and sons, received us near the head of the stairs, and we at once proceeded to the business of the evening. We were not seated, however, without some struggle for places, and I found myself between Grosvenor and, perhaps, the most intelligent-looking native present, who proved to be the king's brother-in-law. Another interesting neighbour was a roast guinea-fowl; off which I made my dinner. The table was laid as nearly European fashion as their acquaintance with our manners and customs would allow, and there was no lack of wine, if one only knew how to ask for it. The king was about the most gorgeous, and yet nearly the most absurd individual I ever saw. All the effect of his magnificent robes and jewels was injured, not to say spoilt, by the ridiculous addition of a 42nd Highlander's bonnet and plumes, which he wore with an air as if he really thought he had "done it now." Besides the usual black feathers, he had added a bird of paradise plume to one side of it, the whole effect being supremely ridiculous. In other respects, with his yellow and gold dress, and blue velvet mantle powdered with gold fleurs-de-lis, his splendid jewelled chains, and his gold embroidered slippers, he was the most gorgeously "got up" individual I ever saw. The chains he wore, three or four in number, were something like the collars of different orders of knighthood, but one mass of pearls or other precious stones. Besides these, he had a string of jewels of immense size hanging about his elbows, an attendant walking close behind him on each side to hold them, for fear they should break off. In fact, as he stood, I should think he would have been cheap at £100,000. * * At his Majesty's particular request, the Resident gave the Queen's health, followed also, at his request, by three cheers, uncommonly well given by, of course, the English part of the company; the bands playing "God save the Queen" (only they began not exactly at the same time). I think the staid orientals were rather astonished at the row we made, and the king was pleased at having nearly the same noise made when we drank his health afterwards. That done, we all adjourned to a balcony overlooking the entrance-court beyond the throne-room. * * Arm-chairs had been placed for us, and the king was no sooner seated than the fireworks, which had been placed in the court, were let off. Fire-balloons by dozens, rockets by hundreds, elephants with fiery tails on a kind of merry-go-round, fish whirling, serpents hissing, fiery fountains playing, and men with their stomachs full of squibs—it was like the last scene in a grand burlesque. * * A grand bouquet of rockets finished the exhibition and the entertainment, and we all retired, receiving the usual tinsel chains, but avoiding the scent ceremony.—*Captain Egerton's Tour in India.*

THE VILLAGE DOCTOR.

A wonderfully wise man is the village doctor! One of the most important men in the village, exciting in all a due admiration for his book-learning and medical skill. He has a cure for all the ills that flesh is heir to, he understands all the symptoms of a patient by a glance, he appears to comprehend intuitively where the pain is chiefly felt, and seems to be no less intimately acquainted with the very remedy that will make the sick man sound. There is healing in his very presence. A shake of the head is enough to produce despair, a nod awakens hope and comfort; there never was so wise a man as the country doctor. This is at least the opinion of the villagers. It may be, the faculty would by no means be impressed with his sagacity, for, if some people speak true, he has passed no examination, studied in no regular and orthodox fashion, but acted as his own instructor, and dubbed himself a doctor. But what of that? good sense and skilful practice may sometimes exist apart from regular practitioners, and the country people have more faith in old Dr. Goodman than in all the College of Physicians, and more respect for his simple remedies than for the whole materia medica.

There he sits with a calm, sagacious, honest countenance, his grey hair rather long and wavy, telling, as it were, of his free handsome youth,—spectacles on nose. He wears no suit of sable, but is very much at his ease in shirt sleeves, open waistcoat, drab shorts, and grey worsted stockings; in one hand a snuff-box, from which he has just removed a pinch; and withal has so pleasant a look that one feels inclined to trust him.

The room in which he sits is his laboratory. It serves, indeed, for other purposes, for "parlour, and kitchen, and hall," but bears the dignified title of study. A very room of wizardry it is to simple country folk—a mysterious apartment, the stronghold of all wisdom, a sanctum sanctorum that one must enter cautiously. From a cord suspended across the ceiling hang simples of various kinds — herbs gathered from all quarters; on a shelf are ranged bottles and jars of healing mixtures, ready to do battle with disease. On the floor stands a pestle and mortar; and on the window-seat are a pair of scales and an open book, and above them, more ominous than all the rest, more to be revered than herbs and potions, a human skull. Doubtless, the doctor is a learned man—it gives a scientific air to the place, which makes our faith in him the stronger.

But a human skull is a terrible object, something that produces an indescribable dread, especially to the peasant girl in the background of the picture, who, with her hand to her chin and a strange solemnity on her face, eyes the eyeless remnant of humanity with a glance of timidity and suspicion. The peasant girl has accompanied her mother and young brother to the domicile of the wise doctor, for the boy grows feverish and restless, and has filled his mother's heart with fear. How solemn she looks, as the boy sits on her lap and she details the symptoms of his complaint; how she multiplies every particular of his disorder!

"He does not appear so bad, poor little ducky!" she says, and at every term of endearment draws him closer to her; "but he is very ill. He very often weeps, dear treasure! he seems to lose his appetite, and cannot relish our simple fare; we have obtained for him little dainties, but he appears so listless, dear heart! that I am quite afraid. I think he requires more sleep. He will never play with his two sisters; he will suffer none but his mother to touch him, pretty lamb! and never seems happy."

"Is he your youngest child?" asks the doctor.

"He is, sir, the last of all; pretty poppet!"

"Are your other children girls?"

"They are, sir; alas! this is the only boy. The girls are well enough. This youngest one who is with me, aids me to carry her brother about; it is for him we feel so much—no appetite, no sleep, no cheerfulness. Alas, we would give our all for him!"

"And you really think that he is suffering severely?"

"We do, indeed, doctor, his hands are hot, and his mouth parched, and he has no energy, poor little lamb!"

"And," says the doctor solemnly, "there is no remedy but one."

"Ah! what is that, doctor?"

"Nothing! Submit him to the same discipline as your other children; do not pamper his appetite, and so spoil his taste and his digestion; do not humour his tempers, and so ruin his character and blight his prospects and your own. Let him go out into the fields and take care of the sheep, let him share with the rest at table; what others can eat, he can eat too, a small piece of meat, a good supply of bread and potatoes, and nothing but clear water to drink, will make a man of him."

"But he is so delicate," says the anxious mother, "and so young. Really, is it possible that this can be good for him? He is so very, very dear to us."

"I like not these over-loved Benjamins," says the doctor, "they nearly always grow up to be selfish men. The malady of the child is plain enough: he has eaten at all hours, and spent three parts of the day at table."

"But, doctor, he can eat nothing; we are obliged to give him spices, and sauces, and cream, and sweet-stuff, something to tempt his listless 'appetite.'"

"Woman," says the doctor, "the boys wants air and exercise. Nature will make a cure of him if nature be permitted to have her own way. Medicine can do nothing for him. Let him rough it with the other children of the family; do not shelter him from every wind that blows, as if every breath of heaven were loaded with infection; let him fare as the rest fare, and labour as the rest labour, and, depend upon it, he will eat and sleep and be as merry as you could wish."

THE VILLAGE DOCTOR.—DESIGNED AND ENGRAVED BY THE BROTHERS GIRARDET.

Admirably the artist has depicted the scene. Every detail is carefully preserved, and there is that life-like character in all the figures, and that careful attention to general effect, that makes the pencil tell the incident better than the pen.

COX & SONS' PRINTING OFFICE
COMBE & BLAKEFIELD
"It is now forty years (1785) since I worked, like you, at this press, a journeyman printer."
B. Franklin
BENJAMIN FRANKLIN.
G. PEARSON SC.

THE PRINTING-OFFICE OF MESSRS. COX BROTHERS, GREAT QUEEN-STREET, LINCOLN'S-INN-FIELDS.

THE HOUSE IN WHICH FRANKLIN RESIDED WHEN AGENT FOR PENNSYLVANIA; NO. 7, CRAVEN-STREET, STRAND.

BENJAMIN FRANKLIN.

Franklin was one of the ablest of the able men whom the the American republic numbers amongst her fathers and founders, and like most of them, he was a "self-made" man, as those are generally designated who have been the architects of their own fortunes. If he had been a mere politician of great talent and eloquence, like Patrick Henry, the half-lawyer, half-farmer, who drove his own cow to the market, and then made the senate house resound with his denunciations of British tyranny, he would have been entitled to a large share of the attention of every student of history for the influence he exerted in the councils of tne United States in the most perilous days of their existence. But he was something more than statesman, politician, or patriot. He was a man of singular energy and perseverance, possessed of far-sightedness, and clearness of judgment which in an eastern country would have classed him among the sages; a philosopher of great accuracy, great penetration, and wonderful originality, and, above and beyond all these, a man of such sterling worth and stainless purity of character, that none of his enemies, even in the heat of a furious and unnatural conflict, ever could allege aught against him that he had need to be ashamed of. He possessed in himself such wonderful versatility of genius, and the story of his life presents such a wonderful variety of incident, men, and places, that no one, no matter what may be his position or employment, can ever read it without being improved by it.

He was the scion of one of those old English families of yeomanry, which were once so numerous. His ancestors occupied a farm of some thirty acres of freehold in Northamptonshire, time out of memory, probably before Duke William landed at Hastings, when a Saxon name was a title of honour. Finding the land insufficient for their support, the kin of the estate invariably eked out a livelihood by following the trade of a blacksmith in his native village. When the doctrines of the Reformation found their way into England, the Franklins were amongst the earliest to embrace them, and faithfully adhered to them through all the terrors of Mary's reign; and when, in the time of Charles II., many hundreds of the church clergy bore a noble testimony to true liberty, by abandoning the church of England, the Franklins were amongst the first to join the ranks of the despised and persecuted sectaries who preferred the conventicles to the parish church. But the conventicles were at that period a special abomination in the eyes of the government. Nay, it was the opinion of many learned and pious individuals, that if itinerant preachers continued to discourse upon matters pertaining to religion without proper and legal authorisation, it would cause the overthrow of the constitution of this kingdom in church and state, as by law established. The measures that were taken to prevent so terrible a catastrophe were certainly not such as anybody would in this day attempt to defend; but they had the effect of driving vast numbers of the really sincere and devout men of England across the Atlantic, to seek in trackless woods and on unknown shores the liberty of speech and action which England had denied them; and, more wonderful still, in the very heart of persecution and oppression, they sowed the seeds of a power that 100 years afterwards was to teach Britain, by the arm of flesh, the lessons of toleration which she should have ever been the first to respect and the last to forget. Amongst the exiles was Benjamin Franklin's father, Josias, who with his wife and three children settled in New England about the year 1682. After his arrival, four other children were borne him by the same wife. On her death he married another, by whom he had ten, making in all seventeen; and of the sons Benjamin was the youngest. He was originally intended for the ministry, for no better reason than that at an early age he had learned to read with remarkable facility. The poverty of the father fortunately saved his son from entering upon an unsuitable vocation. He could not afford to give him a collegiate education, and so instead of a minister he determined to make him a soap-boiler and tallow-chandler, which occupation he himself had followed since his arrival in the colonies. Ben, however, did not by any means relish the change, when at ten years of age he was taken from school, and employed in filling moulds, cutting wicks, and going of messages, and there sprung up within him that inclination for a sea life which always haunts the minds of young gentlemen of tender years when they are not going on to their liking at home. Luckily, however, he managed to continue on peaceable terms with the soap and candles for two whole years, without offering his services to any of the New England sea-captains; but at the end of that period, his discontent rose to such a height, that his father began to fear that he really would take an abrupt leave, and enter himself as a cabin-boy in some sea-going vessel, as one of his elder brothers had already done. The worthy man then determined to discover his bent, and if possible to gratify it. He took him to see handicraftsmen of all trades at work, but nothing still seemed to have such attractions for Ben as books, and it was determined he should be a printer, it being believed, and rightly, that what he loved so much he would like to make. His brother had already started in Boston as a printer, and to him he was apprenticed. His taste for literature first showed itself in poetry, or perhaps we should rather say in versifying; and his brother, who appears to have invariably "had an eye to business," upon discovering this, employed him to write two ballads upon some events of recent occurrence, and then sent him about the streets to sell them. They had a prodigious run, which was highly gratifying to the author's vanity. From this time the taste for reading sprung up in him with extraordinary rapidity. He read a great many of the old English classics, but still possessed no facility in writing prose, until an odd volume of the "Spectator" fell into his hands, and so charmed was he with the style, that he forthwith determined to imitate it, and for this purpose practiced writing out the substance of what he read, and afterwards comparing it with the original. He thus gradually acquired greater fluency in composition; and perceiving where his own faults lay, was enabled to correct them. After some further desultory efforts of this sort, he at length had an opportunity of coming before the public in some essays, which he sent in anonymously to a newspaper his brother started, in 1720 or 1721, entitled the *New England Courant*. This was the second newspaper that had ever appeared in America.

"Some of his friends," says Franklin "I remember, would have dissuaded him from this undertaking as a thing not likely to succeed, a single newspaper being, in their opinion, sufficient for all America. At present, however, in 1771, there are no less than twenty-five." What would he have said, could he have foreseen the prodigious degree of expansion to which the American newspaper press would have attained in 1853! This paper very soon fell under the censure of the assembly; Franklin's brother was imprisoned, and on his liberation was ordered to desist from publishing the *New England Courant*, and in order to evade the prohibition, it was determined that it should be carried on in Benjamin's name, and for this purpose his indentures were cancelled. He and his brother, however, could not agree. The latter was too fond of asserting the *droit d'ainesse*, and his dictatorial manner was intolerable to Benjamin, who at this period appears to have had no small opinion of himself. Their disputes were frequently brought before their father; he seems to have laboured to reconcile them with laudable solicitude, but the breach was too wide to be healed; and, in addition to this, Benjamin had resolved upon seeking his fortune through the world. He secretly took his departure, and reached Philadelphia with a Dutch dollar in his pocket, in his working dress,—his best clothes having gone by sea,—covered with dirt, and spent the first few hours after his arrival in eating a loaf and walking up and down the street. He soon got employment as a compositor, and attracted

the notice of the governor—a boasting, lying, deceitful man—who offered to set him up in business in Philadelphia, and persuaded him to set out for England to purchase types and a press, promising at the same time to give him letters that would make everything very pleasant and agreeable on the other side of the water. Franklin, believed him, and set sail, but without having anything of the oft-promised letters, which were always on the point of being sent on board, but never came. He crossed the Atlantic in the foolish, fond belief that they were in the mail-bag, and that when it was opened in England they would assuredly make their appearance. On his arrival, the captain handed him two or three, which looked very like introductions; but on presenting one of them to the individual to whom it was addressed, it was found to be from a roguish attorney, and he ran a narrow risk of being kicked for his pains, and found himself in England, without a friend, except a young man named Ralph, with his own love of literature, but without his steadiness or application.

Franklin, immediately on his arrival in London, found employment with a printer named Palmer, in Bartholomew-close. While here, a pamphlet he published, entitled a "Dissertation upon Liberty and Necessity, Pain and Pleasure," was the means of introducing him to the notice of a considerable number of literary men in the coffee-houses. His friend Ralph, however, was not equally successful. He appears to have been one of those unfortunates with whom nothing ever seems to succeed. Everything he undertook failed; and he continued to live upon loans from Franklin, until their common admiration of a young milliner caused a final breach between them, to Franklin's great joy, who now began to think of saving some money. He, therefore, entered another printing-office, Watts's, near Lincoln's-inn-fields; and while here, was the means of inducing his fellow-pressmen to abandon beer-drinking, in which many of them indulged to excess. He remained about eighteen months in London at this time, and, having accumulated a small sum, set sail once more for Philadelphia, where he arrived in October, 1726.

He now became a clerk to a Mr. Denham, a gentleman whom he met in England, and who was about to open a store in Philadelphia. In 1727, Denham died, and Franklin once more returned to his old occupation, by becoming manager of the business of a printer named Keimer, who had employed him before his departure for England. Keimer was dirty, knavish, and an insolent, vulgar brawler, who thought that the fact of his employing a man gave him the privilege of being insolent. It may be readily believed that Franklin and he did not long agree. He left him, and, in partnership with one of his fellow-workmen, started an establishment of his own. His companion, however, was idle and a drunkard, and soon left the business altogether in Franklin's hands. By unwearied industry, it was made to thrive and flourish: people passing in the street saw him at work after eleven at night, and long before most others had left their beds in the morning; and to show that he was not above his business, he wheeled home his paper in a barrow along the streets after he had obtained it from the stationer. He now started a paper, which soon obtained a large circulation for its ability and accuracy; and his reputation for diligence getting abroad, he obtained the printing of the public documents, and of the paper-money which was then beginning to be issued in America. In addition to this, he got into some of the most *spirituelle* society in Philadelphia, by joining a club for the discussion of scientific and literary questions. He was now out of debt, and doing well in the world, and thought it time to look around for a wife. His offers in various quarters were rejected, because a printer's business was not considered money-making. At last he returned to his first love, a young lady to whom he had been engaged previous to his departure for England; but, having ceased to correspond with her, she presumed that he had given up all intention of marrying her, which was really the case; and her parents then persuaded her to marry a worthless scamp, who had, as it afterwards appeared, another wife living in England, and who soon abandoned her. Franklin and she got married; and they lived together, and prospered and were happy for many years.

Franklin was now a man of mark in Philadelphia, and in the year 1731 started a project for the establishment of a public library. Fifty persons subscribed forty shillings each, and agreed to pay ten shillings annually. As their number increased, the company was incorporated, in 1742, under the name of the "Library Company of Philadelphia." Similar institutions have since spread through all parts of the United States, and have done immense good in the advancement of knowledge and education. In 1732, Franklin commenced the publication of "Poor Richard's Almanack," famous for its maxims inculcating industry and frugality. In 1736, he entered upon his political career as clerk to the General Assembly of Pennsylvania, and was at last elected representative for Philadelphia; and in 1737 was appointed Postmaster of the State. His advance in public estimation was now rapid, and was consummated by his famous discoveries in electricity.

An account of several electrical experiments which had been made by some philosophers on the continent was sent to the Philadelphia Library Company in 1745, and Franklin immediately upon reading it engaged in a course of experiments himself, and communicated the results in a series of letters to his friend Collinson, the first of which is dated March 28th, 1747. In these he shows the power of points in drawing and throwing off the electrical matter, which had hitherto escaped the notice of electricians. He also made the grand discovery of a *plus* and a *minus*, or of a *positive* and *negative* state of electricity. Shortly afterwards, Franklin, from his principles of the plus and minus state, explained in a satisfactory manner the phenomena of the Leyden jar, which had previously so much perplexed philosophers. He showed clearly that the bottle when charged contained no more electricity than before, but that as much was taken from one side of it as was thrown upon the other; and that to discharge it nothing was necessary but to produce a communication between the two sides, by which the equilibrium would be restored, and that then no signs of electricity would remain. He afterwards demonstrated, by experiments, that the electricity did not reside in the coating, as had been supposed, but in the pores of the glass itself. In the year 1749, he first suggested his idea of explaining the phenomena of thunder-gusts, and of the Aurora Borealis, upon electrical principles. He pointed out many particulars in which lightning and electricity agree, and in the same year conceived the bold idea of attempting to

> "——— grasp the lightning's pinion,
> And draw down its ray
> From the starr'd dominion."

His desire to be practically useful to his fellow-men here strikingly displayed itself. Admitting the identity of electricity and lightning, which, before his time nobody had been disposed to do, he suggested the idea of securing ships, houses, churches, &c., against the effects of thunder-storms, by the erection of long, pointed rods, which should ascend some feet above the most elevated part, and descend some feet into the ground or water. As points he knew to have great power in attracting and repelling electricity, he concluded that these rods would either repel the thunder-clouds, or drain off their electricity and carry it into the earth.

In the summer of 1752 he determined to test his theory by experiment. There was no tower in Philadelphia high enough for the erection of a rod; so he determined to try a kite. He made one of two cross sticks, and covered it with silk, and to the upright stick affixed an iron point. The string was of hemp except the lower end, which was silk. Accompanied by his son, to whom alone he had communicated his project for fear of ridicule, he went out on a common when there was an appearance of a thunder-gust. He raised the kite, saw a thunder-cloud pass over, and awaited the result with intense anxiety. At last he saw the loose fibres of the string move towards an erect position, and on presenting his knuckles to a key which was suspended at

the end of it, received a strong spark, and he found himself a thorough *savan*, with as good a title to fame as any man of his age.

The account of his discovery having spread abroad, letters and congratulations poured in upon him from all quarters. Learned men in all parts of Europe were anxious to correspond with him; learned societies conferred on him admission to their number. His letters were translated into most European languages, and into Latin.

The remainder of his time, until the commencement of the disputes between England and the colonies, was spent partly in philosophic investigation and partly in the political affairs of the States. He was invariably the foremost man in the furtherance of all schemes for the development of the resources of the country, the advancement of education, and the improvement of the condition of the people.

The defence of her colonies was a great expense to Great Britain. The most effectual mode of lessening this was, to put arms into the hands of the inhabitants, and to teach them their use. But England wished not that the Americans should become acquainted with their own strength. The least appearance of a military spirit was therefore to be guarded against; and, although a war then raged, the act of organising a militia was disapproved of by the ministry. The regiments which had been formed under it were disbanded, and the defence of the province entrusted to regular troops.

The disputes between the proprietaries and the people continued in full force, although a war was raging on the frontiers. Not even the sense of danger was sufficient to reconcile, for ever so short a time, their jarring interests. The assembly still insisted upon the justice of taxing the proprietary estates, but the governors constantly refused their assent to this measure, without which no bill could pass into a law. Enraged at the obstinacy, and what they conceived to be the unjust proceedings of their opponents, the assembly at length determined to apply to the mother country for relief. A petition was addressed to the king in council, stating the inconveniences under which the inhabitants laboured, from the attention of the proprietaries to their private interests, to the neglect of the general welfare of the community, and praying for redress. Franklin was appointed to present this address, as agent for the province of Pennsylvania, and departed from America in June, 1757. In conformity to the instructions which he had received from the legislature, he held a conference with the proprietaries who then resided in England, and endeavoured to prevail upon them to give up the long-contested point. Finding that they would hearken to no terms of accommodation, he laid his petition before the council. During this time Governor Denny assented to a law imposing a tax, in which no discrimination was made in favour of the estates of the Penn family. They, alarmed at this intelligence and Franklin's exertions, used their utmost endeavours to prevent the royal sanction being given to this law, which they represented as highly iniquitous, designed to throw the burden of supporting government upon them, and calculated to produce the most ruinous consequences to them and their posterity. The cause was amply discussed before the privy council. The Penns found here some strenuous advocates; nor were there wanting some who warmly espoused the side of the people. After some time spent in debate, a proposal was made, that Franklin should solemnly engage that the assessment of the tax should be so made, as that the proprietary estates should pay no more than a due proportion. This he agreed to perform, the Penn family withdrew their opposition, and tranquillity was once more restored to the province.

The mode in which this dispute was terminated is a striking proof of the high opinion entertained of Franklin's integrity and honour, even by those who considered him as inimical to their views. Nor was their confidence ill-founded. The assessment was made upon the strictest principle of equity; and the proprietary estates bore only a proportionable share of the expenses of supporting government.

After the completion of this important business, Franklin remained at the court of Great Britain, as agent for the province of Pennsylvania. The extensive knowledge which he possessed of the situation of the colonies, and the regard which he always manifested for their interests, occasioned his appointment to the same office by the colonies of Massachusetts, Maryland, and Georgia. His conduct, in this situation, was such as rendered him still more dear to his countrymen.

He had now an opportunity of indulging in the society of those friends whom his merits had procured him while at a distance. The regard which they had entertained for him was rather increased by a personal acquaintance. The opposition which had been made to his discoveries in philosophy gradually ceased, and the rewards of literary merit were abundantly conferred upon him. The Royal Society of London, which had at first refused his performances admission into its transactions, now thought it an honour to rank him amongst its fellows. Other societies of Europe were equally ambitious of calling him a member. The university of St. Andrew, in Scotland, conferred upon him the degree of Doctor of Laws. Its example was followed by the universities of Edinburgh and Oxford. His correspondence was sought for by the most eminent philosophers of Europe. His letters to these abound with true science, delivered in the most simple, unadorned manner.

During this visit he lodged in the house in Craven-street, Strand, represented in our engraving.

The discontents of the colonies increasing, Franklin was again appointed provincial agent, and sent to England. In 1776, he paid a visit to Holland and Germany, and in the following year to France, where he received the greatest marks of attention from the men of science, and was presented to the King Louis XV. When the petition of the Massachussetts Assembly was brought before the English Privy Council, Franklin attended as agent for the assembly, and received very rough treatment from Wedderburn, the attorney-general, a man of narrow mind and violent temper. All his efforts were insufficient to induce the ministry to change the measures, and he returned to America in 1775, just after the commencement of hostilities. He was sent to Paris, in 1776, to conclude the treaty by which the unfortunate Louis XVI. recognised the independence of the colonies; and was one of the American commissioners at the general treaty of peace in Paris, which followed the surrender of Cornwallis's army. He had in the interval been a member of Congress, and during the whole of that unfortunate struggle was distinguished by his energy, prudence, and patriotism, though he never allowed his political engagements to interfere with the prosecution of his scientific studies. It will for ever redound to his honour, that his last public act, in 1789, when bowed down by age and infirmity, was the presentation of a petition to the House of Representatives of the United States, on the 12th of February, 1789, praying them to abolish the slave-trade. He died on the 17th of April, 1790, after a long and useful life of eighty-four years and three months.

The following epitaph on himself was written by him many years previous to his death:—

THE BODY
OF
BENJAMIN FRANKLIN,
PRINTER,
(like the cover of an old book,
its contents worn out,
and stript of its lettering and gilding)
lies here, food for the worms;
yet the work itself shall not be lost,
for it will (as he believed) appear once more
in a new
and more beautiful edition,
corrected and amended
by
THE AUTHOR.

THE AUSTRALIAN DIGGINGS.

GOLDEN POINT, MOUNT ALEXANDER.

CHIEF COMMISSIONER'S TENT AND OFFICERS' QUARTERS, MOUNT ALEXANDER.

MOUNT ALEXANDER.

The eyes of the whole world—and especially those of the poor and needy—have been for some months past turned in the direction of the golden lands of Australia and California. Emigration to both places, therefore, and especially to the former, has been proceeding at a never-before-reached rate from the old countries of Europe. In England the exodus—for that is the modern term for emigration—is beginning to attract the attention of the rulers of the land, and to produce an effect upon trade and commerce. The demand for workers is beginning to exceed the supply; and we are glad of it. To say nothing of the strikes for higher wages which have taken place among various grades of mechanics, and the extra work which is thrown on the hands of all connected with the shipping and provision trades, we have noticed a pleasing evidence lately of an advance in a direction we had scarcely expected. On the dead walls in the suburbs, on the shop shutters of chancery-closed houses in the back streets of the city, in the windows of the bakers, next the play bill, and hung on hooks in butchers' shops like choice joints of meat, we have noticed a blue and red-printed placard, bearing this legend:—"Good wages, constant work, and prompt attention." Now, as we do not belong to that large class of people who appear to have no other object in life than to go shuffling about London streets, and gazing on road-paviors, gas-pipe layers, and play-bills, we should scarcely have noticed this announcement in our ordinary perambulations. The terms of the bill, however, being somewhat unusual, we are tempted to pause a little and read it through. And then we find that this kind invitation—"Good wages, constant work, and prompt attention,"—is addressed especially to needlewomen, who are further requested to call on Messrs. So-and-so, of Houndsditch, where any number of them can be profitably employed in the preparation and completion of "youths' and gentlemen's shirts of the best description." And more than this, the needlewomen aforesaid are urgently invited to "come immediately, and bring a pattern." By the last phrase is meant a specimen of the worker's ability in the shape of the linen front, collar, and wristbands of a long-cloth shirt; but does not the term "prompt attention" betray a story of previous neglect and insolence, such as only poor sempstresses could put up with? And so, reading the bill from beginning to end, we arrive at the comfortable conclusion that the emigration mania has reached the right sort of folk at last; and in our walk onwards we picture to ourself the plain needle-woman transformed from a poor, thin, slip-slop wisp of a creature in a bare garret, to a stout happy-looking housewife in a block farm-house in Australia, with laughing children trooping about her knees.

In the spring of 1851, when all the world was at the Exhibition at Hyde-park, the news reached England that a second El Dorado had been discovered on the side of the island of Australia, opposite to where the disastrous colony of Swan River was founded. People in comfortable circumstances pooh-pooh'd at the idea; and folks who should know something of geography persisted that the thing was likely enough,—till the fact was certified by the arrival of some of the actual gold, which was forthwith exhibited in a glass case at the Crystal Palace, to the wonder and admiration of thousands.

It appears to us, when we hear and read of Australia and the gold found in such abundance there, that too little attention is usually paid to the fact that the precious metals have been, at some or other period of the world's history, discovered in nearly all parts of the world. The Egyptians and the Hebrews evidently possessed it in abundance; Darius of Persia, and Cræsus of Lydia, drew tribute of gold and silver from their subjects. The ancients obtained it from Africa, just as we do now,—from the mines of Nubia and Ethopia, probably; the indefatigable Romans crossed the Pyrenees and penetrated Spain, and braved the seas and conquered Britain in their search for gold; the Austrians and the Russians of old times dug deep down into the mines of Sweden and Norway, and Hungary and Siberia, and blasted rocks, and turned aside the courses of rivers, so that they might get rich all at once. In the fifteenth century, Columbus discovered the "golden Americas;" and in the sixteenth, Pizarro conquered Peru, and Cortez overcame the great Montezuma of Mexico, and the Spaniards got drunk and debased, and finally ruined themselves, with the riches found so plentifully in the New World.

And, coming nearer to our own times, we know that the Dutch, in the last century, fitted out an expedition to California for the special purpose of discovering gold. They went, and found none, though they traversed the valley of the Sacramento through and through, and looked with eager eyes upon the "everlasting rocks of quartz," since discovered to be so rich in virgin gold; and so they came back, and reported it "a barren and desolate land." Accident, we are told, produced the great Australian and Californian discoveries; but only unthinking men call those discoveries accidents. By the inscrutable will of an over-ruling Providence, it has been ordained, in many and varying periods of history, that men should vacate the crowded cities of civilisation and commerce to colonise the wilderness. It was needful that some powerful motive should impel the masses. In nearly all cases the real or supposed discovery of gold has supplied the stimulus. When the design was fulfilled, and the land was full of inhabitants, the gold insensibly shrunk away, and people employed themselves in other ways. How blinder than moles we are!

About the close of the year 1849, the gentleman to whom we are indebted for the graphic sketches we here introduce visited Australia. At that time the colonists were comparatively poor, and no hint of the gold discoveries had been given. Occasionally, bushrangers or escaped convicts brought a weighty lump of the precious metal into the towns, where they sold it cheaply and with a suspicious air; and the purchasers directly concluding that it must have been the produce of some robbery—perhaps murder—in the bush, were therefore unwilling to ask questions, and quieted their consciences with the knowledge of having made a tolerably good bargain. As long ago as 1844, Sir Roderick Murchison, in his address to the Geographical Society, had predicted the presence of gold in Australia. Science, and not accident, led the professor to conclude that the great eastern mountain chain of Australia was highly auriferous, from its geographical correspondence with the gold-fields in the Ural Mountains; and a Mr. Smith, of the Berrima iron-works in Australia, having read the account of Sir Roderick's opinion in an English newspaper, was induced to search for gold in his neighbourhood. He did search, and was partially successful. He brought the gold to the colonial authorities, and offered to make the place of its discovery known for a reward of £500; but the governor, either disbelieving the report, or fearful of encouraging a gold fever, declined to grant his request; and so it remained for Mr. Hargreaves, who visited Australia in the early part of 1851, with the prestige of Californian experience, to re-make the discovery, and get the government reward.

The first discovery of Australian gold was made at a place called Summer Hill Creek and Lewis Ponds River, small streams which run from the northern flank of the Conobalas to the Macquarrie river. The gold was found in the accumulated sand and gravel, especially on the inside and bends of the brooks, or at the junction of the water-courses, where the one stream would be checked by the flow of the other. And in this way is nearly all the surface gold discovered in Australia and elsewhere. At first, coarse, granular gold was found, a certain proof that the parent vein was not far off—existing, probably, in the quartz veins traversing the rocks of the Conobalas. Soon after gold was found in other localities, sometimes in the shape of tolerably large nuggets or lumps, sometimes in fine thin scales, and at others as dust, collected from the auriferous earth by repeated washings.

At the present moment, gold mining is carried on along the whole course of the Murray and Darling rivers, and their several tributaries, embracing the entire tract of country from Morton Bay to the city of Adelaide; and late accounts speak

with confidence of gold having been found also in New Zealand and Van Dieman's Land.

Mount Alexander and its neighbourhood appears to have been the earliest and, upon the whole, the most satisfactory of the gold diggings. It is situated within about forty miles from Melbourne and Geelong. The whole district consists of quartz-bearing rocks, and is highly auriferous. Now, although the quartz is, doubtless, the native matrix of the gold, we have not heard of any actual veins of the precious metal having been discovered. It is generally found lying loose in the sand and gravel, and at others buried deep in the clay which forms the substratum of the soil. Mr. Gibbon, writing to the *Melbourne Argus*, says, that gold is usually found imbedded in the blue clay near the surface on the brow of the hill; but that it is sometimes necessary to dig twenty feet before arriving at it. And Mr. Latrobe, governor of the colony of Victoria, describes the borings as carried through—

1. Red ferruginous earth and gravel.
2. Streaked, yellowish, and red clay.
3. Quartz gravels of moderate size.
4. Large quartz pebbles and boulders, masses of ironstone set in very compact clay, hard to work.
5. Blue and white clay, in which are small portions of gold.
6. Pipe clay, in which gold is almost certain to be found.

Now, as this rich pipe clay occasionally lies thirty feet below the surface, the labour required to reach it will easily be comprehended—fitted, indeed, for railway excavators, brick-makers, well-borers, agricultural labourers, and for few else!

In the first of our engravings, we have a view of the gold field at Golden Point, Mount Alexander. Writing on the spot, the gentleman, who has furnished us with the drawings, which were made at the close of 1852, says, "It is a busy scene indeed. In the distance is the hill called Golden Point, so famed in the early history of Mount Alexander. Crowds of diggers [not very well defined in the engraving] are employed at this spot. Some are digging, some are wheeling barrows filled with the auriferous earth; while others—and those a very large number—are carrying the earth on their backs to the stream, which is concealed by the trees on its banks. Here the soil is washed and cradled, and whatever gold it possesses carefully extracted. In the foreground, some diggers, just arrived, are engaged in fixing their tents.

"Many of the tents are occupied as stores and provision shops, and similar establishments are scattered throughout the various diggings. From the proprietors of these stores supplies of every kind can be purchased—of course, with an advance—at Melbourne prices. Nevertheless, the erection of these stores are a great convenience to the diggers; for were it not for the foresight and business arrangements of the store-keepers, much privation would, doubtless, have been experienced. The additional charges are, generally speaking, moderate enough, except in cases of great scarcity; and even then it is only some few articles which are charged at exorbitantly high prices. In the depth of the last winter, it was feared that many of the stores would be closed from the difficulty of conveying heavy provisions over the bad roads."

Since the above was written, however, the roads to Mount Alexander have, we understand, been considerably improved. In the locality of Golden Point large quantities of gold have been found. So long as water remains in the creek gold rewards the searchers, but when the summer heats dry up the supply, then the digger's labour is almost thrown away. The gold here is generally found in dust and scales, but occasionally large nuggets are discovered, which well reward the lucky finder. It was in this neighbourhood that a twenty pound weight nugget was found in 1852. The Prince of Nuggets, however,—that picked up by Dr. Ker in 1851, which weighed upwards of a hundred weight—was found at what are now the Ballarat Diggings. It is described as a block of highly auriferous quartz, found lying among a lot of other loose blocks, evidently derived from a broad quartz vein running up the hill behind the river. "Such a mass," says Professor Forbes, in describing the geology of Australia, "could hardly be transported far from its original site by any current of water."

Our object being rather to give an idea of the present appearance of the "diggings" than to attempt anything like a continuous narrative of the gold discovery,—an object not yet accomplished, by the way, in any one of the published accounts,—we proceed to "follow our leader," the artist.

The next scene is a perfect contrast to the former one, and might be taken, without any very violent stretch of the imagination, for part of the experimental camp at Woolwich or Windsor, where British soldiers play at sieges, and so forth, every now and then. There is an air of quiet about it which speaks pretty distinctly of official residence, even in the diggings; and except for two or three days of the month, this serene air is tolerably well preserved. The tent to the left is the license office—a most important one, therefore, to intending gold diggers. The next large tent on the other side of the flag-staff is used as a depository for gold while waiting for the escort; and it, also, is as well known to the miners from all quarters as the Bank of England is to the London merchant. Other tents are used as sleeping-places, &c.

Since the sketch was taken, many changes have occurred, both in the numbers of persons in the colony—every day bringing its ship-load or two—and in the official management of the police of the gold districts. Many wooden buildings have since been erected in various parts of the diggings for the accommodation of the soldiery and officials, and a much more regular plan of business has been adopted. More than this, additional police are distributed over the diggings, and a much improved state of morality exists. When our artist was here, there were few police, and even the greater part of them were stationed at the chief commissioner's quarters; and a general feeling of insecurity was the inevitable result. Robberies, riots, and murders were of common occurrence, and scenes of the most abominable description were continually taking place. All that, however, belongs to the past history of the gold-seekers. At this moment life and property may be considered almost as safe as in an English village or an American backwood. The home government having taken energetic measures in the appointment of additional magistrates, and in the enrolment of large bodies of pensionary police at salaries good enough to secure their best services even in the diggings, the aspect of affairs have so far changed for the better, that "the diggers proceed about their work, and go in and out of their tents and huts, with a feelings of as much security as in a well-ordered town."

By this time, likewise, decent roads have been made in the different diggings, and society, even there, is beginning to assume an orderly and respectable aspect. "Our only wants," says a successful miner, writing home to his mother and sisters, "are wives and children. Why don't you come out?"

By the winter of 1852, the number of diggers in Australia had increased so considerably as to produce some alarm in the minds of the colonial government; and it was rashly proposed to impose an export duty on gold, and to double the license fee. No sooner, however, had the news come to the ears of the miners—for state secrets will leak out, even from the best regulated councils—than they took alarm, and a "monster meeting" was called for the purpose of remonstrating with the government. The great interest attached by all parties to the demonstration induced our artist to attend. It took place at Mount Alexander on the 15th of December last and the results were consequent on it. The first, and all-important one, was the withdrawal of the proposed government measure; and the last, the production of the graphic sketch before us. Here we get a glimpse of the sort of folks comprised in that various and motley congregation of men called "diggers." Settlers, sailors, tradesmen, even the "Manilla man" and his boy, and the "old hand," sitting on the stump in the foreground of the picture, are each bold types of their class. Perhaps in no other spot in her Majesty's dominions could such a variously-dressed assembly be gathered together — a sort of open-air masquerade, in which the characters were costumed in anything but ball-room style. Of the meeting itself it is sufficient to say, that the object of the numerous speakers was fully attained—the government

WHIRLEY'S GULLEY, THE SPOT WHERE THE GOLD WAS FIRST DISCOVERED; FOREST CREEK RANGES, MOUNT ALEXANDER.

was impressed with their earnestness, the license fee was *not* doubled, and the thousands of diggers departed in peace. for it was here that the gold on Mount Alexander was first discovered. At this moment there are upwards of 60,000

GREAT MEETING OF GOLD DIGGERS AT MOUNT ALEXANDER, DEC. 15, 1852.

Whirley's Gulley, the other scene depicted by the artist, is interesting, both in itself and on account of its associations, persons at this spot. But what more we have to say on the subject of the diggings we must reserve for another opportunity.

THE ENTRANCE OF QUEEN ELIZABETH INTO KENILWORTH CASTLE.

THE ENTRANCE OF QUEEN ELIZABETH, ATTENDED BY A CAVALCADE OF KNIGHTS AND SOLDIERY, INTO KENILWORTH CASTLE, ON THE 9TH OF JULY, 1575. DESIGNED AND DRAWN BY JOHN GILBERT.

READING now-a-days of any one of Elizabeth's courtly progresses seems like turning back to a page of old romance. The story appears to belong to fiction rather than to fact, and history figures in masquerade. Pageantry and splendour, music and knightly prowess, royal whim and noisy popularity, wasteful prodigality and glittering show, banquets rich without comfort, revelry devoid of real mirth, and courtly phraseology deficient of sincerity, seem to have surrounded

the virgin queen from her accession to the throne of her father to her final departure on that dread journey, which all, even queens, must take.

The festivities at Kenilworth Castle, in Warwickshire, on the occasion of Elizabeth's visit in 1575, have been celebrated in both poetry and prose. Gascoigne has immortalized the occurrence in his well-known and oft-quoted "Princely Pleasures of Kenilworth," and Sir Walter Scott has embodied the scenes of the festival in one of his most popular and delightful novels. Indeed, in the latter work may be found the best and most faithful description of the famous castle, as it existed in the sixteenth century, and the most picturesque and stirring, if not altogether the most veracious account of the Queen's visit to her favourite Leicester, at a period "when the sudden death of the first countess seemed to open to the ambition of the earl the opportunity of sharing the crown of his sovereign."

No period of history—not English alone, but European,—is fuller of important events than the sixteenth century. It was what philosophers call a transition period. To the civilization of the ancients had succeeded an age of semi-barbarism, in which religion and learning were the property of a comparative few, and superstition and ignorance brooded over the minds of the multitude. But to a night of darkness succeeded a morning of enlightenment and inquiry. At the very close of the fifteenth century, the new world was discovered, and ere fifty years had elapsed, Martin Luther had commenced that struggle for religious liberty which was fraught with such momentous consequences to the world. Before a hundred years had passed away, the most celebrated of our female sovereigns had made the name of England powerful among the nations, and Shakspere, the most famous of English poets, had lived to sing her praises. Indeed, in whatever aspect we regard the long reign of Elizabeth, we have cause for congratulation; for, from that period Englishmen are apt to date the rise of real liberty in Europe.

What wonder, then, that authors and artists love to illustrate the events of this important time? All the elements of the picturesque and the romantic, the spirit-stirring and the absorbing, are to be found embodied in it; and the pen and the pencil only need to give them form and substance to enlist the sympathies of the world. Draw back the curtain of time but a little way, and what a prospect opens to the view! Around the cradle of the fair young princess Elizabeth are grouped the wit and wisdom of the age,—Bacon, and Sidney, and Shakspere, and Harrington, and Spencer, and Raleigh, and Cecil, and Leicester,—and we follow with eagerness that little procession through the streets of the quiet village of Greenwich, as it wends forward from the palace to the neighbouring church of Grey Friars, where the young child is christened. We recal the romantic circumstances of her birth and the vicissitudes of her childhood—her mother's execution, and her own strange association with the persons whom she had most to fear and dislike; her scholarship, wonderful indeed for court ladies at that time; her sorrows and imprisonments and varied fortunes, till we find her at last receiving a deputation at Hatfield from her sister Mary's council, who come to offer her the crown. "Domino factum est istud, et est mirabile in oculis nostris!" (It is the Lord's doing, it is marvellous in our eyes!) exclaims the princess; "God save the Queen," responds the deputation, and from that moment Elizabeth is recognised by the people of England as their lawful sovereign.

How important was the mission, and how distinguished was the part enacted by this

"Fair vestal, throned by the west,"

we all know. History and song alike record the triumphs of her long and peaceful reign. Never before had so entirely popular and beloved a monarch sat upon the English throne. Everywhere she went—through the narrow streets of old London's city, or in those right royal progresses to different parts of her kingdom—she was attended by troops of loving people. Lords, knights, and ladies, city magnificence and courtly pageantry, waited on her footsteps; and in almost numberless records we are told of the prowess of her court, and the splendour of the processions prepared to do her honour.

Who does not—looking at the admirable and spirited sketch of Mr. Gilbert—recal the circumstances of the Queen's visit to the fine old castle of Kenilworth, as recorded by the "Wizard of the North." Around the ruins of that princely castle—erected by Geoffry de Clinton for Henry II., and the scene of so many historical dramas—at one time garrisoned against rebels, at another turned into a royal prison; now a place of meeting for the parliament of Henry III., and again the theatre of knightly pageantry and glittering festivity, in the days of Dudley, Earl of Leicester, the Queen's favourite, on whom his sovereign had bestowed it—around the ruins of those massive walls, desolated in the civil wars of the seventeenth century, floats an air of romantic interest such as belongs to no other edifice in all the land.

We take Sir Walter Scott's most admirable description of the royal entry into Kenilworth: "It was on the twilight of a summer night (9th of July, 1575), the sun having for some time set, and all were in anxious expectation of the Queen's immediate approach. The multitude had remained assembled for many hours, and their numbers were still rather on the increase. A profuse distribution of refreshments, together with roasted oxen, and barrels of ale set a-broach in different places of the road, had kept the populace in perfect love and loyalty towards the Queen and her favourite, which might have somewhat abated had fasting been added to watching. They passed away the time, therefore, with the usual popular amusements—whooping, hallooing, shrieking, and playing rude tricks upon each other, forming the chorus of discordant sounds usual on such occasions. These prevailed all through the crowded roads and fields, and especially beyond the gate of the Chase, where the greater number of the common sort were stationed; when, all of a sudden, a single rocket was seen to shoot into the atmosphere, and, at the instant, far-heard over flood and field, the great bell of the Castle tolled.

"Immediately there was a pause of dead silence, succeeded by a deep hum of expectation, the united voices of many thousands, none of whom spoke above their breath; or, to use a singular expression, the whisper of an immense multitude.

"The guards, thickly stationed upon the road by which the Queen was to advance, caught up the acclamation, which ran like wildfire to the Castle, and announced to all within, that Queen Elizabeth had entered the Royal Chase of Kenilworth. The whole music of the Castle sounded at once, and a round of artillery, with a salvo of small arms, was discharged from the battlements; but the noise of drums and trumpets, and even of the cannon themselves, was but faintly heard amidst the roaring and reiterated welcomes of the multitude.

"As the noise began to abate, a broad glare of light was seen to appear from the gate of the Park, and, broadening and brightening as it came nearer, advanced along the open and fair avenue that led towards the Gallery-tower; and which, as we have already noticed, was lined on either hand by the retainers of the Earl of Leicester. The word was passed along the line, "The Queen! The Queen! Silence, and stand fast!" Onward came the cavalcade, illuminated by two hundred thick waxen torches, in the hands of as many horsemen, which cast a light like that of broad day all around the procession, but especially on the principal group, of which the Queen herself, arrayed in the most splendid manner, and blazing with jewels, formed the central figure. She was mounted on a milk-white horse, which she reined with peculiar grace and dignity; and in the whole of her stately and noble carriage, you saw the daughter of three hundred kings.

"The ladies of the court, who rode beside her Majesty, had taken especial care that their own external appearance should not be more glorious than their rank and the occasion altogether demanded, so that no inferior luminary might appear to approach the orbit of royalty. But their personal charms, and the magnificence by which, under every prudential restraint, they were necessarily distinguished, exhibited them, as the very flower of a realm so far famed for splendour and

beauty. The magnificence of the courtiers, free from such restraints as prudence imposed on the ladies, was yet more unbounded.

"Leicester, who glittered like a golden image with jewels and cloth of gold, rode on her Majesty's right hand, as well in quality of her host as of her Master of the Horse. The black steed which he mounted had not a single white hair on his body, and was one of the most renowned chargers in Europe, having been purchased by the Earl at large expense for this royal occasion. As the noble animal chafed at the slow pace of the procession, and, arching his stately neck, champed on the silver bits which restrained him, the foam flew from his mouth, and specked his well-formed limbs as if with spots of snow. The rider well became the high place which he held, and the proud steed which he bestrode; for no man in England, or perhaps in Europe, was more perfect than Dudley in horsemanship, and all other exercises belonging to his quality. He was bareheaded, as were all the courtiers in the train; and the red torchlight shone upon his long curled tresses of dark hair, and on his noble features, to the beauty of which even the severest criticism could only object the lordly fault, as it may be termed, of a forehead somewhat too high. On that proud evening, those features wore all the grateful solicitude of a subject, to show himself sensible of the high honour which the Queen was conferring on him, and all the pride and satisfaction which became so glorious a moment. Yet, though neither eye nor feature betrayed aught but feelings which suited the occasion, some of the Earl's personal attendants remarked that he was unusually pale, and they expressed to each other their fear that he was taking more fatigue than consisted with his health.

"The train, male and female, who attended immediately upon the Queen's person, were of course of the bravest and the fairest,—the highest born nobles and the wisest counsellors of that distinguished reign, to repeat whose names were but to weary the reader. Behind came a long crowd of knights and gentlemen, whose rank and birth, however distinguished, were thrown into shade, as their persons into the rear of a procession, whose front was of such august majesty.

"Amidst bursts of music, which, as if the work of enchantment, seemed now close at hand, now softened by distant space, now wailing so low and sweet as if that distance were gradually prolonged until only the last lingering strains could reach the ear, Queen Elizabeth crossed the Gallery-tower, and came upon the long bridge, which extended from thence to Mortimer's Tower, and which was already as light as day, so many torches had been fastened to the palisades on either side. Most of the nobles here alighted, and sent their horses to the neighbouring village of Kenilworth, following the Queen on foot, as did the gentlemen who had stood in array to receive her at the Gallery-tower."

So passing to the inner court, her majesty, "that never rides but alone, there alighted from her palfrey," and was conveyed up to her chamber. At this instant all the clocks in the castle were stopped; and, by a delicate attention, the hands continued to point at the moment of her arrival, since no one was to take note of time during the royal sojourn at Kenilworth.*

For eighteen days the princely pleasures of Kenilworth were kept up, during which time, we are told by Laneham, "her majesty, with her accustomed charity and mercy, cured nine persons of the painful disease called the 'King's Evil,' which the kings and queens of this realm, without other medicine, but only by touching and prayers, do cure!"

The castle itself, upon the improvement of which the Earl is said to have spent a sum equal to about half a million of our money, is thus described:—

The outer wall of this splendid and gigantic structure enclosed seven acres, a part of which was occupied by extensive stables, and by a pleasure garden, with its trim arbours and parterres, and the rest formed the large base-court, or outer yard, of the noble castle. The lordly structure itself, which rose near the centre of this spacious enclosure, was composed of a huge pile of magnificent castellated buildings, apparently of different ages, surrounding an inner court, and bearing in the names attached to each portion of the magnificent mass, and in the armorial bearings which were there blazoned, the emblems of mighty chiefs who had long passed away, and whose history, could Ambition have lent ear to it, might have read a lesson to the haughty favourite, who had now acquired and was augmenting the fair domain. A large and massive keep, which formed the citadel of the castle, was of uncertain though great antiquity. It bore the name of Cæsar, perhaps from its resemblance to that in the Tower of London so called. Some antiquaries ascribe its foundation to the time of Kenelph, from whom the castle had its name, a Saxon King of Mercia, and others to an early era after the Norman Conquest. On the exterior walls frowned the escutcheon of the Clintons, by whom they were founded in the reign of Henry I., and of the yet more redoubted Simon de Montfort, by whom, during the Barons' wars, Kenilworth was long held out against Henry III. Here Mortimer, Earl of March, famous alike for his rise and his fall, had once gaily revelled in Kenilworth, while his dethroned sovereign, Edward II., languished in its dungeons. Old John of Gaunt, "time-honoured Lancaster," had widely extended the castle, erecting that noble and massive pile which yet bears the name of Lancaster's Buildings; and Leicester himself had outdone the former possessors, princely and powerful as they were, by erecting another immense structure, which now lies crushed under its own ruins, the monument of its owner's ambition. The external wall of this royal castle was, on the south and west sides, adorned and defended by a lake partly artificial, across which Leicester had constructed a stately bridge, that Elizabeth might enter the castle by a path hitherto untrodden, instead of the usual entrance to the northward, over which he had erected a gate-house, or barbican, which still exists, and is equal in extent, and superior in architecture, to the baronial castle of many a northern chief.

Beyond the lake lay an extensive chase, full of red deer, fallow deer, roes, and every species of game, and abounding with lofty trees, from amongst which the extended front and massive towers of the castle were seen to rise in majesty and beauty. We cannot but add, that of this lordly palace, where princes feasted and heroes fought, now in the bloody earnest of storm and siege, and now in the games of chivalry, where beauty dealt the prize which valour won, all is now desolate. The bed of the lake is but a rushy swamp; and the massive ruins of the castle only serve to show what their splendour once was, and to impress on the musing visitor the transitory value of human possessions, and the happiness of those who enjoy a humble lot in virtuous contentment.

Miss Strickland is at some pains to point out the discrepancies between romance and reality, in relation to the position of Leicester at the period of Elizabeth's visit to Kenilworth. Amy Robsart, the fair heroine of Scott, to whom Leicester had been publicly married at the court of Edward VI., had long been in the grave, and the Earl's path to a royal marriage was somewhat clearer than has been indicated by the novelist. "Yet Leicester was encumbered with a secret marriage, somewhat in the manner of the splendid fiction, but with a high-born lady of the court—Lady Douglas Howard, the daughter of William Lord Howard, the Queen's uncle." Leicester is supposed to have married in 1572, after being dismissed as a public suitor to the Queen. "The scandalous chronicles of the day declare that Leicester attempted the life of his second unfortunate wife by poison about the time of the Queen's visit to Kenilworth; and it is said that the words of the old nursery lullaby—

> 'Bilow, my babe, lie still and slumber,
> It grieves me sae to see thee weep'—

were meant as the address of the forsaken Lady Leicester to her boy."

* "Lives of the Queens of England," by Agnes Strickland, vol. iv. p. 423.

THE GIANT'S CAUSEWAY.

"Dark o'er the foam-white waves,
The Giant's Pier the war of tempests braves,
A far-projecting, firm, basaltic way,
Of clustering columns wedged in dense array;
With skill so like, yet so surpassing art,
With such design, so just in every part,
That reason pauses doubtful if it stand
The work of mortal or immortal hand."

No visitor to Ireland should neglect seeing the Giant's Causeway. If the romantic and lovely in scenery is to be found in the neighbourhood of the Lakes of Killarney, certainly the grand and the sublime may be discovered on the wild coasts of Antrim and Donegal. Thus the north and the south of Ireland rival and counterbalance each other in point of interest and attraction. To an Englishman, possibly the north of Ireland may possess historical claims to his remembrance altogether apart from his feeling for the picturesque; for in this district of the sister island the truths of Christianity were first preached, and the struggles of the Commonwealth and the Revolution took place. But for memories such as these a man need scarcely go to Ireland. If he wishes to rake up the dust of the past, he can sit at home by his fireside and do it quietly. One never quarrels with books, and it is a pity really that things should ever be said in print that should make us quarrel with each other; and so, bearing this in mind, we, like sensible people, shut up the volume at the part which speaks of the troubles of Ireland, and open it again at a place devoted more particularly to a description of the spot we are about to visit—on paper. And a very pleasant thing it is, too, to sit at home and travel. No trouble at railroad stations, or on the rail itself; no dust, or noise, or disagreeable fellow-passengers; and, best of all, no expense. Let us set out at once.

GIANT'S CAUSEWAY.—THE CHIMNEY TOPS, WITH RIVER AND VALLEY HEADLAND.

THE GIANT'S GATEWAY.

We will suppose that we start from Belfast. Two routes offer themselves—the direct one by railway to Ballymena, and through the country by jaunting-car to Bushmills or Coleraine; and the more romantic road along the coast skirting the Lough of Belfast, and keeping the sea in sight nearly all the way. Through some of the best scenery in the north of

THE LADY'S CHAIR.

Ireland, and over some of the roughest, hilliest, and boggiest roads as well, the enthusiastic tourist makes his way from Carrickfergus to Ballycastle. He need be under no apprehension, however, of not seeing any of the established sights, or of neglecting any of the notable historical spots of the neighbourhood, for almost every mile of the road from Belfast to the Causeway he will find to be literally alive with guides.

But it is not likely, that, with the Causeway within half-a-dozen miles' walk—or row, for the sea view is by far the best—any, the most enthusiastic, lover of legends will stop long to listen, even to Ossian—

"Sublimest, simplest bard of all."

DUNLUCE CASTLE, NEAR THE CAUSEWAY.

Thus the actual railroad-borne and guide-pestered visitor will—like our comfortable, stay-at-home friend—be introduced to many interesting and lovely "bits" of scenery, and become acquainted also with some curious "bits" of legends and scraps of strange, wild, Ossian-like poetry. From Garron Point he will catch a glimpse of the Scotch mountains, if it be a clear day; and whether it be clear or not, he will be pretty sure to hear the story of the great chieftain, Shane O'Neill, of the Red Hand, or, "Labh Dharig," as he is called in Irish, if he lingers for a few minutes about the ruins of the old church in the glen.

Instead of that, he takes a guide—who may be a very old man, or a young boy such as he standing by the Giant's Well—and goes forward at once. That is to say, after having discharged his car-driver and settled other little preliminaries as to dress and so forth, for it is very cold about the rocks sometimes. Most persons are acquainted, by means of engravings and otherwise, with the general appearance of that gigantic mass of basaltic columns called the Giant's Causeway. The principal or grand causeway—the "Pleaskin," as it is called—

SEA-GULL ISLAND.—GIANT'S CAUSEWAY.

consists of an irregular arrangement of columns of black rock, ranged side by side with such apparent skill and regularity as to seem the work of human hands rather than the effect of crystallisation—which they undoubtedly are. These remarkable specimens of nature's handiwork are of unequal height and breadth. They rise up from the strand to a height of about twenty feet, gradually receding to the water; though how far seaward this arrangement extends is very uncertain. This grand assemblage of basaltic pillars extends for a considerable distance along the shore; sometimes like a vast pile congregated together, as in the Grand Causeway; sometimes taking the shape of isolated masses of broken, disjointed rocks scattered along the beach; sometimes assuming the appearance of regular geological strata in the exposed face of the cliff, as in that remarkable natural curiosity, the "Giant's Organ;" and sometimes becoming part of the rugged mountainous coast itself, as in the headland known as the "Chimney Tops." But in whatever part of the coast these basaltic pillars appear, they have all two peculiarities—their almost uniform pentagonal figure, and the singular manner in which the separate pieces of each column are jointed together. In no cases do the columns seem to consist of single solid blocks, but are composed of a number of short lengths, one on the top of the other, like layers of masonry. But instead of possessing flat surfaces, the ends of each length are articulated one into the other like a ball and socket, in the same way as is observable in the vertebræ of some of the larger kinds of fishes—the one end of the joint having a cavity into which the convex end of the opposite exactly fits. The depth of this concavity or convexity is generally about three or four inches; and it is peculiar that the joint, instead of being conformable to the external angular figure of the block, is exactly round, and as large as the diameter of the column will admit; consequently, as the angles of these columns are in general very unequal, the circular edges of the joints are seldom coincident with more than two or three sides of the pentagon, and are from the edge of the circular part of the joint to the exterior sides and angles quite plain. The articulations of these joints are frequently inverted, in some of them the concavity being upwards, and in others the reverse. This occasions that variety and mixture of concavities and convexities on the tops of the columns which is observable throughout the platform of this Causeway without any discoverable design or regularity with respect to the number of either.

The length of these particular stones, from joint to joint, is various; seldom more than from eighteen inches to two feet; and, for the greater part, longer towards the bottom of the columns than nearer the top, the articulation of the joints being there somewhat deeper. The size, or diameter, of the columns is as different as their length and figure: in general they are from fifteen to twenty inches in diameter. Throughout the whole of this combination there are not many traces of uniformity or design, except in the form of the joint; nor are there traces of a finishing in any part, whether in the height, length, or breadth. If there be particular instances in which the columns above water have a smooth top, others near them, of an equal height, are more or less convex or concave, which shows them to have been joined to pieces that have been washed away, or by other means taken off. It cannot be doubted but that those parts which are constantly above water have gradually become more and more even, at the same time that the remaining surfaces of the joints must necessarily have been worn smoother by the constant action of the air, and by the friction in walking over them, than where the sea, at every tide, beats on the Causeway, continually removing some of the upper stones, and exposing fresh joints. As all the exterior columns, which have two or three sides exposed to view, preserve their diameters from top to bottom, it may be inferred that such is also the case with the interior columns, the tops of which alone are visible.

Notwithstanding the general dissimilitude of the columns, relatively to their figure and diameter, they are so arranged and combined at all the points, that a knife can scarcely be introduced between them, either at the sides or angles. It is most interesting to examine the close contexture and nice insertion of the infinite variety of forms exhibited on the surface of this grand parade. From the great dissimilarity of the figures of the columns, the spectator would be led to believe the Causeway a work of human art, were it not, on the other hand, inconceivable that the genius or invention of man should construct and combine such an infinite number of columns, which should have a general apparent likeness, and still be so universally dissimilar in their figure, as that, on the minutest examination, not two in ten or twenty thousand should be found having their angles and sides equal among themselves, or those of one column to those of another. As there is an infinite variety in the configuration of the several parts, so are there not any traces of regularity or design in the outlines of this curious phenomenon: including the broken or detached pieces, of a similar structure, they are extremely scattered and confused. Whatever may have been their original state, they do not at present appear to have any connexion with the grand or principal Causeway, as to any supposable design or use in its first construction; and as little design can be inferred from the figure or position of the several constituent parts.

On the cliffs all round the coasts of Donegal and Antrim similar masses of columns are observable. The pillars called the Chimney Tops are among the most singular and remarkable phenomena belonging to the Causeway. They are three in number, the tallest standing upwards of forty feet from the face of the cliff. These rocks, according to Mr. S. C. Hall, were mistaken by the crew of a ship belonging to the Spanish Armada for the chimneys of Dunluce Castle, and were fired upon accordingly. The story goes, that the giants, in revenge for the insult, hung out lights from the cliffs, which so bewildered the ship's crew that they fouled among the breakers, and were lost on the coast. At any rate, there is a little bay here called Port-na-Spania.

The entrance to the Causeway through the Giant's Gateway is most imposing. Colonnades of perfectly-formed basaltic pillars rise up against the face of the cliff in apparently the greatest order; and near it is the Lady's Chair, so called from the fact that it is frequently made use of as a seat by the fair visitors to the Causeway. Whether it possesses any of the virtues ascribed to it we cannot say. Like the Giant's Well, the erection of this far-famed stone seat is partly the work of human hands. "The only person I observed on the Causeway when I descended," says Barrow, "was an old woman, sitting by the spring of fresh water, with a whiskey bottle and glasses to mix that national spirit with the pure spring, and render it more palatable to her customers. On returning from my ramble, however, I perceived a young lady in a riding habit, sitting down by the side of the fountain, waiting the return of some gentlemen who were examining the Causeway; the sight of whom, in this lonely spot, I am free to confess, drove all the pentagons and hexagons out of my head; and to escape from the chance of its being filled with something else, I was ungallant enough to take an abrupt departure."

The general effect of the Causeway on the mind of the visitor is one of awe and solemnity. "What shall I say of the Causeway?" inquires Lord John Manners. "There are three promontories running into the sea on a level with the waves, or nearly so, composed of upright blocks of stone, each, it may be, a yard in circumference, hexagonal, pentagonal, octagonal, and one or two nonagonal in shape; some of the cliffs, too, are fluted in this manner, with columus thirty feet high, resembling at a little distance the pipes of an organ. A very steep and narrow track took us from the Causeway to the summit of the cliffs—an ascent of about 300 feet, and a walk of a couple of miles along their edge to the Pleaskin Rock. It rained furiously, so that it was only now and then we could obtain a fair view of the dark creeks, and bold rocks, and strange formations of whinstone, which diversify this mysterious coast.

At short distances from the coast the sea is studded with

numerous small uninhabitable islands, and the coast itself is intersected with many deep and solemn-looking caves, which can only be explored by means of boats. A rock called "Sea-Gull Island," from the fact of those birds frequenting it in vast numbers, lies to the east of the Chimney Tops. This rock, probably, formed part of the mainland at some distant period of time. The view seaward is grand indeed.

In order to view the Causeway with effect, and to enjoy its varied aspects, the artists and the true lovers of nature will not be satisfied with one hasty view of it and its surrounding wonders. They will contrive to see it at sunrise, when the dawn first flings its kaleidescopic tints on those myriad groups of columns:—also at sunset, when the red light of departing day, alternating with deep shadow, brings forth in beautiful relief the outlines of each pillared mass; and, loveliest of all, when the summer moonlight flings its mystic lustre over a scene surcharged with endless shapes of grandeur and sublimity. The Causeway, as a whole, cannot, as already intimated, be properly seen or enjoyed from the land. The tourist will have to embark in one of the many well-manned and serviceable row-boats which are always in waiting either at the Causeway itself, or at the shore near the village of Ballinatoy.

We have, probably, almost exhausted the patience of our fireside traveller, or we might carry him with us over that tremendous basaltic rock the "Stacks," and show him the Fata Morgana in this romantic region. But our space warns us we must be brief.

About a couple of miles west from the Causeway is Dunluce Castle, "the grandest, romanticest, awfullest sea-king's castle in broad Europe. It stands on a great ledge of a cliff, separated from, rather than joined to, the mainland by the narrowest of natural bridges, and overhangs the sea—that dark, chilling, northern sea—so perpendicularly, that how the towers and wall on the sea-side were built I cannot divine: what numbers of masons and builders must have fallen into that gloomy sea before the last loophole was pierced! The landward scenery, in spite of good roads and modern improvements, is dreary enough now; what it must have been when those grim halls were first inhabited by Ulster chieftains, who can guess? There is no castle on the Rhine, or the Loire,

A Vender of Specimens.—The Highlandman's Bonnet, and the Chair in which the Giant sat while his Men built the Causeway.

or the Seine, or anywhere else that I know of, that can be compared with Dunluce for desolate awe-inspiring grandeur. The Causeway itself was quite tame and flat after Dunluce."

Every one who has seen this famous edifice acknowledges it to be the most remarkable building, as to situation and wild outlook, in Europe. Built at the extreme edge of the cliff, the wonder seems that it has not long ago says Mr. Barrow, "could be more adapted to a scene in romance than the wild position of Dunluce Castle, perched as

The Giant's Well, and Causeway Guide.

been washed into the roaring acean at its base. "Nothing," it is on the summit of a naked and lofty rock, surrounded by the sea, and cut off from the mainland, except by a narrow stratum of rock or wall, that serves as a foot-bridge over a deep gulf, through which the sea roars below with a fearful noise. Traditional stories, indeed, are not wanting of the abduction and imprisonment of beautiful virgins by some O'Neill or O'Cahan or M'Mahon, or some other *Mac* or *O*, which O'Hallaron says are affixes of dignity and meaning, by indicating the true Milesian breed, as is fully demonstrated by an old Latin pentameter—

"Per *Mac* atque *O* tu veros cognoscis Hernos:
His duobus demptis, nullus Hibernus adest."

Which may be thus freely translated;—

By *Mac* and *O* you'll surely know
True Irishmen, they say;
But if they lack both *O* and *Mac*,
No Irishmen are they.

THE DYING POET.

OPEN the casement, give me light and air;
And let me gaze upon the day's decline—
Perchance it also may be that of mine.
Let me look out upon the mountains bare,
For I have trod their rugged sides; and now,
When death's cold damps are settling on my brow,
I would have my free spirit ramble there,
And take a loving and a last farewell!
'Twas there I struck the first notes of a spell,
Once joyous, tinged in after life with care—
A mournful type of life's disastrous dream,
That came upon me with a glorious gleam
Of hope—but died like the dim fading day,
That sees my broken spirit pass away.

Those dreams that I should die, like thee are faded;
For now thy glories rest upon the hills,
'Mid the refreshing dews that eve distils,
Shone gorgeous in thy setting. Mine is shaded
By the remembrance of the toil and strife
That met my very outset into life;
'Mid all my hopes and joys they lingered near,
And o'er my young heart's longings flapp'd their wings,
Like shadows dimmed my young imaginings,
And washed my cheeks with disappointment's tear.
Thy beams at morn may rest upon my bier,
And few will mourn my premature decay.
For ages yet fair Hope will tread thy way;
But death for ever closes my career.

T. BEGGS.

A PEEP AT COUNTRY COUSINS, AND HOW IT ENDED.

LETTER I.—MISS DORA HARCOURT TO CECIL HARCOURT, ESQ., OF GROSVENOR-SQUARE, LONDON.

Whitehaven, March 2, 1820.

My Dear Father,—I sit down to fulfil my promise of telling you all that has happened since we parted; and must begin by premising that we arrived safely at Milnthorpe, at which place we were met by my cousin Robert. I then took leave of Mr. Jennings, and mounted into an odd sort of vehicle they call a shandrey, which jolted terribly, and seemed to move very slowly after the rapid travelling we had hitherto enjoyed when posting with four horses. But very soon we entered upon such beautiful scenery that I rejoiced in our tardy speed, and could scarcely withdraw my attention from it sufficiently to answer the numerous formal questions which Robert and William thought it their duty to ask by way of showing me due attention. Indeed, they spoke so gravely, and appeared so frightened of me, I could hardly forbear laughing outright whenever they spoke; and they put such droll inquiries to me! Such as whether I went to a ball every night?—did I like the play, or opera, or Almack's the best?—did I think the Prince Regent handsome?—what were the newest fashions? And when I professed considerable ignorance on most of these weighty points, they coloured up, and seemed to think I was quizzing them. Presently I made some inquiry concerning the country through which we were passing, and then matters brightened, and Robert especially proved himself a most intelligent, agreeable companion. His descriptions of rustic sports and adventures quite charmed me, and by the time we arrived at Langdale Friars, which is the name of their farm, about two miles from Whitehaven, we had become very good friends. The shandrey presently turned into a stony picturesque avenue of elm trees, that were just budding into green shoots, and in whose upper branches were congregated a large bustling colony of rooks, whose caw, caw, so delighted my cockney senses, as to greatly amuse my cousins. On a small, neatly-kept terrace, which ran along the south side of the Friars, we perceived my aunt pacing leisurely, and we got out of our rough carriage in order to greet her properly. You must fancy a portly, handsome woman, decked in a rich, flowery-patterned silk gown, a wide muslin apron, with a huge bunch of keys depending from its strings, white-ribbed woollen stockings carefully drawn over well-shaped ancles, which were still further displayed by high wooden-heeled shoes adorned by massive silver buckles, and her steps supported by a long staff grasped in the middle, its height overtopping her peak-shaped silk bonnet edged with a curiously small lace veil. But what surprised me still more was to see her smoking a very long tobacco-pipe, which she only laid aside in order to salute me, which she did on both cheeks with such friendly hearty cordiality as to bring tears to my eyes. I found dinner had been long over, and my ride had made me so keen set, that I felt rather dismayed at the prospect of only a washy cup of tea to satisfy my cravings; but I need have had no fears on that head, for a most abundant meal was quickly spread, whose stores of muffins, kettle-cakes, preserves, ham, date pies, coffee, and various other dainties, would have furnished at least a dozen London tea-tables. One thing, however, I must mention more particularly; and this was a dish of buns, baked several days since, for Good Friday, and which, though well-tasted, I said seemed to me rather hard; but I found this remark quite offended my excellent uncle, who gravely assured me, that buns baked for that day never grew mouldy, and he maintained he had often seen them when fourteen months old in perfect preservation. I did not choose to laugh, for every one else seemed to agree with him, but it appeared to me very strange how they could all believe that the buns would not grow mouldy in time; besides which, my aunt told me very seriously, when she went with me to show me my bedroom, that hot-cross-buns were well-known to be an infallible cure for the hooping-cough. This morning a rosy, blue-eyed flaxen-haired damsel came to breakfast, whose frank, blythe expression, and arch, merry laugh, greatly took my fancy; but I don't know how it was, she did not appear to like me as much as I did her, which I the more regretted, since I soon perceived she was very intimate with my uncle's family. When the gentlemen were all gone out after the morning meal was concluded, Susannah Gawthorpe, the blue-eyed maiden, produced a large bag filled with remnants of various coloured ribbons, pieces of silk, and scraps of gay calicoes, and the dairy-maid at the same time brought in a basket of fresh eggs, and my aunt told me they were going to prepare the Paschal eggs for Easter. I thought it very amusing work, and she showed me how to make the prettiest marble-patterns by laying little heaps of different coloured dye-woods on pieces of calico, which were then wrapped round the eggs previous to their being boiled; but she would on no account permit me to unfold one of them until several hours had elapsed, and they had become perfectly cold. When the eggs were taken out of their casings, their beautiful and variegated appearance reminded me forcibly of your descriptions of early days, and how gaily, you said, the young people used to sally forth on Easter-Monday to play with and break their pretty eggs in the green meadows. This afternoon I went into the kitchen to inquire about the time the post went out, and hit my head a sharp rap against an old iron horse-shoe that was nailed on the door, which led to Sally's informing me, with many apologies, that it was placed there to prevent witches entering the house; for, as Sally sagely remarked, "No one knew when they might come, and it was best to be prepared." I shall grow superstitious myself if I remain here much longer; and before I quitted the kitchen the old woman gave me a bit of mountain ash, which she begged I would wear to charm away the effects of any evil eye I might chance to meet when abroad. Finding the cow-boy, who took the letters to Whitehaven, was to depart in a couple of hours, I was going to fold up this despatch, when my uncle popped his head in at the parlour-door, and asked me if I would like to see a fine blaze. I did not know what he meant, but ran after him, as he strode towards the village green, where we joined a silent group, composed of Robert and William, and Susannah Gawthorpe, who seemed to be waiting for something to take place. Some one soon called my uncle away, and he desired William to give me his arm, on which I saw the same glance of mingled dislike and suspicion flit over Susannah's bright face as had perplexed me before, but I had no time to ruminate on the subject just then. A loud shout at some little distance was quickly followed by the appearance of a troop of boys, preceded by a tall lad, who carried a huge bundle, much larger than himself, of unthrashed peas, which he deposited in the centre of the green. A moment's silence ensued, and then, I suppose, a lighted match was applied, for a great blaze arose, and the circle of rosy, animated faces, which watched the fire's progress, was in itself worth coming many miles to see. But the blaze hardly lasted sixty seconds, and then the little multitude went down on hands and knees and grubbed about for the charred and smoking peas, as if they were seeking for hidden treasures. Shouts of merriment testified their excessive enjoyment of this feast, which is known by the quaint term of "bousled peas." With faces besmeared like chimney-sweepers, and many a ringing laugh, the crowd dispersed as soon as the last pea had been devoured, and I ran into the house to finish my letter. As you will be anxious to hear from me, I will not delay it another day; and have only time to beg you to believe me at all times your truly affectionate daughter, Dora Harcourt.

P. S.—Please to send me my sprigged white muslin, as I hear some talk going on of a rustic party, and I should not like my cousins to think I actually knew nothing of the fashions. Oh, dear papa, only think how curious it seems! It was new moon last night, and when my aunt first saw it she folded her arms and made a deep courtesy to it; so did Susannah, but I saw her smile in the act, while my aunt evidently regarded it as a sort of religious ceremony.

PORTE ST. DENIS.

In the days of Louis XIV., François Blondel, the architect, was at the height of his fame. He was employed in the construction of some of the noblest national monuments, and his name thus became associated with many of those buildings, which have since been rendered remarkable by the struggles, the battles, the triumphs, and defeats, which have from time

VIEW OF PORTE ST. DENIS, IN PARIS.

to time occurred in the good city of Paris. Among other public works, François Blondel began and finished the Porte St. Denis. This was, perhaps, his greatest work, at all events it was one on which he prided himself; in it he seemed to have out-Blondelled Blondel, and says, in his own account thereof, that it is the grandest work of the kind to be found in the whole world.

It is sixty-two feet high and proportionately wide, with an opening of twenty-four feet in the middle. This is very beautifully arranged, and harmonises well with the rest of the building. The architect knew that ornament must always be subsidiary to the grand effect of the whole, and that convenience must as much as possible be attended to in all public works. He had studied the antique—the column of Trajan, the obelisks of Egypt, the ruins of classic Rome—and he had the happy art of skilfully adapting all that was most calculated to improve the effect of his own design.

With this intention he placed two pyramids at the sides of the opening, so as to flank the arch; these he placed upon massive pedestals, resembling that of the column of Trajan, which, while they answered a very useful purpose as posterns for foot-passengers, gave much grace and elegance to the pyramids. They were ornamented with various figures and devices, all emblematical of the glory of the grand monarque.

The Porte St. Denis was intended to be a sort of sculptured history of that eventful time, a record of all the wonderful victories, chiefly on the ocean, of that most wonderful king. "But," says the architect, "the rapidity of the conquests of the sovereign in his Dutch campaign, and the famous passage of the Rhine, which occurred in the year in which the Porte St. Denis was commenced, obliged us to adopt other arrangements, and Messieurs the provosts made up their minds to decorate the arch after another fashion, following the king by land through his mightiest battles and most glorious victories. The noblest arch of triumph could not do honour sufficient to those noble triumphs." The entablature represents the passage of the Rhine, and the pyramids are covered with emblematic figures, after the manner of the medals which were struck, and the arches which were erected, to do honour to Augustus after his conquest of Egypt, and to Titus after the conquest of Judea. Blondel describes every particular with amazing accuracy, and dilates with no ordinary satisfaction on the appropriateness of each device. The sculptures are indeed justly celebrated, and the whole of them possess great merit. They were executed by Givardon and Michael Anquier; the bas-reliefs which decorate the pedestals of the pyramids are in composition and in execution very remarkable. They were evidently designed, as the architect candidly owns, in imitation of the sculptures on the column of Trajan.

The Porte St. Denis has been the scene of many a fierce struggle. It was once the glory of kings, and showed on its beautiful frontage the triumph of the old regime, but since its architect has slept his last sleep, since Louis Quatorze and his marshals have passed away, since the Revolution has swept away the old regime, many sanguinary fights have happened at the Porte St. Denis, and it has attained another, and a far different description of celebrity than that which it was intended to possess, when sculptors carved in the stonework—Ludovico Magno.

THE MUSICIAN OF AUGSBURG.

There lived, at some former time, in the city of Augsburg, a musician whose name was Nieser. There was no kind of musical instrument that he could not fashion with his own hands, nor was there any upon which he could not perform indifferently well. He was also a composer; and, although none of his compositions are now extant, tradition informs us that his reputation in that, as well as in the other departments of the art, not only filled the city, but extended throughout the whole circle of Suabia. Other causes contributed to swell his fame: he possessed great wealth—acquired, it was sometimes whispered, not in the most creditable way; and the only inheritor of it was a daughter, whose beauty and innocence might well have been deemed dowry sufficient, without the prospective charms of her father's possessions. Esther was indeed almost as celebrated for the softness of her blue eyes, and the sweetness of her smile, and her many kind actions, as old Nieser was for his wealth, and the excellence of his stringed instruments, and the paucity of his good deeds.

Now, in spite of the wealth of old Nieser, and the respect which it had obtained for him, and the musical celebrity which he enjoyed, one sore grievance pressed heavily upon him. Esther, his only child, the sole representative of a long line of musicians, could scarcely distinguish one tune from another; and it was a source of melancholy anticipation to Nieser, that he should leave behind him no heir to that talent which he held in almost equal estimation with his riches. But, as Esther grew up, he began to take consolation in thinking that, if he could not be the father, he might live to be the grandsire, of a race of musicians. No sooner, therefore, was she of a marriageable age, than he formed the singular resolution of bestowing her, with a dowry of two hundred thousand florins, upon whomsoever should compose the best sonata, and perform the principal part in it. This determination he immediately published throughout the city, appointing a day for the competition; and he was heard to affirm, with a great oath, that he would keep his promise, though the sonata should be composed by the demon, and played by the fiend's own fingers. Some say this was spoken jocularly; but it would have been better for old Nieser had he never spoken it at all; it is certain, however, that he was a wicked old man, and no respecter of religion.

No sooner was the determination of Nieser the musician known in Augsburg, than the whole city was in a ferment. Many who had never dared to raise their thoughts so high, now unexpectedly found themselves competitors for the hand of Esther; for independently of Esther's charms and Nieser's florins, professional reputation was at stake; and where this was wanting, vanity supplied its place. In short, there was not a musician in Augsburg who was not urged, for one motive or another, to enter the lists for the prize of beauty. Morning, noon, and night, the streets of Augsburg were filled with melodious discord. From every open window proceeded the sound of embryo sonatas; nor was any other subject spoken of throughout the city than the approaching competition and its probable issue. A musical fever infected all ranks: the favourite airs were caught, and repeated, and played, and sung, in every house in Augsburg; the sentinels at the gates hummed sonatas as they paced to and fro; the shopkeepers sat among their wares singing favourite movements; and customers as they entered took up the air, forgetful of their business, and sang duets across the counter. It is even said that the priests murmured allegrettos as they left the confessional; and that two bars of a presto movement were found upon the back of one of the bishop's homilies.

But, amidst all this commotion, there was one who shared not in the general excitation. This was Franz Gortlingen, who, with little more musical talent than Esther, possessed one of the best hearts and handsomest persons in Suabia. Franz loved the daughter of the musician; and she on her part, would rather at any time have heard her own name, with some endearing word prefixed to it, whispered by Franz, than listened to the finest sonata that ever was composed between the Rhine and the Oder. Nieser's decree was therefore of sad import to both Esther and Franz.

It was now the day next to that upon which the event was to be decided, and Franz had taken no step towards the accomplishment of his wishes: and how was it possible that he should? He never composed a bar of music in his life: to play a simple air on the harpsicord exhausted all the talent he was master of. Late in the evening Franz walked out of his lodgings, and descended into the street. The shops were all shut, and the streets were entirely deserted; but lights were still visible in some of the open windows; and from these came sadly upon the ear of Gortlingen the sound of instruments in preparation for the event which was to deprive him of Esther. Sometimes he stopped and listened, and he could see the faces of the musicians lighted up with pleasure at the success of their endeavours, and in anticipation of their triumph.

Gortlingen walked on and on, until at length he found himself in a part of the city which, although he had lived in Augsburg all his life, he never recollected to have seen before. Behind him the sounds of music had all died away, before him was heard the low rush of the river, and mingled with it there came at times upon the ear faint tones of wondrous melody. One solitary and far distant glimmer showed that the reign of sleep was not yet universal; and Gortlingen conjectured, from the direction of the sound, that some anxious musician was still at his task, in preparation for the morrow. Gortlingen went onwards, and as he drew nearer to the light, such glorious bursts of harmony swelled upon the air, that, all unskilled as he was in music, the tones had a spell in them which more and more awakened his curiosity as to who might be their author. Quickly and noiselessly he went forward until he reached the open window whence the sound proceeded. Within, an old man sat at a harpsichord, with a manuscript before him: his back was turned towards the window, but an antique and tarnished mirror showed to Gortlingen the face and gestures of the musician.

It was a face of infinite mildness and benevolence; not such a countenance as Gortlingen remembered to have ever seen the likeness of before, but such as one might desire to see often again. The old man played with the most wondrous power; now and then he stopped, and made alterations in his manuscript, and as he tried the effect of them he showed his satisfaction by audible expressions, as if of thanksgiving, in some unknown tongue.

Gortlingen could at first scarcely contain his indignation at the supposition that this little old man should dare to enter the lists as one of Esther's suitors; for he could not doubt that he, like the others he had seen, was preparing for the competition; but as he looked and listened, gradually his anger was quelled in contemplating the strangely mild countenance of the musician, and his attention fixed by the beauty and uncommon character of the music; and at length, at the conclusion of a brilliant passage, the performer perceived that he had a sharer in his demonstrations of pleasure, for Gortlingen, in his unrestrained applause, quite drowned the gentler exclamations of the mild old man. Immediately the musician arose, and throwing open the door—"Good evening, Master Franz," said he; "sit down, and tell me how you like my sonata, and if you think it likely to win Nieser's daughter." There was something so benignant in the old man's expression, and so pleasing in his address, that Gortlingen felt no enmity, and he sat down and listened to the player. "You like the sonata, then?" said the old man, when he had concluded it.

"Alas!" replied Gortlingen—"would that I were able to compose such a one!"

"Hearken to me," said the old man: "Nieser swore a sinful oath, that he would bestow his daughter upon whomsoever might compose the best sonata, 'even although it were composed by the demon, and played by the fiend's own fingers.' These words were not spoken unheard: they were borne on the night-winds, and whispered through the forests, and sank on the ears of them who sat in the dim valley; and the demon laugh and shout broke loud upon the calm of midnight, and were answered from the lone depths of a hundred hills; but the good heard also; and though they pitied not Nieser, they pitied Esther and Gortlingen. Take this roll; go to the hall of Nieser: a stranger will compete for the prize, and two others will seem to accompany him: the sonata which I have given to you is the same that he will play; but mine has a virtue of its own: watch an opportunity, and substitute mine for his!" When the old man had concluded this extraordinary address, he took Gortlingen by the hand, and led him by some unknown ways to one of the gates of the city, and there left him.

As Gortlingen walked homewards, grasping the roll of paper, his mind was alternately occupied in reflections upon the strange manner in which he had become possessed of it, and in anticipation of the morrow's event. There was something in the expression of the old man that he could not mistrust, though he was unable to comprehend in what way he could be benefited by the substitution of one sonata for another, since he was not himself to be a competitor. With these perplexing thoughts he fell asleep, while all night long Esther's blue eyes were discoursing with him, and the tones of the old man's sonata were floating in the air.

At sunset next evening, Nieser's hall was thrown open to the competitors. As the hour approached, all the musicians of Augsburg were seen hurrying towards the house, with rolls of paper in their hands, and accompanied by others, carrying different musical instruments, while crowds were collected at Nieser's gate to see the competitors pass in. Gortlingen, when the hour arrived, taking his roll, soon found himself at Nieser's gate, where many who were standing knew him, and pitied him, because of the love he bore the musician's daughter; and they whispered one to another—"What does Franz Gortlingen with a roll in his hand: surely he means not to enter the lists with the musicians!" When Gortlingen entered the hall, he found it full of the competitors and amateurs, friends of Nieser, who had been invited to be present. Nieser sat in his chair of judgment at the upper end of the room, and Esther by his side, like a victim arrayed for sacrifice. As Gortlingen made his way through the hall with his roll of music in his hand, a smile passed over the faces of the musicians, who all knew each other, and who also knew that he could scarcely execute a march, much less a sonata, even if he could compose one. Nieser, when he saw him, smiled from the same cause; but when Esther's eye met his, if she smiled at all, it was a faint and sorrowful smile of recognition, and soon gave place to the tear that stole down her cheek.

It was announced that the competitors should advance and enrol their names, and that the trial should then proceed by lot. The last that advanced was a stranger, for whom every one instinctively made way. No one had ever seen him before, or knew whence he came; and so forbidding was his countenance, so strange a leer was in his eye, that even Nieser whispered to his daughter, that he hoped his sonata might not prove the best.

"Let the trial begin," said Nieser:—"I swear I will bestow my daughter, who now sits by my side, with a dowry of 200,000 florins, upon whomsoever shall have composed the best sonata, and shall perform the principal part."—"And you will keep your oath!" said the stranger, advancing in front of Nieser.—"I will keep my oath," said the musician of Augsberg, "though the sonata should be composed by the demon, and played by the fiend's own fingers." There was a dead silence; a distant shout and faint laughter fell on the ear like an echo. The stranger alone smiled; every one else shuddered.

The first lot fell upon the stranger, who immediately took his place, and unrolled his sonata. Two others, whom no one had observed before, took their instruments in their hands and placed themselves beside him, all waiting the signal to begin. Every eye was fixed upon the performers. The sign was given; and as the three musicians raised their heads to glance at the music, it was perceived with horror that the three faces were alike. A universal shudder crept through the assembly; all was silent confusion; no one spoke or whispered to his neighbour, but each wrapped himself up in his cloak, and stole away; and soon there were none left excepting the *three*, who still continued the sonata, and Gortlingen, who had not forgotten the injunction of the old man. Old Nieser still sat in his chair; but he, too, had seen, and as he remembered his wicked oath, he trembled.

Gortlingen stood by the performers, and as they approached what he remembered to be the conclusion, he boldly substituted his for the sonata that lay before them. A dark scowl passed over the face of the three, and a distant wail fell upon the ear like an echo.

Some hours after midnight the benign old man was seen to lead Esther and Gortlingen out of the hall; but the sonata still proceeded. Years rolled on. Esther and Gortlingen were wedded, and in due course of time died; but the strange musicians still labour at their task, and old Nieser still sits in his judgment-chair, beating time to the sonata. When it ends—if it ever shall end—Esther will be far beyond the reach of the wicked vow made by the musician of Augsburg.

WAR.

Man's evil nature, that apology
Which kings who rule, and cowards who crouch, set up
For their unnumbered crimes, sheds not the blood
Which desolates the discord-wasted land.
From kings, and priests, and statesmen, war arose,
Whose safety is man's deep unbettered woe,
Whose grandeur is debasement. Let the axe
Strike at the root, the poison tree will fall;
And where its venomed exhalations spread
Ruin, and death, and woe, where millions lay
Quenching the serpent's famine, and their bones
Bleaching unburied in the putrid blast,
A garden shall arise, in loveliness
Surpassing fabled Eden. *Shelley.*

MOUNT AMANUS.

Mount Amanus, which now bears the less euphonious appellation of *Alma Dug*, is one of a chain of mountains in Cilicia. It is a wild romantic spot, with lofty heights and impenetrable gorges—here giant hills, bleak, barren, and desolate, and here beautiful strips of verdure and cool refreshing waters. It resembles in its natural character the land of Syria, and sometimes is indeed called the Syria of Cilicia. The hills, the valleys, the herbage, the people, the sky of intensest blue, all recall the ideas we have formed of what the Holy Land must be; and those who have trodden the soil of Palestine acknowlege that this portion of Cilicia strongly reminds them of the land which flowed with milk and honey.

There are two great roads over the mountain, one of which leads to the sea-shore, where in the days of old the ports were situated to which Assyrian merchants came, and which were then considered the great marts of commerce and emporiums of the world.

The country is now covered with forest trees, and presents a strange, deserted aspect, and one may travel many a mile without meeting a single inhabitant. Yet the country once flourished; magnificent ruins still remain to tell of its ancient splendour. Xenophon speaks of Mount Amanus; Strabo dwells with infinite delight upon the picturesque beauties of that portion of Cilicia; and his contemporaries tell of wonderful things connected with the mountain. They mention an inflammable cavern, which seemed to them the very mouth of Hades, and yet was nothing more, perchance, than choked-up fire-damp; they mention petrified rivers, and other prodigious phenomena, and have bestowed upon the place a marvellous reputation for enchantment. Metals, and marbles of the most beautiful character, are still found in these mountains; but they are not one-half so beautiful, not one-half so rich and rare, as they appeared to the men of the old time. The people of the past lived in a world of wonders, for they understood but little of natural science, and to them everything was a mystery. Modern inquiry has made it apparent that the ancients knew but little of the geology or geography of Asia Minor.

The temperature of Mount Amanus is dry and sultry. Its solitudes are now rarely disturbed but by the passing of some caravan. Once it re-echoed to the tramp of conquering armies, but its glory has departed, and now but a few people of the poorer sort inhabit its rocky heights and mountain fastnesses. Thus the peopled city arises where once the cry of the bittern alone disturbed the silence, and wild flocks pasture where towered palaces pointed to the sky.

MOUNT AMANUS, IN CILICIA (ASIA MINOR). VIEW OF THE CHATEAU IN RUINS.

The scene which our engraving represents is one of the most picturesque in Amanus. The lofty hills arise on every side and stretch their summits to the skies, the mountain pass is fringed with herbage, and the muleteer is returning to his home. To the right are a few scattered houses, their white fronts catching the eye from afar, and in the centre are the ruins of an old chateau. There is something mournfully beautiful in the whole, for it seems to tell how the spirit of change is passing over all things, and how the world's glory and the world's triumphs give place to silence and desolation.

MONT BLANC.

CLIMBING A WALL OF ICE.

On the morning of a lovely day in August, in the year 18—, two travellers were seen to enter an Alpine village, &c. &c. This is the usual way of beginning a romantic description. At this present writing, however, we are not particularly inclined

to indulge in high-flown phrases, even about Mont Blanc. For Albert Smith and the other modern travellers treat the ascent of this great mountain as such a very ordinary affair—simply a matter of ropes, guides, good spirits, and determined perseverance—that for stay-at-home travellers to get up any sort of enthusiasm about the matter is rather ridiculous.

The mere fact, however, of a man not having seen a particular place is no reason whatever why he should not write a charming description of it. And, in truth, the *not* having seen Mont Blanc, for instance, would be rather an advantage to a writer than otherwise, as he could draw upon his imagination and poetic temperament without danger of encountering that shock to his feelings, that strange sense of disappointment, which almost invariably attends the first sight of any grand natural phenomenon. Not having witnessed the real dangers of the ascent, and being quite unconscious of the icy coldness which benumbs alike the senses and the imagination, he could rhapsodise at his ease about "everlasting clouds" and "mighty hills so shadowy and sublime;" and, looking at the Alps from the home point of view, it would be easy to indulge in a proper degree of enthusiasm concerning those

> "——— palaces of nature, whose vast walls
> Have pinnacled in clouds their snowy scalps,
> And enthroned eternity in icy halls
> Of cold sublimity."

And more than this, being in no way liable to the slightest inconvenience by reason of any awkward avalanche overhead, or any yawning chasm at his feet, and being in no fear of speaking loud or laughing—

> "Lest a word or breath
> Bring down a winter's snow,"

he can take his own time in looking at the mighty scene; and using imagination's spectacles, need undergo no trouble in passing over the snow bridge at the "Grand Mulets," or even in climbing the great cone itself.

In the present instance, however, we are spared all trouble in the matter of reminiscence; for we have lying before us the second monthly part of one of the most complete and beautifully illustrated works ever devoted to the subjects of mountains and valleys.* In its pages are collected accounts of the most celebrated ascents of Mont Blanc—from that of Saussure in 1785, to the daring expedition of Albert Smith and his friends in 1851. In this splendid work the editor has been at considerable pains to bring together all the best information on the subject of the interesting countries traversed by the Alps. We, sitting at our ease, will accompany a party of adventurers up the sides of the famous mountain. We start from the Valley of Chamouni. The last human habitation which the traveller sees is the Châlet de la Para, about an hour and half's journey from the Village des Pélérins. At the north-eastern extremity of the valley there rises the lofty green passage of the Col de Balme; then come the red, craggy, thunder-smitten pinnacles of the Aiguilles Rouges; then, directly opposite, the long fir-woods, and bare broken summit of the Brévent, and turning a little round, the bold calcareous turrets of the Aiguille de Varens, partly covered by a low mass of white cloud. Then come the green hills closing the other end of the Valley of Chamouni.

Looking directly downwards, just under the feet, are seen the dark pine-woods at the base of the mountain, intersected by the white stony torrent that has burst for itself several channels to form the Arve. Then, further on, numerous brown châlets, dispersed irregularly among the parallelograms of yellow corn, green hemp, flax, or clover. A little further appears the clustered village of Chamouni, and the light tin covered spire of the church. Turning the back on the village, and rising a little from the valley, there is a long line of tall, thick, dark-green pines, forming a most beautiful back-ground to the white icy pinnacles of the rugged Glacier des Bossons, which projects far down into the smiling valley beneath. Then, higher up above, is the Aiguille du Goûté, and the huge bulk of the Dôme du Goûté, shining like polished silver in the morning sun; and still higher, and directly over head, the snowy pinnacles of the stupendous Aiguille du Midi; its base covered with ice, and lower down with moss, heath, juniper, rhododendrons, and other plants.

At the Châlet de la Para the vegetation diminishes, and, at length, the fir-trees disappear. Before this, provision is made for the evening meal, by wood being picked up, and sometimes chopped into a convenient size and shape. This fuel is then tied on to the knapsacks of the guides. "I was apprehensive," says Mr. Browne, "of some accident to men thus heavily laden, and presently, as we were scaling a most awkward block of ice, down went Favret, load and all, into the *crevasse*, and but for his long protruding faggots of wood, which stuck on either side of the *crevasse*, he would have gone to a great depth."

Should the adventurers proceed on mules thus far, they are dismissed as soon as a sort of stone tent is reached, which is formed on one side of a vast block, and on the other of a wall of uncemented pieces. The mouth is open, but within the visitor is tolerably snug, especially in the anticipation of the fatigue and discomfort about to be encountered. In this rude refuge the solitary goat-herd and part of his flock find occasional shelter from the biting blast, which, at such elevations, is frequently experienced, and from the still greater violence of the pelting storm.

Soon after leaving this spot, the course is continued by a narrow foot-way, or ledge, in the face of the cliff, in some places perpendicular, and in others overhanging the abysses below. This track, partly natural, is, in some places, improved by the people of the valley; and a tolerably accurate idea of it may be formed by imagining, that against a precipice of some hundred feet in height, a wall of two feet thick was built about half way up, and the path consists entirely of the space on the top of the wall, which is frequently so narrow as to compel the adventurers to advance sideways with their faces towards the rock, because the ordinary breadth of a man's shoulders would throw the balance of his person over the edge of the precipice.

The travellers have but commenced their journey. The Glacier des Bossons reached, their further progress seems stopped by a precipitous tower of ice. But this surmounted, by means of a staircase of notches cut by the hatchets of the guides, a chasm of uncertain depth has to be crossed, and the onward journey lies over ice ridges, slender arches suspended over dark abysses, and huge blocks of ice which appear mountains of themselves. The adventurous party, tied together with ropes, and preceded by careful guides, arrive at length by painful steps at the edge of the glacier. Snow mountains and ice hills, *crevasses* numerous and deep, solid walls of ice, and ugly fissures, bar their passage to the Grand Mulets. But even this is reached at last, and they prepare to spend the night on granite rocks 11,000 feet above the level of the sea.

The Grand Mulets consist of a narrow chain of rocks, which derive their name from a fancied resemblance of their aspect, as seen from the valley, to a team of mules; but all images fail to exhibit the awful contrast of their dark isolated range of pinnacles with the dazzling fields of ice and snow above, around, and beneath them.

Mont Blanc is still 5,000 feet above them. The view from this spot is, however, of no ordinary beauty and magnificence. The panorama, heightened by the deep azure of the sky, and the clearness of the atmosphere, embraces within its mighty grasp, mountains than which none are more sublime—masses of ice and snow of surpassing grandeur—valleys smiling with verdure, lit up, perhaps, by the rays of the sun,—Leman, all placidity, appearing like a lake of molten silver—and the blue hills of Jura, "far, far away." Mont Blanc, the most prominent feature of this august scene,—

> "High o'er the rest, displays superior state,
> In grand pre-eminence supremely great."

* "The Alps, Switzerland, Savoy, and Lombardy." By the Rev. Charles Williams. In Monthly parts at One Shilling.

Here they pass the night; and early in the morning the travellers recommence their toilsome and dangerous journey. Again are the awful ice-hills and treacherous snow-drifts to be dared; again dark chasms, which may not be looked into by nervous heads, are crossed with careful steps; again, fastened one to another, dangerous, ice-formed, slippery-looking bridges, are ventured on by the daring company; again are strength of character and determination put to the test, and the Grand Plateau is gained.

Above are the Rochers Rouges, or Red Rocks, at the foot of which lay the old route to the summit, prior to the ascent of Messrs Fellowes and Hawes in the year 1827. The really hazardous part of the journey commences here. Avalanches and *crevasses* are equally to be avoided. The Dernier Rochers, the highest visible rocks are above them; below appear a vast assemblage of white pyramids—Monte Rosa, the Col du Géant, and the snow-clad rocks reaching down to the Mer de Glace.

"Snow piled on snow; each mass appears
The gathered winter of a thousand years."

The travellers, drawing near the summit, experience the effect on the frame of so great an elevation. Some parts of their bodies become very dry, a livid colour and constriction of the skin begin to be observed, the thirst is intense, and can scarcely be allayed, even by continually eating sugar, French plums, and snow. In a narrow valley, sheltered from the wind, and exposed to the sun's direct rays,—the common focus, too, of rays reflected from vast surrounding walls of snow,—the heat is oppressive, and the face becomes scorched. A veil is, therefore, put on, and green spectacles are used, which are indispensable to obviate the glare from the sun.

Greater sufferings still follow; every two or three minutes they all sink down on the snow, absolutely breathless, and scarcely able to utter a word. In so rarified an atmosphere, they cannot hear one another speak, even at a short distance, without great exertion, and then the voice sounds thin and remote, like a bell in the half-exhausted receiver on the plate of an air pump. "I should no more have thought," says Mr. Auldjo, "of calling to a guide fifty yards from me, than a man on Ben Lomond would do to a friend on the opposite summit of the Cobler." One of the guides has an hæmorrhage from an accidental blow, and the blood appears of an unusually dark colour. The lips of the party are quite blue, their faces extremely contracted and pale, and the eyes very much sunk, with a deep dark zone beneath the lower eyelids. Every moment, a longing look is cast towards the summit, and then, holding their heads low, they press onwards, some with overwhelming headache and various other pains, till the feeling of exhaustion becomes irresistible, and they sink again quite flat and still upon the snow.

Another effort, and success must be achieved. The Côte is yet above them. "I had the greatest difficulty," says Albert Smith, "in getting my wandering wits into order, but the risk called for the strongest mental effort, and with just sense enough to see that our success in scaling this awful precipice was entirely dependent upon 'pluck,' I got ready for the climb. The Mer de la Côte is some hundred feet high, and is an all but perpendicular iceberg. At one point you can reach it from the snow, but immediately after you begin to ascend it obliquely there is nothing below but a chasm in the ice, more frightful than anything yet passed. Of course every footstep had to be cut with the adzes; and my blood ran cooler still, as I saw the first guides creeping like flies upon its smooth glistening surface. The two Tairraz were in front of me, with the fore part of the rope, and François Cachat, I think, behind. For upwards of half an hour we kept on slowly mounting this iceberg, until we reached the foot of the last ascent,—the *calotte*, as it is called,—the 'cap,' of Mont Blanc. The danger was now over, but not the labour, for this dome of ice was difficult to mount. The axe was again in requisition, and everybody was so 'blown,' in common parlance, that we had to stop every three or four minutes. My young companions kept bravely on, like fine fellows as they were, getting ahead even of some of the guides: but I was perfectly done up. Honest Tairraz had no sinecure to pull me after him, for I was stumbling about as though completely intoxicated. I could not keep my eyes open, and planted my feet anywhere but in the right place. I know I was exceedingly cross. I have even a recollection of having scolded my 'team' because they did no go quicker; and I was excessively indignant when one of them dared to call my attention to Monte Rosa. At last one or two went in front, and thus somewhat quickened our progress. Gradually our speed increased, until I was scrambling almost on my hands and knees, and then, as I found myself on a level, it suddenly stopped. I looked round, and saw there was nothing higher. The batons were stuck in the snow, and the guides were grouped about, some lying down, and others standing in little parties. I was on the top of Mont Blanc!"

HOPE ON.

BY DOUGALL CHRISTIE.

If ever Fortune's sunny face
Hath smiled upon thee for a space,
But frowned when clouds began their race,
Look not back!

If ever Joy's soul-cheering smile
Hath lighted up thy fate awhile,
But gloomed at last with treacherous guile,
Look not back!

If ever Happiness' pure ray
Hath glinted on thy opening day,
But sorrow tinged thy noon with grey,
Look not back!

If ever dreams of well-won fame,
To weave a garland round thy name,
Should wake in woe but not in shame,
Look not back!

Oh! look not back with fruitless pain
Nor hug remembrance' torturing chain;
What's done is done, and must remain,
Then look not back!

Stoop not to profitless despair,
But hope; the haggard cheek of care
May yet a smile of comfort wear,
Forward look!

Trust to the Fount of peace and power
To soothe the miseries of the hour;
Man's help is but a withered flower—
Trust in God!

ANCIENT MITRE AND CHASUBLE.

This mitre, formerly preserved in the Museum of Reims, belonged, if report speak true, to the Cardinal of Lorraine, Charles of Guise, and was worn by him at the Council of Trent. In 1669, the value of the mitre was estimated at 45,000 livres, a sum equal to £2,500. The stones were mounted on silver cloth, covered with gold filagree; the highest point of the front of the mitre being formed by a figure of Saint Michael, the archangel, destroying the dragon. This was originally ornamented with seventeen small diamonds, valued at sixty crowns. A fine torquoise and two rubies, immediately under the image of the saint, were estimated at 400 livres. On the frontal band, the title of Jesus, in Gothic letters, was formed of diamonds. Two emeralds, engraved, one with an image of the Virgin, and the other with an image of the angel Gabriel, were also in this frontal band, which, besides, was decorated with rubies. Pearls, rubies, and emeralds, formed the edging to the mitre, and the exquisite filagree work was jewelled here and there with precious stones. The centre band of the mitre was peculiarly rich in jewels, and the pendents were formed of cloth of gold.

This beautiful mitre was hidden during the French Revolution, together with some other valuable property presented to Louis XIV., in a secret chamber in the Museum of Reims. There they were supposed to be perfectly secure; but when

all danger of robbery and violence was over, they were sought in vain. All inquiry was fruitless, and the circumstances of their abstraction still remain in mystery.

ANCIENT MITRE.

A chasuble is that part of a Romish priest's habit worn over his surplice when he performs the service of the mass. Among the many curiosities to be found in the Castle of Carrouges, in the department of Orne, may be seen the curious chasuble represented in our engraving. It is one of those antiquities, formerly common in the chapels belonging to castles and the treasuries of churches in France, but which, before the period of the Revolution, had, for the most part, fallen into a state of decay, in consequence of the carelessness of their possessors.

This chasuble differs little in shape from those of the present day. It is made of green brocaded silk, upon which, placed at right angles, are flowers beautifully worked in gold, and blue and white silk, bordered with red. The cross, of red silk with silver fleurs-de-lis, is much faded by time; ribands of blue and violet velvet, upon which is written in Gothic characters the motto, *Dieu et mon droit*, are arranged so as to form six rings along the upright part of the cross; between each of these rings are two crowns, one royal, the other episcopal, placed side by side, and between these crowns may be observed a large L, sometimes joined to another letter which is too indistinct to be deciphered; these ornaments are richly embroidered in gold. In the centre of each ring is a sun, resplendent with gold and silver; it is in strong relief, on a blue and violet ground, disposed in such a manner as to alternate constantly with the blue and violet of the velvet ribands. On the transverse piece of the cross are similar crowns and L's; below, placed between the flowers, of which we have before spoken, are two shields, gules, semé of fleurs-de-lis argent. The front of the chasuble is precisely similar to the back, except that the L's and the crowns are placed horizontally.

There have been many conjectures as to the origin of this curious vestment, which bears the motto belonging to the royal arms of England, *Dieu et mon droit*, as well as the shield charged with fleurs-de-lis, which would lead one to suppose that it belonged to France. It is thought by some to have been presented by Louis XI. to the chapel of the Castle of Carrouges, when he visited that place in the year 1473. The room in which he slept, with the large mantel-piece and carved and gilded wainscot is still shown. But the Seveneur family, who have long been in possession of the castle, do not credit this tradition respecting the chasuble, and believe that it was brought from the Castle of Tillières, which belonged to their ancestors.

This is not the only object of interest which the Castle of Carrouges affords to the antiquary; some valuable family portraits, many interesting remains of the antique decorations of the interior, some curious halberds, a beautiful cuirass which belonged to Jean Seveneur, who was killed in the battle of Agincourt, in the year 1415, are all well worthy of his attention. The castle, like a carved frame, gives additional value to the treasures which it contains. It is composed of an enormous mass of buildings, in the form of a quadrangle, perforated with doors and windows of a variety of shapes and sizes, and covered with peaked, irregular roofs. This series of constructions, erected at various times during the 16th and

ANCIENT CHASUBLE.

17th centuries, according to the caprices of the architect or proprietor, possesses neither elegance nor regularity, but is characterised by a curious and original diversity.

LAPLACE.

Pierre Simon Laplace, was one of the most skilful geometricians of modern times—one who, by the magnitude of the results which he obtained, has greatly contributed to demonstrate the powers of mathematical science in discovering the laws which rule the material world.

When scarcely twenty years of age, Laplace began his scientific career by writing a dissertation on the secular inequalities of the movements of the planets. Guided by the most learned analyses, he penetrated the intricacies of acceleration and retardation of velocity, variations of form, changes of distance and inclination, produced by the influence of universal attraction. He rendered the laws of these complicated system, the smallness of their masses compared with that of the sun, the coincidence of their motions, the slight mutual inclinations of their orbits, and the smallness of their eccentricities.

It is true that, in his calculations, Laplace only admitted the existence of a single force, that of universal attraction or gravitation; however, observation, the touchstone of all theories, seemed to contradict his. In comparing the observations of the ancients with those of modern times, it is found that there has been a continual acceleration in the motions of the moon and of Jupiter, and a diminution, not less manifest, in those of Saturn. But to an acceleration of velocity

PIERRE SIMON LAPLACE, THE GEOMETRICIAN.

movements distinct, and demonstrated that, in the midst of these multifarious changes, one thing at least remained stable, namely, the major axis of each orbit, and consequently the time of the revolution of each planet;—thus were the doubts that Newton and Euler had entertained, regarding the stability of the system of the world, set aside; thus were the fears of those gloomy spirits, to whom the admirable order of the universe appeared but transient, at once dissipated. Laplace has proved, that, in the course of ages to come, there is no reason to fear that chaos will arise from the destruction of the present state of things. As to the cause upon which depends this beautiful and highly important result, it consists merely in the primitive disposition of the bodies which compose our should correspond a diminution of distance from the sun; to a reduction of speed, an increase. It seemed then that some unknown cause, counteracting the laws of gravity, would one day upheave our world, Saturn and his mysterious attendants; that the moon would precipitate itself upon the earth; that Jupiter and his brilliant satellites would be absolved into the mass of the sun.

But Laplace, by some new analytical methods, discovered the laws of these grand phenomena, proved their periodicity, assigned their limits, and arranged them definitively in the class of common perturbations depending upon gravitation. It is, then, mathematically demonstrated, that the solar system can only experience inconsiderable oscillations about a certain

mean state, that the momentary acceleration of the motion of a planet has been preceded, and will be followed, by a similar reduction of speed, without the order of the universe being deranged by these feeble variations.

These great discoveries are not the only ones which Laplace has made in the celestial mechanism. Thanks to his inquiries regarding the perturbations caused by the variations of distance from the moon to the sun, the mean distance from the sun to the earth may be found by observing the motions of our satellite; thanks to the investigations which he made concerning the influence which the depression of our globe may have upon the perturbations of the moon, it is now possible to calculate the mean value of this depression. To him we are also indebted for having demonstrated, in an indisputable manner, that the cooling to be sustained by our globe in the course of ages, can be by no means comparable to that rapid congelation with which the contemporaneous theory of Buffon threatened us. In comparing the observations made by Hipparchus, 2,000 years ago, with those of modern times, it is found that the moon's revolution round the earth is accomplished in precisely the same number of days and minutes now as then. Now, the movement of the moon is quite independent of the length of the day; this, on the contrary, depends essentially upon the thermometrical state of the earth, and the smallest diminution of temperature would have caused a very sensible difference in the length of the day, because it would have been accompanied by a contraction, a diminution of volume, and the rotation of the earth on its axis would have undergone a corresponding increase of velocity. Therefore, if the period of the moon's revolution, expressed in days, has not sensibly varied since the time of Hipparchus, the reason is, that the length of the day and the temperature of the globe remain unchanged. Let us allow for the possible errors of ancient times; let us suppose that the contraction, owing to the cooling of the earth, be the feeblest ever observed in any body, and we shall find that the temperature of our globe has not varied a hundredth part of a degree, from the time of Hipparchus to the present day; for had there been even a small diminution of temperature, the duration of the day would have diminished, which the observations of the ancients do not allow us to admit.

The theory of the tides, scarcely sketched out by Newton, was again left very imperfect after the labours of Maclaurin, Bernoulli, and others. It remained for Laplace to pursue these observations, by a method analogous to that which he had employed to find the distance of the sun and the depression of the earth; he concluded, from observations of the tides made at Brest, that the mass of the moon is only the 64th part of that of the earth; then, to confirm the laws of the stability of the system of the world, he proved that the equilibrium of the ocean was, from its nature, essentially stable, the mean specific gravity of the earth being about five times that of water; had the contrary been the case, all the water, in the event of a disturbance either of the solid or fluid parts, would run to one side, leaving the land on the other. In the present state of things, the continent stands in no danger of being swallowed up by the ocean.

Laplace also made very important discoveries regarding the planets Jupiter and Saturn. His three great works are the "Exposition du Système du Monde," the "Mecanique Celeste," and the "Théoree Analytique des Probabilities."

Having only considered the genius and learning of this great astronomer, we have been unrestricted in our eulogiums. Unhappily, as a man, his character was not so high. His biographers agree in describing him as an accomplished courtier, greedy of honours and dignities; they picture him as being ridiculously reserved on the score of his birth,—as if the son of a poor husbandman, of the valley of Auge, was not more worthy of merit, had not acquired more glory, in becoming the author of the "Mechanique Celeste," than if fortune had smiled on him from his childhood!

He had no capacity for public affairs, in which he had a great desire to take an active part; we may judge of this from the six weeks during which he held the office of minister of the interior in the time of the consulate. Napoleon says of him, in his "Memorial de Saint Helene:"—"An eminent geometrician, Laplace, appeared to be an administrator of more than ordinary powers; from his first proceeding we found that we were mistaken. Laplace did not see any question in its true light; he was always seeking for subtleties, had only problematical ideas, and, in short, carried the spirit of *infinite quantities* into his administration."

Laplace was born at Beaumont-en-Auge, 23rd March, 1749, and died 6th March, 1827. On the restoration of the Bourbons he was made a peer, and preserved the empty dignity of a French marquis until his death. Amongst the last words which he uttered were these:—"The things which we know are few, those of which we are ignorant are unbounded."

THE ART OF TURNING.

Turning is the art of giving a circular form to a variety of materials. It is employed in manufacturing articles of wood, bone, ivory, horn, marble, albata, stone, diamond, glass, steel, and all metals. It is an art of great antiquity, and vast importance in practical science. It includes many varieties requiring different arrangements of machinery, from the simple throwing-wheel of the potter to the complicated slide-lathe. There is great versatility in the mode of operation, but the principle is the same throughout. Thus, the material to be turned may be made to revolve round its own axis, and the cutting-tool applied to its surface so as to produce the requisite form as in the simple turning performed in the lathe commonly used by cabinet makers; or the article may be made to continue stationary while the cutting instrument revolves; or it may be made to move in some curve derived from circular motion, and the cutting-tool applied as before;—the action may be changed in a variety of ways, and all the motions may be more or less continued, but the simple mechanical operation still continues the same, and under the head "turnery" are comprehended all operations performed with the turning-lathe.

The art of turning is employed in almost every branch of manufacture; snuff-boxes chess-men, children's toys, cups and balls, cases, spinning-wheels, table legs, tools for embroidery, reels, billiard balls, and a host of other things which we daily use, we owe to the skill of the turner. When we are at peace, he supplies all that can contribute to our comfort and convenience, in business, in pleasure, in scientific investigation; and when we are at war, he turns out pieces of artillery with a finish and perfection altogether unattainable by any other means. The cannon being cast solid, the outside cools first, with a close sound grain, and the porous or spongy parts of the metal are found in the centre. This is afterwards turned or bored out in an engine-lathe, which leaves the inner surface perfectly true, and the bore of an equal diameter.

There is no manufacturing operation so general as turning. It is used to fashion the rudest shapes, and also to bestow the highest polish. The lathe works with automatic precision. Without it the operative must labour at all parts of his work with care and trouble to produce a regular figure, and after all only partially succeed. The value and principle of the lathe has been summed up in a few words:—for every point marked by the workman it produces a circle; and is a machine for moving the material to be wrought in such a manner that, being fixed opposite to the tool, any point in the circumference will act upon the whole circle in precisely the same way.

Turnery is not only a *useful* branch of art, but it is one of peculiar *interest*, and many have found it an agreeable *relaxation*. In our article we do not propose furnishing a complete history or description of the process; but as there are hundreds who possess some taste for the mechanical arts to whom some

general information may be acceptable, we intend indicating the most simple process of turnery, and presenting therewith engravings of the machinery employed, and of the most interesting and most useful results of the process.

The workshop in which a lathe is to be employed should be carefully selected. It should neither be exposed to the direct rays of the sun, nor yet so situated as to be affected by damp, and the lathe should be so placed that the light may fall from the left-hand side.

The most simple and primitive lathe is formed by two upright pieces, each having a conical iron or steel point fixed on the side opposite the other, the two points directly opposite one another. One of these uprights, called puppet heads, is tat ionary, the other moveable, so that it can be fixed at any the work. This is called a rest, but can only be applied during the fall of the treadle, and thus a great loss of time is occasioned; and on this account the pole lathe is now but little used.

A slight modification of this principle is represented in fig. 1.

The piece of wood (A), previously prepared, is placed between the points B B, which are fixed in the uprights; the puppets, C C, arranged according to the length of the piece of wood to be turned, and the whole is supported in the table, D D. A cord, E, is turned twice round the piece of wood, A, which cord is fixed underneath the frame-work to a treadle, F, and is attached above to the cat-gut string of a steel bow (G), perfectly flexible and securely fastened to a beam. As the wood is made to revolve, the tool (H) is applied, resting as before on a slight support, and thus the form of the article to be turned

FIGS. 3 TO 12.—GOUGES AND CHISELS OF VARIOUS KINDS.

part of the bed by a wedge beneath; the wood to be turned having been reduced to the desired length, the centre of one of its ends is pressed against the point of the fixed puppet; the point of the other puppet is then brought against the centre of the other end, and the puppet wedged firmly in its place; over the lathe, and at right angles to it, is a long flexible wooden pole or lath—whence the term *lathe*—one end fixed firmly overhead; the other, which must be just over the end of the work nearest to the left-hand puppet, has a cord or a cat-gut attached to it, which passes once or twice round the work, and is fixed at the lower end to a treadle; the oppression of the treadle and counteraction of the pole give an alternate rotary motion to the work. The workman rests the tool upon the top of a fixed piece between the two puppets, and close to is modified according to the direction given by the hand of the workman. On page 373 is an enlarged view of the working part of this lathe; the reference figures being common to both.

Another description of foot lathe is represented (fig. 2). This is of excellent construction, and is adapted to all ordinary work. It is of cast-iron, but is mounted in much the same way as the other lathe. But whilst in the last mentioned case the material to be turned had to be supported at both ends in the puppet, the lathe now under consideration is adapted principally for the work which does not require such support, and is sustained on a single point, by an axletree of iron.

To the left of the turn-bench an apparatus is strongly fixed by two screws, on which the tools used in the operation are allowed to rest.

In giving the ordinary movement to the treadle, A, the large wheel B and the corresponding small wheel, C, are set in motion, the cord, D, passing over both wheels, and communicating to them a rotary movement, a movement which rapidly turns the iron axle, E, the end F of which is adapted to the purposes of the turner, and is called the nose. The nose is cut with a coarse screw to receive the instrument named the mandril, G, and the mandril receives upon it the article to be turned, H.

When the article which is to be turned, I, is long and flexible, it is fixed in a sort of rest at the point K, which is established in the same manner as the other.

The tools used in turning are very numerous, and of great variety. We can only mention a few of them, and those the most commonly in use. The principal and most indispensable are the following:—the gouge (fig. 3), which is used to rough out the work, and is chiefly employed in wood-turning; chisels (fig. 4) with a cutting edge and sharp point; chisels sharpened on both sides (fig. 5), so as to form two right angles with the sides A B of the tool; others are formed on an acute angle, E, and on an obtuse angle, D. Drills, and chisels, and gouges, are used of every conceivable shape—straight, oblique, double angular, curved, hollow, semi-circular—according to the form of the work (figs. 6, 7). The ripping chisel (fig. 8) is chiefly used to make the first opening, which is afterwards enlarged by other tools. Instruments indicated at fig. 9 are principally employed in wood-turning. The hooked tools are used for turning the interior of an orifice. Figs. 11 and 12 are other specimens adapted for particular work.

For finishing the work, gravers of different sizes and shapes are used. The drills and tools are generally made so as to be used with a hook held upon the rest to the left hand. This allows much more freedom to the operator.

Chucks are employed for holding the work, and are of various descriptions; the three principal being the common chuck, the ring chuck, and the screw chuck.

The common chuck is very simple in its construction. It is a small cylinder, two or three inches long, varying in thickness according to the size of the article to be turned. The interior is fitted for a screw, and while the end, A, is screwed to the nose of the lathe, the work is attached to the extremity marked B.

The ring chuck is four or five inches long. That part which is screwed to the lathe is the same as in the other chuck, but the other part is very much longer, is separated into four pieces, and diminishes in size toward the extremities, A. The work can thus easily be introduced, and is firmly held by a metal band, B, which presses down the sides of the chuck. This renders the operation of turning much more perfect and

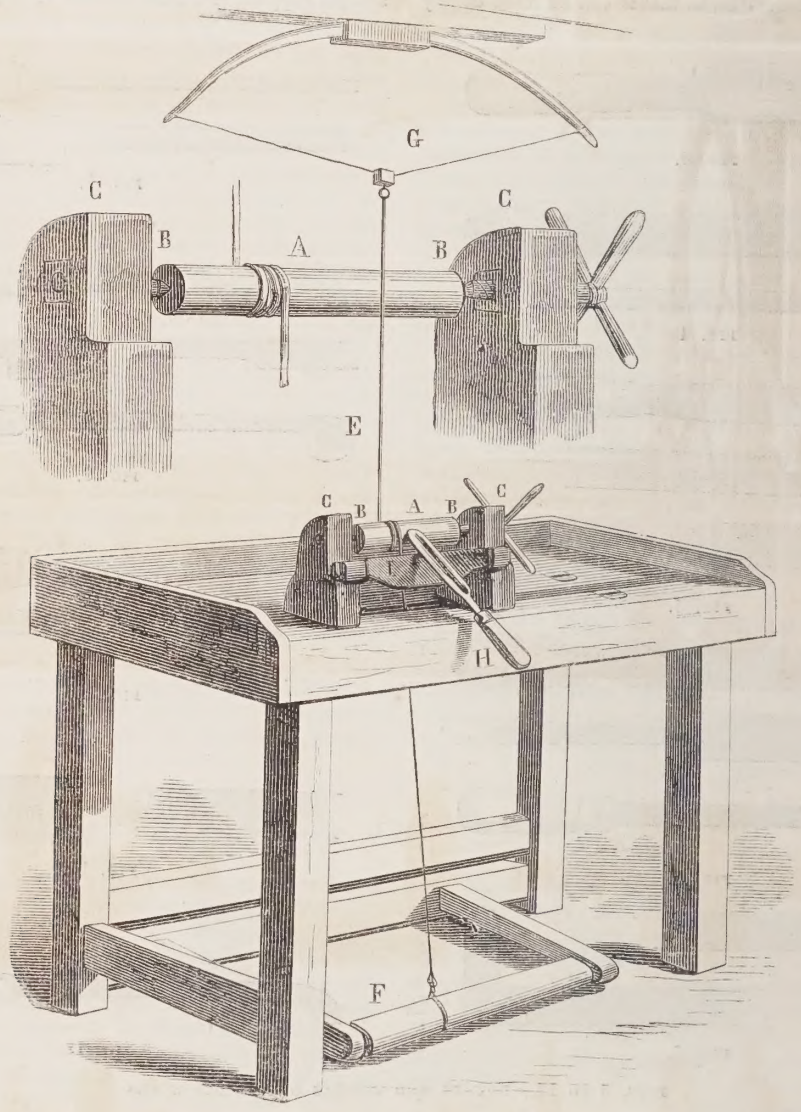

FIG. 1.— SIMPLEST FORM OF A LATHE.

easy than when the material is held by the common method. It is perfectly secure, and the work can be continued without any fear of accident by the looseness of the chuck.

The screw chuck is a circular plate of metal, with a boss at the back tapped to screw upon the nose of the mandril. The face is turned quite true, and in the centre is a coarse conical screw to hold any large piece of wood to be turned; a hole being made in the centre of the work, it is screwed tight up against the face, and no further adjustment is required.

Screw tools are important appendages to a lathe, and with the engineer are in constant use. They are filed up with several teeth exactly the shape of the spaces between the threads, and are applied in the following manner:—The piece of metal having been turned to the proper size and shape, the workman holds the tool in his right hand upon the top of the rest; then, clasping the rest with his left hand, he places the thumb across the tool, and gives the point a circular motion towards the left as the work revolves; this operation he

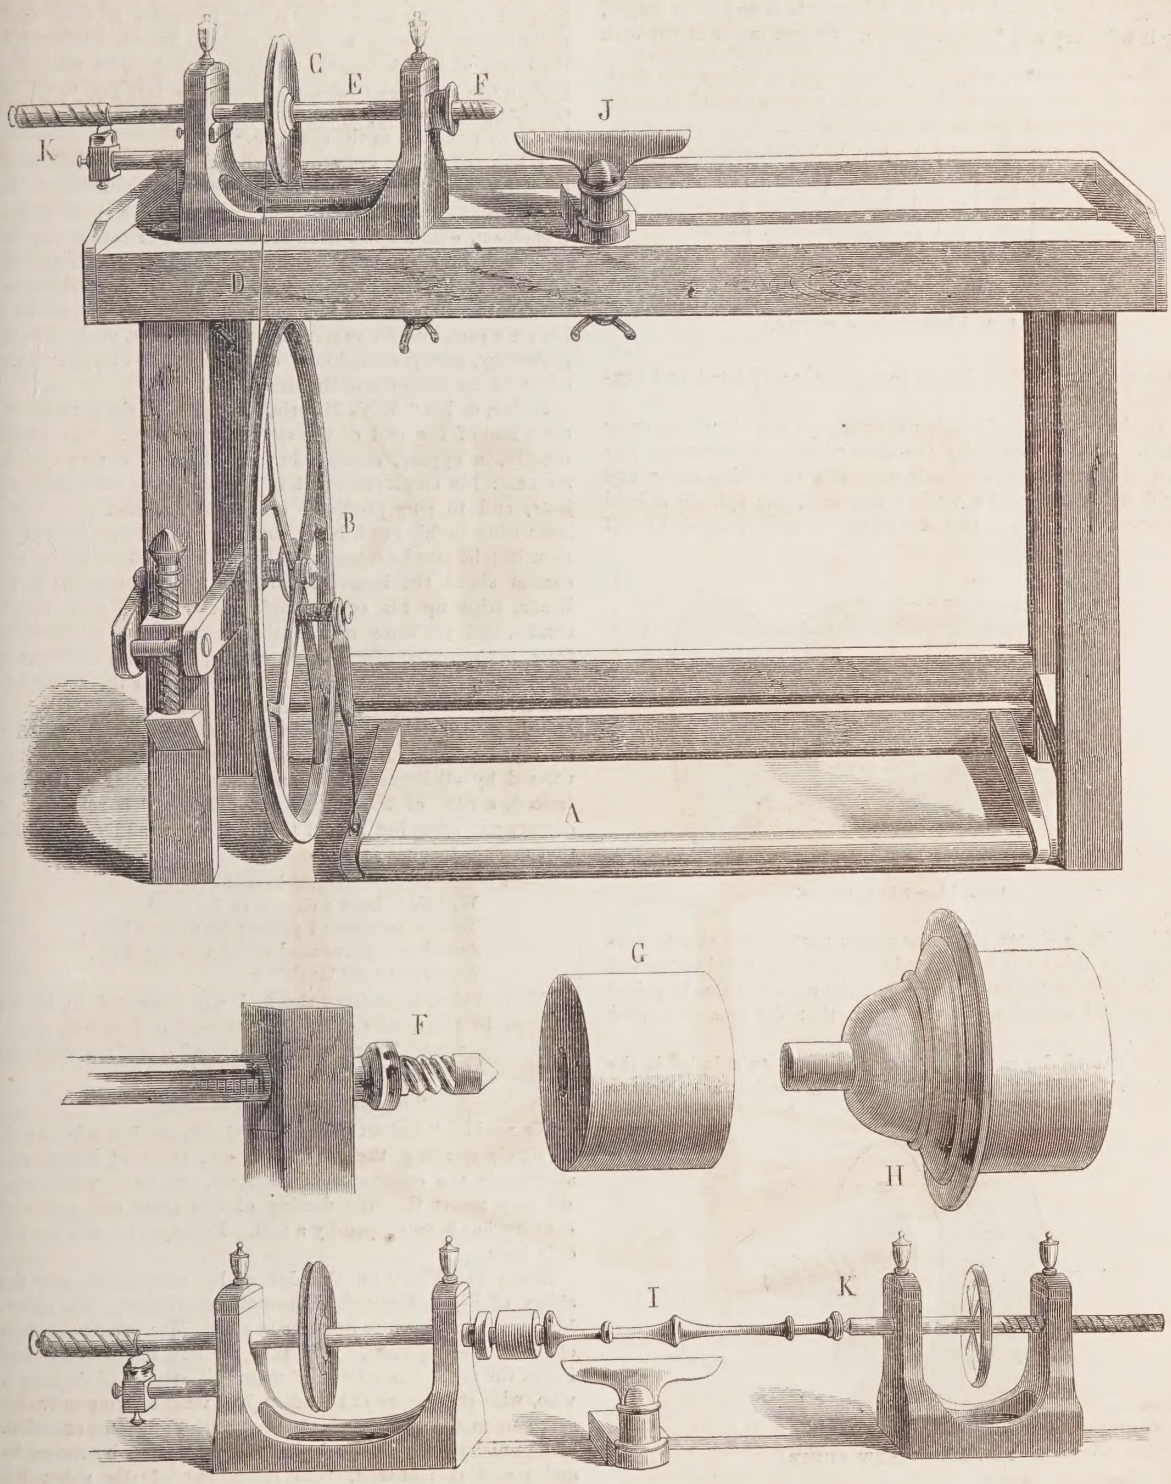

FIG. 2.—FOOT-LATHE.

repeats until a few threads are cut near the point, which serve as guides for the next, and so on till the screw is finished. This operation requires very great care. The tool must be firmly held, so as to prevent it getting out of the thread and spoiling the screw. But, though held firmly, the pressure must be light, especially when the screw is of any great length, or it will vary and become untrue. Screws are thus cut with

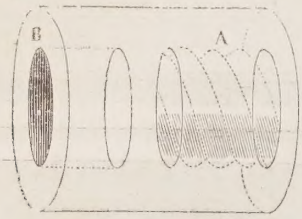

FIG. 13.—COMMON CHUCK.

extraordinary facility, but it requires a steady hand and considerable practice.

In the operation of turning a circular saw is very frequently used. This is especially the case with ivory turners. The saw is placed upon a spindle against a projecting collar, and held in its place by a washer and nut; the spindle is held between the mandril and front puppet, and over it is a small

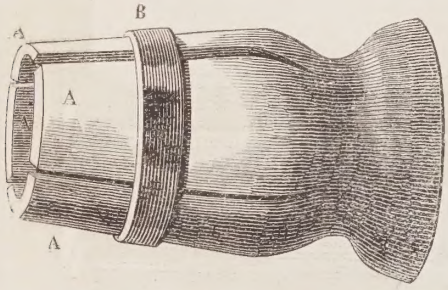

FIG. 14.—RING CHUCK.

table, with a slit to allow the upper part of the saw to pass through; this table is mounted upon a frame fitted to the bed of the lathe in the same manner as the rest, and can be raised or lowered according to the depth that the saw is wanted to cut.

But one of the most important adjuncts to a lathe is the *slide rest*. When the tool is held in the hand it is subject to

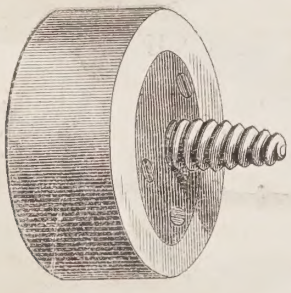

FIG. 15.—SCREW CHUCK.

any unsteadiness in the workman. To obviate this imperfection was a great desideratum: it was effected by the invention of the slide rest. The principle of the slide rest is, that the tool is fastened to a plate moved in the required direction by means of a screw, instead of being held in the hand.

We have thus briefly specified the tools employed in the process; in another paper we shall give some description of the process itself.

COURT FOOLS.

"So, by your circumstance, you call me fool."
Two Gentlemen of Verona.

In this paper the reader must not expect a biography of any of the aristocracy, either of ancient or modern times: we purpose devoting it entirely to the narration of some anecdotes connected with a class of persons known familiarly by the name of Court Jesters, or Court Fools—men who filled formerly a place at court, whether of sovereigns or of the chief nobility, as fully recognised as the steward of the household, the minstrel, or the chaplain.*

When the spirits grew dull, who like the court fool could brighten them up? The jingle of the bells attached to his motley garments, the flourish of his bauble—a short stick or truncheon, with a fool's head carved on it, or sometimes that of a doll or a puppet; to this instrument was frequently annexed an inflated bladder, with which the fool belaboured those with whom he was inclined to make sport;—the shake of his ass's ears, and his numerous practical jokes, made even the grave gay, and prepared men of all moods to abandon themselves to the humours of the times.

Lodge, in his "Wit's Miserie," has painted the portrait of a court fool of the end of the sixteenth century:—"In person comely, in apparel courtly, but in behaviour a very ape and no man: his employment, it is asserted, was to coin bitter jests, and to sing profligate songs and ballads; give him a little wine in his head, he is continually fleering and making mouths: he laughs intemperately at every little occasion, and dances about the house, leaps over tables, outstrips men's heads, trips up his companion's heels, burns sack with a candle, and performs many other madcap and mischievous feats, in the course of which his morals, it is more than hinted, 'lose all quality of fastidiousness.'" Such was the darker and coarser side of the picture; but under much of the fool's folly and unbridled liberty of censure and mockery, would be often conveyed useful truths—home-thrusts—which durst only be uttered by all-licensed lips, and the utterance of which was, indeed, a part of the court fool's office, which required, of course, any thing but a fool to fill it successfully. And for that reason, Jacques says:—

"I must have liberty
Withal, as large a charter as the wind,
To blow on whom I please; for so fools have;
And they that are most galled with my folly,
They most must laugh" †

We find that sometimes the fool was rewarded by kinder feelings in the master than their respective positions might seem to warrant. There were both affection and regret in the exclamation of the distracted Lear—

"And my poor fool is hanged!"

We read in "Robert Wace," of Golet, the fool who saved, by timely warning, the life of William, Duke of Normandy, afterwards the conqueror of England. So that, with truth we may assert that the destiny of this great and powerful country has been shaped by a fool. Perhaps this was not the only time.

Henry the First, on the day of his coronation, gave the abbey of Ely to Richard, the son of Garl Gilbert. The abbot, however, soon fell into disgrace at court. The principal reason of the king's displeasure was, that my lord abbot had turned out of the court "in a scornful manner" a jester of the king's, who, with the license of his office, had ventured to reprove his grace upon the pomp and state with which he was attended. The punishment of his fool was never forgiven by the angry and resentful monarch, who demanded of the abbot his crosier; and it was only by the apostolical authority of the Pope that Henry was induced to restore to him the church of Ely.

William Picolf was appointed King John's fool; and his majesty held his jokes and pleasantries in such high estima-

* The court fool was a regular officer of the royal household from the Conquest to Charles II.

† "As you like it."

tion, that he granted him an estate in the year 1200. The document, which is still in existence among the records in the Tower, is addressed by the king to William Picolf, and Geoffry, his son:—

"Know ye," it continues, "that we have given, and by the present charter have confirmed, to William Picolf, our fool, Fonte-ossaune, with all its appurtenances, to have, and to hold it, for himself, and his heirs, on condition of doing henceforward annually for ourself the service of fool, as long as he shall live, and after his decease, his heirs shall hold the same land from us, by the service of one pair of gilded spurs to be rendered annually."

This same Picolf and his son received other donations in land and men from King John.

The fool of the Count of Artois added considerably to the entertainment of the guests at the nuptials of Margaret, the fifth daughter of Eleanor, queen of Edward the First, for which he was rewarded by the king, with a present of forty shillings—no contemptible sum in those days.

When that "poor, heavy, and wretched priest," Cardinal Wolsey, had lost the light of his king's countenance, he was ordered to leave his sumptuous palace at York-place, and confine himself to his house at Esher. For that purpose he proceeded to Putney in his barge; and as he was travelling by land from Putney to Esher, one of the royal chamberlains, Sir John Norris,—afterwards executed as one of the lovers of Anne Boleyn,—spurred after him, and overtaking him on the rise of a hill, presented him with a ring, which the king, who had taken it from his own royal finger, sent him, with a flattering message.

The cardinal, transported with joy at this gleam of returning good fortune, instantly dismounted from his mule, fell upon his knees in the mud, pulled off his cap, and thanked God for the happy intelligence. He told the chamberlain that his tidings were worth half a kingdom; but as he had nothing left except the clothes on his back, he could make him no suitable reward. He, however, gave Sir John a small gold chain, with a cross of gold enclosing a piece of the "veritable wood of the cross," which he continually wore round his neck next his skin.

"As for my sovereign," he added, "sorry am I that I have no worthy token to send him; but stay, here is my fool that rides beside me. I beseech thee, take him to court, and give him to his majesty. I assure you, sir, for any nobleman's pleasure, he is worth a thousand pounds."

This fool, however, whose name is said to have been Master Williams, otherwise called Patch, was so much attached to his old master, the cardinal, that he would not leave him until forcibly carried off by six stout yeomen; although he knew that he was to be transformed from disgrace and want to royalty and splendour. It is a pleasure to add that the king received him most gladly.

Sir Thomas More, after he had resigned the Great Seal, set about providing for his officers and servants; transferred his state barge—for the Thames was then the great highway of London—with its eight rowers, to his infamous successor, Audley, and his fool to the Lord Mayor of London for the time being.

Towards the close of the fifteenth century there lived at his splendid residence at Eston-Neston, in Northamptonshire,—now called Eston Hall,—a retired grocer of London, named Richard Fermor. He is recorded to have lived here in great splendour. But adhering steadily to the old religion throughout the changes of the latter years of Henry the Eighth, he became, with his Romanism and his wealth together, a tempting object of attack for the unscrupulous monarch and his myrmidons; and they at last found means to ruin him. He was arraigned in Westminster Hall, and found guilty of a premunire, and attainted; the effect of which was that he was deprived of everything he had possessed in the world, and that his wife and children, as well as himself, were thrust out of "house and hold."

The old merchant found refuge at the parsonage of Wapenham, near Towcester. The advowson had been in his own gift, and the parson had been presented by himself. Here he remained throughout the rest of the reign of Henry, and also for some years after his successor came to the throne.

But there was another person besides the parson who retained a grateful remembrance of kindness received from Fermor in the days of his prosperity.

Among other members of his numerous household had been a jester, whose art and drollery had drawn many a smile from his free-hearted master, and probably been now and then rewarded by something more substantial than applause. The jester was a great artist in his vocation, and from the service of the opulent Northamptonshire esquire had, in course of time, won his way to that of King Henry himself, where, though his merry quips might be often the dread of the courtiers, they were not the less likely on that account to be the delight of his majesty. In short, he was no other than Will Somers, who, in some degree, united the characters of court fool, and favourite.

Somers having admission to the king at all times and at all places, and especially in Henry's last days, when he was often much depressed in spirits, as well as oppressed by bodily ailments—he had grown so enormously fat that he could not pass through an ordinary door, nor could he move about from room to room without the help of machinery, or of numerous attendants; besides having an inveterate ulcer in one of his legs—took a favourable opportunity for letting fall some words in regard to the hard fate of his old master which touched the royal conscience or heart, so that Henry forthwith gave orders for the restitution of all his property to the oppressed old man. That king's death, however, happened before anything could be done; and it was not till three or four years afterwards that Edward the Sixth or his government allowed his father's mandate to be carried into effect. But at last, in 1550, letters patent were issued restoring to Fermor all his lands that still remained in the possession of the crown; and even for various lordships and manors that had been alienated some compensation was made by the grant of others in the counties of Dorset, Somerset and Essex.

In a "Banquet of Jests," published in 1634, there is a pleasant story of Archee, who, having fooled many, was fooled himself. Coming up to a nobleman, upon New Year's-day, to bid him good-morrow, Archee received twenty pieces of gold; but covetously desiring more, he shook them in his hand, and said they were too light. The donor answered, "I prythee, Archee, let me see them again, for there is one amongst them I would be lothe to part with." Archee, expecting the sum to be increased, returned the pieces to his lordship, who coolly put them in his pocket, with this remark, "I once gave money into a fool's hand who had not the wit to keep it."

Archee continued to be employed after the demise of the modern Solomon; but he incurred the displeasure of the Archbishop of Canterbury, and was therefore disgraced, and banished the court by Charles the First. It came about in the following manner.

When news arrived from Scotland of the bad reception which the king's proclamation respecting the Book of Common Prayer had met with in that country, Archee happened to meet Laud, who was going to the council-table.

"Wha's feule, now? doth not your grace hear the news from Striveling about the Liturgy?"

This was too sore a point, even for the court fool to raise a laugh upon; and Laud laid a complaint against him before the council. The complaint was attended to, and the following order was issued the same day on which the offence had been committed:—

"At Whitehall, the 11th of March, 1637.—It is this day ordered by his Majesty, with the advice of the Board, Archibald Armstrong, the king's fool, for certain scandalous words of a high nature spoken by him against the Lord Archbishop of Canterbury his grace, and proved to be uttered by him by two witnesses, shall have his coat pulled over his head, and be discharged of the king's service and banished the court; for which the Lord Chamberlain of the king's household is prayed and required to give order to be executed."

ANCIENT SHIELD IN THE "ARMERIA REAL," AT MADRID.

THE royal magazine of arms at Madrid was built from the designs of Gaspard de Vega, architect to Philip II. It is situated opposite one of the façades of the royal palace – a modern building erected upon the site of the ancient Alcazar. A selection of fine arms, brought from the fortress of Simanca according to some authors, from Valladolid according to others, served as a foundation for the *Armeria Real*, or Royal Armoury, which contains the finest, if not the most numerous, collection of the kind in Europe. The arms are ranged on either side of a long gallery, at the end of which is an armed statue of St. Ferdinand; in the centre are complete suits of armour, arranged in the same manner as those in the Tower of London. Some very valuable pieces were carried away during the civil disturbances; among these was the splendid shield represented in our engraving.

The motto upon this shield, "Seræ Spes Una Senectæ," is an allusion to the merit attached by soldiers to shields and bucklers as a means of insuring and prolonging life. The shield itself is broad and ample. The animals, which occupy the centre of the shield, are symbolical of the victories won by Spain, or by the emperor, over Africa: the imperial and crowned swan is devouring the dragon or winged serpent. The historical scenes, in the upper and ower compartments of the shield, seem to be representations of the taking of Granada and of Tunis.

From the character and beauty of the workmanship of this shield, there is little doubt that it was a production of the sixteenth century, though the artist is unknown. It is supposed to have belonged to Charles V., who was a passionate admirer of rare and beautiful arms and armour,

ROYAL SHIELD IN THE ROYAL ARMOURY AT MADRID.

CURIOUS CARVING BY ALBERT DURER.

VASARI, in his "Lives of the Painters," speaks of Albert Durer as "a diligent, industrious, *universal* man;" and his claim to the title of a "universal man" will be readily admitted by all who are acquainted with his productions. His *paintings* are admired for the lively and fertile imagination, the excellent conception, and the wonderful union of boldness and correctness of design which they display. His *woodcuts* are considered masterpieces of the art. He was the first who excelled in *etching*. His *portraits* also were highly esteemed. Albert Durer, however, not only distinguished himself as a painter,

THE NAMING OF JOHN THE BAPTIST.—FROM A CARVING BY ALBERT DURER, IN THE BRITISH MUSEUM.

and an engraver on copper and wood, he also executed several pieces of sculpture with surprising delicacy and natural expression of character. An admirable specimen of his skill in this department of art is preserved in the Print-room of the British Museum, to which institution it was bequeathed by the late R. Payne Knight, Esq., who had purchased it at Brussells for 500 guineas, several years before. This exquisite piece of sculpture measures seven inches and three-quarters in height, and five inches and a half in width. It is carved in *alto-relievo*, in hone-stone of a delicate cream colour, and is in one piece, with the exception of the dog and one or two books in the front. It bears date 1510. The subject is, "*The Naming of John the Baptist*," according to the narrative contained in the Gospel by Luke, chapter i. verses 59 to 64.

In the front, to the right, is an old man with a tablet, on which some Hebrew characters are inscribed. Further to the right, and immediately behind him, is another old man; and behind him a young man, said by some to be intended by the artist for a portrait of himself. Kneeling before the recording priest, is an aged nurse with the infant John in her arms. On the bed, Elizabeth, the mother of John, is seen lying, on the more distant side of which a female attendant is standing, and on the other an elderly man is seen resting on the edge of the bed. This latter figure is doubtless intended for Zacharias, the father of John, and as the sacred narrative informs us that he was struck dumb for a season, the artist has represented him in the act of making signs to Elizabeth with his fingers.

The figures in the foreground are executed in bold relief; and the character and expression of the heads have rarely been surpassed in any work of sculpture executed on the same scale. Albert Durer's monogram, with the date 1510, is inscribed on a small tablet at the foot of the bedstead.

This curious carving is in perfect condition, with the exception of the hands of Zacharias and Elizabeth, some of the fingers of which are broken off.

Those who are acquainted with the works of Albert Durer will perceive that our artists have copied his style of drawing and engraving very successfully.

A PEEP AT COUNTRY COUSINS, AND HOW IT ENDED.

LETTER II.

Whitehaven, April, 1820.

My Dear Father,—My last letter would say all that was necessary regarding family detail, so I will go on with my description of old customs, which you say you like so much to receive. Tom and Edward, the two younger boys, have lately been very full of an odd kind of barring-out, in which they have been engaged at the village school. This said affair has had a melancholy ending, as you will hear. The barring-out, it seems, is an annual spring-tide event, when all arrangements concerning the holidays and other matters are settled between the master and his scholars, yet it is considered a profound mystery, and the appointed day is only whispered to the initiated. When it arrived this year, the school-room was filled long before daylight, a good fire was lighted, and the door securely barricaded. Soon after daybreak, exclamations resounded of "He is coming, he is coming!" and with beating hearts (so Tom declares) the boys awaited the arrival of their dominie. He knocked at the door, then tried the latchet, but not a sound could be heard from within, and finally he looked in at the windows, confronting the boldest of the school, to whom he called out, "Boys, open the door! boys, I insist on your letting me in." But neither coaxing or threats availed him, and he left the place, to return in a few minutes with my uncle, because he was looked on as the principal parent in the village. All these preliminaries are styled "sham," and the chief fun consists in firing off salutes with a pistol, generally wheedled out of some reluctant father for the purpose. My uncle came up under a grand discharge, since, you must know, he had privately furnished each of his three boys with a pistol the previous evening, and a long speechifying succeeded, and then the master demanded through the keyhole what was the cause of the insurrection; to which his riotous pupils replied, "Our old laws, sir," and my uncle made answer, "Very well, boys, let me see them." "Here they are, sir," was the glad response, and the protocol or manifesto of grievances was pushed through a chink in the door, and in a loud voice the dominie proceeded to read the document. I saw a copy of it afterwards, and its principal negotiations were, "that the scholars should neither be whipped nor set in a corner; that they should have three vacations, of two weeks each, at Easter, Christmas, and Midsummer, as well as two days' hunting, and two days' fishing." The master in my uncle's presence signed the paper, and in the safe custody of the latter it was then lodged for the ensuing twelve months. Of course, no lessons were attempted that day, and a general holiday was allowed, which gave rise to much merry-making, and this unfortunately ended in an accident which proved fatal to a brave little lad named Hugh Johnstone. We were told afterwards that the boy's clothes caught fire, when the scholars were engaged in the daring amusement of jumping over some burning tar-barrels, that my uncle had generously bestowed in order to make fine bonfires in honour of the barring-out. So employed, the child's woollen trousers had probably been ignited some time before he took any notice of them, and when he did, it was with great difficulty that the fire could be extinguished; and the surface of his body was so extensively burned, that, after thirty-eight hours of very sad suffering, the little lad expired. My aunt stayed with the boy the whole time; but before she came back we knew that life had departed by the tolling of the passing bell early last Thursday morning; and in the evening Susannah Gawthorpe came in to us weeping bitterly, for the lad was her own cousin. She asked me whether I would accompany her to Widow Johnstone's, assuring me my going would be regarded as a token of goodwill. Of course, I assented, but could not help saying,—I longed so greatly to take her to my heart and try to console her,—"Why is it you will not let me be your friend, when I like you so much?" She replied, very sweetly, "Indeed, you are mistaken, since I liked you the first moment we met, and I know I have done wrong in appearing to avoid you." It is evident to me that some other cause than personal feeling towards myself has had to do with her peculiar manner; but we said no more on the subject just then, for our hearts were full of sad thoughts, and it was with mingled awe and reluctance that I thought of first looking upon the face of death. All dread was, however, superfluous; nothing could be more peaceful or more exquisitely beautiful than the young boy's quiet features. A little mirror over the chimney-piece, and several coloured prints, that hung round the room, I noticed were all covered by white cloths, and several young men and women sat round the body to secure its undisturbed repose until it should be laid in the grave. Even the widow seemed, to my surprise, really glad to see us; and, taking us into an inner room, perhaps experienced some relief in giving free vent to her sorrow in the presence of one who had loved her boy as Susannah had done. But she was soon wanted elsewhere, and we, in less than half an hour, took our leave, Susannah gladly accepting my invitation of her to sleep with me that night. A few words which fell from her when we were preparing for bed gave me, I thought, some insight into the feelings on her part that I had not hitherto suspected; but of these I must tell you another time. On the day before the funeral the clerk of the village church went round from house to house with a bell, which he rang in a peculiar toll, denoting the parish to which the deceased belonged. Every now and then he stopped, while his long funeral band, placed in his hat, floated on the breeze, as he made proclamation: "All friends and neighbours are desired to attend the burial of Hugh Johnstone, from Red Hope-lane to St. James's Church, to-morrow at three o'clock." This was the general invitation; but to the dwelling of those most nearly connected, and to the more influential persons in the neighbourhood, there was sent round a young girl wearing a large white calash, and carrying a tray under her arm, in

which were laid, neatly folded, packets of white paper containing gloves and bands. One set of these articles was left at my uncle's, and on Friday, about noon, the whole family went down to Widow Johnstone's, where preparations for the ceremony had been made on a large scale.

On each side of the door I noticed a small table, covered with snowy damask, and holding old-fashioned china vessels filled with sprigs of boxwood; and when the mournful procession filed out of the cottage, every one took a sprig, which they afterwards cast into the open grave. We had just left the house, when some one whispered, "The bees, the bees, has any one told them we're going?" I could not conceive what was meant, and Susannah, to whom the inquiry had been addressed, only said to me, "Wait for me one moment," and hastening back a few steps to the sunny wall, where stood the widow's chief wealth, a range of bee-hives, she spoke to them in a tone of singular mournfulness, her words barely audible, they were so interrupted by frequent sobs, as she said, "Toil on, pretty bees; toil on, for the widow's sake; but he who loved you best, little Hugh himself, is this day to be carried out a corpse from his mother's house." I learned afterwards that it was believed the bees would make no more honey if they were not informed when the deceased was going to be buried. On Susannah's rejoining me, and the procession moving on, she told me how every one was hoping that the Armstrongs—two of the guests, and distant relations to the widow—would keep quiet until all was over, for they belonged to a family celebrated for laughing loud on all occasions. We certainly heard nothing but the sounds of suppressed weeping during our melancholy walk, or until the ceremony had been concluded. But I was rather startled, at the close of the service in the church, by the fat, rosy clerk shouting out, "All friends and neighbours to take tea at the house of the deceased!" and when my uncle's family and the widow returned to the cottage, which we reached somewhat in advance of the rest of the party, we assuredly did hear an indubitable roar of merriment approaching, which caused Robert to remark to me in a low tone, "The party will be here directly, for one may hear the Armstrongs laughing; it is, alas! no wonder—the people look upon a border burial as better fun than a Carlisle wedding." My uncle told me very riotous scenes generally took place at such times, and it was a great relief to Susannah, when she found that he and my aunt had very kindly persuaded the poor desolate widow to come to the Friars, where she passed the night, as soon as she should have bade her guests welcome. This has been rather a sad letter, but it is already too long; so I must hope my next will be more cheerful; and I remain, at all times,

Your affectionate daughter,

DORA HARCOURT.

HENRY THE GREAT, KING OF FRANCE AND NAVARRE.

IN every country there are certain names which are sure to invoke enthusiasm whenever they are mentioned. In England we speak of "Good Queen Bess;" in America the mention of Washington at a public meeting is always hailed with applause; in Spain the days of Ferdinand and Isabella are considered as the "golden" ones. The deeds of William Tell, form the subject of many a stirring story for the simple dwellers of the Swiss valleys; and in France, from the Pyrenees to the Seine, the memory of Henry the Fourth is held in a kind of veneration, which we islanders scarcely understand. This sort of hero-worship is common to all ages and to all classes of minds—with the difference, however, that among the poor and uneducated the feeling is spontaneous and avowed, while with the rich and learned it is felt without being acknowledged, and spoken of only to be ridiculed; but it exists, nevertheless.

Few periods of French history are more interesting than that in which Henry the Fourth plays a part. Like his great contemporary Elizabeth, he is the most prominent historic figure of his time and country; and of his life and actions it may be said that where the historian has failed to illustrate either the one or the other, the poet, the novelist, and the painter have stepped in and gracefully filled up the canvas. Thus what Sir Walter Scott has done for the court and time of Elizabeth, Alexandre Dumas has accomplished for that of Henry the Fourth; and in the historical novels of both these writers we certainly get a clearer idea of the state of living in England and France in the sixteenth century than we can by possibility obtain from the writings of Hume or Rapin—mixed, it may be, with much that is objectionable, in a strictly historical point of view.

Henry IV. possessed all the qualities necessary to a hero. Brave, hardy, handsome, and of good address, it was not surprising that the French people should have hailed his accession to a throne which he claimed as a direct descendant of the heroic Hugh Capet. During the reign of Charles IX., and amidst the tumults which agitated France in the time of his successor, the weak and vacillating Henry III., the King of Navarre was faithful to the religion of the Huguenots; and though, to escape the massacre of St. Bartholomew, and to quiet the reproaches of the haughty Catherine de Medicis, the mother of the king, he feigned to be reconciled to the state church, there is little doubt that he was a sincere adherent to the reformed religion.

The murder of Henry III., in 1589, by the monk Jacques Clement, opened the way to the throne of France for Henry of Navarre. He had married Margaret of Valois, and had been named by the dying monarch as his successor; but the peaceable possession of power by the Bourbon was disputed by the adherents of the Guise.

"The king is dead!" was the announcement, as Henry III. fell back into the arms of his sister's husband: "Long live the king!" was the loud response; and the dynasty of France was transferred to the Bourbon.

But a rival disputed Henry's right to the throne, and only through blood he reached it at last. It would be tedious to follow the steps of the first Bourbon king too minutely, or we might tell how, after having defeated the factitious Charles X., he engaged, by the assistance of England, in wars with Spain and Austria, his popularity with the people increasing every day; how the Catholics tried many and various schemes to dethrone their Huguenot king; how, by the advice of the celebrated Sully, Henry called together the heads of the state church, and made profession of the faith; how Henry made triumphal progress through his kingdom, and won back rebellious provinces from the hands of his enemies, everywhere winning, too, the hearts of the people by his magnanimity and noble presence; how his coronation was celebrated with great pomp at Chartres; how he entered Paris as undisputed king; how, despite his generosity and great qualities, his life was many times attempted; how he issued the famous and world-known Edict of Nantes, which gave religious liberty to all persons freely; how his divorce from Margaret de Valois, and his marriage with Mary de Medicis was sanctioned by the Pope; how the conspiracy of Biron was discovered and prevented from taking effect; and how Henry made treaties of alliance with the princes of England, Holland, and Germany, with the design of humbling the house of Austria.

Only the coronation of the queen remained to be performed ere Henry intended to join the army of the allies. But it was not to be. "Man proposes, but only God disposes." The queen was duly crowned, and Henry appointed her regent during his absence. This is the episode chosen by Rubens. Henry is presenting the golden orb, the emblem of sovereignty, to his queen; his son Lewis, then about thirteen years old, standing between them. At that moment it may be that he was meditating splendid and glorious projects for the advancement of his country, and the "pomp and circumstance" of war already filled his imagination. On the morning succeeding the queen's coronation, he wished to visit the arsenal, but the illness of

Sully made him postpone it. The next day he fell by the hand of the infamous Ravaillac. Ordering his carriage, he set out, attended by a small number of gentlemen, and very few attendants; the curtains were drawn up, that he might witness the zeal of his subjects, in the various ornaments they had prepared. In a narrow street the coach was stopped by the accidental meeting of two carts: the attendants took a nearer way. As the king turned to read a letter to the Duke d'Epernon, he received a stroke from a knife: he had scarcely time to say, "I am wounded," before a second, more violent, pierced his heart: he sank back in the carriage, a corpse!

Thus perished, A.D. 1610, Henry the Great. No one ever ascended a throne under more unfavourable auspices; a dis-

FROM A PAINTING BY RUBENS.

united kingdom, discontented nobility, a clamorous and oppressed commonalty; his policy cemented the provinces, his valour humbled the nobles, his humanity relieved the commons; he restored plenty at home, and rendered his kingdom great and formidable abroad.

THE LEUCORYX ANTELOPE.

The antelopes form a family of themselves, and stand at the head of the caprine tribe. They are distinguished from the goats by possessing spiral and lyrated horns, and frequenting open plains and barren wastes instead of rocks and mountains. animals depicted in the engraving are a rather rare kind of antelope, frequenting the deserts of Nubia. A male and female specimen were purchased by the Zoological Society from the celebrated collection formed by the late Earl Derby

THE LEUCORYX ANTELOPE (CRYX LEUCORYX) OF NUBIA.

The larger species live in families, while the smaller kinds of antelopes are not unfrequently solitary in their habits. They possess extreme strength, agility, and swiftness; and though shy and wild in their natural state, are soon tamed when brought into communication with mankind. The at Knowsley, and the kid was born in the gardens at Regent's Park.

The Leucoryx is a gracefully formed and gentle animal. It has a smooth coat of a light fawn colour, and displays none of those vicious propensities observable in some descriptions

of antelopes. It feeds upon all kinds of corn and several varieties of green herbage. Though naturalists now speak of the Antelopes as a distinct species, Cuvier considered them but as a variety of the goat tribe, of which the Ibex formed the connecting link. The Ibex is not unlike the Leucoryx in appearance, frequenting the mountainous ridges of Switzerland and Savoy in vast numbers.

In reference to the animal under consideration, it may be said to differ from the Ibex rather in external than in anatomical form. Each species would, probably, breed with the other; it is extremely difficult to say where the sheep ends and the goat begins, and no less so to declare what difference really exists between the Antelope and the Ibex.

The Abyssinian Ibex is somewhat more elevated on the legs than the Leucoryx, of a dirty, brownish, fawn colour, with a short beard, and lengthened hair under the throat down to the breast.

The Caucasian Ibex.—M. Guldenstadt first described this species, which he discovered in the northern part of the Caucasian mountains. In size and proportions, it resembles the Ibex of Europe, but is broader and shorter in the body; dark brown on the superior parts, and white on the inferior. The hair of this species is hard, more ashy in winter, and at the root interspersed with much grayish underwool. This species of Ibex is equal, if not superior, in strength and agility, to the Alpine, making immense bounds with the utmost confidence. Monardes relates that he saw an Ibex leap from the top of a tower, and falling on its horns, immediately spring up and move on, without having received the slightest injury. It resides in the Caucasian mountains, and is probably found in the highest mountains of eastern Persia.

The ægagrus is another species distinguished from the former by the horns forming an acute angle in front, with the ribs less broad, assuming an undulating edge, and the posterior part rounded.

NATURAL FORMATION OF SOIL.

Nothing can be more truly beautiful in itself or more deeply interesting to a reflecting mind, than the process by which nature constantly produces an accession of soil, and an accumulation of vegetable matter to render it fertile. The process is varied so as to be exactly adapted to overcome the obstacles which the circumstances which each particular district present; but although the means employed are infinitely various, the final result is always the same. When the surface of a rock, for instance, becomes first exposed to the atmosphere, it is at once attacked by agents which operate mechanically and chemically. Light calls into activity the latent heat; the pores become, by that means, sufficiently enlarged to admit particles of moisture, which gradually abrade the surface and produce inequalities; upon these inequalities the seeds of lichens are deposited by the atmosphere; these forerunners of vegetation take root, and the fibres by which some sorts of these diminutive plants adhere to the rock, concoct a vegetable acid peculiarly adapted to corrode the substance with which it comes in contact, and increase the inequalities which heat and moisture had already formed. These diminutive plants decay and perish; when decomposed they form a vegetable bed suited to the production of larger plants; or when the surface of the rock happens to present clefts, or natural crevices, they fall into them; and there mingling with fine particles of sand, conveyed thither by the atmosphere, or crumbled by the action of the air from the internal surfaces of the crevices themselves, they form fertile mould. Nature having advanced thus far in her preparations, makes another forward step. She sows the soil which has been created by the decomposition of vegetable matter, with some of the more perfect plants, which it is now becomes capable of sustaining. These continue to be produced and decomposed until a soil has been prepared of sufficient depth and richness to bear plants of still higher quality and larger dimensions. The process of nature acquires accelerated force as it advances toward its consummation. When a sufficient depth of soil has been formed to produce ferns, for instance, these annually decay and die; their decomposed materials gradually form little conical heaps of vegetable mould round the spot on which each plant grew. When this has gone on for a period of sufficient length to spread these cones over a given surface, nature takes another stride: she sows furze, thorns, and briars, which thrive luxuriantly, and by annually shedding their leaves contribute, in the end, to add greatly to both the depth and fertility of the mould. This species constitutes, in truth, the means which nature principally uses in preparing a bed for the growth of the more valuable trees. It is well known that these are the plants which make their first appearance in fallows, or in woods which have been recently cut down. Into the centre of a tuft of brambles, is accidentally carried the seed of the majestic oak; meeting with a congenial soil, it soon vegetates: it is carefully and effectually cherished and protected by its prickly defence, against all injuries from the bite of the animals which roam over the waste. The larger trees having reached a height and size which render shelter unnecessary, destroy their early nurses and protectors, by robbing them of the light and air indispensable for their well-being. The thorny plants then retire to the outskirts of the forest, where, in the enjoyment of an abundant supply of light and sun, they continue gradually to extend the empire of their superiors, and make encroachments upon the plain, until the whole district becomes at length covered with magnificent trees. The roots of the larger trees penetrate the soil in all directions: they even find their way into the crevices of the rocks, filled, as these are already, by decomposed vegetable matter: here they swell and contract, as the heat and moisture increase or diminish. They act like true levers, until they gradually pulverize the earthy materials which they have been able to penetrate. While the roots are thus busy under ground, boring, undermining, cleaving and crumbling every thing that impedes their progress, the branches and leaves are equally indefatigable overhead. They arrest the volatile particles of vegetable food which floats in the atmosphere. Thus fed and sustained, each tree not only increases annually in size, but produces and deposits a crop of fruit and leaves. The fruit becomes the food of animals, or is carried into a spot where it can produce a new plant: the leaves fall around the tree, where they become gradually decomposed, and, in the lapse of ages, make a vast addition to the depth of vegetable mould; and whilst the decomposition of vegetables makes a gradual addition to the depth of the cultivatable soil, another cause, equally constant in operation, contributes to increase its fertility—the produce of the minutest plants serves to subsist myriads of insects: after a brief existence, these perish and decay, and their decomposed particles greatly fertilize the vegetable matter with which they happen to mingle. The period at length arrives when the timber having reached its highest measure of growth and perfection, may be cut down, in order that the husbandman may enter upon the inheritance prepared for him by the hand of the all-wise and all-beneficent Author of his existence. Such is the system, which they that have eyes to see may see. Plants which appear worthless in themselves—those lichens, mosses, heaths, ferns, furze, briars, and brooms, in which *economists*, forsooth! perceive only the symbols of eternal barrenness—are so many instruments employed by perfect Wisdom in fertilising new districts for the occupation of future generations of mankind:

"The course of Nature is the art of God"

The wastes of this country, as they have been managed for ages, have been partly taken out of the hands of Nature without having been wholly taken into the hands of man. The constant depasturing of cattle on wastes and commons counteracts the means which Nature makes use of in producing fertility, and, in consequence, greatly retards the period when the soil becomes sufficiently deep for agricultural purposes. There is not, perhaps, a healthy waste in England, which would not become a forest, were the peasantry restrained from setting their flocks upon it.

EUROPEAN MANNERS IN THE EAST.

At the time I was in India there were many, particularly among the younger branches of the army, who complained that they could not get into society at the presidency; but I cannot help thinking that the fault was, in some degree, their own. They were either too proud or too idle to seek it. Sullenly shutting themselves up in their barracks, or in obscure quarters in the Black Town, they expected that men accustomed to have court paid to them for their situations, or engaged in official business, would, or could, go out of their way to find them out. If at a ball, they would complain of the impossibility of procuring partners; but this they owed chiefly to their want of acquaintance; for I did not observe that the ladies—that is, the married ones—gave themselves greater airs in India than elsewhere. In fact, a *mère de famille*, from the scarcity of petticoats, thinks it becomes her to be as gay, if not gayer, than single ladies in England. With a miss it is quite different; for if her appearance be such as to render her desirable as a partner in a dance, she is also, for the same reason, considered by many as a desirable partner in a more important concern, and therefore not likely to be left at liberty to dance with a subaltern, even if she should feel disposed to accept that honour, which is not at all probable. Indeed, the matrimonial market in India is much the same as other markets for live stock, where the best possible price is obtained for the article. The first ball after the arrival of a fleet from Europe may be considered as a kind of fair day, where the new-comers of the softer sex are shown off, and where every family that has the advantage of possessing a fresh attraction, whether of its own, or consigned to it from the mother-country, takes care to appear. The rank or property of the suitor is the price offered for the article; and, in estimating this, the gradations from a member of council or general to an ensign or assistant-surgeon are as well understood and as clearly defined as the gradations of the currency from a sovereign to a farthing, or from a gold mohur to a doody; the civil and military branches of the service preserving the same relative value that is assigned to them in the tables of presidency published in the East India Directory. The system pursued in disposing of the fair objects is exactly the same as that used at the sales of king's stores in a dock-yard, where the auctioneer begins by putting the highest price on the article, and keeps lowering and lowering, till some bidder assents to the price and bears off the goods. First, the young lady is instructed to set her cap at a civilian high in office, or at an officer high on the staff. If in the course of a few months there is no bidding at that price, then she condescends to cast a smile upon the second rank, and so on to the bottom. Should she possess any pretensions to beauty, she is soon snapped up; for the scarcity of the article prevents people from being very fastidious in their tastes. If of the true European white, she is almost sure to go off tolerably well; but no mixture of the Asiatic will suit persons of any rank. Should the young lady continue on hand till the arrival of a fleet conveying a fresh supply of fair ones, she is, of course, thrown somewhat into the back-ground, and her chance of a good match considerably diminished; so it often happens, that females are thus compelled to accept offers which, at first starting, they would have rejected with disdain, and in some instances to take the very men whom they once treated with scorn. But she must be a hapless virgin indeed, and possessed of no ordinary *de*tractions, who is compelled, as a *dernier resort*, to put up with an ensign of native infantry, by whom she may be borne off to spend the honeymoon in a hill-fort. How happy marriages in general prove among Europeans in India may hence be inferred.

In every society there will always be a certain number of low-minded persons, who pay no respect but to rank or riches. One family I recollect in particular at the presidency, which was so notorious in this respect, that a trick, which was played them by a captain of the navy whom they had offended, afforded considerable amusement, if not gratification, to the greater part of the settlement. Expecting to meet this family at the assembly-rooms, he brought his son, a young midshipman, ashore with him, and introduced him as the *Honourable* Mr. So-and-so. As he anticipated, the bait took, and a set was immediately made at this sprig of nobility by the party in question. The daughters monopolised him as a partner during the evening. His dancing was admired, his face pronounced truly patrician, his manners considered superior, and even his *gaucheries* set down as the *véritable ton*. They begged as a favour that the captain would allow him to stay on shore with them for a short time—they would take such care of him. To which the captain, after some demur, for "he was given into his special charge," consented. The next day middy is taken round to see the lions, and to be introduced to their most fashionable acquaintance. His cocked hat is rather the worse for a sea voyage, and his dirk is grown shabby: they stop at the European shops, and new ones are presented to him by the hands of the young ladies. A ball is given on purpose for him. In short, every possible attention is paid to the little *honourable*, whose noble parents will doubtless seek out the family on its return to England, to repay the obligation; and already had they began to anticipate the pleasure which they should enjoy at the countess's fashionable parties, and the advantages they should derive from being introduced into the *beau monde* through the means of her ladyship. In fact, middy was in clover. To be obliged to part with their young friend at last was painful. It cost the fair members of the family some tears, and gained middy some caresses, and, what was of more value, some substantial tokens of friendship; and fame went so far as to say that he carried away a lock of hair belonging to one of the young ladies. Nor did they part without mutual promises to renew the acquaintance in England.—*Twelve Years' Military Adventures.*

THE PRESIDENT'S HOUSE AT MONROVIA, THE CAPITAL OF LIBERIA.

Among the interesting and picturesque scenery on the western coast of Africa, few points present to the traveller greater attractions than the little city of Monrovia, the seat of government of the republic of Liberia; situated near the mouth of the Mesurado river, about four miles south-east of the entrance of the St. Paul's river into the ocean, immediately in the rear of Cape Mesurado, in lat. 6° 19′ north. Located on an elevated site, commanding a fine view of the ocean to the west and south, and of the forest-clad hills and mountains of that luxuriant and beautiful country towards the north and east, and containing many comfortable-looking dwelling-houses, interspersed among tropical fruit-trees of almost every variety, it presents an appearance of comfort and refinement among the citizens, and strongly contrasts with the rude hamlets of the uncultivated aborigines in the vicinity.

Less than a third of a century ago, the spot where now stands this beautiful and flourishing little metropolis was covered with a dense forest, the solemn silence of which was disturbed only by wild animals, or occasionally by human beings apparently scarcely more civilised than their four-footed neighbours. But through the agency of the hardy pioneers of the great African colonisation enterprise, the forest-trees were felled, and temporary places of residence erected; which, from time to time, have been superseded by more elegant and substantial buildings, among which is the mansion-house of his excellency, Joseph J. Roberts, the President of the Republic—a two-story brick house, with the necessary back buildings, located near the centre of the town, immediately opposite the old government-house.

The dwellings of many of the citizens of Monrovia, as well as the presidential mansion, are not only comfortably but elegantly furnished; and some of the residents of this little bustling com-

mercial mart live in a style of ease and affluence which clearly demonstrates the fact that a residence in Africa is not necessarily associated with the privation of the good things of this life. Many of the houses are built of bricks manufactured in Liberia. The state house, and the three principal churches—all commodious buildings—and most of the large warehouses, are built of stone. Attached to most of the dwelling-houses are gardens, some of which are handsomely adorned with trees, shrubs, and flowers, of great variety and beauty; among which may be seen the symmetrical orange and mango, the luxuriant guava, the graceful papaw, the broad-leaved plaintain and banana, the beautiful cocoa-nut, the delicate and fragrant white-blossomed coffee, and many other useful and ornamental products of that land of perpetual spring,—the greater part of which for ages has remained in its native uncultivated state, the abode of ignorance and superstition, the hunting grounds of the untutored aborigines, or the battle-fields of contending belligerent tribes, saturating the soil with the blood of the slaughtered victims of superstition and cruelty.

But a brighter day has dawned on that land. The standard of Christianity has been planted on the margin of that vast continent. Institutions of learning have been established there. A young republic, composed entirely of persons of colour, has arisen upon that coast; and like a beacon it there stands, "self-poised and erect," casting its cheering light athwart the midnight gloom of that benighted land, and unfolding to the degraded sons and daughters of Africa the practicability of the maintenance by the coloured race of all the institutions of political and religious liberty, and of the highest civilisation and intellectual cultivation.

"To the Anglo-Saxon race," says Mrs. Stowe, "have been intrusted the destinies of the world, during its pioneer period of struggle and conflict. To that mission its stern, inflexible, energetic elements were well adapted; but, as a Christian, I look for another era to arise. On its borders I trust we stand; and the throes that now convulse the nations are, to my hope, but the birth-pangs of an hour of universal peace and brotherhood.

"I trust that the development of Africa is to be essentially a Christian one. If not a dominant and commanding race, they are, at least, an affectionate, magnanimous, and forgiving one. Having been called in the furnace of injustice and oppression, they have need to bind closer to their hearts that sublime doctrine of love and forgiveness, through which alone they are to conquer, which it is to be their mission to spread over the continent of Africa."

President Roberts is now about forty-four years old. He was born of free parents in the city of Petersburg, Virginia, where he resided until he emigrated, with his mother and brothers, to Liberia, in 1829. He has resided in Liberia about twenty-four years, during the last eleven of which he has presided over the destinies of that young nation—for six years in the capacity of governor of the "commonwealth," under the appointment of the American Colonization Society, and during the last five years in the capacity of president of the "republic;" having been first elected by the people in 1847, re-elected in 1849, and again re-elected in 1851. In 1848, he visited Europe, and succeeded in obtaining a formal recognition of the sovereignty and independence of the republic of Liberia by both the British and French governments, with both of which he concluded important treaties of amity and commerce. From the officials of both these governments, as well as from many other distinguished and influential persons in these two countries, he received evidences of the highest consideration. During the last year he again visited Europe, and succeeded in effecting further arrangements highly important to the prosperity of Liberia. Under all circumstances in which he has been placed, he has shown himself to be a wise statesman, a judicious and skilful diplomatist, a correct and vigorous writer, and an uncompromising patriot, a true lover of his country and his race, and altogether an extraordinary man, peculiarly qualified for the responsible duties devolving on him as the chief magistrate of the republic of Liberia.

RESIDENCE OF JOSEPH ROBERTS, PRESIDENT OF THE REPUBLIC OF LIBERIA.

THE DEAD BRIDAL.

CHAPTER VI.

"Amongst many other things that doe famouse this citie, the mountebankes are not the least; for although there are mountebankes also in other cities of Italie, yet because there is a greater concourse of them in Venice than elsewhere, and that of the better sort and the most eloquente fellowes; and also for that there is larger toleration of them here than in other cities, therefore they use to name a Venetian mountebanke for the Coryphæus and principall mountebanke of all Italie. I have observed marveilous strange matters done by some of these mountebankes; moreover, I have seen some of them doe such strange iugling trickes as would be almost incredible to be reported."—*Coryat's Crudities.*

BARTOLOMEO, THE CHARLATAN, ADDRESSING THE CROWD. PAGE 387.

The cheery sun of a spring morning was shining down upon the waters that flowed around and through Venice—not as he shines upon us here in Britain on an April day, now blotched and blotted out from the face of heaven by a mass of clouds, now struggling through lighter vapours, now laughing them away with his brightness or mocking their tears with his smiles—no, but looking down through a cloudless sky, in which there was not one fleck of white to chequer the universal blue, and scarce a breeze to temper a warmth that would be to us at home as the heat of summer. The hour was, judging from the sun's elevation, midway between dawn and noon; and the gondolas were skimming to and fro along lagunes and canals, just as hackney-coaches in the days that are now gone by, and Hansoms and cabs at present, ply through our metropolis, only in a manner far more easy to the half-recumbent body, and more picturesque to the half-closed eyes. As one of these aquatic coaches sped along through the Canale Grande, close by the water's edge, it was encountered by a similar vehicle, which shot suddenly from under one of the low narrow bridges that span the smaller canals which everywhere open into the principal one, as the smaller arteries into the great ones. Accidents of this sort will even still sometimes happen in Venice now-a-days, notwithstanding the marvellous skill and dexterity of the gondoliers; and, of course, there is no reason why the oars and men of five hundred years ago should be exempt from a casualty which their modern successors cannot always avoid. The boatmen of the respective gondolas commenced forthwith to indulge in that species of vituperation which, in all times, seems to have been a favourite mode of warfare with the propellers of conveyances when impeded in their motion, from the days of Juvenal, who commemorates the "stantis convicia mandræ," to those of our own days, when our ears have been edified with the maledictory slang in which London cabmen apostrophise each other's eyes when they meet and obstruct each other in a narrow thoroughfare. The gentleman, for such he was, who sat within the first-mentioned gondola started up and drew back the curtains, with the intention, very probably, of personally resenting the insolence of the other gondolier, in case he found that his fare was of a sex and constitution with whom he could quarrel; and, indeed, such results were not very uncommon amongst a people where the blood was as quick as the pride was sensitive. How the matter might have ended it would be difficult to say, nor indeed would it, as will appear, be very important to speculate, had it not so happened that at the same moment the occupant of the assailing gondola—for such we consider the one which came from the smaller canal was—also pulled aside the curtain which screened him, and they both were face to face. An exclamation of surprise was uttered at the same moment by each of the gentlemen.

"Jacques!" cried the one.

"Giulio!" cried the other.

The boatmen, seeing the friendly recognition with which their respective fares greeted each other, at once discontinued their wordy contest, and, by a tacit understanding, they brought their gondolas side by side, so that the two gentlemen were able to exchange a cordial grasp of the hand.

"Ben arrivato a Venetzia, ben arrivato carissimo mio," cried our old acquaintance, Giulio Polani. "Per Bacco! you were about the last man I should have expected to see in our fair city."

"Pardieu!" replied the stranger in an accent that had something of the farther side of the Alps in it. "Pardieu, my dear Polani, it may be so, yet, nevertheless, here I am, and I assure you I count myself fortunate that almost the first respectable face I have seen since my arrival in your bella Venetzia should be that of so dear a friend. Ben trovato, ben trovato!"

"Well, and whither are you going now, Jacques?"

"Faith, nowhere in particular, Giulio; I was about to kill an hour or two at this unfashionable time of day, and for that purpose I put myself into the care of this worthy, ce monsieur le gondolier, who has, as you perceive, made so excellent an attempt just now to kill your humble servant instead of his enemy, Time. Ma foi, I should not much like to make much acquaintance with the bottom of your canals; and as to the surface, we have been shooting this half hour through all sorts of dykes that look like over-grown sewers, and under little, low bridges that make one involuntarily take off his bonnet and bow his head in token of respect for such stupendous creations."

"Or out of regard for your own aigrette and feather, and your exquisite chevelure, Jacques," added Giulio, laughing. "But come, my friend, you shall put yourself under my guidance. Let your gondolier put round," said he, making a sign to the boatman; "I was just going to the Palazzo Polani, which is close at hand here, when those fellows knocked the heads of their boats together."

The men obeyed the signal, and both gondolas skimmed side by side along the water for a short distance, till they stopped beside a flight of marble steps that, rising from the water, led up to the portico of the Palazzo Polani. The two gentlemen left their gondolas, and ascending the steps passed into the mansion.

"Well, Taddeo," said the gondolier of Count Giulio to him who had rowed the stranger, "what hast thou got there, lad? Thou lookest as if thou wert bitten by a tarantola? Has the stranger, with all his bravery, given thee base coin or a paltry zecchino?"

"Proprio il diavolo! no such thing, Christophero," replied the man addressed, who was intently regarding something in his hand. "The eccelenza is a true noble, a lord or a prince, or an emperor mayhap. Look you, 'tis a real yellow golden piece," and he held it up between his finger and thumb admiringly.

"A golden florin, by St. Nicholas!" cried the other. "Thou art in good luck to-day, Taddeo mio. But thou knowest one half of that is a '*buonmano*,' and thou art bound to drink the health of his excellency. So come, lad, thou shalt take me with thee to aid in doing him honour. Besides, thou owest me something for running foul of me just now."

"Cospetto, no, Christophero; 'twas thine own fault entirely; thou knowest very well thou shouldst not have kept so close to the *riva*; 'tis against the ordinances. Faith, if I were to have thee up before the '*Signori alle acque*,' I trow they would lay upon thee smartly in the shape of fine."

"Well, well," said the other, "whoever was in the wrong, thou hast got the best fare and I the most damage. See you how the side of your boat has bent the iron of my prow and well-nigh broken it in two; but I bear thee no malice, Taddeo."

"Nay, for the matter of that," said the other, "I will keep up no grudge either. So come along, *compare*, I care not if I stand a bicchiere di vinello."

"Diavolo, what dost talk about—a bicchiere di vinello! I tell thee, we cannot do less than drink a whole fiasco of the best wine, Liatico or Muscadine at the least, to the health of his excellency. So push away, Caro mio, no one keeps better wine than old Paolo, the tavernajo, near the church of San Nicolo."

While the boatmen were gliding amicably away through one of the lateral canals that led from the Canale Grande to the quarter of San Nicolo, the two gentlemen whom they had been rowing had passed through the pillared hall, and up the marble staircase, and entered a stately apartment such as the Venetian nobles delighted to display for the reception of guests. The walls were covered with ancestral pictures, and the furniture was rich in gold and marble, and curiously wrought tables, and costly ornaments of glass. Giulio now cordially embraced his friend, pressing him within his arms, and touching either cheek with his lips—a custom which at first strikes an Englishman as extravagant and effeminate, but which, in time, he learns to feel is neither the one nor the other amongst people whose impulses are stronger by nature, and put under less restraint by education than are our own.

"Welcome, once more welcome, my dear Jacques, to Venice and to my father's house. I grieve he is not here to receive

the friend and benefactor of his son as his merits deserve; but count his house your own; and such poor cheer as it can afford in these times of war and necessity is heartily at your command."

"A thousand thanks, dear Giulio," said the other, warmly returning the pressure of his friend's hand. "But in truth thou dost rate too highly the trifling service that it was my good fortune to render thee in the gay capital of France. The loan of a few gold pieces happily enabled thee to avail thyself of the fortune of the dice, and to retrieve thyself. It was a pleasant sight to see thee take thy revenge upon the sharpers of Paris. But as thou must needs remember this matter, why thou shalt even repay the obligation tenfold by showing me some of the wonders of your celebrated city of Venice, whereof I have heard so much."

"Most willingly, my dear Jacques," said the young Venetian, "though I advertise thee that thou shalt see us now but to small advantage. The present war has drained the city of our gayest nobles, and thou wilt find Venice but a *triste* place just now. But tell me, to what favouring gale we are indebted to thy presence? When we parted in France, a visit to Italy was not in thy thoughts."

"In good faith, Giulio, I am, as thou knowest, but a rolling stone at best, gathering little moss, as the proverb hath it."

"Aye, Jacques, but gaining all the more polish."

"Well, it may be so," said the other. "But now, how wilt thou order our movements?"

"Why, Jacques, it is yet too early to see our clarissimos and ladies, so we shall even sally forth in the meantime to see whatever chance may throw in our way. Believe me, there are things in this our Venice that will amuse thee, if it be but for their strangeness."

"It is so reported," said Jacques, "and I long much to inspect them."

"Meanwhile," said Giulio, "your effects shall be brought from the Osteria, and then we shall return to doff our travelling attire, and prepare for visiting. I would willingly make you known to some of my fair countrywomen."

"That is what I most desire. I have always heard that your Venetian dames are not easily accessible to strangers, but that they are beautiful and charming; and in truth I count much on your friendship in affording me this pleasure."

"That will I gladly, and thou shalt confess that rumour has not overrated their loveliness. So look to your heart, Jacques."

The young man laughed with careless gaiety—"Oh, fear not for me, Giulio, I am well nigh proof against the spells of womankind."

"We shall see, we shall see," said the other; "be not over-boastful, my friend."

"Well, well, let us proceed. Thou shalt first pledge me, Jacques, in a cup of such wine as Venice affords."

So saying, Giulio summoned a servant, who speedily entered bearing a salver upon which were various refreshments and two large bottles of coloured glass, small in the neck, but swelling out into very goodly dimensions in the body, and which from their shape had obtained the name of *Ingistere*. When they were set down on the table, the host continued:—

"Here is wine of Cyprus, if thou wilt; or, what sayest thou to this other, which is from the grape of Southern Italy? We count the Lagrime di Christo the most delectable of all liquors."

"And with justice," said Jacques; "I have heard of a worthy French monk who was so affected with its delicious flavour, that he exclaimed, '*O Domine, Domine, cur non lachrymasti in rigionibus nostris!*'"

"The taste of the good father was more to be commended than his piety," remarked Giulio, with a smile; "but let it pass. So now fill to our pleasant rambles."

"Buon viaggio," said Jacques, pouring out the wine into a drinking glass, and courteously touching the rim of his host's bicchiere with his own.

The young men issued forth from the palazzo at the side opposite to that which faced the canal, and found themselves in a *cortile*, which having traversed, they passed along various narrow streets or *cali*, and crossing occasionally the small canals by means of steep bridges which were ascended by flights of steps on either side, at length they emerged into more open ground in the front of the church of *San Geminiano*, which forms the western limit of the Piazza di San Marco.

A little beyond the façade of the church, a dense crowd was collected, consisting principally of the lower classes, mechanics, sailors, and labourers, with here and there a merchant or a master of a bottega, the one arrested, it might be, in his passage through the great thoroughfare of Venice, the other attracted from his counter to witness the spectacle at which they were now looking. There were not wanting, too, troops of boys and an abundance of the women of that rank in life who scruple not to be abroad whenever their avocations require, and their large veils of black, white, and yellow, according to their age and condition of wife, maid, or widow, and their glancing necks and shoulders, which were but poorly concealed by such flimsy covering, gave variety and piquancy to the scene. The most casual observer could not fail to be struck with the fact that the heads of the women for the most part were on a level with those of the other sex, and indeed occasionally out-topped them. When one looked down, however, the mystery was solved, for each woman stood in a strange sort of wooden clogs, called *cioppini*, covered with leather of different colours, according to the caprice of the wearer, and varying in height from a few inches to half a foot. The concourse thus brought together were evidently intent upon some object that was in the Piazza, in the direction of Saint Mark's, and as the further progress of the two friends was somewhat impeded, they also turned their eyes in the same direction. Midway in the Piazza was a rude stage of boards, raised up some few feet from the ground upon benches or forms; and upon the stage appeared several persons, some of them with masks of a grotesque character, and all dressed in the tawdry bravery of players of those days. One was readily recognised by the gaudy colours of his hose and doublet, and the immense ruff beneath his chin, as the representative of the gallant or young lover; another, by his visard and antics, was unmistakeably the fool or jack-pudding; while two or three women (an unusual thing except in Venice at this period) appeared in various dresses. But the principal of the troop was the ciarlatano or mountebank, who stood at one extremity of the stage near to a large chest, in which were deposited a strange variety of the most incongruous things imaginable. A flourish of music ensued, which, to speak truly, was more commendable for its noise and energy than for any harmony which was produced; indeed, harmony could not be reasonably expected from the musicians themselves, or the instruments upon which they performed, which were cornets, lutes, and hurdy-gurdys, or vielles as they were called. During this performance, the ciarlatano opened the chest and drew forth his various wares. There were unguents of divers kinds in bottles of various colours; waters and lotions of marvellous virtues; drugs of unheard of potency; elixirs, salves, cosmetics, songs, charms, and a multitude of other wonders which no tongue save his own could recount or describe. These, as he took them forth one by one, he held up to the gaze of the multitude, and when the first tempest of music was stilled, the ciarlatano raised himself to his full height, and extending both his hands, the fingers of which were covered with thick, silver rings, he held up a phial with an oily liquid in one hand, and flourished the other as he addressed the people.

Jacques said to his friend—"Stop a little, Giulio; I would gladly listen to one of your ciarlatani, who, I hear, are the most wonderful in the world."

The young men accordingly stood still, and had no difficulty in hearing the mountebank's oration.

"Eccomi, cittidani di Venetzia, eccomi, Bartolomeo Venturini, medico, magico, astrologico, dentista e professore. Here am I, who can read the stars, cure all diseases, and draw teeth—*senz'alcun dolore*—without your feeling as much as a twitch of pain. Messires, have any of you here a bad tooth? Eh ben, I can draw it, if it have one prong, or two

prongs, or three prongs (and here he held up a finger for each prong), be they straight or crooked (twisting his fingers together), it is all the same to Bartolomeo Venturini. Ebbene, qui vuol un di queste mirabile bottiglie? And only two zecchini a-piece." The ciarlatano upon this held out the bottle to the crowd.

"What is it good for?" asked an old woman who had made her way up near to the stage.

"What is it good for?" said Bartolomeo, repeating her question. "What is it *not* good for, mamma mia? 'Tis good for cholics and rheumatism—for the ague and for the fever; aye, per bacco, and for the plague itself."

"Santissima Virgine!" ejaculated the old woman, at the dreaded name of the plague. "If 'tis good for all these, 'twill do something for the rheum in my eyes, belike."

"Sicuro, madre mia, sicuro, 'tis the very thing for them. Here"—and he gave the poor old soul the bottle, and got her money.

"Ah, bella, bella," addressing a smart young widow, "thou hast nothing amiss with thine eyes, and needst no salve or wash for them, but I have the choicest cosmetic for thy cheeks, that will make them glow like the brazen horses above St. Mark's, there beyond, with the sun shining on them."

The widow simpered, and said nothing; nevertheless, when the quack held out a little box of unguent to her and said, "Only four zecchine, bella donna," the money speedily found its way into his hand, and the bottle into hers.

"Who wants julaps for all sorts of weakness of the limbs? Ecco una medicina maravigliosa! una medicina santissima!" and he held up high in the air a small paper packet "the receipt whereof was gotten from the blessed Saint Luke the physician himself. Know you not all of you Giuseppe Ladro, the Calzolaio, the cobler, that lives hard by? Well, his brother Tomaso, un povero diavolo, did I not cure him of a weakness and anguish of his loins, when he was doubled up—thus—cosi?" And the knave mimicked a man bent together with pain, in a manner so irresistibly comic, that the whole of the rabble burst into shouts of laughter.

And so the wily charlatan continued to sell his nostrums, and above all his love philtres and charms in all directions. Then, when he rested for a while, the others began to play and sing, and the jack-pudding amused the bystanders with all sorts of jokes and smart things suitable to his auditory.

After a short time, Bartolomeo again advanced to the front of the stage with a knife in his hand, and, bareing his left arm, he inflicted a frightful gash mid-way between the wrist and elbow that seemed to cut almost into the bone. The blood spouted from the arteries so frightfully, that one would have thought the man could not fail to bleed to death in a few moments, and the shriek's of the women, and ejaculations of the men, at once testified to their horror and astonishment. The mountebank, however, poured upon the wound a dark glutinous balsam, and in a moment the blood was staunched, and when the arm was wiped the wound was not discoverable. This marvel being performed, he drew from the inexhaustible chest a large viper, and suffered the reptile to crawl and twine round his naked arm. He was just announcing to the wondering crowd how that this same viper, with whose sting he played, was lineally descended from the very reptile that stung the blessed Saint Paul at Melita, when his eye recognised Giulio and his friend at the outer extremity of his audience.

"Ah! noble young gentleman, excellent clarissimi!" cried he. "What can Bartolomeo do for you? Here is a mirific unguent from a cock's comb to make your beards grow; or will you have a philtre of agnus castus to cause all the doors of Venice to fly open to you, and to set every bella ragazzina in the town dying of love for your sweet persons?"

The youths, as might be expected, only smiled but made no reply, and now endeavoured to make their way along the skirt of the crowd, seeing that the eyes of the people were turned upon them. But the ciarlatano was not to be thus baffled, for he well knew that a joke at the expense of a noble, when it could be indulged in safety, was ever relished by the people with the keenest enjoyment.

"Nay, do not depart yet, eccelentissimi: we have got choice drugs for nobles. Here is a famous purge for pride; this other is a fomentation to bring down vanity; and here are sweating powders to assuage sensuality."

The young men had by this time pressed onward, and had reached almost the centre of the Piazza, and come right opposite the front of the mountebank's stage; Giulio turned round quickly at these last words, and looking scornfully at the utterer, exclaimed—

"Per dio, varlet, wert thou not beneath my displeasure, it were well done to send thee to the office of the '*Cinque della Pace*,' hard by. A score of stripes across thy back would, I trow, be a better medicine to cure thee of petulance, than all thy drugs and nostrums."

Bartolomeo was stung by the bitterness of the youth's rebuke, more than he would have been by louder or angrier words; and as the laws for the internal regulation of the city were administered somewhat laxly during the war, he was emboldened to take his revenge. So he continued his bantering:—

"Brave gentlemen, would ye have the latest news from the troops, seeing that ye keep at home with your mothers; or shall I consult the stars and cast your nativities. Beseech you, let me calculate your horoscopes, noble sirs?" continued he, taking from the chest a paper covered with squares and triangles, and marked with strange characters. "Or would ye rather have a proof of my skill in the wonderful art of Palmistry? Show me your hands, sweet sirs, and I will tell you your fortunes, incontinently. Nay, then," he continued, seeing that the persons whom he thus interrogated made no reply, "nay, then, I shall show you, noble sirs, that Bartolomeo Venturini knows you better than you know yourselves. Your fates are written on your faces for him who can decipher the legend by the divine light of the science of metoposcopy."

At this moment the faces of the young men were turned directly towards the speaker, and he proceeded to comment upon their features in a rapid and elevated voice, which gradually lost all the bitterness of tone in which he had so lately accosted them. Indeed, he was now apparently hurried away by the contemplation of his subject, forgetful of everything else; and one could well believe that he was as much the dupe of his own fantasies as were those whom he endeavoured to mystify—a result not uncommon with persons who had given themselves to the study of the occult sciences, as they were called.

"Ah! how plain are the planetary influences upon that countenance," cried he—but to which of the youths he alluded it was impossible to discover;—"I trace them as clearly as I would upon the heavens of a starlit night. How *Mars* dominates on that high forehead! Choleric, fiery, courageous, and, at the same time, haughty and somewhat reckless; he is one who brooks not readily to bend to the will of another. A fine nose, truly, with a well-defined nostril—ah! *Venus* lies there, as if it were her own Paphos; I find he is of a sweet nature, loving and somewhat voluptuous, and one who shall be loved with the whole heart of woman. But, then, I like not the curl of that lip: truly, *Mercury* is malign in the mouth, and crosses *Venus* with a sinister influence. Alas, what a pity! Assuredly, some evil awaits him, and that in a quarter whence he least expects it—sad, sad!"

The man muttered a few words which were inaudible: then turning, as it seemed, to the consideration of the other face, he said:—

"Dio, what fine eyes!—*Sol* in the meridian and *Luna* at the full. Truly hast thou a benevolent and noble disposition: faithful in friendship, and true; ingenuous, yet secret; sincere, yet reserved and thoughtful; engaging manners; no craven anxiety about the future; imaginative, versatile, fond of travel and of knowledge, a lover of the arts. And yet see how *Saturn* lowers in that left ear, and flings his pale, leaden shadow across the sallow cheek! Ahime! thou, too, young man, shalt have thy hour of sorrow."

While the ciarlatano was uttering these disjointed comments upon the characters and destinies of the youths, mingled with the unintelligible jargon of that now-exploded lore which pretended to assign to each of the planets and zodiacal signs a particular feature over which it was said to exercise a special influence,—the rabble listening the while in mute wonder,—the objects of his remarks, as if wrought on by an irresistible fascination, stood still, affected to some extent by the enthusiasm of the speaker. Now, however, they held on their way again, and had nearly effected their escape from the crowd, when the voice of the conjuror pursued them in deep and solemn accents :—

"Thou shalt seek a bride in her house, but thou shalt find the angel of death there before thee! She whom thou wouldst take to thy heart shall be ravished from thee for ever. Through the portals whence the bride should go forth in the morning to the altar, shall the corpse be borne at evening to the grave. So do the planets portend, and so do I declare."

The words of this prophecy, though it was doubtful to which of the young men they were addressed, arrested at once the step and the attention of Giulio, and made him turn pale with a mingled feeling of rage and horror. Half drawing his short rapier, which was concealed beneath his cloak, he was springing forward to administer a chastisement upon Bartolomeo that would, in all probability, have defied the efficacy of his wonderful styptic to heal, when Jacques, seeing at a glance all the danger of so rash a step—for the people observed the movement and shewed symptoms of taking part with Bartolomeo,—seized his friend by the arm, and hurried him forward towards the church of San Marco.

"Nay, Giulio," said Jacques, as they stood beneath the western portico of the chapel, "thou shouldst not heed the random words of that poor devil. If the stars are to declare the course of our lives, they must be conjured by some more potent influences than yonder quacksalver can command."

Giulio laughed, but made no reply, and so they passed between the columns of porphyry and verd-antique which support the arches of the façade, and passed into the interior of the building.

But, despite of his gay laugh, the mind of the young Venetian was not altogether at ease. At the period of which we write, it will be borne in mind, men's intellects were but little emancipated from the trammels of gross superstition. A belief in the occult sciences was everywhere prevalent, and the most enlightened minds did not venture to discredit the marvels of witchcraft and demonology. Amongst other dark lore, astrology was then in high repute ; and we cannot wonder at the universal credence it obtained in this age, when we recollect that two centuries later, Catherine de Medicis and Cardinal Mazarin regulated their conduct in every affair of moment by astrological predictions ; that Dee gained influence over the strong mind of our own Elizabeth, and visited the courts of Poland and Bohemia ; and, later still, Lilly gave public lectures in astrology, calculated nativities, received a golden chain from the warlike Charles Gustavus of Sweden, and was consulted by Charles the First of England. It could not, therefore, be expected that Giulio Polani should be above the prejudices or the superstitions of his age ; and though his disposition did not lead him to shrink at physical danger, in the case of supernatural influences he was no more valiant than others. Thus a morbid sensibility of feeling, increased, no doubt, by the interview of the preceding evening with Bianca, and the revival of all his old affections, made him apply the words of the ciarlatano to himself and to her whom he already hoped would yet be his bride ; and without acknowledging to himself that he believed thoroughly in the prophetic powers of Bartolomeo, yet neither did he feel the assurance that the prophecy, strange as it seemed, was nothing more than what his friend Jacques had pronounced it—the random words of a mere quacksalver.

For a time, despite of himself, he was moody and abstracted ; but—not caring to let his friend see that he was really disturbed by what Jaques did not think worth a thought, though it might apply as well to the one as the other —he rallied his spirits, and by a strong effort shook off the uneasy feeling. Occupying himself in showing to the stranger the glories of a city of which every Venetian was justly proud, Giulio soon forgot the scene of the morning, and not a shadow lingered in his memory to mar the sunshine of his heart.

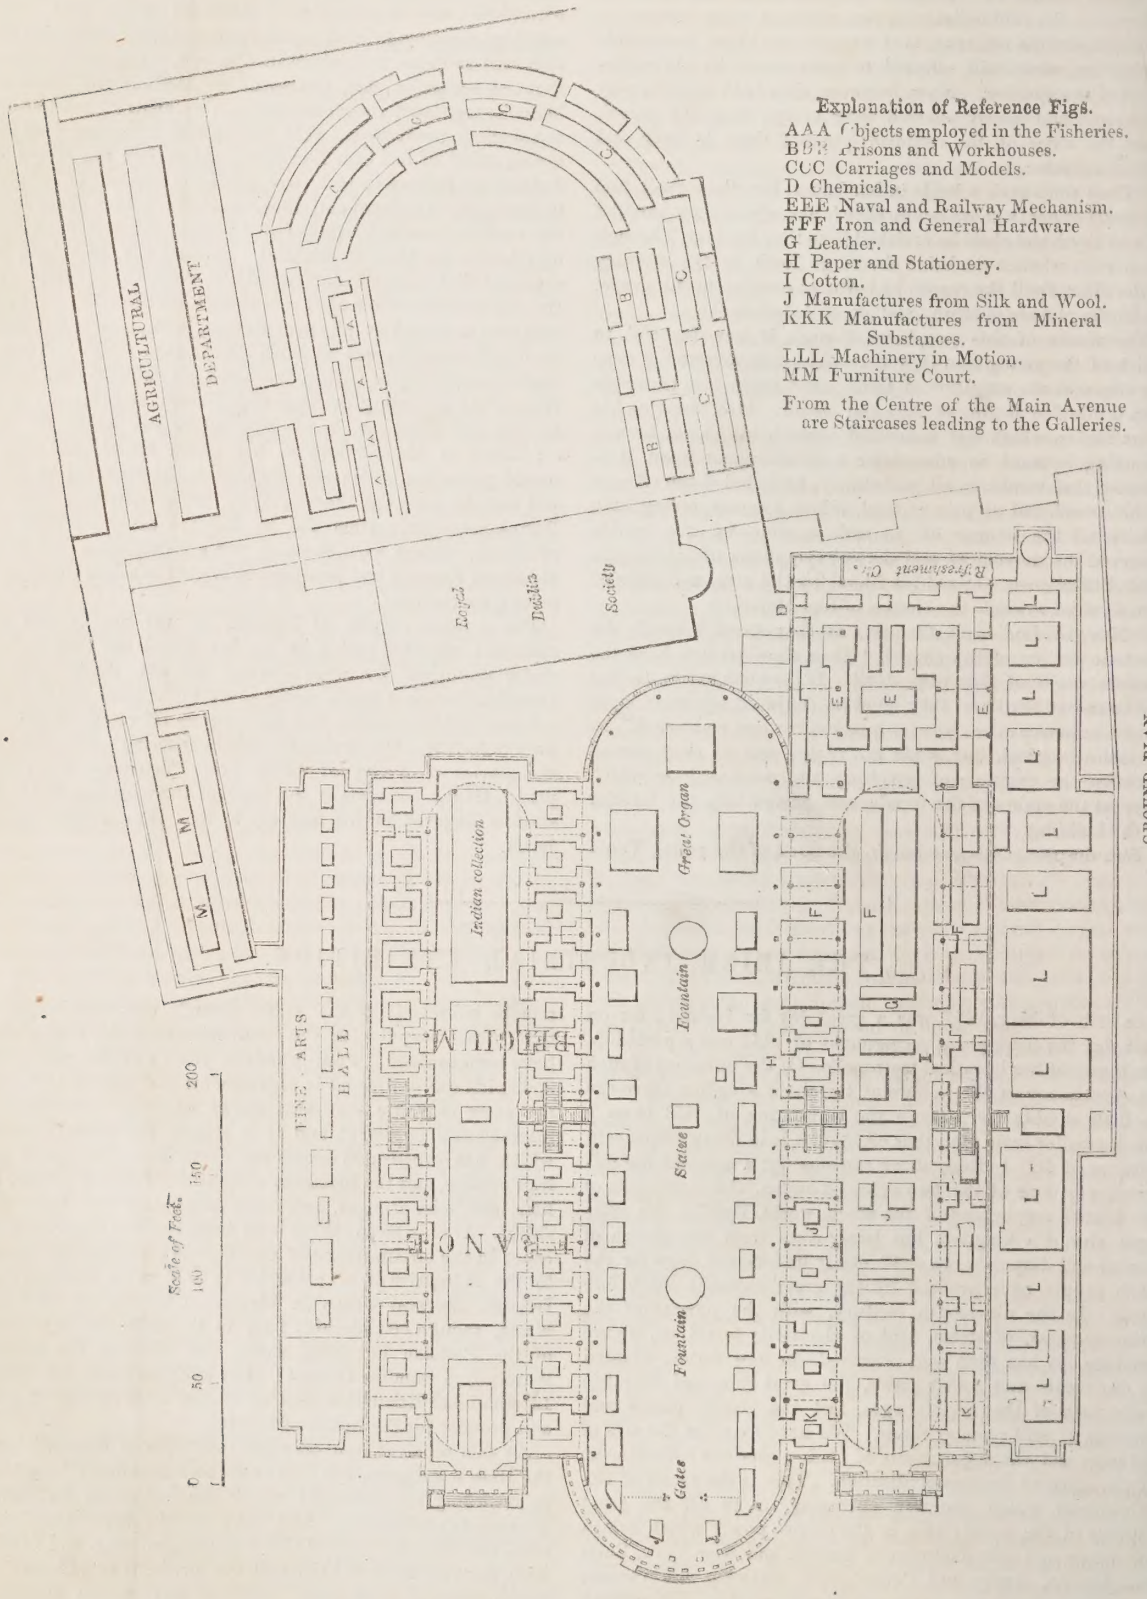
THE IRISH INDUSTRIAL EXHIBITION.

The 12th of May, 1853, was a great day for Ireland ; for on that day the triumphant experiment of 1851 was repeated in the centre of her beautiful metropolis. Of the influence of such an experiment on the welfare of the sister kingdom there can be little doubt ; for, though the Exhibition of 1853 is on a much smaller scale than that of 1851, it is in many respects in advance of it. Indeed, if we consider for a moment the different positions of the two cities—London, the metropolis of the British empire and of the whole world, Dublin, the principal city of a kingdom but lately risen from the slough of famine and despond—we shall easily understand how far the Irish people have profited by the great example set before them. In the nineteenth century, with the powers of the printing-press, of steam, and of electricity to aid us, we are reviving—it has been well observed—in new forms, adapted to our wants and social states, the great fairs and chivalric gatherings of the middle ages, and the classic games and contests of still remoter times. We have found in the arts of industry and the departments of trade a glorious embodiment of the spirit of modern civilisation. This is the secret of the exhibitions which are now springing up in all the great capitals of the world ; this is the motive power which brings the artists and manufacturers of London and New York, Paris and Dublin, Berlin and Petersburgh, Antwerp and Vienna, into such intimate connexion and friendly rivalry. The present generation of men, devoted to peaceful pursuits, has not the less, on that account, the enthusiasm and romance of character which belonged to the men of the old time. These sentiments remain substantially the same, though the complexion of them has changed with the circumstances under which they have been evolved. Four hundred years ago the public will and spirit was expressed in tournaments and crusades—to-day the same chivalric sentiment shows itself in exhibitions of international industry ; and it is simply the force of events which has substituted executive committees, and glass and iron palaces, and the bloodless contention of skilled labour, for lists, and men-at-arms, and fierce encounters with lance and shield. If this be so, there is an immense and happy significance in the circumstance of that second great display opened to the industries of all countries is held in the metropolis of Ireland. Several weeks in advance of the New York Exhibition, though considerably later in the field—far in advance of the Parisian industrial show, and winning the earliest laurels even from the Crystal Palace at Sydenham—the Dublin International Exhibition may be looked upon as a great hope and promise for the future of Ireland.

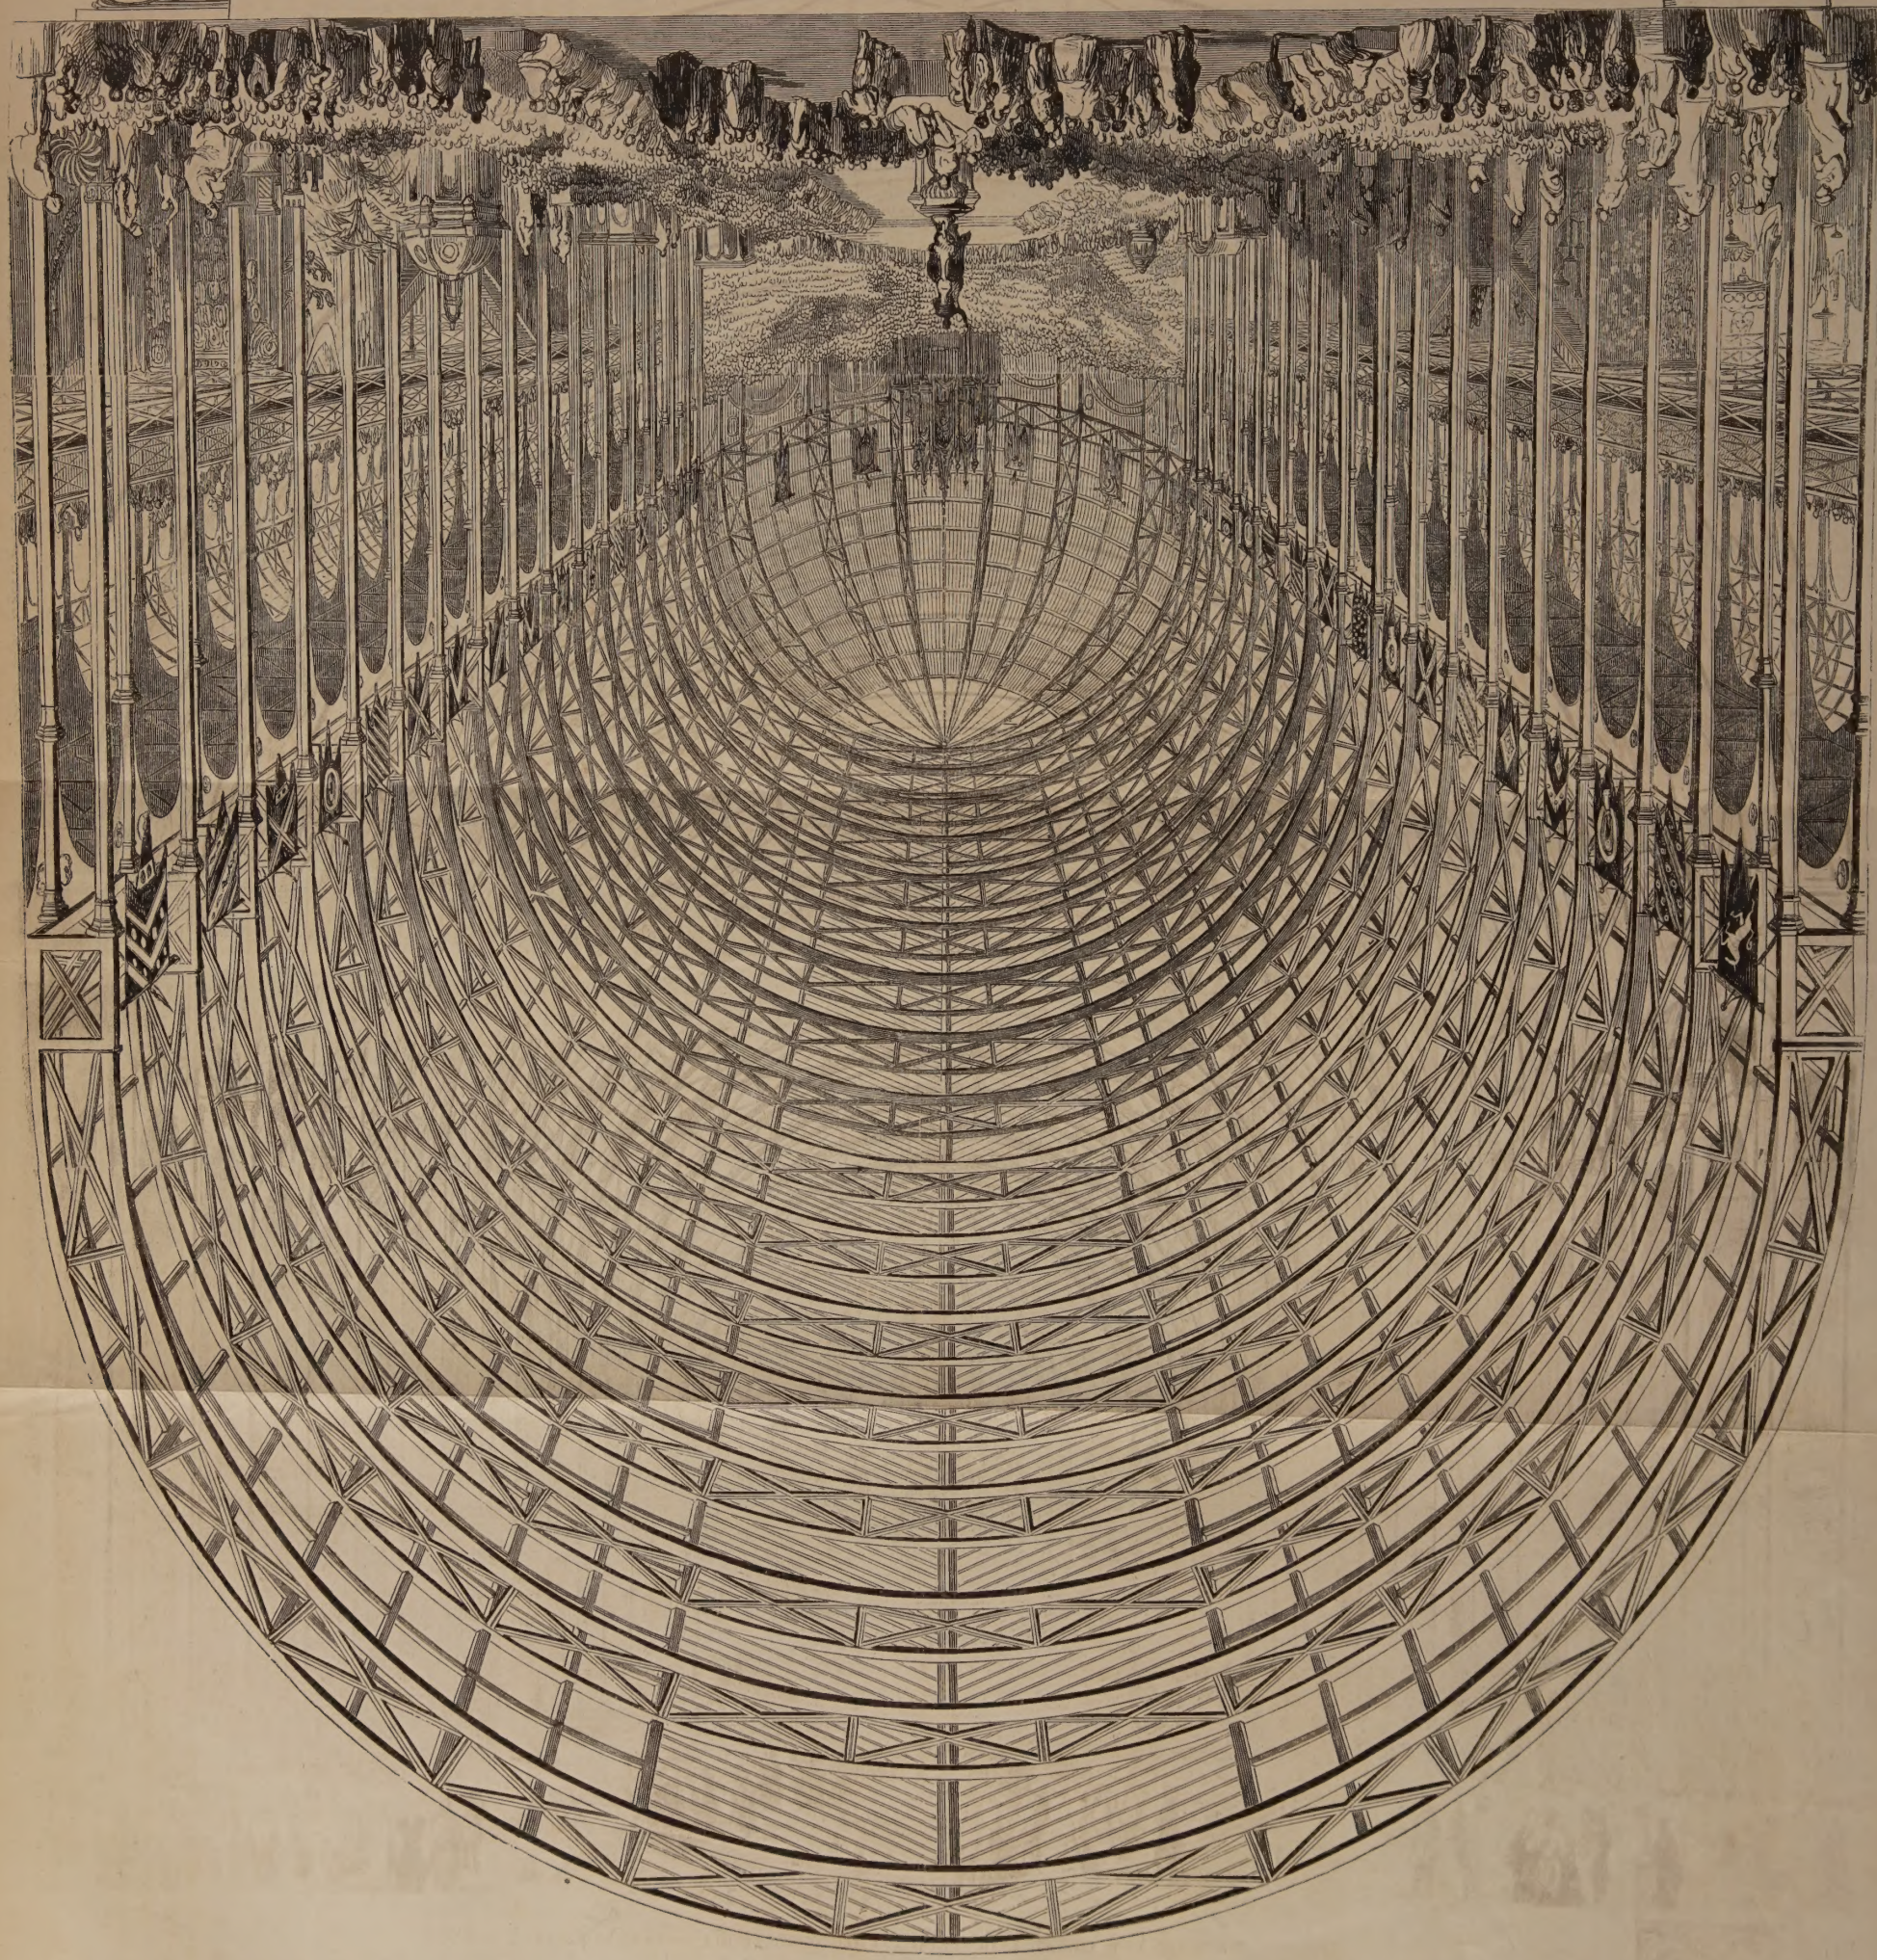
At this moment, not only are the "eyes of Europe" upon the Irish metropolis, but "our own correspondents" are busy in recording the triumphs which the Industrial Exhibition is every day achieving. And it is a proud reflection for Irishmen, that they have raised this beautiful building, and filled it with the evidences of skill and the products of industry, by means entirely their own. Without government assistance of any kind, but by sheer force of perseverance, and through the patriotic endeavours of a single individual, the Irish Exhibition of 1853 has won for itself a name and distinction

which cannot but be beneficial to the social, industrial, and political welfare of the people.

We have already—*ante* p. 24—made our readers acquainted with the patriotic Mr. Dargan, to whom, indeed, the present Exhibition is mainly owing; or we might show how, rising from the people, and possessing a spirit, energy, and liberality, which appears to belong as much, or more, to the merchants and traders of our time, as to the inheritors of great historic names, he has laboured untiringly, grudging neither time nor money, for the good of his country. Although upwards of £100,000 have been advanced by Mr. Dargan for the purposes of the Exhibition, for the repayment of which he looks alone



VIEW OF THE INTERIOR OF THE GREAT INDUSTRIAL EXHIBITION, DUBLIN—OPENED MAY 12, 1853.



DRAWN BY GILBERT, FROM DESIGNS BY J. MAHONY, ESQ.] [ENGRAVED BY H. LINTON AND G. PEARSON.

to the receipts at the doors, it must never be forgotten, that the main motive of this gentleman has been, not pecuniary benefit or advantageous employment of capital, but a desire to place within the reach of his humble countrymen, in the midst of their own metropolis, a collection of the products of human skill and ingenuity, the contemplation of which might encourage them to work out with patience and self-reliance the great problem of their own social and political welfare.

The beautiful building in which the Exhibition is held is the production of Mr. Benson, from whose designs it has been erected. By reference to the annexed ground plan, the distribution of the various parts will be understood.

The Irish Exhibition Building differs in many important respects from its progenitor in Hyde-park. Like it, the framing of the building is composed of iron columns and girders, but, unlike it, the whole light is admitted from above, a portion only of the roof being glazed. The peculiarly light and airy appearance of the Crystal Palace is therefore lost; nevertheless, sufficient light, well toned down, is admitted to all parts of the present building to set off the objects exhibited to the best advantage. If the reader will turn back to page 24, he will perceive what an elegant appearance the main front of the building makes. It was originally intended to erect it of much smaller dimensions, and the chief features were a main central hall with side aisles, each hall having a grand semicircular roof. This arrangement of the space still continues to a certain extent; but, instead of there being only two aisles, the building now consists of five large parallel halls, the centre one of which is about the size of Westminster-hall. The mixture of the oriental with what may be called the modern style of building is strikingly displayed in Mr. Benson's novel structure. In case any of our readers have a talent for realizing space from figures, we give them the benefit of the following:—

The main portion of the building forms nearly a square, presenting a frontage of 405 feet, and a depth of 425: this is divided into five large halls, the central one being a noble compartment of 425 feet in length, by 100 feet in breadth, and 104 feet in height. The great semicircular roof is supported by trellis ribs, constructed of timber, and rests on cast-iron columns, 45 feet in height; on either side are two compartments of 25 feet in width, running the whole length of the building; adjoining these are two halls of 325 feet in length by 50 in width, with semicircular roofs 65 feet in height. These halls are separated by compartments of 25 feet in width, on one side from the Machinery Court, a fine hall of 450 feet in length by 50 in breadth; and on the other from the Fine Arts Hall, 325 by 40 feet. In addition to these, the Fore Court of the Dublin Society's House is surrounded by a large building 500 feet in length and 55 in breadth, being connected with the main building by a Court for Agricultural Machinery, 250 feet by 40 feet on one side; and on the other, by a Corridor leading into the Machinery Court.

These figures, however, convey but a slight idea of the *tout ensemble* presented by the circularity of the roofs and ends of the building—the centre dome towering high above the others—and the novelty of the form adopted. The exterior of the building, as well as the interior, is decorated in much the same style as that adopted by Mr. Owen Jones at the Crystal Palace; but the main front, which looks towards Merrion-square, possesses an entirely new feature, namely, an outer gallery, or balcony, some 20 feet wide. This balcony is reached from the inner galleries, which are disposed on much the same plan as those at the Crystal Palace; and when it is filled with company, it will present a very gay and lively appearance.

From the galleries a good view of the arrangements below will be obtained; but it is remarkable that in no position in the building can its entire figure be seen at a glance, as was possible at either end of the Crystal Palace in Hyde-park.

We may now, previous to entering upon a description of the various articles contributed to this international bazaar—the second "world-idea," as the Germans emphatically call it—attempt a slight sketch of the

CEREMONIAL OBSERVED ON THE MEMORABLE 12TH OF MAY.

It is late in the day to speak of the hopes of the sanguine, and the fears of the timid, concerning an event already accomplished; therefore we may pass from the night of the 11th, when all was bustle within the building and concern without, to the morning of the 12th, when the sun shone out a welcome to the thousands who made holiday in Dublin in honour of the auspicious occasion.

It was really a grand sight.

Let the reader try to picture to himself the scene which the great hall of the building presented. By incredible exertions, it had not only been cleared of all obstructions, but through the good taste of Mr. Jones, the artist, nicely decorated with sculpture, plants, and other objects. Its ample width, and the galleries along either side, accomodated, without any inconvenience, a brilliant assemblage of not less than 15,000 persons. They were arranged consistently with the best pictorial effect, the ladies in front, and forming on all points a gay bordering of colour and elegant drapery which filled and satisfied the eye. The utmost order, good-humour, and comfort prevailed, and not only inside, but without also, nothing could be better than the police arrangements. No confusion or scrambling for places occurred, and with great patience the time for commencement of the ceremony, mid-day, was awaited. The hall, filled with people, and just sufficiently decorated with other objects to break the monotony, presented a singularly striking aspect. A fine equestrian statue of the Queen by Marochetti occupied the centre, and attracted all eyes. By a happy thought, MacDowall's "Eve," a work of the highest artistic merit, a souvenir of Hyde-park, and which is here very naturally claimed as native, was placed near the top of the hall, and looked exceedingly well there. A spacious platform of raised seats mounting tier above tier, and containing an orchestra of 1,000 performers (vocal and instrumental), closed in this part of the building. Above the orchestra rose the fine organ of St. Peter's College, at Oxford, built by a Dublin maker named Telford, and lent by the college with very commendable liberality. Below the orchestra stood the *dais* prepared for the Lord St. Germans and the Viceregal Court. In the immediate vicinity of this were the reserved seats for the privileged, and down into the centre of the hall a broad avenue was kept clear to afford greater facilities for seeing the details of the ceremony. As in Hyde-park, the police were almost entirely relied upon for carrying out the arrangements, any conspicuous display of the military being considered unsuitable to such an occasion. The hall had filled early with all but the more distinguished people, and nothing occurred for a considerable time to break the hum of innumerable conversations which rose from every corner of the spacious interior. First, the judges appeared, and occupied front seats on the left of the viceregal throne. With them the clergy of the Established Church and the Doctors and Fellows of the University consorted; while the mayors of the different towns in England and Ireland present ranged themselves on the right. Some dignitaries of the Roman Catholic Church next appeared upon the scene, and then Sir E. Blakeney, the Commander-in-Chief, made his way to the top of the hall, followed by a brilliant staff; the veteran, who seems very popular in Dublin, being loudly cheered by the assemblage. A number of Irish noblemen then came in; among them Lord Cloncurry, Lord Talbot de Malahide, the Marquis of Kildare, Lord Portarlington, Lord Clanmorris, the Earl of Meath, the Earl of Dunraven, Lord Rossmore, Lord Carew, Lord Castlereagh, the Marquis of Conyngham, Lord Massareene, and the Marquis of Headfort. Lord Gough, who has taken a deep interest in the Exhibition, arrived early. The number of peeresses was also considerable; and, altogether, the aristocracy of Ireland was well and even splendidly represented on the occasion. Some sensation was created by the Lord Mayor and Corporation of Dublin, as they moved through the assemblage to their appointed places on the right of the viceregal throne. Shortly after twelve o'clock, the procession from the Castle arrived. His Excellency the Lord Lieutenant was attended in his progress by

his suite, and by the knights and officers of the Order of St. Patrick; and along the route which was traversed in state great crowds of people had collected.

ARRIVAL OF THE PROCESSION.

At a quarter-past twelve o'clock the procession came in view, and the members of the Executive Committee assembled at the doors to receive their Excellencies; and as the carriage containing the Lord Lieutenant and the Countess of St. Germans approached the building, the band of the 11th Hussars played the National Anthem.

At half-past twelve o'clock a general buzz and eager move-

GROUP OF VASES FROM THE FOREIGN DEPARTMENT.

ment in the vast assembly indicated the advent of the procession, and in a few minutes it had advanced up the hall in the following order:—

Officers of the Corporation, with the insignia of State.
The Right Hon. the Lord Mayor.
The members of the Executive Committee, with their wands and badges of office, two and two.
Sir William Betham, Ulster King at Arms.
Sir George Morris, Usher of the Black Rod.
The Hon. and Very Rev. Dean Pakenham, Chaplain of the Order of St. Patrick.
The Right Hon. Lord Carew, the Most Noble the Marquis of Headfort, the Right Hon. the Earl of Charlemont, the Most Noble the Marquis of Conyngham, and the Right Hon. Lord Massareene and Ferrard.
Knights of the Most Illustrious Order of St. Patrick invested with the Collar of the Order.
His Excellency's State Household.

Aides-de-Camp. Aides-de-Camp.

His Excellency the Lord Lieutenant.
Grand Master of the Illustrious Order, wearing the Collar of the Order, and the Brilliant Diamond Badge and Star of Grand Master.

Her Excellency the Countess of St. Germans,
Attired in a magnificent dress of Irish poplin, and wearing a shawl of Limerick lace.

As they advanced towards the *dais* prepared for their reception, their Excellencies were greeted with hearty and prolonged acclamations by the whole assembly.

At this moment one of the great features of the day—the musical performance—commenced by the full band performing the National Anthem. Often as this grand and beautiful composition has been heard in public, and well known though it must have been to all present, it assumed a new interest, and we had almost said new features, from the massive strength of the orchestra.

The scene now presented in the Great Hall was one of affecting interest and grandeur,—the scarlet uniforms of the military gentlemen present, the robes of the corporate officers, and the dark shades of the civilian full dress, contrasting with the diversified hues which floated joyously in the wide expanse of laces, silks, and ribbons that everywhere met the view, while the rich and solemn peals of the organ added to the impressiveness of the general effect.

At the entrance of the building his Excellency was received by the Executive, who, two abreast, and followed by the vice-regal retinue, led the way to the upper end of the hall. The immense assemblage rose to welcome his Excellency with three cheers, and the National Anthem, succeeded by the 100th Psalm, terminating with the "Gloria Patri," and then Handel's "Coronation Anthem;" after which the General Committee drew near, and Mr. Roe, their chairman, read an elegant and impressive address to his Excellency.

The presentation of Mr. Dargan formed a very interesting event. On coming forward he was most warmly applauded, and the Lord Lieutenant, in the heartiest manner, expressed the Guilds of Ireland; besides many distinguished visitors from England, Scotland, the United States, and the Continent of Europe, Mr. Dargan, the founder of the Exhibition, Mr. Benson, the architect, and Mr. Roney, who traversed Europe in search of objects for exhibition, and interested crowned heads and noble families in the success of the experiment by force of his own enthusiastic perseverance, were the honoured guests of the evening. Mr. C. Wentworth Dilke, of the Executive Committee, and Mr. Sheriff Croll, represented the Royal Commission of 1851 and the City of London.

Of course the evening passed off with the greatest éclat,—the usual "royal and patriotic toasts" being given, and the usual number of complimentary speeches, in this instance, at least, sincere, being given.

The following is a correct list of the Executive Committee of the Great Industrial Exhibition of 1853:—G. Roe, Esq., Chairman; Major Fairfield, Deputy Chairman; The Right Hon. the Lord Mayor, the Lord Talbot de Malahide, the Hon. John P. Vereker, the Hon. G. Handcock, Sir John Kingston James, Bart.; Sir Edward M'Donnell, Sir Robert Kane,

GROUP OF SILVER OBJECTS; TWO URNS AND A TEAPOT.—BENNETT, GRAFTON-STREET, DUBLIN.

the admiration which he entertained for his patriotic and generous conduct. He also stated the regret which he felt that the highest honour which he had it in his power to confer had been declined by Mr. Dargan. Mr. Benson was likewise highly and deservedly complimented by his Excellency on the merits and beauty of the building. He was made a knight upon the spot, and the spectators had the gratification of seeing the ceremony performed. The address read by the Mayor to his Excellency was feeling and appropriate.

On the return of the procession, and after the orchestra had performed a Hymn of Praise, his Excellency, in a loud tone of voice, declared the Exhibition Opened, and invoked God's blessing upon it. "The heavens are telling," from Haydn's "Creation," and the "Hallelujah Chorus" by Handel, were then sung with magnificent effect, and the ceremony concluded, as it had commenced, with the National Anthem.

The opening day was closed by a Grand Inaugural Banquet, at which were present the Lord Lieutenant, the representatives of the Church and State, the Bench, the Bar, the Universty, the Army, the Lord Mayor and Corporation, and Thomas Ball, Esq.; Dr. William Barker, John Barlow, Esq.; John Barton, Esq.; William Dargan, Esq.; Lundy E. Foot, Esq.; Professor Harrison, M.D.; Nathaniel Horne, Esq.; Alderman Kinahan, William Digges La Touche, Esq.; J. W. Murland, Esq.; John Pennefather, Esq.; William Henry Porter, Esq.; James Stirling, Esq.; Walter Sweetman, Esq.

We may now attempt to briefly indicate

THE PRINCIPAL CONTENTS

of the Great Industrial Exhibition of Ireland. Although several exhibitions of a similar nature have taken place since 1851—that at Silesia, and that at Cork last year, for instance—this is only the second really international bazaar that the world has yet seen. Thus, in the enumeration of the objects exhibited, we give precedence to those exhibited by our foreign friends. Bearing in mind the general distribution of the space, and glancing at the ground-plan, the reader will easily comprehend the position which the foreign exhibitors occupy. The ground-floor of the southern hall is appropriated to the display of the objects shown by the several states of Europe. The most perfect and comprehensive view of these is to be

obtained from the eastern end of the gallery, looking directly down the hall. The general effect of the graceful contributions of our continental neighbours is remarkably pleasing; but a close and minute inspection is necessary to reveal their peculiar excellences and great artistic beauty. The eastern end of the hall is devoted to the productions of Prussia, which consist chiefly of articles from the Royal Porcelain Manufactory at Berlin—bronze and iron castings, and terra cotta ornaments. The vases from the Royal Porcelain Manufactory are most beautiful articles, graceful in form, richly gilt, and painted in the highest style of art.

The Belgian contributions are placed next to the French department, and from their intrinsic value and beauty, are entitled to a very high place amongst the most valuable and attractive objects in the Exhibition. The Belgian department is curtained round by several beautiful pieces of tapestry, the rich decoration of which has a most brilliant effect.

France comes next in the order of arrangement, and occupies the greatest amount of space; but as only a portion of the French contributions have yet arrived, the present display must be regarded as merely partial. It is composed for the most part of zinc castings, gilt and bronzed, from the establishment of the Vieille Montagne Company, including ornamental time-pieces, figures for the chimney-piece, chandeliers, candelabras, &c. The figures are in every instance modelled with great spirit and artistic skill, and the material of which they are composed cannot be distinguished by the eye from real bronze. There are also a number of lamps of novel and elegant design. Besides these, many of the manufacturers of articles in silver are already making the French department gay with their varied and elegant contributions.

The German States of the Zollverein also make a fair display; terra cotta wares and such like art-appliances being the most conspicuous.

GROUP OF MUSICAL INSTRUMENTS FROM THE JAPANESE COLLECTION.

But, of the foreign contributions, the most important are those illustrative of the arts of India, China, and Japan. To the indefatigable Mr. Roney the world of sight-seers in Ireland owe the most complete illustrative museum of East Indian arts and manufactures ever collected together; for to that gentleman is due the credit of having interested the possessors of rare and curious specimens from the countries in the Eastern seas in the success of the Irish Exhibition. Soon after the close of the Crystal Palace in Hyde-park, it was proposed, in consequence of the attention the Indian collection

had excited, to get together a larger number of objects from that country, and exhibit them in the rooms of the Society of Arts. The splendid proposals of Mr. Dargan, and the representations of Mr. Roney, however, had the effect of transferring the display from London to Dublin; and we doubt not that the East India Company will maintain in the sister island the honours it won so well in this.

China, too, is ably represented by Mr. Hewett, of Fenchurch-street, assisted by a large and excellent collection of objects brought from that country by an officer of the British army. A most glittering show of rare and curious objects, therefore, awaits the visitor to Ireland.

But the most unique and remarkable contribution in the entire Exhibition is that of the Japanese specimens contributed by the Dutch government. As most of our readers are aware, Japan has hitherto been a closed book to all but a very small section of European traders—the Dutch only being allowed to trade with the peculiar and exclusive merchants of Jeddo. Now, however—thanks again to Mr. Roney, who travelled to the Hague for the purpose of obtaining the boon—English, and Irish, and American, and French, and German visitors may gaze upon the handiwork of the Japanese with perfect impunity. The many valuable specimens shown are under the care of M. Van de Kasteele, the Director of the Museum of Curiosities at the Hague,—to which the collection belongs. The beauty of many of the specimens is certainly unsurpassed. The small specimens of china exhibit a much higher condition of art than that of the Chinese,—and the colours are brilliant and well chosen. The papier-mâché is ornamented in the most elaborate, but at the same time in perfectly chaste, manner, in gold and mother-o'-pearl,—inlaid with the greatest nicety, and brought to a perfect and brilliant surface. But the perfection of workmanship is exhibited in nearly all the portion of the collection which includes altar-pieces and screens, arms, ornaments, and clothing, musical instruments of many varieties, and beautifully constructed—mechanically, not scientifically,—numerous models of temples, ships, palanquins, and a hundred other articles. There is also a large number of drawings, maps, printing apparatus, and other things, which have scarcely ever been seen in England, in consequence of the very strict laws prohibiting their being taken out of the country. The offence of exporting a map of the country is punishable by the laws of Japan with death.

Our engraving shows some of the curious musical instruments in use among the Japanese; but as we shall probably have to refer again and again to the contents of the foreign department, we pass at once to a slight review of

THE IRISH CONTRIBUTIONS.

The Dublin Exhibition, owing everything to the patriotism and public spirit of one man, is yet—we speak only of the present display—not thoroughly understood by the Irish Exhibitors. "As a mere display of the products of Irish industry," says an eye-witness, "the collection would be a poor one indeed. Imperfect as the arrangements are, this important fact is already manifest. Linen manufactures from Belfast, poplins from Dublin, hosiery from Balbriggan, lace from Limerick and Cork, frieze, tweeds, and blankets are all the special manufactures that illustrate Irish industry at the Exhibition, with the exception of the Valentia and Killaloe slate quarries. The splendid marbles of the country are shown not by private traders, as commercially remunerative, but by the Royal Dublin Society, as undeveloped sources of wealth. The stands of lace bear about them many tokens of a manufacture hardly yet relieved from an almost eleemosynary character. The crochet work, originated by Lady Deane near Cork, has already risen from an annual value of £50 to one of £15,000, and from its extraordinary beauty and cheapness promises to take healthy root as a branch of national industry."

"With regard to the Limerick lace, nearly the same observations apply as to Cork, though in a less degree—Mr. Forrest, Messrs. Lambert and Bury, and other exhibitors, showing the really splendid specimens which they exhibit as strictly trade speculations.

"Of the flax trade, as represented at the Exhibition, there are some really splendid illustrations, supplied by Messrs. Coulson of Lisburn; Andrews, of Ardoyne; Roddy, of Belfast; Fenton, Bell and Co., Hemming, and others. From the finest fabrics to the coarsest fabrics of Drogheda, the whole manufacture is displayed, and over it the Royal Flax Improvement Society is seen watching with jealous care. It is necessary that it should do so, for the linen trade of Ireland, though its healthiest and most prosperous commercial interest, is exposed to a formidable rivalry both in Scotland and in Yorkshire.

"Dundee and other Scotch towns show in the Exhibition the coarser fabrics which they make with the prices significantly attached. The English manufacturers do not appear to have come forward, but, even if they had, it is not probable that the excellence of the higher qualities of linen produced in the north of Ireland would have been attained by them. In this respect very considerable progress appears to have been made even since the Exhibition of 1851. The goods shown are finer in quality and better in design."

The poplins and tabinets of Dublin are splendidly represented, and fortunately well placed. Pim, Fry, and Co., Atkinson, Keely, and Leach, are the chief exhibitors of this splendid product of the loom. The display includes not only the fabrics themselves, but the processes of the manufacture also, and the spectacle of so much skill and excellence, all Irish, is surely encouraging.

A similar observation holds good with reference to lace, the state of the trade affording facilities for giving it at the outset a high artistic character, which it is to be hoped it may always maintain. Of the friezes, blankets, and other woollen manufactures of Ireland, as represented in the Exhibition, little can be said that is new.

Balbriggan hosiery is the only remaining branch of industry national in its character which it seems necessary to allude to. The specimens of these goods exhibited are remarkable for their fineness of quality, and in this respect it may be observed that it is mainly branches of industry adapted to the wants of the wealthier classes that seem hitherto to have taken root in Ireland.

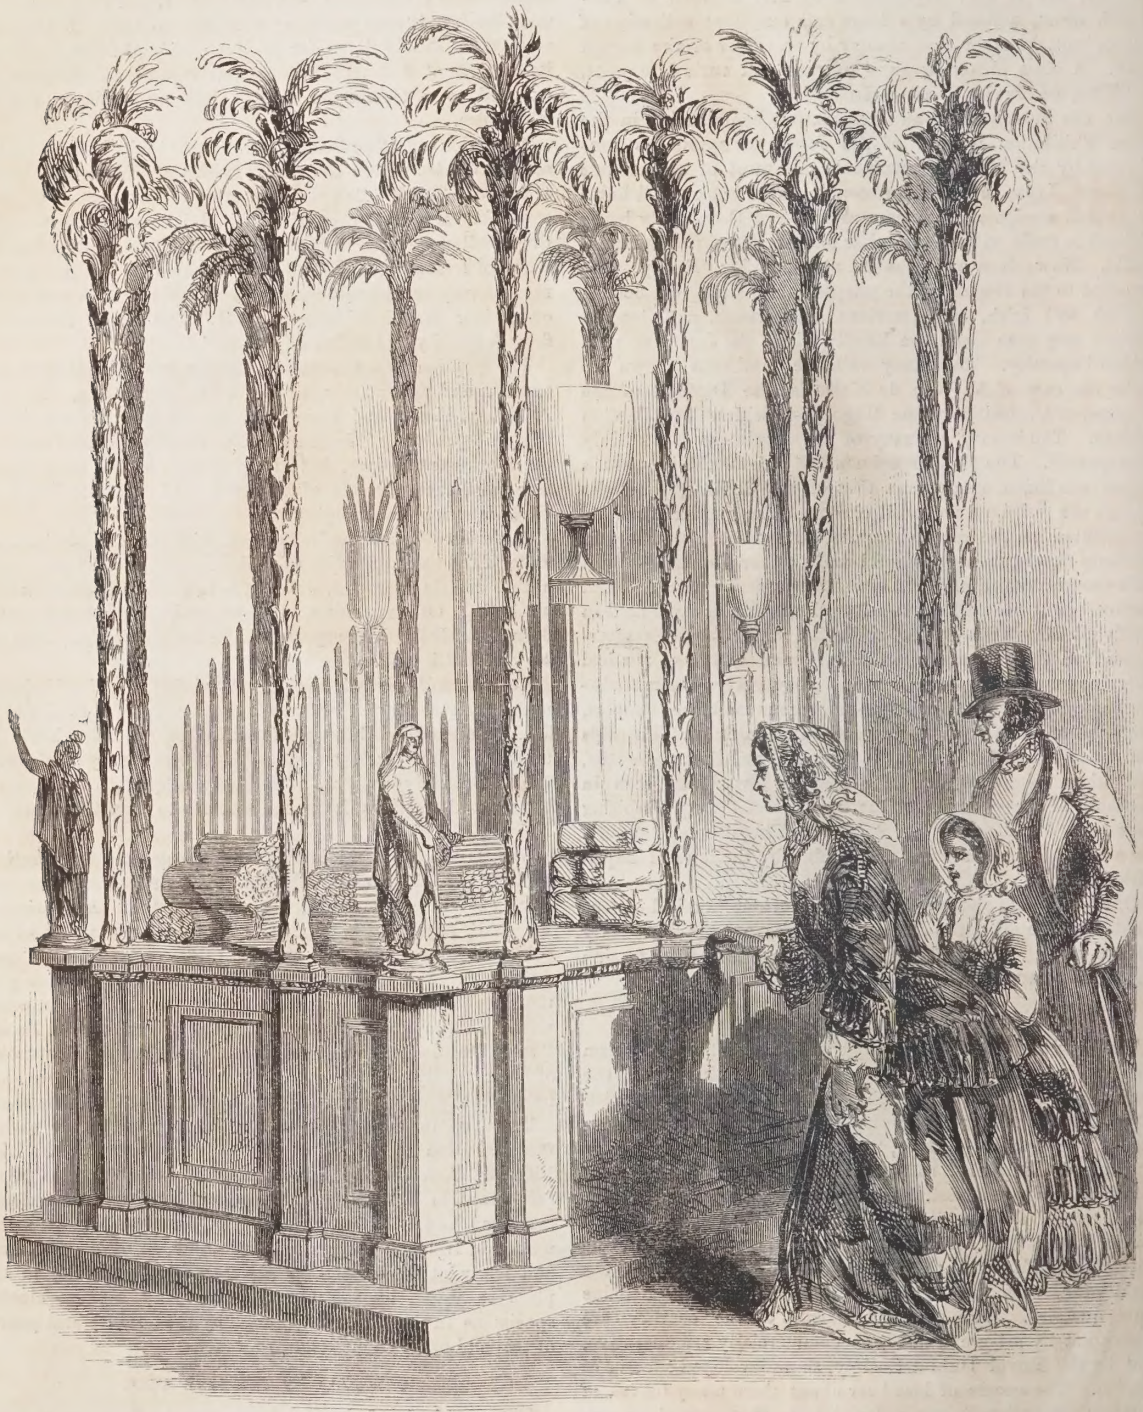
We have as yet said but little of the general contributions to the Exhibition; and of the Fine Arts department, the most complete and attractive of them all, nothing. As, however, we shall have yet to introduce engravings of many of the principal objects shown, we shall be excused if we pass quickly through the building, or if we attempt no more particular account of its contents than can be obtained on a first visit. In the great Central Hall the proprietors of Price's Patent Candles make a grand show. We give an illustration of their tastily-arranged stall; on a future occasion we shall have something to say of the manufacturers and their works.

Thus, on the present occasion, we must pass over with a mere mention the group of objects contributed by the Irish Fisheries Commissioners, illustrative of the tackle and apparatus used in the fisheries; the collection of domestic manufactures shown by the guardians of twenty-seven poor-law unions in Ireland; church bells, clothing, furniture, saddlery, and many other interesting objects; to say nothing of the plate exhibited by the Queen, and many highly valuable specimens in the arts, contributed by the nobility and gentry of this and other countries.

THE HALL OF THE FINE ARTS.

The main body of the Exhibition was far from complete on the opening day, says an eminent contemporary; but the managers had wisely provided a great treat for their visitors in the collection of pictures brought together in the Fine Art Gallery. The Great Exhibition of 1851, though professing to represent *art* and manufactures, ignored the existence of pictures, except they happened to be painted on glass; the Great Exhibition of 1853, more wise than its progenitor, not only represents, but encourages *art* in its most captivating form.

Consequently we have, in the pictures in the Irish Exhibition, the finest and most characteristic collection, perhaps, ever brought together, especially of living artists. The room in which the pictures are hung is 325 feet long by forty broad, and already contains nearly 600 pictures. Many more have yet to be hung; and an additional gallery, about a quarter



PRICE'S CASE OF COMPOSITION CANDLES, IN THE GREAT HALL.

the size of the present, is in preparation for the remainder. The Belgian and English schools are most fully represented; next to these, the German; then the Dutch; and, lastly, the French. The foreign collections were made by Mr. Roney, the Secretary, with the assistance of the Emperor of the French, the King of Prussia and Dr. Waagen, the King of the Belgians, and the Dutch Government. The English pictures have been contributed by private individuals,—including her Majesty and Prince Albert; and several of the finest productions of the English school have thus been brought before the public for the first time for many years,—among which may be mentioned Hogarth's "Gates of Calais" and "Last Stake;" Landseer's "Bolton Abbey;" Wilkie's "Rent Day;" Barker's "Woodman;" Danby's "Deluge;" Mulready's "Wolf and Lamb;" Etty's "Rape of Proserpine." A large number of water-colour drawings and prints are placed on screens in this gallery,—and the centre is occupied by sculpture. The sculptors of Ireland make an excellent show.

WORKS OF THE GREAT MASTERS.

JEAN BAPTISTE GREUZE.

Jean Baptiste Greuze was the pupil of a man of letters, and, in fact, passed through no school of painting: his studio was a book—Diderot's *Essai sur l'Art Dramatique*.

THE BROKEN PITCHER.

This painter is one of the most striking examples of the close connexion of French art with the general sentiments of the nation, in all the great epochs of its history. Thus, in the eighteenth century, in the midst of that universal spirit of enterprise which was the passion of France, there appeared in the literary world a small volume, which has no reference to painting. Of what does it treat? Of a dramatic revolution. The age is weary of the monotonous heroism of kings upon the stage, the worn-out solemnities of tragedy, so much in vogue during the pompous age of Louis XIV. The time of regal display and courtly ceremonial is gone by: the new age calls for another accession—that of the people; the new worship offers its images to the multitude; citizens appear upon the stage instead of kings, as kings formerly had appeared in the place of gods, the first heroes of the scene. The people first usurped the buskin, while, awaiting the throne, Agamemnon abdicates in favour of the *Père de Famille*. Direct utility, practical morality, the grandeur of passion, familiar precepts, all are to be found in these new plays. The purpose of Diderot, in writing his book, was to prove this in theory; and, as examples, he gives his dramas of private life. In literature the sensation was great, for Diderot, that Danton of the literary revolution, possessed a powerful influence over the minds of philosophers, men of letters, and the people.

In the meantime painting rendered homage to the mistresses of the king. La Tour scattered powder from his crayons upon the hair of Madame de Pompadour. Boucher wrote, in irresistible characters, voluptuous prefaces to the beauty of Madame du Barry. Frigonard painted moral tales, more energetic and even more brilliant than those of Marmontel. Those artists who were still influenced by the grace of Watteau painted marquises, seated languidly on the greensward, shaded by trees, through whose branches the breeze seemed to sigh.

In the midst of this amorous Gaul, the true kingdom of Louis XIV., there suddenly appeared an unlooked-for picture, "La Lecture de la Bible," the "Father explaining the Bible to his Children." * An old farmer is seated at a large table, round which are ranged his boys and girls; one hand is placed upon the Bible, in the other he holds his spectacles, which he has just taken off. He is paraphrasing a passage of Holy Writ: his brown hands are marked with deep wrinkles, his forehead, furrowed with age, expresses the simplicity of a believer and the unction of a pastor. The children listen each according to their age or temperament, one with melancholy sensibility, another with the thoughtlessness of a school-boy. Two fine rosy girls, with their sleeves tucked up, displaying their white arms, are listening to the old man; but one only appears to follow him attentively. The youngest, almost on her knees, allows her bare arms and plump hands, which household work has rendered large and rather red, to fall upon her apron; her eyes cast down, she is thinking—very little of the Bible, unless it tell of Ruth and Naomi. The old mother, spinning her wool, silences a very little boy who is teazing the dog; whilst his twin brother endeavours to reach a piece of straw upon the table before him. The room shows signs of poverty; but one feels that a sweet and tranquil happiness reigns there, and that the youngest of the farmer's daughters has not yet known the disturbances which will, one day, trouble the peace of her heart.

The Academy, surprised at not having trained this new painter, inquired with astonishment: Whence is he? Whose pupil is he? He was Diderot's pupil; his mind was formed from the dramas of France. Yes, the recent theories had not only affected men of letters, the sensation had re-echoed in the soul of a painter; and painting, by that sympathy belonging to French art, took part in the general revolution of the century. The canvas, as well as the stage, required its domestic dramas; and the brush, abandoning the cheek of Madame du Barry, like a departing kiss, prepared to dedicate its *chefs-d'œuvre* to morality.

Brilliant conquest, to which Diderot had not looked forward! What! it was painting which was to obtain the victory which he, Diderot, had sought for in the literary and dramatic world! And, in short, how are we to compare that which the theatre had gained by the dramas of Diderot and the earlier and too homely pieces of Beaumarchais, with Greuze's brilliant entrance into the gallery of the Louvre. We must say that the *Père de Famille* of the disciple far surpassed that of the master. The success of the young painter was a perfect *coup de theatre*—in painting. M. de la Live de Jully, a rich and celebrated amateur of the time, bought the picture for his gallery: artists, amateurs, literati, all Paris repaired thither, and were lavish in their praises; Diderot came in his turn, recognised his pupil, and adopted him. Thus commenced, between the painter and the writer, that friendship of talent to which the *salons* of Diderot bear amusing testimony; the disciple illustrating the theories, the master celebrating the *chefs-d'œuvre*. "This is your painting and mine," exclaims Diderot, to Greuze, in his *salon* of 1765, "the first amongst us who bethought himself of introducing morality into art."

Jean Baptiste Greuze was born at the little town of Tournus, in Burgundy, in the year 1724. Some accounts give 1726 as the year of his birth. In the present day the house in which the painter first saw the light is rendered conspicuous by an inscription over the porch. Voltaire remarks, and he could speak from experience, that nearly all men who have made the names of their fathers illustrious, have had their early inclinations thwarted by these fathers. Thus it was with Greuze: his father constantly seeing him, charcoal in hand, covering the white walls of the cottage with persevering and ambitious sketches,—initials of a talent of which he was ignorant,—became irritated at these scribblings; and one day ill-treated the simple artist, who thought to have decorated what his father considered disfigured. Greuze was then only eight years old. Happily in the lives of celebrated men, as in fairy tales, one often meets with good spirits, who interpose just in time to set things right. The painter Grandon, father of Madame Gretry, was the happy influence which descended upon this child of great but unappreciated genius. He was going from Paris to Lyons, passing through Tournus; but having witnessed the depredations committed by his little contemporary, and the punishment by which they were followed, he asked for the child and took him to Lyons.

After this anecdote of his introduction to painting and to the world, Greuze is lost sight of by his biographers. It is known that he afterwards went to Paris, but he is not spoken of as being in any study there. Greuze's talent was of that happy order which has no dawn, but rises at once in all its glory. During this gap in the historical accounts, we may imagine Greuze as a young man living freely, receiving lessons from no master; but breathing in the theatre, in the books, and even in the air of Paris, the powerful inspiration of the sentiments of the age, and thus, tormented at once by the genius of the time and by his own, seeking ardently the expression of the new philosophy. After the appearance of his *chef-d'œuvre*, "Le Père de Famille lisant la Bible," which excited the attention and admiration of all Paris, there followed a series of pathetic or pleasing scenes, of dramatic feeling or irresistible grace, which continually augmented the success of his brilliant *debut*, and proved on the canvas the truth of Diderot's book,—that is to say, that dramas of domestic life may have the nobility of heroic dramas, manifesting to the multitude a more profitable and human emotion.

What a drama, indeed, is that in which the infirm father sends forth the paternal curse upon his son, and then dies in consequence! But let us hear what the friend and confidant of Greuze says about it; let us listen to the words of Diderot, who, happy in recognising in it his own sentiments, describes the scene with enthusiasm:—"Imagine a room to which light is only admitted by the door. Turn your eyes around this sad apartment, and you will see nothing but poverty. In spite of the help which the eldest son of the house might be to his old father, his mother, and brothers, he never goes away without having taxed these poor people. He has come with an old soldier, and has made his demand; his father is indignant, and does not spare hard words to this unnatural son, who returns his reproaches with insult. He is seen in the centre of the picture; his appearance is violent, insolent, furious; he stands erect, his right arm raised against his father, threatening him with his hand; his hat is on his head. The good old man endeavours to rise, but one of his daughters, kneeling, detains him by the skirts of his coat. The young libertine is surrounded by his eldest sister, his mother, and one of his little brothers. His mother has her arm around him—the brute is endeavouring to disengage himself, and is repulsing her with his foot. The eldest sister is also interposing between her brother and her father; the mother and sister seem to be trying to hide them from each other. Meanwhile the little brother is crying, and carrying one hand to his eyes, clings with the other to the right arm of his great brother, striving to draw him away from the house. Behind the old man's arm-chair, the youngest boy stands with a stupified look. At the other end of the room, near the door, the old soldier, who has enrolled and accompanied the ungrateful son to the house of his parents, is seen retreating, his back turned on what is passing, his sabre under his arm, and his head cast down. In the midst of this tumult, a dog, placed in the foreground, augments it by his barking."

This description, which Diderot doubtless wrote from the design furnished him by the painter, is now found to be very inexact, when compared with the picture of the "Paternal Malediction," which may be seen in the gallery of the Louvre. The bad son has no hat upon his head; he appears more angry than insolent. The recruiter is not retreating; on the contrary, he stands on the threshold, with his face turned towards the scene, looking on with an indifference which renders the expression of the other countenances more striking. The figure of the father alone remains on the canvas as it was at first

* Page 405.

pictured by the imagination of Greuze, indomitable, irritated, beautiful in anger; his hair thrown back, his arms outstretched, the rigidity of his attitude, the contraction of his wrinkled hands, being expressive of the indignation of his heart. It belongs only to modern art—to the new art of Diderot and Greuze—to extend to this point the limits of action, thus to displace propriety. The arms raised, the faces distorted by passion, the exaggerated gestures, so far removed from the strong and grave sobriety of Poussin, suddenly break the chain of tradition and indicate a recent evolution in art. For the first time, noble tragedy enters into the family of a simple farmer; the anguish of a labourer is judged worthy to be represented by the pencil, and to interest all hearts. Even if we descend to the most obscure station in life, the grief of an outraged father, however common his dress and simple his abode, appears great enough to serve as a theme to the painter of the emotions of the human heart.

"The scene is very beautiful," exclaims Diderot, "but it does not nearly equal that which follows. The bad son has ended his campaign; he returns, and at what a moment! His father has just breathed his last—he is stretched on his bed. On a straw stool at his feet stand the burning consecrated taper and the vessel containing holy water. The eldest girl is seated upon an old leathern chair, her body bowed down in the attitude of despair, one hand supporting her head, the other raised and still holding the crucifix, which she had given to her father to kiss. One of the little children has hidden his face in his bosom in fear; the other, with his arms in the air and his fingers spread out, appears to conceive his first ideas of death. The poor mother is standing near the door, her back against the wall, in deep affliction, her trembling knees almost refusing her support. Such is the scene which awaits the ungrateful son; he advances,—his mother receives him,—she is silent, but her arms, stretched towards the corpse, say to him, 'Look!' The unhappy youth is overwhelmed, his head falls on his breast, and he strikes his forehead with his fist. What a lesson for fathers and for children! It is beautiful, very beautiful, sublime," exclaims Diderot, "all, all!"

Thus the melo-dramatic style, which offends us in this picture of Greuze, was just that which Diderot most admired. Melo-drama! Diderot and Greuze invented it, and why should we reproach them for having attained the end they wished to attain? Style!—but whoever becomes a painter of the people ought, for that reason, to renounce style. Are we to confine an innovator to conventionalities, which he reasonably wishes to destroy? To become celebrated as the painter of any certain style, it is necessary above all things to represent, not any particular class of people, but humanity in its highest acceptation. Greuze only observed society in the world, and in society he only studied one class of men, the little *bourgeoisie*. But amongst them he met with noble sentiments, dramatic emotions, or simple pictures of happiness. Greuze never painted for the pleasure of painting, he did not allow himself to be tempted by a wall splendidly illumined by the sun, by a passing dog, or the first coloured object which met his eye. He pursued the course dictated by sentiment. Sentiment is the domain of Greuze.

In those of his pictures which tend to the drama, there reigns an indescribable tenderness, the most charming gentleness and kindliness expressed by grace.

What are the thoughts of the young girl, who weeps over her dead bird? She is in full front, her head resting upon her left hand, the dead bird is before her, quite dead, alas! Its wings droop, its feet are in the air. How pensive the little girl is! Her blue eyes are veiled in reverie, and tears glisten there. For a lost bird the grief is very deep! Death, doubtless, thus causes sighs at the age of sixteen, but love as well. What can the beautiful girl have to regret? The head is that of a child, the sorrow that of a woman. Diderot has consecrated several injudicious pages to seeking and betraying the secret of this melancholy gaze. Why these pages? A delicate touch of Greuze's pencil would have sufficed to have thrown all that into this pensive look, and is it not destroying the delicacy and even the charm of the thought of the painter, to divest it of all that is vague and divine?

One might people a large establishment with these young girls of Greuze, who dream in maidenly amazement. Poor young girls! the broken mirror, the broken pitcher, [p. 397] the dead bird; they have always something to weep about. With what charming regret does this one carry her cracked pitcher on her arm, with one hand gathering up her apron full of flowers! She is going to enter the house, thus grieving, her eyes not cast down, but, on the contrary, open with the most touching simplicity. This little pitcher, then, was of great value? No, it is only of stone. The reason is, then, that her mother is very severe? No, the families of Greuze are gentle and smiling, from the child to the grandfather. Wherefore, then, this grief?

> Je ne savais pas même
> Son nom jusqu' à ce jour.
> Hélas! lorsque l'on aime,
> On a donc de l'amour?

"And grace, still more lovely than beauty;" this is, doubtless, the ideal of Greuze. He was much in the company of women, with whom he was generally a great favourite. "Greuze," says M. Lécarpentier, who knew him, "was of middle height; he had a finely developed head, a high forehead, bright eyes, an intellectual face, and the bearing of a man of genius. Fond of praise himself, he was always the first to lavish it, with an affectionate warmth and artistic delicacy, which always seemed to address to art what was intended for the model. Greuze spoke well, enthusiastically, especially of painting and of himself. Full of his own merit, he created enemies among his most wary rivals, by his unguarded naïveté."

"Our painter is rather vain," cries Diderot, "but his vanity is that of a child, it is the intoxication of talent. Deprive him of that ingenuousness, which causes him to say of his own work, 'Look at that! that is beautiful!' and you take from him his spirit, you extinguish his fire, and his genius will be eclipsed. I much fear that when he becomes modest, he will have reason to be so. Our good qualities, at least some of them, approach near to our faults; most of our virtuous women have their caprices, and great artists are a little eccentric."

The Marquis of Marigny having repaired, in his capacity of *ordonnateur des arts*, to the Exhibition of 1765, was received with distinguished honour; and walked leisurely through the picture gallery, accompanied by some artists favoured by his good opinion. Other artists were also there. He passed on, examining the pictures, approving some, condemning others. Greuze's "Weeping Girl" arrested and surprised him. "That is beautiful," said he to the artist, who answered, "Monsieur, I know it; I am praised, but work fails me." "The reason is that you have a swarm of enemies," interrupted Joseph Vernet, "and among these enemies there is one who appears to love you to distraction, and who will ruin you." "And who is this enemy?" asked Greuze. "Yourself," replied Vernet.

When the marine painter addressed to him this cutting remark, Greuze had been, on the suggestion of Pigalle, received into the Academy, which had given him the right of exhibiting his works at the Salon. Several criticisms, cast amidst the general admiration, piqued him so much, that he determined to make a journey to Rome, for the purpose of changing his style. Ingenuous error! Ah! what would he seek at Rome? what could teach the sentimental and natural painter of the people to represent heroes and gods—the painter of the honest citizen in the midst of his family, of the aged mother at her spinning-wheel, of children quarrelling with their dolls? What had he to do with copying the "Virgins of Raphael," reserved for divine love; he, who knew by heart the blooming maidens created for earth and the devotion of man? Can one imagine the painter Greuze visiting the Sextine chapel? He hastened to leave Rome, and returned to Paris to paint the "Good Mother," and the "Twelfth Cake," in the garret in the neighbourhood of the Sorbonne, where he lived.

And that "Twelfth Cake"—Le Gateau des Rois—what a charming picture it is. How admirably each figure seems to take its place in the composition, and how harmoniously the various elements blend into one perfect whole! Here again we have the father and mother, surrounded by their family of loosely-dressed little ones, in a poor apartment. It is the celebration of the last day of Christmas. Joy beams from every countenance, and mirth peeps out from every eye, as the various members of the family join, in anticipation, in the revelry of the time. No, not from every face and every eye; for behind the father's chair, looking wistfully at the steaming bowl, which the eldest son bears aloft in his hands, we notice a pensive and sorrowful countenance. It is the naughty little girl, who, in another minute or two, will be received into the arms of the mother and made happy for the rest of the evening. At present she is undergoing punishment for some trifling fault; but it is only a preparatory step to happiness. What a contrast to the little fellow who brings his parcel of Christmas gifts, and places them in the hands of his father for distribution among his brothers and sisters. See, with what kind motherly affection the woman listens to the tale the bright-eyed boy is whispering in her ear; and with what attention the children on the other side of the table regard the preparations for the feast. These simple creatures seem to want little indeed to complete their happiness. The room may be a mean one, crowded with domestic utensils, but the poverty of its inmates is rather seen than felt by the spectator. There is a look of comfort in the round plump faces of the children, a sleek contentedness in the posture of the cat,—all Greuze's domestic pictures have a cat or dog in them,—and an entire absence of that pinched and miserable expression which belongs to severe poverty. It is a happy scene. The simple hearts of the loving family are united one to another by a band which no outer influences can break asunder.

"The Bride of the Village" (page 404) is another of those domestic scenes which our artist knew so well how to depict. There is no mistaking the story. The youthful pair, "whom love beguiled," have just entered, or are just about to enter, the bonds of matrimony. Joy and sorrow mingle strangely, but naturally, in the scene. The beautiful maiden, though she clings to the youth of her choice, cannot part from those dear ones at home without regret. The sister lays her head upon the shoulder of the bride and weeps; the mother clasps her hand and looks up into her face appealingly, and almost weeps for sympathy. She, too, remembers when she left her father's house to become a wife, and well can she understand the feeling which agitates the breast of the maiden. Old associations have to be given up, new friendships have to be formed, and henceforth father and mother, brother and friend are centred in one—the husband, the bread-winner. And the latter, with the maiden's portion in a leathern purse, is listening, with a grave and respectful reluctance, to the words of

GIRL AND DOG.

advice which the hearty old man is giving him. Meanwhile, the advocate looks gravely, and the domestics tearfully, on; and even the children—those never-absent adjuncts to Greuze's pictures—seem to share somewhat in the interest of the passing scene; though one of them cannot resist, even now, the temptation of feeding the chickens on the floor. Like nearly all of our artist's productions, the interest of the pictured story is eminently home-like. If Lancret was entitled the painter of court ladies and gallant gentlemen, Greuze may be styled pre-eminently the painter of the people; for only in his productions do we really catch a glimpse of village life in France in the last century. His stories are all eloquent, for they are all natural,

whom no man better understood or studied with greater assiduity than Jean Baptiste Greuze.

In the pictures of Greuze one might trace the touching history of the daughter of the people, from the day she imprudently went to the fountain and returned, her eyes full of tears and her apron full of flowers, to the day when we find her the mother of a family, surrounded by a group of fresh and blooming children; she will realise, in the tender austerities of duty, the dreams of sixteen. Who would not recognise her as the "Bride of the Village?" Who has not seen her pass on her way to sign the contract, supported by a friend of her childhood, and led by her betrothed, who does not yet dare to press her arm in his? Her charming head

THE PRETTY WASHERWOMAN.

The framed picture, called "The Return of the Nurse Child,"—given in page 409,—is another of those subjects which won such applause from the people of France. In it we have the same forms and faces as figure in so many of Greuze's pictures. There is the same bare-raftered room, the same dog smelling about it, the same domestic utensils, and almost the same disposition of the principal draperies. The materials are alike, but the expression and the story are new and original; and herein lies the triumph of the master. The mind and hand worked in unison, and what the one conceived the other executed successfully. In this picture, as in many others, we obtain another view of the habits of a peasantry, covered with a pretty cap, her figure enveloped in a white boddice, the rose which is placed upon her bosom, would absorb the attention of all the spectators were they not engaged by a scene in which every one so admirably plays his part. And, besides, there is so much modesty in the bride's downcast look, in her attitude, that one would scarcely dare to address to her the compliments she merits, for she is at once modest and triumphant, delighted at being young, embarrassed at being beautiful, affected at being loved.

Greuze was the painter of domestic life, and it is not astonishing that his pictures should be full of detail, that the light should be spread over a thousand objects. Is it not

natural that as much importance should be given to detail in Greuze's pictures as in private life? What interest does not one attach to the least of the inanimate objects contained within the narrow limits of home, an interest which is at the same time the effect of habit, selfishness, and kindness! With Greuze domestic harmony, the sweetness of a caress which the young wife reserves for the father of her child in the cradle, all these good things are inseparable from the centre from which they proceed: but the utensils which are in order in the house are represented in the painting in picturesque confusion. The cage of canaries is hung against the linen-press, the housewife is employed in washing beside the table, upon which are placed glasses, round loaves of bread, and large jars of preserves. The kitchen utensils shine here and there, but not so much as the neck and arms of the washerwoman; a bunch of onions is seen by the side of the children's top; and the house-dog, an inseparable part of the family, smells everything, barks, caresses, looks fixedly at his mistress, or sleeps upon an old crazy chair. In the midst of this pell-mell, Greuze usually places his *mère de famille*, whom he represents surrounded by children, with bare necks, pouting, smiling, asleep, observed in every posture, and at all times of the day, their stockings falling about their feet, their little shoes trodden down at heel, and their dresses so torn that glimpses of the white, delicate, plump little bodies may be caught through the rents. The drums are already cracked, and the wooden horse lies forgotten in a corner; however the *bouilli* is on the fire, the saucepan awaits the appetites of those dear children, who, after having filled the house with their din, come to dispute the spoonful of pottage which their pretty mother holds, as in the picture of *La Maman*.

"That preaches *population*," cries Diderot, in his usual blunt style. Certainly, after Rubens, no painter has portrayed more lovely children: in this particular Boucher is, perhaps, the only Frenchman who equals Greuze: but Rubens and Boucher have painted naked children; Greuze has represented them dressed negligently, and, if he have avoided in this manner a greater difficulty, he has at least made the very most of the charming loosenes of their costume. It seems that he wished to depict the history of those happy unions which, in old romances, always end with a great number of children; and it would be more appropriate to say, that preaches *marriage*. As to the mothers, they have that richness of carnation which is the effect of their peaceful, happy life: pensive Flemish women, such are the women of Greuze. The same exuberance of flesh, the same brilliancy, but with that additional charm—grace. How easy it is to recognise a French painter by the lively manner of distributing, or rather of throwing about, objects; of arranging, or rather disarranging, the toilet. The shoulders are exposed, the head-dress ruffled, the neckerchief displaced, as if not to conceal the beautiful neck; an end of lace falls also in elegant disorder upon the blooming cheek, together with some curls of hair. And since this was the age of careless and floating frills, it is not surprising that the mob-cap should be so oddly placed on the head by chance, that most skilful of coiffeurs.

Greuze's wife served as the type of that prosperous and pure beauty which he has represented in all his pictures. "This painter is certainly loving towards his wife," writes Diderot; "and in fact she was constantly his model. A precious woman to have given celebrity to the painter and happiness to the husband!"

The love of Greuze for his wife, the preference which he so willingly bestowed on that animated and fresh kind of beauty, sufficiently explains why he incurred the reproach which was applied to him, even during his lifetime, of having given a family likeness to all his heads of women, which makes them too easily recognised as the children of one father. His partizans, for he had many and distinguished ones, defended him, saying, that beauty is *one*, that ugliness alone is manifold: that, after all, Greuze was the creator of his family, that his children were really his own, as their resemblance proved them to be,

"——— Facies non omnibus una,
Nec diversa tamen, qualis decet esse sororum."

But certainly the reproach was merited, and it would be a feeble excuse to recollect, in favour of Greuze, that the heads of women bear a general resemblance in the pictures of Raphael, Titian, Rubens, and Guido. Such monotony is only permitted to the painter or statuary who has found, like Apelles or Phidias, the true and immutable type of beauty: To deviate from it then would be a fault, unless there were necessity for a contrast. And besides, between severity and grace there are so many shades, that the artist may be faithful to his ideal, while avoiding too much uniformity; that is to say, to find, without any alteration, all the gradations of the beautiful.

The most serious fault that can be found with Greuze is an affected negligence in the execution of his draperies. This fault was with him voluntary, and he made a principle of it; he neglected them to give more brilliancy to the flesh. But it may be said that this is an useless and mistaken sacrifice; the dress sets off the flesh merely by difference of tone, and that is true of very light as well as very dark draperies. It might be excused if the negligence of the painter were dissembled; but as it is sufficiently marked to strike the eye, he has defeated his purpose, since he has drawn the attention of the spectator to the very point from which he wished to divert it.

That Greuze was deeply sensitive we can see from his pictures, and those who lived near him say that his humour depended entirely upon the subject which occupied his mind; it deeply affected him, he entered like an actor into the scenes he represented, at least as much as a painter, and in the evening he carried into society the character of the picture he had been painting during the day; sad or gay, playful or serious, gallant or reserved, according to what had occupied his pencil or his imagination. How charming must he have been the day of the "Bride of the Village!"

But doubtless he had worked at some sad subject when he made so violent a sally against Madame Geoffrin, who, detesting marriage and large families, had laughed, it is said, at that *fricasée d'enfants* which surround the beloved mother in one of Greuze's pictures. "What is she thinking of!" cried the painter, on hearing the remark of Madame Geoffrin; "let her take care I do not immortalise her! I will paint her as a school-mistress, a whip in her hand, and she will frighten all children both now and in future."

Diderot, of whom Greuze has made so excellent a portrait, has, in his turn, portrayed his friend, accompanied by his talent, wherever he went, in crowds, in churches, at the market, on the promenade, in the family circle, in the streets. He went about constantly observing actions, passions, characters; thus the world was transformed into a vast studio, in which every passer-by became a model for Greuze. Thus he stole from the crowd those images which the delighted people afterwards saw at the Louvre, in his agreeable pictures, without recognising them. The picture of a fair little girl, holding a black dog* in her arms, is doubtless the result of a happy meeting. Living scene! The eyes of the child and the eyes of the dog glisten like four stars. The illusion of art, the action of life, could not be carried farther; it is, perhaps, the *chef-d'œuvre* of Greuze. A child playing with a dog: this was nothing remarkable in the street, on the canvas it is most lovely—as a glance at our exquisite engraving will testify. Neither would anybody but Greuze have paid attention to the scene, in the Rue Mouffetard, of two children, a little boy and a little girl, sheltering themselves from the rain under the little girl's tucked-up petticoat; Bernardin de St. Pierre passed, and the simple episode of this rainy day became one of the sweetest pages of French literature.

From familiar poetry Greuze attempted, on a day of mistaken inspiration, to raise himself to history, to reach historical poetry. But though he knew the theories of Diderot, he did not know those of Corneille. "Septimus Severus

* Page 400.

reproaching his son Caracalla for having attempted his life in the defiles of Scotland," was a shocking outrage against Greuze himself, and brought down upon him reproaches from every one. The Academy, for which the picture was intended, deserved it, but grumbled; it received Greuze into its bosom. Ashamed, however, of his "Caracalla," he quickly returned to his own style, vowing never again to be led into the defiles of Scotland and the Academy.

"Greuze had much natural wit," says the *Journal des Débats;* "his conversation with women was full of politeness and gallantry, and appeared to proceed from a profound admiration, and the lively sentiment he had of their excellence. It was with him a sort of worship, and the praises he lavished upon them had in his mouth an extraordinary grace and originality. His conversation with men was piquant and animated, especially when he spoke of his art, with which he was thoroughly conversant, and for which he had a true enthusiasm. His mind was naturally exalted, even a little proud, and his pride was not slow in manifesting itself when he did not obtain the justice which he considered due to his talents, or when it was provoked by a bitter and ignorant censure. Although it was long before he was held in the estimation which he merited, although he never enjoyed it without contradiction, he nevertheless received many flattering testimonials of public admiration. He was extremely sensitive on this point, often brought them to mind, and spoke of them with an ingenuousness which served as an excuse for, and qualified the appearance of, vanity, which one must have when speaking of oneself with complacency."

Poor Greuze! He was not of a yielding nature, as Diderot so well observed to him. It was with a bad grace that he submitted to dance attendance upon the *Directeur-ordonnateur des Arts;* he was not the man to say to his compeers that he looked upon them as masters, and considered himself a mere child compared to them. Besides, the favours of M. de Marigny did not encourage the painter. A director of the fine arts would naturally seek out proud talent, were it only to revenge himself upon the sycophants by whom he is besieged. But that is not always possible, because the importunate, though they make themselves detestable, occupy the time which should be devoted to unknown or unobtrusive merit. In a note to the *Salon* of 1765, is the sarcastic list, made out by Diderot, of the favours which M. de Marigny had, up to this time, procured for Greuze. "When the talent of this painter was known," says the witty philosopher, "he was permitted to go to Rome at his own expense; and when he had exhausted the small sum of money which he had collected for the journey, he was allowed to return to Paris, before having gained the advantage for which he had hoped. Since his return he has been allowed to execute the most beautiful pictures, and to sell them as well as he could. At the time of the success of the picture of the 'Paralytic,' in the last exhibition, he was permitted to have it conveyed to Versailles, to be shown to the king and the royal family, and to spend twenty crowns for the journey. Then, not having been able to find a purchaser for this picture, which cost him a hundred louis in study, he has just been permitted to sell it to the Academy of Arts of Petersburgh, in order to carry the reputation of the painter to the extreme limits of Europe. Series of favours granted to M. Greuze for the next exhibition." Here is, doubtless, something to laugh at, but something also for which to blush.

In spite of his pride and the obscurity in which the government left him, Greuze enjoyed, towards the end of his life, easy circumstances; but his savings, invested in government stocks and bank shares, were almost entirely lost, in consequence of successive conversions and failures. Domestic misfortunes destroyed the remnant of his fortune, so that at the age of seventy-five, he was compelled to have recourse to his brush and pencil, to procure means of subsistence. One may easily imagine the distress of this old man, when the illness, of which he died, deprived him of the power of drawing or painting. To the uneasiness, so natural at his age, was added cruel anxiety for the fate of his two daughters, to whom he could leave no other inheritance than an illustrious name. In this extremity he wrote a touching letter to Napoleon's minister, which has been preserved, and the translation of which is as follows:—

> The picture which I have painted for the government is not half finished, and the situation in which I find myself placed renders it necessary for me to request that you will give me an order to retouch it. I have the honour, by your kindness, to tell you all my misfortunes; I have lost all,—talent and courage,—I am seventy-five, and have not a single work in hand. Your kindness is great—your heart is good—and my necessities are urgent. The respectful salutation of GREUZE.
>
> The twenty-eighth of Pluviose,*
> Greuze Rue dertotier,
> Gallerie du Louvre.

Greuze died in 1805, at the age of eighty. "The simplicity of his funeral was relieved," says the *Moniteur*, "by a scene as touching as it was unexpected. When the body was about to be removed from the church, to be placed upon the funeral car, a young person, whose emotion and tears were perceptible, although her face was covered by a veil, approaching the coffin, placed upon it a bouquet of everlasting flowers, and then retired to the furthest part of the church, to continue her prayers." The stalks of the flowers were held together by a folded paper, upon which were written the words, "These flowers, offered by the most grateful of his pupils, are the emblem of his glory."

It was right, adds the narrator, that one woman, in the name of all, should come to place this tribute of admiration upon the tomb of the celebrated artist, who had especially consecrated his works and genius to them. This young person was Mademoiselle Mayer, a pupil of Greuze, and afterwards a friend of Prud'hon.

Deprive Prud'hon of the style and feeling of the antique, the ideal, and you will recognise a resemblance to Greuze. Between these two masters there exists the delicate bond of grace. It is that which gives interest to the "Betrothed" of Greuze, his "Spinners at the Spinning-wheel," his "Pea-shellers," to all those sweet household occupations, in which reign domestic peace and health, all his mothers displaying their little Gracchi, their treasures. Grace is a sort of poetry, which, when added to passion, may render citizens heroes. Now, grace and passion were represented by the blue and vermillion of Greuze; he had them constantly on his palette. Flemish, in point of style, he is eminently French in thought. His playful, light, and powdery touch, deposits on its course a sort of cross-hatching; but if it is suitable to express the rosy cheek of a child, or the fresh complexion of a young girl, it sometimes seems to cut up objects, multiplying them beyond all measure. Greuze's touch often resembles the flat touch of Metzu, the excellences of which it often exaggerates. It may be truly said, however, that this defect, which is less perceptible in his more finished works, entirely disappears in his best productions. We will repeat what M. Paillot de Montalembert says upon this subject. "A multitude of painters who have been, and who yet are, very monotonous and insipid by their affected polish, do not, however, equal the finish of Greuze, who certainly did not possess their smooth and even brush or subtle workmanship." But in composition so far as regards the dramatic and the sensible, Greuze adheres sufficiently to the French school to be an honour to it; but not too strongly to be the most original of its masters. If his pictures are sometimes deficient in dramatic uniformity, they possess a moral unity, if we may so express it, the domestic spirit, and one not only illumined by the light of day, but by a mild ray of philosophy.

With a brief notice of the other pictures we have introduced we will conclude. The picture known as "A Family Scene," but which is also called "Reading the Novel," is but another phase of our artist's peculiar and popular manner. It appeals

* Pluvoise was the fifth month of the calendar of the first French republic, from 20th of January to the 18th or 19th of February.

at once to the senses; and, appealing, charms them. In the "Midsummer Night's Dream," Helena says—

> "Things base and vile, holding no quantity,
> Love can transform to form and dignity."

And so, by a slight paraphrase of meaning, we may assume that incidents, of themselves commonplace enough, may be transformed, by the power of the narrator, into tales of wondrous witchery and power. At any rate this would seem to have been the idea of the painter of our picture; for he has given to the three figures, which form his group, the precise expressions which belong to the delighted reader and the absorbed listener.

Who amongst us has not, at some time or other, formed one of such a group as is here represented? By winter fire-side or in summer bower, who has not listened spell-bound to

> "Some sad tale
> That tells of blighted feelings, hopes destroyed;"

or melted into tears, or almost cracked his sides with laughter, at the alternations of the story? But for the anachronism—the painter of the picture having lived a hundred years ago—we might suppose the young lady to be reading "Uncle Tom's Cabin," so interested do the listeners appear. But simple folk, such as Greuze delighted to depict upon his canvass, were content with tales of far less truth and pathos. With them the woes and sorrows of imaginary knights and maidens, of love-lorn ladies and deserted children, were certain to obtain sympathy; and with tears and laughter the cunning master of words was rewarded, as page and chapter succeeded each other.

Glance at the picture: see what an air of attention and repose appears to dwell upon it. The reader has thrown her work aside, though the open basket, the worsted balls on the floor, and the riband hanging over the back of the chair, suggest its resumption presently; and her father and mother—for such we may suppose them to be—are intent upon the story she is reading. It is a charming and well-told group.

Nor less interesting is the single figure called the "Knitter Asleep," (page 412) considered either as a specimen of the painter's manner, or in reference to the subject chosen. There is nothing that Greuze selected for a subject that he did not raise into poetry and beauty.

F.BEEMAN D.

THE BRIDE OF THE VILLAGE.

Jean Baptiste Greuze, has painted a great number of pictures, principally domestic scenes, portraits, and studies of heads; he has taken but one subject from history: "Severus reprimanding his son Caracalla."

John Smith, in his "Catalogue Raisonné of the Works of the most Eminent Painters," gives the description of 184 compositions by the hand of this great artist.

In the galleries of France are to be found some of his most valuable pictures, and England possesses many beautiful specimens of his works.

We will now proceed to give a list of the pictures of J. B. Greuze which are contained in the public and private collections of Europe: in the Louvre are eight pictures by this master, although the catalogue, which is very defective, only points out five.

"The Bride of the Village." Valued at £600 during the empire, £1,200 at the restoration, and which is now worth £6,000 It has been engraved by Flipart. It was bought by the Marquis of Menars for £360, and sold by him, in 1782, for £695.

"The Broken Pitcher," engraved by Massard, has been copied a thousand times, but never successfully. It is one of the most highly finished and finely conceived of Greuze's pictures. It was sold, in 1785, at the Marquis of Verre's sale, for £120; amateurs value it at from £1,000 to £1,200. The little engraving under the portrait of the artist is a very successful rendering of this charming picture.

"The Paternal Malediction." An admirable work, valued at

"Morning Prayers." An exquisite composition, valued by M. Paillet at £640, but which is now worth double that sum.

"The Twelfth Cake." A picture containing eight figures, and signed J. B. Greuze, 1774, valued at £420 It has been engraved by Flipart. There is engraved a very good copy of this celebrated picture.

"The Little Mathematician." A half-length figure, valued at £232. In 1795 it was sold for £596.

"A Young Girl with clasped Hands," valued at £200. "The Young Girl with the Basket," £160. "A Girl's Head," valued at the same sum. "Study of a Child of four or five years old," £80.

THE FATHER EXPLAINING THE BIBLE TO HIS CHILDREN.

£400, in 1816, by the inspectors of the Musée. It has been engraved by R. Gaillard.

"The Son Punished." A companion to the last; is valued at the same price, and engraved by the same artist. At the Marquis of Verre's sale, in 1785, it fetched £840.

"The Portrait of the Artist," an engraving of which is in the Musée Français. It is from this portrait that our engraving is taken.

"The Portrait of the painter Jeaurat." Admirable for expression and truth.

Lastly, two Heads of Young Girls.

The Musée Fabre, at Montpellier, contains eleven pictures by Greuze:

These seven pictures of Greuze's were presented to the Montpellier gallery by M. Valedeau, in 1836.

The generous founder of this celebrated collection contributed "The Head of a Paralytic," and the study of "A Head of a Sleeping Child."

To these the town of Montpellier added two other studies by Greuze; one of a Young Boy, the other of a Young Girl, each valued at £32.

Delessert Collection:—"The Reading of the Bible." Engraved by Martinasi and Flipart. In 1769, at the sale of La Live de Jully, this picture obtained the price of £190. In 1777, at the sale of Randon de Boisset, £268, and £164 10s. at that of the Clos Cabinet, in 1812.

"A Head of a Young Girl," "The Child Fishing," "The Portrait of Wille," the celebrated engraver, which Diderot ranks with the best portraits of Rubens, Rembrandt, and Van Dyck.

Baron J. de Rothschild's collection contains "The Pretty Milk-maid," engraved by C. Levasseur. This is one of the most charming works of this master; it was painted as a companion to "The Broken-Pitcher," and was sold in 1794 for £122. This picture is now worth from £1,000 to £1,200.

"Meditation." A young girl supporting her beautiful head upon one hand.

"The Thought of Love." Companion to the last, representing the form of a charming young girl reading, whose head has just sunk upon one of her arms.

The Marquis Maison, in his collection, possesses "The Twelfth Cake." It is very vexatious to the owner, that the counterpart of this composition is in the Montpellier gallery.

In the collection of Jules Duclos is "The Portrait of the Artist." "The Head of a Young Woman," expressive of grief. "The Emigration of the Little Savoyards," a beautiful sketch in the style of Correggio, full of sentiment.

In the collection Pourtales Gargier is "Innocence," a half-length figure of a young girl, who lightly presses a lamb to her bosom.

The collection of the Marquis of Hertford contains "Prayer, or the Offering to Love," an engraving of which, by Macret, was contained in the gallery of the Duc de Choiseul. The picture was bought at Cardinal Fesch's sale, in 1845, for £1,296. At the sale of the Duc de Choiseul, in 1772, it was knocked down at £266, and at £200 in 1777, at the sale of the Prince of Conti.

"The Unforeseen Misfortune, or the Broken Mirror," engraved by Damel, obtained £933 10s., in 1777, at the sale of Cardinal Fesch; but in 1769, at the sale of La Live de Jully, this picture only fetched £140.

Mr. Holford, of London, possesses a very beautiful head by Greuze.

In our National Gallery we find a "Study of a Young Girl," bequeathed in 1840 to the Hermitage at St. Petersburg, by R. Simmons; "The Paralytic waited upon by his Children," an excellent composition of ten figures, engraved by Flipart, valued at £1,000; and a "Study of a Young Woman with a smiling Face."

Amateurs, especially those in London, possess a large number of the compositions of this celebrated French painter.

"A Mother with her three Children," was in George the Fourth's private gallery in Pall-mall; and "The Bust of a Young Girl" in Lord Yarborough's collection.

Mr. John Cole possesses "The Blind Man Deceived," engraved by L. Cars; Sir Robert Wigram "La Voluptueuse," engraved by Gaillard; Richard Foster "The Young Girl with the Dog," admirably engraved by Porporati and Ingouf, and, in the Choiseul gallery, by de Lannay. At the sale of the Duc de Choiseul, in 1772, this picture was sold for £288; in 1832, for £670. It is now well worth £1,000.

In the Queen's gallery is one picture by Greuze, "La Trompette," engraved by Jardinier; it is valued at £400.

General Ramsey possesses "The Dead Canary," engraved in oval by Flipart; and the "Studious Youth," engraved by Levasseur.

In the collection of Baron Lionel de Rothschild is "Irresolute Virtue;" engraved by Massard. A very elaborate painting, valued at £400.

It will be observed that we only mention those works which have been engraved. Otherwise we might point out twenty others.

In the Pauloffsky Palace, near St. Petersburg, is the half-length figure of a "Young Girl sheltering a Bird in her bosom;" "The Widow and her Curé," engraved by Levasseur.

In the celebrated Grosvenor Gallery, which has been chiefly formed by its present owner, the Marquis of Westminster, there is a good specimen of Greuze's talents. It consists of four figures—a mother with three children. The younger child is asleep on the lap of its mother, who is warning one of the other children not to disturb the repose of the infant by the noise of a flute which one of them holds in his hand. Dr. Waagen* is of opinion that this is one of the finest pictures of the master in the possession of a private person. "The refined expression and truth of the mother's action," he says, "the greater precision in all the forms, the careful execution throughout, distinguish this picture, much to its advantage, from the sketchy and bloated girls' heads of Greuze, which we so often meet with. If the colour is less brilliant than in them, it is, however, fuller and tenderer." The Doctor looks upon French art with the critical eye of a German, or he would not surely have considered it necessary to characterise the female heads of our artist as "sketchy and bloated." One other specimen of the French School—the "Franciscans at Morning Service in the Choir of their Church," by Granet, is in the possession of the Marquis.

In Lord Yarborough's collection there is also another very fine and genuine Greuze. It is the "Head of a Girl," peculiarly clean in the colouring, with luxuriant tresses, and a sweet expression of countenance. These two pictures have never, we believe, been engraved.

There are, doubtless, numerous examples of Greuze in the private galleries of the nobility and gentry of this country; and the estimation in which his works are held in England is sufficiently indicated by the high price which they attain whenever any of them happen to appear in a public sale-room.

We will complete these references by a list of those engraved pictures of this master, of which we have not yet spoken.

"The Portrait of the Artist," in profile. "The Toy," engraved by Ingouf. "The Little Pouter," by Guttenburg. "La Devideuse," by Flipart, sold for £640 (Choiseul collection, 1772). "La Belle Blanchisseuse," by Danzel. This picture has been selected by us (page 401) as an illustration of Greuze's most popular manner: although consisting of but a single figure, the various accessories introduced render this composition a really delightful study. "The Knitter Asleep," by Jardinier. "The Tender Wish," engraved by the same. "Les Sevreuses," engraved by Ingouf. "Thais," or "The Beautiful Penitent," by Levasseur (the sale of Duclos Dufresnoy, in 1795, £480). "The Prayer to Love," by P. P. Moles, the same sale, £840. "The Spoilt Child," by Maleurre. "Melancholy," engraved, after the manner of a pencil drawing, by an unknown hand. "The Benevolent Lady," by Massard, in 1778. "The Magdelene in the Desert," and "A Young Girl," engraved in outline, in the gallery of Prince Lucien Bonaparte. "Love," by B. L. Henriquez (Count Perregaux sale, 1841, £300. "The Serenader," engraved by P. L. Moitte. "The Tender Glance of Colin," by Damel. "The First Lessons of Love," by Voyez. "Little Jeannette," by Guetin. "The Angry Mother," or "The Abashed Daughter," by Ingouf. "Repentance," by Moitte. "Diana," by Gaillard. "Calistes," by the same. "The Broken Eggs," by Moitte. "Serena," by Bause. "The Mother and Child," by Watelet. "Retour sur soi-même," by L. Binet. "The Little Neapolitan," by Ingouf. "Little Nanette," by Beljambes. "The Young Nurse," and its companion, "The Kittens," by Moitte. "The Ragged Little Boy," by Breteuil. "Portrait of Catherine II.," by Gaudier. "Portrait of Diderot," by Saint Aubin. "Portrait of Mademoiselle Babuti," the wife of the artist, engraved by the same. "Young Girl with a Rose on her Bosom," by Ingouf. "The Little Brother and Sister," by Haner. "The Astonished Children," by Elleum. "A Gentleman standing," in imitation of the Burgomaster Six, by Rembrandt, engraved by Watelet. "The Welcome," engraved in aquatinta, anonymous. "The Sleeping Philosopher," by Aliamet. "Sensible Privation," by Simonet. "The Pea-Shellers," by Moitte. "The Mother-in-law," by Levasseur. "The Beloved Mother," by Massard, 1775. "The Torn Will," by Levasseur. "The Hermit," by Marais. "Le Geste Napolitain," by Moitte. "Household Peace," and "Good Education," by Ingouf.

* Works of Art and Artists in England. By Dr. Waagen.

"The Return of the Nurse," after a drawing, by Laurent. "La Maman," after a drawing, by Beauvarlet. "The Grandmamma," after a drawing, by Binet. "The Discharged Servant," after a drawing by Damery. "The Market Woman." "La Curieuse." "The Chestnut-woman." "The Woman selling Baked Apples;" "A Grisette," engraved after drawing, by Beauvarlet; "The Chimney-sweeper," from a drawing, by Voyez; "Lubin and Annette," by Binet, after drawings; "Music;" "Poetry;" "La Trileuse;" the "Flower-girl," by Moitte, who has also engraved twenty-four sheets, entitled, "Divers Habillements Suivant le Costume," drawn after nature by J. B. Greuze. Weisbrod has engraved a series of five heads, after studies by our artist. The drawings of Greuze, like those of Prud'hon, are much coveted by amateurs; they are generally in red chalk, sometimes in pencil washed with Indian ink; the Louvre possesses a fine collection of them.

Greuze very rarely signed his pictures; his autograph compositions are consequently scarce.

"Before the death of Watteau," says Allan Cunningham, "the School of Painting in France began to decline in natural beauty and in lofty simplicity. The magnificent affectations of Louis the Fourteenth aided largely in this; the pictures which gave to Francis Boucher the name of the Anacreon of painters, finished what royalty had begun, and the purity of Art was profaned and polluted. Vernet, with his marine compositions, which have a sea savour about them, and Claude Caylus, with his classic taste and national enthusiasm, laboured to preserve a love of nature, and a respect for the pure and the lofty; in this they were ably seconded by John Baptiste Greuze, whom his countrymen call the painter of the Graces; he might with equal propriety be called the painter of the Virtues, for he loved to delineate moral and pathetic subjects—scenes of devout emotion and tender sentiment. Joseph Marie Vien may be named as the last of that long line of artists who interpreted Scripture and prophecy for the church. He was born at Montpellier in 1716, and established his reputation in an age inclined to the licentious and the loose by his pictures of "St. Martha," the "Centurion," the "Miraculous Draught of Fishes," and the "Preaching of St. Denis;" he suffered by the Revolution, which abated effectually that love of devout histories which distinguished his country for centuries.

"The storm of the Revolution purified and cleared the air; it swept away the splendid affectations of the court, and restored society to something like the simplicity from which it had fallen. The ridiculous etiquette, the hollow courtesies, and the ceremonious frivolities, were abated by a stern hand, and with them went much that could be spared both of costume and manners; the dresses, caped and cuffed, laced, lappeted and lapelled, frogged, frounced and frittered, gave place to the plain and simple attire of republicanism; and Nature, taking the pencil from the hand of Fashion, delineated scenes of heroism and glory in a style of simplicity real and unaffected. The first step of France was in her own blood; but the second was on the heads of her enemies; the march of her victorious armies was to her painters a new inspiration; and Napoleon and his marshals took the places of saints and madonnas; the one painted nearly as well as the other fought, and continued longer in the field."

THE GROWTH OF FREE PUBLIC LIBRARIES AND MUSEUMS.

The present state and prospects of the various public libraries and museums in Great Britain, must be an interesting study for all who take the question of the people's advancement seriously to heart; the following extracts, therefore, from an important parliamentary document recently moved for by Mr. Ewart, will be acceptable to our readers. It shows in what boroughs in England and Wales libraries and museums have been formed, in pursuance of the two acts passed in 1845 and 1850. The return occupies nine folio pages, but the pith of it may be thus briefly given:—

In Liverpool there have been established, since 1845, a botanic garden, herbarium, museum, and public library. The Earl of Derby presented upwards of 20,000 specimens of natural history to the museum; the sum of £1,389 was raised for the purchase of books by public subscription; 4,000 volumes of books, 600 specimens of the commodities imported into Liverpool, being probably the same collection as that shown by Liverpool at the Great Exhibition, and a few works of art have been presented by various individuals. The library, which is open without restriction to the public, now contains about 12,000 volumes, and there is besides a small library of botanical works connected with the gardens and herbarium. The estimation in which such institutions are held by the people, will be so well expressed by the following figures, that, in this instance, it will be well to set them out in full:—

Visitors to the Botanic Gardens and Herbarium.

1846	(from October)	4,031
1847		88,461
1848		131,529
1849		154,226
1850		168,782
1851		208,386
1852		212,802

The books in the library have not yet been allowed to circulate, and until this is done the wants of the people cannot be said to be supplied. The demand for intellectual food is exhibited in the fact, that, during a period of six months, upwards of 57,000 volumes have been issued to readers within the library itself.

The entire cost of the Botanic Garden, the Herbarium, and the Library attached thereto, has averaged about £950 a year; and the Free Public Library and Museum cost during the first year £1,162. The amount raised by rate since 1848 exceeds £4,000.

Manchester has established noble libraries both for circulation and reference. The former contains, at present, 5,832, and the latter 16,619 volumes. Between 4,000 and 5,000 of these have been presented, the rest were purchased out of a subscription fund amounting to £12,742; of this sum, £7,013 was spent in the purchase and adaptation of premises, and £4,296 on books and binding. The visitors, when counted by the police, were found to amount in fifty-two days to 107,545; and in 126 days the issue of books from the circulating library amounted to 37,252, and those consulted in the other departments to 33,094 volumes. During five months, 3,735 people were admitted, on the production of a guarantee of respectability, to the privilege of taking books home to read. In the adjoining borough of Salford, there is a museum and library established by subscription. The library contains 10,794 volumes, and the number issued to readers (they are not permitted to take them home) were as follows:—1850, 26,718; 1851, 32,978; 1852, 33,461.

At Bath, a free public library, museum, and gallery of art are in course of formation. At Bolton, a rate has been levied which yields about £280, and a subscription has been set on foot which has produced between £2,000 and £3,000. The establishment of a "Free Lending Library for the Working Classes" is considered the first and most important object, after which a library of reference is to be founded.

The corporation of Canterbury has expended £1,600 in the purchase of a museum, and £94 a year has been raised by rate for its support, together with a library. The books are issued to readers at a penny a volume. The donations of books, specimens, and works of art have been considerable.

At Dover a museum has been built by means of a rate, which produces about £177 a year. The annual cost of maintenance is only about £55. 3,282 specimens of natural history have been presented.

The town-council of Leicester established a museum in 1848, receiving considerable assistance from the Leicester Literary and Philosophical Society, which presented its own museum to the town, and at present pays the curator's salary. The rate levied produces £239 a year. The museum is open free five times a week, and the visitors are estimated

at about 2,500 a month. The specimens in the museum, including works of art, amount to 11,505 in number. The popularity of the institution is described as being decidedly on the increase.

Sunderland has made some efforts to supply itself with a museum, but has yet achieved but a very small amount of success. The importance of a library seems, however, to be recognised, and a committee has been appointed. Considerable donations of books are promised.

At Warrington a museum and library were formed in 1848, and £700 subscribed towards a new building. The library contains about 4,700 volumes. The rate yields between £80 and £90 a year.

The acts as they at present stand permit the levying a rate of a halfpenny in the pound for the purpose of establishing and maintaining public libraries and museums, but they do not permit any portion of the money to be expended in the purchase of books or specimens, so that although a borough may furnish a building and provide for the current expenditure, the collections themselves must be obtained by voluntary subscriptions or donations. We shal continue this subject.

READING THE NOVEL.—J. B. GREUZE.

THE RETURN OF THE NURSE CHILD.—J. B. GREUZE.

THE DEAD BRIDAL.

CHAPTER VII.

"O mercy God! what masking stuff is here?
What's this? a sleeve?—'tis like a demi-cannon.
What! up and down carved like an apple tart?
Here snip and nip, and cut and slish and slash.
Why what the devil callest thou this?"—*Taming of the Shrew.*

It might be then an hour of the mid-day when the two friends sat together in one of the saloons of the Palazzo Polani. They had partaken of that meal which in those days preceded noon, though succeeding generations and the advance of civilisation has gradually postponed it, till, in in our own days, it is never witnessed by the sun. In a word, they had dined, and now sat in pleasant converse previous to going abroad for an afternoon's lounge. On the table beside them stood various flasks of those fine wines the Venetians imported from allparts.

The style in which the gentlemen were dressed indicated that their intention was to seek the places of fashionable resort. They had laid aside the plainer attire in which we found them in the early forenoon, and now appeared, each in the costume of his own country. Jacques wore a jupon, or cote-hardie reaching half-way down his thigh, at this period considered a very smart and fashionable curtailment of the length of these garments. It was of black velvet, and the sleeves opened midway in the upper arm, so that the arm itself could pass out at pleasure, leaving the rest of the sleeve to hang down till the wearer should be disposed to draw it on. At present it was not in use, and the part of the arm thus uncovered displayed the tight-fitting sleeve of the under garment or vest, which was of satin; the right sleeve was red, the left one yellow. A belt of embroidered leather passed loosely over the hips, so that it sloped downwards beneath the stomach; and from it depended, in front, a short sword or dagger in a sheath

of crimson velvet, tipped with a ferule of gold. The hose, like the vest, fitted tightly to the person, from the thigh to the ankle, and was of the same colours and material as the inner sleeves, only that those colours were on opposite sides—the right leg being yellow, while the left was red. His shoes were made of black velvet, very long, and tapering to a sharp point at the toe, and were fastened to the foot by a band of black velvet which passed over the instep. Round his neck was a cape of crimson velvet edged with gold; and on a chair near him lay his cap, which was also of crimson velvet, ornamented with a large button of gold, and a plume of white feathers; across the cap were carelessly thrown his embroidered gloves.

The costume of Giulio Polani was very different from that of his guest, or from what the Venetian gentlemen of more advanced years were in the habit of wearing. But it will be remembered that Giulio was yet within the age of full manhood, and considerable latitude in dress was permitted to the young nobles during their non-age, before which period the sumptuary laws in relation to dress were not enforced. He wore a doublet of mulberry-coloured satin tabby, which was slashed on the breast and sleves in the form of a cross, through which appeared the lining of yellow taffeta; the dress was closed down the front from the neck by buttons or studs of gold, and terminated at the upper end by a lace ruff, and a chain of Venetian wrought gold hung midway down his breast. The hose matched the doublet in material and colour, and was slashed upon the thigh, and shoes of dark Spanish morocco leather completed his attire.

"And so thou sayest, Jacques, that thou findest this, our Venice, does not disappoint thy expectations?"

"In faith, no, Giulio; for once, Fame hath not been a liar. Your Chiesa di San Marco hath not its equal in the world. And the palaces of your nobles may compare with those of any other land."

"Ah, but thou shouldst see us under happier circumstances, when war has not drained us of our wealth and thinned our city of its noblest, and wealthiest, and gayest. But, come, there is still somewhat for thee to see, and thou shalt now make thy selection. Shall we take a turn or two in the piazza and piazzetta of Saint Mark? There you shall be sure to meet such of our claressimi and gay youths as are in town. 'Tis the fashionable promenade of Venice in the afternoon."

"Faith, Giulio, thou must arrange our mode of proceeding thyself. To me all is new."

"Well, then, let us first to the promenade. After that we shall stroll into the Merceria, where we shall not fail to see some of our fair dames and donzelle looking at the mercers' wares and the stationary. Afterwards we shall step into a gondola, and run down to the Murano to have a stroll in the public gardens, and taste the most delicious oysters in the world."

"And see your manufactory of crystal, Giulio, of which I have heard so much. Is it true what they report, that the glass has such an excellent virtue and purity that it will not bear the slightest taint of any poison, but will incontinently break if but a drop be poured into it?"

"Such is the common belief," answered the Venetian; "but I cannot certify the fact of my own knowledge."

"Come, then, Giulio, let us make use of our time. As an old traveller, I know its value."

The young men now rose from the table, and prepared to leave the house, Giulio throwing over his gay attire the Venetian cloak of sombre black; but to indemnify himself for this compliance with the gravity of the Venetians, he placed on his head a bonnet of rich morone velvet, having an ornamental band and a rich loop and button.

We shall not follow the two friends in their promenade through the piazza and the piazetta, nor detail how the young Venetian explained to his companion the manner in which the different offices and grades of the Venetian nobles were indicated by the various colours with which their gowns were faced, the length of the sleeves, or of the flaps that fell over the left shoulder. In one respect, however, Jacques observed, that they were all similarly attired, namely, in the flat black cap of felt, which was very low and small and had no brim, and in the small band of linen that fell down not more than an inch or two. Giulio encountered more than one of those who had been his intimate companions before he had gone to travel; the meeting in those cases was in remarkable contrast to the general sobriety of demeanour which the Venetians affected. They embraced and kissed each other on the cheeks, and repeated the salutation at parting; while in the cases of recognition between mere acquaintances, each made a low formal bow, and placed the right hand upon the breast.

"Ah, what a stately figure!" said Jacques to his friend, as they passed down the Merceria.

Giulio looked in the direction to which his companion pointed, and replied:

"What, that lady in the veil of white holland edged with bone-lace; she that wears the robe of flowered black silk with enormous sleeves reaching almost to the ground?"

"And who walks upon red chioppine half a cubit high," added Jacques. "Pardieu, she would surely fall if she were not borne up under the left arm by that serving-man. The same."

Giulio laughed heartily, as he surveyed the stately gentlewoman to whom his friend alluded.

"Ah, carrissimo!" he replied, "that is indeed a very noble signora, as you would have at once known from the height of her chioppine, had you been familiar with these our customs of Venice. That is the lady Lucretzia Polani, my very honoured kinswoman, one of the most pious matrons, as well as the most inveterate gossips, in all Venice. I dare be sworn she is now going to gratify her vanity for dress in some of the fashionable shops, after which she will most likely turn he steps to the chiesa to perform her devotions. Ah! there, too, is my cousin, her fair daughter Caterina."

"What, that donzella with the huge veil of pale yellow silk, which is quilled in such a strange fashion? in good sooth, it is slight and aerial as gossamer."

"And as transparent as a summer cloud. I warrant me, Jacques, you have no difficulty in discovering through it that Caterina is a charming brunette, with a pair of black eyes that sparkle like stars at midnight."

"And a finely-turned shoulder and bosom," added Jacques, which that cobweb kerchief of lawn doth ill conceal."

"At all events this meeting is most fortunate; let us pay our respects; I shall make you known to the ladies."

So saying, Giulio advanced, and lifting his bonnet from his head (a reverence which Venetians only showed to men of the highest rank and to ladies), and making a profound and courteous obeisance, said:

"I salute the noble Signora Lucretzia Polani. Have I the felicity to find her excellency in the enjoyment of good health?"

The matron drew herself up haughtily, not recognising the person who addressed her; but the sharper eyes and quicker memory of Caterina in a moment discovered who the seeming stranger was, and so, with a joyous exclamation, she said:

"Why, dearest mother, have you forgotten our kinsman, Giulio?"

"Ah, Santissima Maria, is it possible?" said the elder lady.

"'Tis even as my fair cousin hath said," replied Giulio; "let me thank her for her kind recognition," and he saluted the blushing beauty with more warmth and gallantry than he had shown towards the matron.

"Well, Giulio, I am heartily glad to see thee, child; why, thou art grown a man outright. But when did you return to Venice? where did you come from? what have you been doing? how are you? what news from the count, your father? Ah, I have a thousand questions to ask you, and so many things to tell you, too; who is that forestiere?" This last she added in a lower tone, glancing towards Giulio's friend, who stood a little apart.

"With your excellency's permission I will make known to

you my most honoured friend and sometime companion in Paris, the Sieur Jacques Dela Mole."

The matron returned the bow of the young gentlemen with a gracious yet ceremonious movement of the head; the bright eyes of Caterina gave a warmer acknowledgment to the courtly salutation, which the youth concluded with a glance of respectful admiration and a gallant pressure of his hand upon his heart.

The matron turned towards Giulio and resumed—

"I am just going to a mercer's booth yonder, to see some Dalmatian velvets, which he hath apprised me have just arrived to him, and are, he says, of rare beauty. Shall I have the honour of your escort and that of your friend, and the benefit of your judgments in the matter? You travellers should be judges of everything."

The gentlemen assented. Giulio placed himself at the right side of his elder relative, while Jacques attached himself to the younger lady. When they had inspected the merchant's wares, the matron selected a figured velvet cloth, richly embroidered with gold, and demanded its price.

"Ah!" said the crafty mercer, with an obsequious bow, "the Signora's taste is unimpeachable; that is the finest cloth of velvet in Venice. Her highness the Dogaressa has as yet been the only lady to whom I have shown it, and she has purchased a robe of it."

This announcement at once decided the lady's choice, and she accordingly ordered a mantle of the costly fabric. Let not our readers be surprised at this extravagance of a Venetian lady. At the period of which we write, their expensive luxury in dress had reached a height that must have been very formidable to their lords, with whose graver apparel that of their wives and daughters so strikingly contrasted. To such a pitch had the feminine passion for dress arisen, that in the beginning of the fifteenth century some of the Venetian ladies appeared in robes that were covered over with gold, and of such vastness that the sleeves touched the ground. The senate was at length obliged to interfere to check this perilous mania, and by a sumptuary law of the year 1402, it was ordered that the sleeves of the ladies' robes should not exceed in circumference eight *quarters*, and that the robes themselves should not be wider than eight bracchia. As to the matter of the robes of gold, "it appeared," in the words of an old Venetian writer, "to be a very grave affair to the fathers," and accordingly they ordained that it should not be lawful for any woman to be so attired for the future. At this day one smiles to think of the dread powers of the law being brought to bear upon such things as the cut of a lady's sleeve or the texture of her garments. Were such tyranny attempted to be recorded upon our statute-book in the benign reign of Queen Victoria, we verily believe that "the better half" of the nation would be in a state of insurrection, and the *modistes* of the kingdom would organise the overthrow of the ministry.

"Now," said the elder lady, when she had completed her purchase, "I am going to the chiesa; one, you know, my dear young friend, should never be remiss in the discharge of religious duties. I never am. Is not that so, Caterina?"

"Indeed it is, dearest mother," said the girl; "I sometimes think your over strict devotion may injure your health."

"I am a good Catholic, I humbly trust," replied the lady, with a self-satisfied air that partook but little of humility. "Gentlemen, will you be disposed to accompany us to prayers?"

An arch smile lurked on the lips of the daughter, which her thin veil could not entirely conceal, at this invitation from her mother. The young men, however, excused themselves on the score of previous engagements.

"Ah, che infortunio!" replied the matron. "Well, you must assuredly call to see me before evening. We shall be at home in an hour, and shall be happy to receive the Sieur de la Mole at our Palazzo."

A willing assent was given to this invitation, and the two parties took leave of each other. The ladies proceeded to their devotions, while Giulio and his friend stepped into a gondola, and glided through the small canals in a north-easterly direction, till they emerged into the lagunes and entered into the canal leading to the island of Murano.

Then, as now, the island of Murano was, to use the language of one of our own countrymen who visited it some centuries ago "a very delectable and populous place, having many faire buildings both public and private, and divers very pleasant gardens;" it is not, therefore, to be wondered that the two friends spent a considerable time in so agreeable a locality. The sun was, it might be, half-way on his westward journey towards the blue hills of Verona, when the young men found themselves again in Venice.

"And now," said Giulio, "I propose we pay our promised visit to Madonna Lucretzia. You will find an hour pass away not unpleasantly, believe me, with her sprightly daughter; for the better insuring whereof, I shall take upon myself to occupy her honoured mother."

"An excellent arangement," said Jacques, smiling; "let us proceed forthwith."

The prow of the gondola was turned in the direction indicated by Giulio, and in a few moments they entered the principal reception-room of the palazzo.

We will not venture to affirm that either of the youths felt any very great disappointment when they found that the beautiful Caterina was its only occupant. She was superbly clothed in a dress of rich flounced brocade, so fashioned as to expose to view the bosom and back to an extent that, in our days and country, would be thought scarcely consistent with maidenly propriety; but the truth is, that the over strictness exercised over the ladies of Venice in their attire and deportment out of doors, produced the natural result of stimulating them to greater licence in their houses. The waist was long, so as to allow room for the display of a rich stomacher; the neck was encircled by an enormous quilled ruff of bone-lace, and the yellow veil of the morning was replaced by one of white gauze, which was thrown back from the head, and stood out from the shoulders like an immense wing; in her hand she held a circular fan, and over her head towered the mass of crisped curls in two mountains glittering with unguents that made them look like hills in the sunset. In a few moments a waiting-maid, fantastically dressed, as was the habit of her class, entered, bearing from the signora a request that Giulio would come to her in her dressing-room, a request with which he immediately complied, leaving his fair cousin and his agreeable friend to the enjoyment of a *tête a-tête*.

Madonna Lucretzia Polani received her young kinsman within the very penetralia of the shrine—a favour only conceded to those who are nearly allied, or on terms of the most familiar intimacy. It so happened, that at the moment, an operation of a most important and mysterious nature was in progress; and as it was peculiar to Venetian ladies, and has now, alas! with many another peculiarity—things of wisdom and glory as well as of vanity and folly—passed away for ever, we shall count ourselves fortunate in being able to record it for the admiration, if not for the imitation, of the fair daughters of our own land. To speak plainly, then, the noble dame was then undergoing that peculiar process by which the Venetian *chevelure* was worked up into that wonderful formation which we have already alluded to. Be it known, then, that the Lady Lucretzia sat in a window which commanded a south-western aspect, so that the sun at the moment was shining strongly into the room through the open *jalousies;* her hair was gathered up all round her head, and enclosed within a high circlet of lead, somewhat like a crown, which fitted close to the head; within this, a serving-maiden poured certain oleaginous and perfumed drugs, the properties of which were to dye the hair of a light colour, a hue much affected by the Venetian women, as enhancing, the brilliancy of a dark complexion, which they considered the most beautiful. The lady held a mirror in her hand, and from time to time inspected the operation; and when she deemed that a sufficient quantity of the dye had been absorbed by her hair she then directed the next step in the process, which was to fling back her hair and spread it out over the rim of the leaden circlet, so that it was exposed to the sun,

which gradually bleached and dried it. This was a slow and tedious process one may judge; but vanity is a passion that is full of patience and as enduring as charity itself. It was in this stage of the proceeding that Giulio arrived, and the lady hailed his coming, as it afforded an agreeable mode of alleviating the tedium of the toilette, and the best opportunity of satisfying her love of acquiring and communicating everything new or interesting.

"Welcome, my dear kinsman," said the lady, as the young man entered, "you see I accord to you the privilege of a relation."

The youth bowed his acknowledgment, while the lady continued—"Come, sit down here beside me. Well," she proceeded when he was seated, "Che nuove ci portate? What news have you for me? You must tell me all about your travels, and first of all about this friend of yours. Where did you make his acquaintance."

"In Paris last year."

"Ah! is he a Frenchman?"

"I have always considered him to be so, but in truth I never took the trouble of inquiring."

"Dear me, how strange; never to have the curiosity to ask him where he came from. Do you know any of his family?"

"Not one. He had no relatives that I know of in Paris, nor for ought I know in the world."

"My dear Giulio, how very imprudent of you to form an intimacy with you know not whom. You don't know how disadvantageous such an acquaintance may prove to you."

"True, dear signora, but I know how advantageous it *has* proved to me. He has rendered me a signal service."

"Ah! what was it? I should so like to know."

"Pardon me, I am not at liberty to disclose it. He has insisted that I should not."

"Well, how very singular. But now tell me every thing about yourself."

Giulio being under no restraint on this subject, proceeded to detail such points as he thought might prove interesting to his auditress. Meantime the sun did its duty upon the hue and moisture of the lady's locks, after which the serving-maiden removed the leaden crown, and heating in a brazier, which stood at the further end of the apartment, a pair of frizzling or crisping irons, she plied them with such skill upon the locks of her mistress, that in a short time she raised a vast superstructure over the forehead, which acuminated at either side, in one of those monstrous peaks. When this operation was performed, nothing further remained to complete the personal adornment of the Signora Polani, save drawing on a loose robe of satin tabby. Having done this, she graciously took the young man's arm, and proceeded to the apartment where we left Jacques and Caterina engaged in a *téte-a-téte*, which we have no doubt each party had wit enough to improve to the utmost.

THE KNITTER ASLEEP (SEE PAGE 404).—J. B. GREUZE.

FLEMISH INN.—FROM A PAINTING BY ISAAC VAN OSTADE.

ISAAC VAN OSTADE.

Isaac Van Ostade was the brother of the celebrated Adrian Van Ostade, and was born at Lubeck, about the year 1617. Both the brothers, when very young, were sent into the Low Countries, where the eldest studied under François Hals, in whose school Brouwer was a contemporary, and where they contracted a most intimate friendship. Adrian is supposed to have been the instructor of his brother Isaac; but little is known of their early history. Soon they separated, and never afterwards were they found in any close connexion. Adrian dwelt in the city of Harlaem; Isaac travelled to the banks of the Zuyder Zee, and finally settled in Amsterdam. He died in 1671; his brother lived a few years longer, long enough to see the French victorious in the neighbourhood of his country, and threatening to destroy its independence.

Speaking of Isaac Van Ostade, Houbraken says, "He terminated his career after having attained the summit of art." This is great praise. But Isaac was a special favourite, a prophet that was honoured in his own country. One says, 'He was in no way inferior to his brother; he designed with the utmost care, and was the king of light and shadow." It has been argued, on the other side of the question, that the disparities in the painting of Isaac and Adrian are easily perceptible; that in the former the touch is very different, the transparency abundantly less, the pencilling not nearly so delicate; nor can they, either in force, warmth, or spirit, admit of being compared with the paintings of the latter. Nevertheless, the pictures of Isaac Van Ostade are deserving of much praise.

Adrian and Isaac resemble each other in their style of painting and in the choice of their subjects. But still, to a close observer, the peculiarities of each are apparent. The first painted the interior of cottages, drinking-houses, and similar scenes; the other represented out-of-door life, streets, and fields, and bridges, and canals, and busy groups, chattering, gossiping, laughing,—forming a *coup d'œil* of no common interest. The picture, from which the engraving is taken which we now present to our readers, is particularly characteristic of the style of Isaac Van Ostade. It represents a halt of travellers before a road-side inn. The landscape is well arranged and remarkably natural. The tree in the foreground, not overloaded with foliage, is a perfect study in itself; and the avenue at the back of the picture, where the two cavaliers are riding, is tastefully designed and gracefully finished. A quiet, comfortable-looking place is the hostel, with its gable front toward us, and the vehicle that stands before the door, and the tired horses with their heads bent forward, and the stooping figure of the hostler who has brought the cool refreshing water, and the group within and about the cart, and the dogs, all life and motion, united together, show us that no common hand designed the sketch. It is natural. Boucher and Lancret might complain that nature was too green, and wanted harmony; but by closely studying nature — nature on the banks of the Zuyder Zee—Ostade has left us some admirable pictures. There is an air of repose over this Flemish halt, which is quite in character with the design of the painting. One or two topers are smoking and drinking beside the door of the inn; towards the front of the picture, a traveller is resting on the ground, his bundle and his stick beside him; on the other side, two are lounging on the rising ground, while another, in an indolent position, is gossiping with them both, and close beside them a dog is lying fast asleep. The sky is calm and clear. Beyond the hostel there is a rich mass of foliage, on which the sunlight falls in all its beauty; and further still away, uprises the steeple of a village church.

Isaac Van Ostade has painted several winter scenes with admirable effect,—frozen canals, and the people amusing themselves on the ice, were indeed his favourite subjects. They are faithful and well-executed representations of nature, and, deservedly, are held in the highest estimation.

A misconstruction of the abilities of this artist has sometimes arisen from contrasting his earlier productions with the more finished and elaborate specimens of his brother. Some of these early specimens are indeed slight in execution and brown in colour, and are comparatively of but little value; but his later paintings competed successfully with those of the best of his contemporaries, and obtained corresponding prices. Bryan says, "These consist of out-door scenes, such as travellers halting at an inn, frozen canals with figures amusing themselves on the ice, and views of Dutch villages. To these he confined himself, but so varied was his treatment of the subject as to obviate the charge of self-imitation. The amateur who possesses one of them may consider himself fortunate; indeed they are now estimated so highly that few besides princes or nobles, or others of equal opulence, can retain them. One in the Duchess de Berri's collection sold, in 1837, for £1,306; the same picture sold in 1801, at Robit's sale, for £361; many others have equally progressed in value." Such of his best pictures as are dated, are of the years 1644 to 1649 inclusive."

There are several good examples of Isaac Van Ostade in England, but they are principally in the private galleries of noblemen and gentlemen. In the Dulwich Gallery—"God's Gift College in Dulwich"—there is only a single picture of Isaac's, though there are four specimens from his brother Adrian's pencil. This is rather singular, as the collection is rich in paintings of the Dutch school. The National Gallery does not possess a picture by either of the Ostades, nor are we aware of any other specimen of the younger painter, to which the public have free access, than the one mentioned above. Travellers Halting at an Inn appears to have been a favourite subject with Isaac Van Ostade. Nearly all the pictures by him in the possession of English noblemen bear something of this character. In the celebrated Bridgewater Gallery, the property of Lord Francis Egerton, we have "Travellers Halting at an Inn;" in the private collection formed by George IV., there is an Isaac Ostade, "Various Travellers Halting before a Tavern;" in Lord Ashburton's collection, again, there is a picture representing "Travellers and Country People, engaged in various ways in front of a Village Ale-house;" at Corsham-house, Wilts, the seat of Paul Methuen, Esq., there is another Isaac Ostade. It is but a variation of the famous subject: "Travellers on horseback and on foot, listening to a village musician, in front of a road-side public house;" and lastly, to complete the list, there is a famous picture of Isaac's at Alton Tower—the seat of the Earl of Shrewsbury, in Staffordshire—which represents the artist's never-tiring and always-well-painted "Group of People," or "Halt of Travellers," before a village inn.

But, perhaps, the most famous picture of Isaac Van Ostade's which is to be seen in England, is that in the private collection formed by the late Sir Robert Peel, at his house in Whitehall-gardens. The well-known baronet was a good judge of pictures, as well as a great statesman; and knew almost as well as a dealer the proper value of the "old masters" which he purchased. Sir Robert's "Isaac Ostade" may, therefore, be considered a first-rate specimen. It cost 4,000 guineas, and is as far superior to the poor pictures of country life, which are often ascribed to this painter, as a genuine Claude is to a modern baked and varnished copy. This genuine example of the painter is warmly praised by all good judges of art. It represents a man on a grey-horse riding past a house, followed by two dogs, one of which is caressed by a boy. On the other side of the picture are two swine, and in the picturesque middle distance are peasants and cattle. "This finely-drawn picture," says Dr. Waagen, "possesses a solidity of the most spirited execution, and an union of the finest *impasto* with the greatest glow and depth of tone, such as is rarely met with. The tone of the flesh is more yellow in the lights, and browner in the shadows, than with his brother, who mixes redder tones in both. Paul Potter himself could not have painted the grey horse better. In his village scenes and winter pieces, Isaac is wholly original, and by no means inferior to his brother."

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER IV.

Towards the end of December, 1835, Leonard completed his competition picture for the gold medal of the Royal Academy. He had withdrawn himself entirely from his fellow-students, and living absorbed in his work, had been almost lost sight of by them, for the last several months.

The subject which he had chosen for his picture, was St. Michael and St. Margaret appearing to Joan of Arc, and announcing to her the astounding future, whilst still the simple shepherd girl was tending her flock. Leonard's imagination had keenly entered into the devoted enthusiasm of the young girl, who having once heard heavenly voices announcing her sublime mission, steeled her soul and sense against every allurement of earth, love, home, and kindred to obey the celestial behest; accomplishing through the might, solely of obedience, faith, and enthusiastic love, a work almost miraculous. Leonard in imagination had completed a series of pictures illustrative of her career—treating her almost fabulous history from his own peculiar point of view; making her conquer alone through the power of spirit; making her vanquished when fallen from her immaculate throne of spiritual beauty, by faithlessness in the spiritual voices, and by the desecration of her inspired hand by the shedding of blood.

But the sole picture of the series completed was the "Announcement of her Mission"—another development of that thought which Leonard had sketched upon the wall of the little chamber in his uncle's house—the arousing of a dormant soul to action. He had lived, whilst painting, wrapt in a golden mist of poetry, filled with entire faith in his creations, and filled with a restless eagerness. Now, when his picture stood completed, the mist parting, his picture, as if struck by the wand of some evil magician, faded and shrunk before him into meagreness and poverty. A bitter contempt of his picture induced him to turn its face to the wall—to forget it utterly, and its destination—to leave that London room behind him, with the sickening roar of wheels rising ever up through its dingy window—to stand within a solitary wood, with pure snow and ice around his feet, with solemn, leafless trees above his head, with a sharp winter's breeze striking upon his burning brow—to stand upon the gypsum cliff in Clifton Grove, as he had done five winters before—to silence, but for one hour, the cry after his mother—to silence, but for one hour, the unappeasable longing which devoured his heart's core! Leonard buried his face in his hands, and wept like a child. Still sitting with bowed head before his picture, the door of his little room opened, the Professor of Painting, together with Signor Lambelli, stood before him. He had not heard their preparatory knock, so absorbed had he been in his reflections. The Professor's eyes were rested upon the picture.

"Good! Lambelli," said the professor; and an unmistakable smile of benevolent satisfaction played about his lips. Lambelli rubbed his hands, and commenced criticising in a remarkably lively and energetic manner. Leonard meanwhile stood coldly aside, a strange contempt swelling within his breast. Could then this faded shadow of his dream call forth aught but censure from the lips of men possessed of knowledge? Could he not, even then, accept with gracious thanks the censure which Lambelli passed upon his picture, when it was *censure* rather than *praise* which he desired? No; for the censures passed upon it were censures for mere technicalities, and the censure cast by his own spirit was the failure of his ideal!

"You have overworked yourself, Hale," remarked the professor, cordially taking leave of poor Leonard. "He must wear a brighter look, must he not, Lambelli, when next we see him?" and the visitors were gone.

The professor's few words, and his manner still more, had conveyed to Leonard the conviction that the gold medal would be awarded to him. But no longer did this medal appear an object worthy of such eager quest as it had done but a few hours before—the crowning satisfaction, peace in his work was wanting. "How easy to do better—ten-fold—than this miserable picture!" muttered Leonard bitterly to himself. "My mother! and will this have been my first triumph for which I shall have wrung thy heart! I have looked upon this as an earnest of future success—what if it be but an earnest of future bitter disgust!"

Leonard paced up and down his dingy room with steps strangely akin with those of poor Ursula pacing her son's deserted chamber five years before. Suddenly he paused, a deep flush passed across his face, and the muscles of his mouth worked with a nervous spasm. He seized his hat, and rushing down the stifling staircase, was soon rapidly pursuing his way along the crowded streets. He walked like one in a dream. The roar of omnibuses, cabs, and carriages; the murmurs of the thousand dissonant voices of the great city grated upon his over-wrought nerves, till he was filled with a feverish anguish, the foreshadower of delirium. His eyes, when they unclosed to outward objects, fell only on the squalor of great London; mouldering, slatternly marine stores, gin-palaces, pawnbrokers' shops bursting with their rich produce of misery, doctors' shops and hospitals. Now he encountered a sick person borne along through the bright sunshine in a curtained litter, from which the passers-by shrunk with loathing dread. Leonard's imagination piercing through the dusky canvas curtains, descried the woe-struck, disfigured countenance of the sick; and strange, too, in his imagination, it was like the face of his mother! Leonard's eyes fell upon a placard pasted on a pump: "If this should meet the eyes of Sarah L——b," read Leonard, "who left her home on Sunday, 15th of December, she is earnestly besought to return to her afflicted mother; or to communicate at least by letter. As she values the life of her heart-broken mother, she is implored to communicate. Through the blessing of God, may these words speedily meet the eyes of S. L. Soon it may be too late!"

As a dagger these words had pierced to Leonard's soul—*his* mother it was who implored him to communicate with *her;* the old pleading tones of her sad voice, with which, as in years gone by, she had implored her unhappy husband, echoed in his brain; and the voice ever ringing through his ears, Leonard raced on: and as he moved rapidly through the fresh wintry air, coming out into the Regent's Park, the straight formal alley of which he restlessly paced up and down, oblivious to the gaily-attired children there, eternally trundling their hoops, and to the nursemaids who criticised his gestures and his shabby clothes, his thoughts formed themselves into a burning letter to his mother, which he immediately would despatch. In fancy he saw her vehement joy as the boy in the canary-coloured jacket presented to her, whilst sitting at her little work-table, the long-expected letter in the beloved hand-writing of her son; he saw the quivering of her fingers as she tore open the seal, the tears of joy and love showering down upon the paper. The might of yearning was so strong within him, that all thought of triumph over his uncle was thrust aside—love, deep love alone, and keenest sympathy, held dominion in his being.

In Albany-street, Leonard, with a fevered cheek, paused at a small stationer's shop, and, entering, bought paper, and there indited a few lines of warmest love, dwelling but slightly upon his own career, though proudly announcing that so far it had been crowned with as much success as ever he could have anticipated; but the essence of his words was the yearning love which flamed up within him.

The expression of a deep emotion, whether by written or by spoken words, has an almost magical power of relief to certain impulsive and passionate natures; and Leonard was of such a nature. Having written his letter and posted it, a calmness settled over him; and the joy which he believed his words

would cause his mother, shed a celestial peace within his soul. He began to anticipate the arrival of her reply, and to count the time which probably would elapse ere the receipt of it—perhaps even she herself might reply in person! The possibility of resentment for his long silence and desertion never, for one moment, presenting itself.

Posting the letter, Leonard reminded himself that his very meagre funds were all but exhausted—but one half-crown remained. This, however, was a usual state of affairs with our poor hero; and as now for several years, by means of rigid economy and constant hack-work, in which he conscientiously employed a portion of his time, he had maintained himself, it was but a small matter of anxiety to him. In fact, so much had the writing of his letter restored Leonard to his natural state of mind, that he called, before returning home, at a publisher's, for whom he was in the habit of making ornamental designs, from the emblematic cover of an annual to the frontispiece of the last new cookery-book. To-day he obtained certain orders for designs of an equally elevated class; and, retracing his steps homewards, he mentally arranged his little designs, looking at the fruiterers' and florists' windows and stalls in Covent-garden market, to obtain hints, these designs being destined to adorn Macalpine's "Growth of Hot-house Fruits." Purchasing a spray of vine with sixpence of the last half-crown, and having lingered with an artistic enjoyment of the rich combinations of form and colour displayed by the fruits and flowers, he hastened home immediately to commence his sketches; for until a certain number were received by his employer, no more money could Leonard obtain. The publisher for whom Leonard had now worked for several years—and whose system, wise and upright, had been a moral training especially healthful for our hero's desultory nature—most sternly refused all payment in advance, as strictly, however, and as justly, paying his employed so soon as the work accomplished was received by him.

The necessity of labour gradually wrought its holy work within poor Leonard's breast; his morbid horror of his picture slowly decreased; he drew and drew, and a healthier pulsation was in his blood. The time arriving for him to send off his picture for the competition, this was done, but all as a matter of indifference almost; and then, with coldness, resuming his pencil, he drew and drew, leaves, fruits, flowers, flowers, leaves, fruits, with marvellous patient industry. But his ear became hourly, daily, keener; and restlessly he would resume his agitated pacings of his room at times; and the postman's sharp knock at the door of the house where he lodged, and all down the street, made him start and breathe quickly, and a sick giddiness to gather over his eyes. But no letter arrived as yet. "Who knows?" said Leonard in his heart, "perhaps she is from home; if she had received it, one thing I know—silent she would not remain. But who knows?—who knows?" asked he a hundred times an hour of his heart. But that this silence could proceed from death or any grievous evil he denied to himself sternly, angrily. "No; he was only over-impatient; or it might be his uncle———" A violent burst of unrestrained anger, uttered in loud words within his solitary room, startled himself, and broke the completion of his supposition.

The distribution of prizes had arrived, but no letter. At the important hour, Leonard attended in the amphitheatre of the Royal Academy, and with him the scarcely-acknowledged anxiety gnawing his heart's core unceasingly. He seated himself far up among a group of students, in as unconspicuous a place as possible. He was greeted with questions innumerable, and merry jokes about his hermit's life—words seemed to buzz about him like a swarm of flies. The amphitheatre was crowded; the hum of anxious suspense died away; the ordinary preliminaries were gone through—the president addressed the students. During the address, Leonard recognised the kind-hearted Lambelli peering anxiously about through his eye-glass. He knew that he was the object of the good man's anxiety. Leonard wondered how it was possible for him to feel so little excited—so wholly indifferent; but his strongest feelings were for the time swallowed up in a vast discomfort. His head sank on his breast, and the old brooding recommenced. He was aroused by hearing his own name clearly enunciated by the president—then it was repeated around him with a confusing hum; he was pushed forward—there were acclamations on all hands—he was the successful candidate. But the triumph was a cold, joyless one, with this worm of anguish gnawing at his heart's core.

Slipping away from his congratulators, Leonard hurried home. The slatternly girl opening the door, holding in one hand a flaring candle, with the other gave him a letter, which she took up from a begrimed slab in the passage. The handwriting of the address was bold and masculine, and not the peculiar, delicate one of his mother. Leonard paused various times whilst ascending the staircase to his room—turning the letter round and round. The post mark was Nottingham. A weakness crept into poor Leonard's knees, and his lips grew parched. He unlocked his door with an unsteady hand—closed it—dropped upon a chair beside the table strewn with the Macalpine sketches, the candle swealling down the stick in long gutters of grease, and with the lamps from the street gleaming in balefully through the uncurtained window. Leonard gazed upon the letter. "God! God! be merciful!" he muttered in low, hoarse accents—and still his eyes rested upon the unopened letter held in his trembling hand. At length, slowly breaking the seal, he read—

Nottingham, December.

Dear Leonard,—Your letter to Mrs. Mordant of the 8th instant came duly to hand, and in consequence of your mother's state of health—or rather, state of mind—I was compelled to break the seal and become master of its contents, which, under existing circumstances, you must pardon. Being absent from home when your letter arrived, a slight delay in my reply has, unavoidably, been occasioned.

The perusal of your letter, shows me that you are not aware of the unhappy state of your mother. She has been an inmate of the lunatic asylum of this place for the last four or five years—in fact, almost immediately from the time of your leaving Nottingham.

Of your circumstances since that time, we have had no intelligence, but it is satisfactory to perceive by your letter that you are doing well. To the painful occurrences connected with your hasty departure, I do not refer further than that your mother's derangement dates from that time, and from the distress of mind occasioned by your unaccountable silence. You are not aware that your uncle has left Nottingham, and is now residing at Hamburg.

I shall take an opportunity of communicating to your poor mother that news has been received of you.

It may be satisfactory to you to know that all suitable and necessary attention is paid to your mother.

Dear Leonard,

Yours truly,

Ellis Stamboyse.

P. S.—It is painful to me to find that you have changed your name, as no good can possibly accrue from such disguises.

Like one transfixed by the spear of his enemy, Leonard writhed with agony, whilst his eyes perused these fearful words, the very straight-forwardness of which tore every germ of hope up from his breast.

Dropping his head upon the table, Leonard remained sunk in the depths of utterest bitterness. The candle flared and flamed,—then the wick lengthened into a glowing and spectral fungus, and the light grew dim. And hour after hour was tolled mournfully from the near church-tower; and the footsteps of passers-by had long since died out of the streets, and the candle sunk in its socket, sending forth fitful glares across the melancholy room and athwart the melancholy bowed youthful head; and the stench of the expiring wick made the air thick and noisome. But Leonard stirred not. Like one dead, except for a keen throb of agony which ceaselessly stirred within his soul, he sate throughout that long December night with his head bowed upon the sketches which became blisterred with his tears.

Ellis Stamboyse had returned home from his wedding tour to the old house in ——— street, now all freshly painted, and

refurnished with the most comfortable and most ponderous of costly furniture for the reception of its new mistress, when he had read poor Leonard's letter, and indited his reply. Within the newly furnished dining-room, the scene of Mrs. Mordant's altercation with her brother, and of Leonard's with his uncle, were seated the newly-married pair upon this the first evening of their return. L'Allegro, more beaming than ever, had, with an arch grace, which truly would have driven John Wetherley

THE ANGELS APPEARING TO JOAN OF ARC—LEONARD'S COMPETITION PICTURE.

utterly distracted could he but have seen it, poured forth unnumbered cups of tea for her loving husband. Luckily, however, John, more than a hundred miles away, was sternly absorbed, forgetful of the lovely being, in drawing by gaslight with might and main from the model in Lambelli's rotunda. Then flinging herself back in a low and softly-cushioned chair near the brightly burning fire, she had first admired her dainty feet placed upon the fender, sunk deep in the white fur which lined the loveliest of scarlet embroidered slippers, then she had drawn a little scarlet mantle, trimmed also with white fur over her round white shoulders, for the night was cold, even within that most comfortable and wealthy abode—and every now and then she glanced with a pretty pettishness at her husband, who would so pertinaciously read the heap of letters awaiting him upon the mantel-piece. "It was very provoking of Ellis, to forget his dear pet that very first evening, she would scold him for it, that she would, the first instant he laid down those dreadful letters;" but a sternness sat upon his face, as he read letter after letter—and L'Allegro had secretly a little fear of Ellis' sharp clear voice, and of that determined, strong look upon his brow and lips, his very hair had a strong determination in its crisp, dark-brown curls, and his short figure was stronger than that of many a giant. No. Ellis Stamboyse was no man to be interrupted by his lovely, beautiful little bride, thought L'Allegro. L'Allegro watched him, and then amused herself with thoughts of all the bridal gaiety awaiting her, and then again watched Ellis; but he seemed quite to have forgotten her—his face had become sterner than ever—he had risen, and after standing in deep thought, with an open letter in his hand, before the fire, and bringing an inkstand and paper to the table, had, after another pause of deep thought, begun slowly writing. L'Allegro's eyes closed, and she fell into a gentle sleep, with her pretty profile as it lay upon the cushions, gilded by the flickering fire-light. Ellis folding and sealing his letter, rose, and with his hands crossed behind him, like a youthful image of old Stamboyse, paced slowly up and down the room, as the elder Stamboyse had done a thousand times before him—suddenly pausing beside his sleeping wife, an unusual expression of tenderness suffused his whole countenance—a strange look of Leonard, a look, as of a transfigured soul shone through his clearly chiselled features, and bending over the unconsious girl, his lips pressed her brow with profound tenderness, and a prayer ascended up from his soul, "God, enable me worthily, unswervingly to fulfil towards this poor child the awful responsibilities which I have taken upon myself, and enable me to strengthen her. What unutterable miseries flow from an unworthy, an unconscientious marriage, Thou alone knowest, for Thou 'visitest the sins of the parents upon the children to the third and fourth generation.'" When L'Allegro woke up, she flung her arms round her husband's neck, and her red lips kissed his broad forehead a dozen times; because he was "such a dear creature, and had put away his tiresome letters!" Ellis drew her towards him, and looked quietly at her, with such a grave smile, yet so full of love, and without speaking a single word, that L'Allegro exclaimed, between laughing and crying, "Oh, Ellis, you *are* so queer! I wish you talked more—you are not half as amusing as John Wetherley used to be—poor John. I wonder, now, what he is doing?"

In the sumptuously furnished dressing-room of L'Allegro, where tall mirrors reflected back the blazing fire which carecred up the broad chimney, and where massive wardrobes stood with open doors and drawers to receive the rich dresses which a half-unpacked portmanteau displayed; and where the softest of curtains and carpets, and the easiest of chairs and couches, and innumerable toilet nick-nacks, prophesied a life of luxury for the young wife, sat another being, who wondered what John Wetherley was doing. But in her heart he was "dear, beloved John;" "the adored," "the tenderly-cherished John." Need we say, that this was poor Il Penseroso! She looked very pale and meek, and seemed as though she had been suddenly struck by some idea whilst arranging her sister's dresses in the new wardrobes, and had sat down by the fire to complete her meditations—

> "God hath his own great plan:
> And joy and suffering
> Are his commissioned discipline of man!
> Each is the seraph-wing
> That lifteth from the clod;
> *That* to the angelic band,
> *This* to a higher sphere, the sphere of God;"

murmured Il Penseroso to herself, "those are lines by Mordant, the poet. I remember well copying them into my book—it was the day that dear John stole Emma's ringlet in the studio behind the Indian-screen, and I saw him press it to his lips. I did not know at that time what comfort some day I might find in these lines. I suppose life may be a school, and that 'God hath his own great plan.'"

DEBATE OF THE FACULTIES

ON THE PURSUITS OF LIFE.

The members being assembled in the Rotunda called Cranium, Order took the chair by general consent, when Causality introduced the following resolution:—

"Resolve, That it is time to make a selection of a pursuit for life, and that this question be now discussed."

"In deciding upon the merits of this resolution," said Causality, "I think it the part of wisdom to attach something which will be useful to mankind, and which can always be relied upon for a support. Anything will satisfy me which will not fail with the change of fashion. Agriculture is good, and can never fail to be needed, nor will it ever be overdone. Besides, the king and the clown alike need bread; so that the vibrations of fashion, and fluctuation of opinions, religious or political, can never set it aside. The same is true of blacksmithing, ship-building, masonry, and manufacturing cloth, leather, iron, and lumber, and many other substantial trades. Legitimate commerce and general trade are likewise necessary, but very liable to be overdone."

Ideality arose, and said, "I trust that great care will be taken in this selection, for really I can hardly perceive it possible for me to be contented with any of these common pursuits named by our venerable friend. I must earnestly implore that we may have something ornamental, like sculpture, painting, daguerreotype, selling fancy goods, or, if we manufacture, let it be watches, jewellery, or that which is decorative and beautiful."

Approbativeness addressed the chair: "I agree, in the main, with the last member up; but some of the occupations he has named would not suit me. The idea of working in plaster and marble, and looking dusty, like a miller, is horrible. True, we might excel so as to obtain fame, like a Canova or a Powers, when we would be courted by the great, and our name sent down to posterity on the enduring statute and scroll of honour. But should we fail of achieving the highest honours of the art, I would by far prefer to be a genteel tradesmen in an elegant store, aristocratic customers, where we could dress finely, and live in style. This is the life for me. I go for a business of the highest respectability, and one in which our efforts will not be regarded as *labour*."

Causality whispered a word to Calculation, who rose and said, "Our friend who has just resumed his seat, perhaps is not aware of the anxious cares, the searching estimates and calculations, the far reaching plans and harassing duties which will devolve on us to keep such a mercantile business in successful operation. Financiering and calculating profit and loss, contriving to meet payments, posting books and making bills, running after bad debts, and managing a store full of clerks and selfish customers, all day and half the night, is no trifle, but is so much like *labour*, that it makes a world of vanity to twist it into any other name. One may bow and smile over a counter to fashionable customers, and be arrayed in nice attire, with hair perfumed, and lily-white hands loaded with sparkling rings, and perhaps reap a few bargains; but this is

the poetry of the business. There are ten thousand annoyances and cares that the inexperienced little dream of until they become sober realities. Look at the grey locks, care-worn features, and anxious, agitated manner of merchants—old before their time—and it takes off some of the tinsel of the commercial pursuit."

"I am informed," said Cautiousness, "that ninety out of every hundred who engage in mercantile pursuits fail in business and die poor; and I shall take time to consider before I engage in so hazardous an enterprise, with the assurance, too, that we must work—yes, *work*—as hard as any mechanic, and that kind of work, too, which wears out the health, nerves, patience, and sometimes the honesty of a man. I had rather have the dust of the miller, or the soot of the forge, or the clamour and labour of the lumber mill, with the certainty of a substantial competence, than to shine in gay colours a few years among fashionables, and run the risk of being kicked at last into the hovel of pinching poverty by the very cliques, for the gratification of whose pride and vanity we had lived and laboured, and to which we had finally been sacrificed."

"But," responded Approbativeness, "I am informed by Hope, and believe it true, that we shall be of the fortunate class who get rich; and Self-Esteem says, we can, without doubt, succeed, as he is quite confident that few possess the talent which we can bring into the business. I don't care if we do have balance-sheets to make and bank-notes to pay, for every one knows it is respectable to be seen and known 'on 'Change;' and as to the night watchings and drudgery of the business, so much feared by Cautiousness and magnified by Calculation, who cares so much for that, if one can be called a splendid merchant, ride in his carriage, and live fashionably? But it should be remembered that a merchant does very little work; that is done by clerks and porters. It should not be forgotten that we are to be merchants, the owner and proprietor. Then we can wear fine cloth, elegant ornaments, polished boots, and live in ease and respectability."

"Nonsense," said Combativeness, "give us a business that is manly in its character. I am utterly disgusted with the soft twattle of Approbativeness about elegance, gentility, and effeminacy. For a white hand, standing dicky, flashy chains and rings, and fashionable dress, he would run the risk of protested notes, bankruptcy, a hungry stomach, and a hovel. I would a thousand-fold prefer to grapple resolutely in stern effort, and force from the grasp of relentless fortune an honourable competence, than to smile and bow to win the good graces of the fickle dame. He may rub his white hands, and whisper soft persuasive blarney for success; but I prefer to seize the prize with my hard hand and stalwart arm, and shout my manly triumph with the lion's voice. I am ready, with Firmness, Destructiveness, and Constructiveness, to plunge into the rugged wilds of the West, and redeem it from solitude; or to build ships, or in them ride the stormy ocean; or in the mine, forge, or factory, force matter into usual forms; anything of an industrial character, that will enable us to drive our way in prosperity, will suit me better than selling shirt buttons, needles, pins, and tape. It is not in my nature to wait for a business to come to me. I desire to rush out into active life, and by main strength of muscle or machinery, force Prosperity to yield her treasures."

"Well said," responded Firmness; "give us a business, whatever it may be, that requires, and will repay, manly energy and perseverance. I cannot endure fickleness and irregularity. 'Sure and steady wins the day.' Our friend Combativeness may rely upon my constancy in aid of his proposition."

Self-Esteem rose, with unbending dignity, and having surveyed each member very coolly, proceeded to say, "I have listened to the several suggestions of members, hoping that the choice of a pursuit might be made without any counsel from me, choosing that those who have the work to do, would satisfy themselves as to the kind of business to be done, leaving to me merely the general direction or supervision of the business when established. Let it be understood, however, that I would much prefer a dignified calling—a large, heavy business, I care not what is its character, whether tilling the soil, navigating the ocean, wielding the sledge, rearing the edifice, felling the forest, or substantial merchandize. Give me as aids, Consientiousness, Firmness, Causality, Combativeness, Destructiveness, and Constructiveness, as right-hand men, and I will engage to make honourable any business which a man ought to engage in. Inglorious idleness, and consequent dependence, I cannot tolerate. To pursue a course requiring us to cringe to public caprice is equally odious. I cannot eat the bread of dependence, nor wear garments spotted with dishonour. I would be a street scavenger rather, and ennoble my avocation by a character above reproach and an elevated intelligence. No labour which is useful is degrading, and, if I could be heard, to make a boot or rule a kingdom should neither elevate one man nor depress another. We lack true personal dignity when we suppose that the honest dust and sweat of useful toil degrades the MAN, or that simpering gentility, in ornamental occupations, necessarily accompanies true HONOUR.

A PEEP AT COUNTRY COUSINS, AND HOW IT ENDED.

LETTER III.—MISS DORA HARCOURT TO CECIL HARCOURT, ESQ., OF GROSVENOR-SQUARE, LONDON.

Whitehaven, June 24th, 1820.

MY DEAR FATHER,—I have been long in writing, and I do not know how it is that one seems to be quite as busy in the country as in the town, and I could fancy it would be very agreeable to live here permanently, if the good folks only knew a little more about books. Yet I believe Robert is a very well-read young man, but he is so shy and reserved. I do not feel much better acquainted with him than on my first arrival. He is, however, very attentive in catering for my amusement, and on the morning of May-day he invited me to join a merry party of young men and maidens, who sallied forth at five o'clock in the morning to gather the soft yellow catkins of the willow, and I observed that William presented his basketful to Susannah; since which occurrence, she has conducted herself towards me so frankly and affectionately, that I feel sure she must be attached to William, and had previously feared my becoming her rival. I do not know what Robert did with his catkins, and I found him so silent a companion, that I was not sorry when we quitted the meadows and went to look at the old May-pole, which a crowd of ragged urchins, under the direction of the dominie, were covering with garlands of spring flowers. Almost every house in the village displayed bunches of broom and furze over their doors and lamp-posts, and all the horses engaged in traffic throughout Whitehaven and the neighbourhood were adorned with branches of lilac, or ribbons, or ivy. Later on in the day, I believe some animated games of wrestling went on, many competitors attending the sport from distant places; but this amusement was not at all in my line, and I enjoyed much more a novel sort of race they called a dog-trail. Early in the morning, I was told, two men had started on a circuit of eight miles, dragging after them over hill and dale a large piece of sailcloth saturated with some essential oil. The dogs that were to run were really splendid creatures, and my uncle says they are similar to fox-hounds, but of a peculiar breed, brought up for the purpose by the country people, and singularly swift in action. A row of these fine creatures was laid on the scent where the cloth had passed over, and then they scoured over the whole distance without a single pause—William's beautiful dog, which he had named "Gawthorpe," coming in first, and winning the prize, a very handsome riding-whip mounted in silver. Robert's noble "Arrow" came in the second, but its master looked so excessively mortified at this comparative failure, that I could not help pitying him, though I knew better than to express such a sentiment in words to one of his lordly sex. We were engaged that evening to "go

forth," as Susannah expressed it, which seems understood to mean attending an evening meeting for spinning; and on this occasion the party were to meet at Mr. Gawthorpe's, a substantial farmer's abode, some three miles off. I was in some doubts what dress to put on, since the guests were to assemble at three o'clock in broad daylight; but my aunt said every one was expected to look smart, so I put on my sprigged muslin, which had duly arrived, though it was sadly crushed, my dear papa, by the heavy parcel of music-books you had laid upon it. Susannah appeared in a gay broom-coloured gauze gown, with scarlet ribbons in her hair; and we put on all sorts of defensive wraps to protect our finery safely over the mountain bogs, being followed by Neddy, the cow-boy, who carried my aunt's spinning-wheel, destined for my use. I asked her whether she was not coming with us, a question which made every one laugh, and to which no answer was vouchsafed in words; but on reaching the Gawthorpe's homestead, we were ushered into an oak-pannelled hall-kitchen, containing at least twenty young women, all busy with their spinning-wheels, but no elder female or any of the men were present. I did my best to spin like they did, and to give my finger and thumb the peculiar dale-twist used in pulling the flax from the distaff, but I saw many good-humoured smiles directed towards me, and was glad when the general attention was diverted by the buzz of conversation which soon began. The girls sang, too, and I heard several quaint old songs which sounded very sweet, though often given in a sort of monotonous slow chaunting, in order to keep time with the burring wheels. Curious tales, too, were told; and one young woman mentioned a strange superstition that exists about the aspen tree, of its being the wood of which the *vera coux* was made, and how, in sign of shame and fear, it has ever since trembled from generation to generation. We had been spinning a couple of hours when my cousins, Robert, William, and Edward, made their appearance, and they were quickly followed by other young dalesmen, who each demurely took a seat by some fair expectant—at least, those assembled appeared in no way surprised at this sudden accession to our party. By and bye I found my thread kept breaking so frequently as to be quite unaccountable; in vain it seemed to fasten on again, for the very next minute snap went the thread, and on looking round I saw to my relief that other spinners were in the same predicament, while sounds of repressed laughter seemed to indicate the brewing of some hidden mischief. I perceived several sharp boxes on the ear administered to the attendant cavaliers, and presently saw that Edward had been cutting the thread of my flax; and I certainly gave his black curls a little pull on this discovery, while Robert sat just behind me, looking too shy and awkward to interfere between me and his younger brother, who had never before been considered old enough to be admitted to the honours of a "going forth." After a good deal of merriment, the burring of the twenty wheels, which sounded like fifty hives of bees confined in the apartment, ceased altogether, and, after a plentiful supper, old Mrs. Gawthorpe told ghost stories and fairy legends, and about eight o'clock the signal was given for breaking up, by the farmer saying, "It is time for ye to be going home, bairns." We must have formed a droll moonlight procession over the mountains, each maiden escorted by a rough-coated gallant bearing her spinning-wheel on his shoulder; and frequent bursts of laughter were elicited by the various mischances that overtook us during the rough pilgrimage. I was well off, since Edward carried my wheel, and consequently Robert gave me the assistance of his arm unincumbered; but he seemed more silent than ever, and when we reached the Friars, I overheard Johnny Latterthwaite say to him, "Why don't you speak to her, man; do ye think a woman will ever admire a glum lad that has nought to say for himself?" To which remonstrance, Robert replied, if I am not mistaken: "Ye may be right, man, in the main, but did *ye* ever see any one dressed like my London cousin afore? When I saw her looking so superior, and so unlike every one about her to-night, I tell ye I did not *dare* to speak a word to her." I had half suspected this reason for my grave cousin's reserve; yet he is so sensible, I wonder he should let such a trifle as my sprigged muslin prevent our conversing comfortably together. Yesterday was Midsummer-eve (the 23d of *June* is so kept popularly), and we all went out to look at the immense bonfires which were lighted up in all directions in each parish, and called Baal-fires; perhaps the only relic of fire-worship, Robert said, in England still remaining. The lurid effect of the blazing fires illuminating the dark purple hills was extremely grand, and I should have wished so picturesque an old custom might continue for many years to come, where it not that it is still regarded by the uneducated as something mysterious and sacredly supernatural. Quantities of poor diseased cattle and sheep we saw made to walk through the blinding smoke of these fires, and none of the dales-people appeared to entertain the slightest doubt that the animals would be thereby perfectly restored to health. The Baal-fires are never allowed to be lighted from any other burning substance, as this would destroy their virtues, but must be ignited from the sparks created by rubbing together two pieces of dry wood; and many persons carried torches, which added to the wild singular aspect of the scene, and are also a remnant of the same species of nature-worship. And now I have only left room to sign myself, dear papa,

Your ever affectionate daughter,

DORA HARCOURT.

TO A SKULL.

(*From the Russian of Prince E. Baratinsky.*)

SLEEPING brother, who hath sought thee
And profaned thy silent dust?
From the halls of death I brought thee,
Dark, thy skull, with age and rust!
One slight lock of hair was clinging
Round the emblem of decay—
Thoughts of sad reflection bringing,
Of a being past away!

Comrades, young and happy hearted,
Gamboll'd round me near thy tomb;
Had thy voice, oh! long departed,
Spoken to them through the gloom—
Telling how stern Time was pressing
Youth, and hope, and joy beneath,
Thou hadst proved, perchance, a blessing
Warning them to think of death.

Could the skull I now am holding
Whisper secrets of the grave;
Fate mysterious, dark, unfolding,
Many a sinful heart to save:
On the brink we should, recoiling,
Place our trust in yonder skies;
And the tempter's meshes foiling,
Look to love that never dies!

But, I err—since Heav'n ordain'd thee
Thus, in silence, to repose;
Dews of mercy once sustain'd thee,
Ev'n to thine ev'ning's close!
Thus, while through life's road we wander,
Let us cheerful hail the light,
Not ungrateful, ever ponder,
On the shadows and the night.

Then, without weak fears or trembling,
We can sleep, like thee, below,
Gentle, loyal, undissembling,
Such can never sink in woe!
Skull, may none again molest thee!
Sacred be thy haunt from strife!
In the gloomy charnel, rest thee,
While we taste the sweets of life!

TABLE MOVING.

A GLIMPSE AT VITAL FORCES.

All the world is much interested—not to say excited—with the newly-developed force as manifested in table moving. Pamphlets are passing through numerous editions; public lectures are constantly delivered; private circles are animated with the moving tables. Some are believers, some are sceptics, and some are apostates. What has given rise to such an intense interest? On what foundation does the whole matter rest? Is it conjecture? Is it experiment? A detailed account of some dozen experiments has appeared in one of the morning papers. This account has been extensively copied, not only into other public journals, but has formed the basis of a pamphlet which is now to be seen in every bookseller's window. Let us just explain the gist of these experiments. A party of ladies and gentlemen sit round a table (fig. 1), their hands laid upon it, with their thumbs slightly overlapping each other: each person joins the little finger of his right and left hands with the nearest little fingers of his neighbours, as in fig. 2. In this manner they wait for the manifestation of the force; a quarter of an hour, twenty minutes, half an hour elapses; after which the hands are not in the same position, they have become, as it were twisted. Now the table is moving, and the party rise: the motion becomes rapid; the ladies and gentlemen are compelled to run.

FIG. 1.—SHOWING THE MANNER IN WHICH THE OPERATORS STAND ROUND THE TABLE.

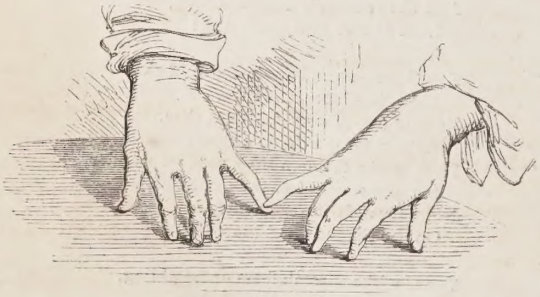


FIG. 2.—MANNER OF PLACING THE HANDS UPON THE TABLE.

Let us now place a hat on the table, and lay our hands lightly on it, as represented in fig. 3: the motion is very soon induced, the hat revolves, and appears to present the same kind of phenomena as the table; doubtless it is influenced by the same force.

Another illustration of the operation of the same force is supplied by the plaything represented in our fourth engraving. The apparatus is very simple, and capable of a pleasing variety. It consists of a thread, from four to eight inches long, to which a doll or puppet, or any thing else of that sort, is attached, and which is held between the fingers as firmly and steadily as possible. After an interval of longer or shorter duration, it will begin to oscillate, and ultimately it will execute every variety of movement that the will directs. The experiment may be rendered still more amusing by causing several children to join their hands together, so as to form a sort of chain; and then, if one of them holds the thread, and another orders the various movements—either mentally or by word of mouth—they will inevitably follow in every instance.

Various cases of hat and table moving have been related by persons whose characters are altogether above suspicion. A writer in the *English Churchman*, a newspaper of high moral and literary standing, gives his experience in the matter After describing the necessary preparations for the experiment, and premising that he merely states the *facts*, without pretending to understand or explain the *philosophy* of the phenomenon, he goes on to say,—"The table, which we saw most powerfully acted upon, was of mahogany, solid, not veneered or inlaid, about three or four feet long, and two feet wide; without castors, and standing on a carpet, in a room with a fire. About six persons, standing, placed the palms of

their hands flat upon the table, rather near the edge, every person's two thumbs touched each other, one's hand touched the little finger of his or her neighbour, forming a complete chain. In this position all remained for about twenty minutes, some occasionally kneeling down, for relief from a stooping position, but no one else coming in contact with them. At the end of that time, the table visibly and tangibly began slowly to move; before this, however, it was agreed, but this we feel more hesitation in recording as a positive condition of the experiment, that some of the party should join in forming a fixed determination as to the direction in which the table should move. However this may be, the table moved from one room to another, and, after a short pause, back again at a moderate pace; it also turned round several times, at a more rapid pace, and apparently at the will of two or three of the party, who appeared more powerful than the rest."

The Paris correspondent of the *Globe* newspaper states, that he was present at a party, when not only did hats and small tables move by the simple fact of the hands of the company being placed upon them, but that a table *actually rose up from the ground*, because of its inability to move round on the thick worsted carpet beneath it!

FIG. 3.—MANNER OF MOVING THE HAT.

Numerous like instances might be cited, but we are fearful of too far testing the reader's credulity. We may, however, state that many scientific men in England, America, and on the Continent, are at this moment engaged in attempting to discover the true solution of the mystery.

These instances include the type—if we may use the expression—of the experiments. It is calculated to excite a smile when we are informed that half a dozen persons sitting round a table have power to move it without either pulling or pushing it; that, in fact, by some agency not clearly understood, the table acquires a slow rotatory motion, carrying with it, first the hands of the persons sitting around it, and afterwards their bodies, so that it is necessary to rise and walk or run around the table as the case may be.

Which is it that moves, in the first instance, the table or the parties sitting round it? (these, for the sake of distinction, we shall afterwards call the operators;) and by what agency is this motion brought about? are questions which we will endeavour to answer to the best of our ability. In reference to the first question, it would appear that the table moves and carries along with it the operators. Gentle reader, art thou aware of any physical or other force that could effect this extraordinary motion? Is it electricity? Is it magnetism? Let us inquire; and first as to electricity. Every one knows, who is conversant with electricity, that it communicates motion to bodies; thus a small disc, having projecting arms terminating in points bent nearly at right angles to the arms, will revolve rapidly under the influence of an electric current; in the same way a temporary magnet will revolve when submitted to electric action. Here, then, we have a solution of the moving table. A current of electricity passes from the operators towards the earth *through* the table, and it revolves. Stop a minute; bring an electrometer, let it be a delicate one; there now, commence the experiment again; place the electrometer on the table.

FIG. 4.—VITAL FORCE, AS SEEN IN THE MARIONETTE EXPERIMENT.

Are the threads or gold leaves diverged?

No.

Is the table insulated?

No.

Well, let it be insulated; it is done by having glass feet attached to it.

Now, do the electrometer threads diverge?

No.

Surely something must have been overlooked?

No. Every precaution has been taken to obtain indications of electricity, but there are none.

Are you sure the table moved without any one pulling or pushing it?

Yes. The operators merely laid their hands on it.

Was there any manipulation?

Only the joining of the little fingers of the neighbouring operators, the thumbs of each being in contact.

No electricity, and the table moved? Well, then, it cannot be electricity, it must be something else.

Of what use is it to join the little fingers?

Did you ever hear of animal magnetism or mesmerism?

Yes; but what has that to do with it?

Do you know how to mesmerise?

No.

You must take the patient's hand in yours, and look steadily into his eyes.

How must I take hold of his hands?

You must hold his left hand with your right, and his right hand with your left, and some influence or force will pass from you to him, and conversely from him to you.

Well, what has this to do with the table moving?

I will tell you. The operators sitting round the table are in contact, and this contact is mesmeric; the little fingers of each operator are in contact with the nearest fingers of each of his neighbours.

That a force or influence passes from the mesmeriser to the patient in cases of animal magnetism is undoubted: if some of the instances have been known to be delusions, all have not; and while we possess a series of undoubted cases given on the authority of a philosopher who stands high in the scientific world, one who is intimately acquainted with electricity and magnetism, we cannot reasonably question the existence of phenomena that cannot be explained on any theory we at present possess. This gentleman * has demonstrated that if two magnets be placed in contact with a bar of soft steel, so as to inclose the upper and under sides, the bar of soft steel will become slightly magnetic, *i. e.*, some of the magnetism will pass from the two magnets to the soft steel. Now, if passes or strokes be made from the middle of the bar of soft steel towards its extremities, with opposite poles of the two magnets, the bar will acquire magnetic polarity. In the same way he has shown that passes from the head downwards with opposite hands, *i. e.*, the *right* hand of the mesmeriser along the *left* side of the patient, and conversely the left hand along the right side, will greatly increase and exalt the mesmeric effect, so much so, as to throw the patient into a mesmeric sleep, as it is called, in the which the characteristic phenomena are developed.

Why is it called animal magnetism?

Because the mode of developing the phenomena is in some degree similar to developing magnetism in soft steel; but the relation appears to consist only in similarity, not in any identity of influence or force.

How is this proved?

By electrical and magnetic instruments being unaffected during mesmeric operations. An electrometer exhibits not the slightest indication of a current of electricity; neither does a magnetic needle. The mesmeric influence is consequently distinct from electricity and magnetism, and so is the influence or force that operates in turning the tables.

Retiring from the parlour in which the tables have been turned, to the garden to inhale the fresh breeze, to luxuriate amongst the innumerable odours given off from the gems of Flora, we fix our attention on a well-known plant: it is the common scarlet bean.

Why are those strings placed against the garden wall?

Surely, you hardly require to ask so simple a question. Do you not know that they are placed there for the plants to twine round? they are climbers, and in a garden need support.

Let us leave the flower-garden and stroll a little in the hop-plantation. How healthy the hop plants appear; how strongly they entwine themselves around the hop-poles. Ah, here is a phenomenon of a similar character—the hops are climbers. You intimated that the table moved by an influence or force. Do not these plants twine around the poles by means of a force?

Yes, you are quite right; it is by a force we know very little of, and it is called a vital force, or, in other words, a living force. Let us attend to this a little: if you carefully watch the hop or the bean, you will observe the extremity to exhibit a continual rotating or twisting motion, so that when once it has entwined itself around a pole or twig, it goes on by this motion ascending to the summit, and when such plants grow wild, as the convolvulus, they entwine themselves gracefully among the branches of the trees, and impart liveliness and fragrance to our hedgerows. Now mark the exhibition of this force; it is a vital force which exhibits a rotatory motion.

Ah, I see you are teaching me something of the table moving in the hop-plantation, and you said, "Is it the table that moves first, or the operators sitting round it?" But the operators are men and the hops are plants. I don't get any link between them.

Never mind, ideas will gradually develop themselves as we go on, and as knowledge increases so we shall know more of this table moving. Don't forget the vital forces of the hop, the bean, the convolvulus, and other climbing plants. Let us go home.

O dear me! what is the matter with that bird? it has lost its power of standing, and how rapidly it whirls round—it is in a fit, surely. There's a good boy, run and fetch some water quickly, and throw it over the bird. It begins to recover, now it is able to stand on its legs, the water has done it good, and it is able to walk home to its roost. I am very glad it has so soon recovered; why, it might have died in the fit; but what made it whirl round?

Ah, just think of the hop plant: if a vital force made the plant twine round the pole, so a vital force made the poor bird twirl round.

But there is a great difference between a bird and a plant.

Truly, but it may be that the two forces are identical, that in some way the bird may possess a vital force that tends to twirl him round, just as a hop plant possesses a vital force that twines it round the pole.

But why do we not see all birds twirl round, if they possess such a force?

See, here are some boys carrying the bird that was lately in a fit; ask them what happened to it. "Oh!" said one, "a bad boy threw a stone at it, and struck it on the head; see, here is the mark." Ah, now we know why it twirled round; it was partly stunned, but not sufficiently so to stretch it motionless; the action of the brain was impaired, and that higher force which keeps the rotating force in abeyance, and doubtless modifies its action, was neutralised, so that the rotating motion was exhibited while the bird continued in the fit.

I think I now begin to apprehend a link between the twining of the hop and the turning of the table, if the bird possesses a similar force to the hop, but this force is concealed by the higher vital forces that enable him to strut about amongst his hens, to answer the crowings of similar birds to himself, to show signs of pugnacity when another invades his roost; may not all plants and animals, and even man himself, possess such a force? Well, I think it highly probable that such may be the case; that force which has been left, as it were, unconcealed in the climbing plants, has been masked by other forces, perhaps exceedingly various, yet applied in all cases, according to the ends for which the various living beings have been designed; and it is only, as in the case of the bird, when these forces are neutralised that the lower force, although continually acting, manifests itself, just as the force of a clock-spring is kept in check by the pendulum, and is manifested by the clock rapidly running down when the pendulum is removed. Now, observe, what is done in the experiment of the table moving, see the operators sit round it, their hands are on it, their fingers joined, they have exerted their wills in placing themselves in this position, but they do no more, they are intent on the experiment, scarcely thinking of anything else. Are any of them pulling? No. Are any pushing? No. Look at their hands, they are slightly twisted, but has the table moved? No, not apparently so; yet it must have moved, or their hands would not have been in such a position. They appear to have resigned themselves entirely to the experiment. Now the table begins visibly to move, the motion is established. Well, I think the rotatory motion

* The Rev. Dr. Scoresby, F.R.S.

you spoke of has been the cause of this; the operators first began to move, and by keeping in contact with the table, it has obeyed the impulse, and the result has been a moving table.

This is very remarkable; it appears to indicate the existence of a force belonging to vegetable and animal life evidently distinct from electrical forces, and of a lower order than those that give rise to the phenomena of mesmerism. Within certain limits there appears to exist a similarity between the two, namely, the mesmeric and the lower vital force; but this similarity appears to extend but little beyond the mode of manipulation. The highest development of vital force is evidently in connexion with the will; a man wills to raise his hand, and immediately he does it. Perhaps if we descend in the scale of organisation we shall find living beings endowed with less and less of the higher vital forces, until, in the region of the monads and other similar existences, the force alluded to of the lowest order is almost the only one regulating their motions. For some reason yet undeveloped, it may be that all living beings are endowed with the peculiar force that forms the prominent subject of this paper.

Our principal illustration (fig. 1) shows the manner in which the parties to the experiment stand round the table. In a trial made in Paris of the phenomenon, it was found that five persons were enabled to move a large dining table with three children seated upon it. On the occasion alluded to, the table-top worked upon a pivot, and the children were carried with it in much the same manner as they would have been had they been seated in what we call a "merry-go-round" at the fair. Moreover, the table is said to have moved in various directions at the simple will of any one of the children!

A FRUIT PIECE, BY LANCE.

The next best thing to a country trip in this bright summer weather, is a stroll through the rooms of the Royal Academy. Outside, the hot sun is shining down upon the shadeless flag-stones of Trafalgar-square. Pedestrians, with business in hand, are making their weary way eastward or westward, in spite of the heat, while gaily-dressed little girls and boys, with nurses attending them, and ragged and not-over-clean little girls and boys, without nurses, crowd round the "dumb-waiter" fountains, and feel, without knowing anything of the philosophy of the matter, that the mere sight of falling water is refreshing in the summer time. And elegantly dressed ladies and gallant gentlemen step daintily out of well appointed carriages, and pass up the entrance steps of the Academy, without so much as glancing at the hot and tired red-coated sentinels on either side.

Beyond, in the Strand, and away towards Westminster,—the long vista of Whitehall interrupted only by Charles's statue at the "Cross,"—the pavements are full of people; and all kinds of vehicles, from the coronetted carriage with a pair of padded and powdered footmen behind, to the overful omnibus with young gentlemen smoking cigars on the roof, go rattling along the hot roadway. Altogether, the sight from the terrace in Trafalgar-square is a hot and uninviting one on this June afternoon.

But follow the aforesaid ladies and gentlemen into the hall of the Royal Academy, and you experience a change of climate immediately. In the streets you were oppressed with the heat; here, there is a delightful and refreshing coolness in the atmosphere, which is only equalled by the well-bred coolness of the gentleman who takes your two shillings for admission and catalogue. And so, feeling entirely a different kind of personage to him who, just now, stood and wearied on the pavé outside, you pass at once into the great west room; and, assuming the air of a nonchalant quiet connoisseur, begin to examine the pictures.

Beautiful, exquisite, refreshing! Sea pieces by Stanfield, in which the water is positively cool to look upon; landscapes by Cooper and Danby, with dark depths in the shady avenues that seem to invite repose and contemplation; forest scenes by Landseer, with "Children of the Mist"—as the painter chooses to call a herd of deer—flying over brake and brook; village scenes and domestic incidents by Frith and Webster; portraits, of fine ladies and gentlemen in drawing-room costume, by Mr. Secretary Knight; figures by Eastlake and Mulready, and flowers and fruit by Lance.

These last,—in a greater degree, perhaps, than any of the others—have a cool and pleasant look. How tempting the round ripe apples; how inviting the luscious grapes, both black and green; how exquisitely toothsome the rough mottled skin of the green fig! And then with what art the painter has introduced rich silver tankards and brightly painted porcelain ware, and dark carved woodwork into his picture; and how well the great green and red-dappled vine-leaf contrasts with the crimson velvet of the table-cover, and the hangings at the back; surely, Mr. Lance must be a great lover of fruit and flowers! For ourself, we say unblushingly, that we have quite a child's love for both—the only remnant of youth that, with most people, remains with them after thirty.

Mr. Lance is a little before the season, though; the flowers blossom in June, the fruits come in autumn. But no matter, we may enjoy the picture without anticipating the time when the grapes and the apples become ripe; and certainly without it suggesting to us that autumn is the afternoon of life as well as of the year,—for, thanks to the skill of scientific gardeners, and the properly-regulated temperature of hot-houses, we can obtain fruit all the year round! Not always do the delicious fruits which form the painter's models replace the faded flowers, for they exist while yet the yellow buttercups and pink-eyed daisies dot the fields. Fruits have a charm peculiarly their own—a charm which it requires no imaginative powers to enhance; for, superadded to their outward beauty, they possess medicinal utility. In Mr. Lance's pictures, as in an old orchard, "the mellow apple, whose golden brilliancy is heightened by rich streaks of purple, weighs down the branch that bears it; and the luscious pears and grapes, whose juice is sweeter than honey, display their beauties and invite us to pluck them."

Who, gazing at the picture, does not wander, in fancy, far away into the green fields, and lie down lazily beneath brown old trees, humming over to himself that fine old ballad of Shakspeare's, which begins—

> "Under the greenwood tree
> Who loves to lie with me?"

or, curbing his imagination, and trusting to his less fickle memory, recall some incident of his youth, associated with flowers and fruit? Some orchard frolic, in which fair girls and brown hearty boys—who are staid men and women now with girls and boys of their own, perhaps,—took joyous part? some happy winter meetings, in which those who shall meet no more on earth, sang songs together and made a merry noise, and gathered factitious fruit and artificial flowers from Christmas trees of green and gold?

And thus, standing in that great western room, with the triumphs of modern art before us, oblivious to the moving throng, and with a strange sense of past and present happiness floating through our brain, grave solemn thoughts uprise, and scraps of poetry, long forgotten or but dimly remembered, come upon our lips. And thus the "Fruits" of Lance remind us of autumn, and with autumn we call up the words of the poet:—

> "With golden sheaves and laden boughs She comes,
> Bringing contentment in her smiling face. The day
> Is hot with sunshine labour, and the night
> Is merry with the joy of harvest homes.
> The year is almost ended; 'tis well to be so gay,—
> Days darken, shadows lengthen—so pass our lives away."

In the exquisite design which the courtesy of the painter

has enabled us to present to our readers, all that grace and opulence of fancy for which Mr. Lance is so justly celebrated will be discovered. In works of this kind the artist, though he was for many years engaged in historical composition, artistic creations. In his creative art is discovered the genius of the painter. Taking his materials from the most obvious and ordinary sources, he idealises and refines, till his finished productions are worthy the companionship of the more ambi-

FRUIT PIECE BY G. LANCE. DRAWN BY J. GILBERT, AND ENGRAVED BY H. LINTON.

stands unrivalled. He possesses the rare faculty of embodying the real with the poetical, and blending with representations of the products of the orchard and the hot-house, such ornamental and architectural adjuncts as serve to raise his compositions from the rank of mere copies of nature to real tious art-specimens which hang upon the same walls. His flowers, indeed, have no perfume, and his fruits no flavour; but considered as works of art, they possess a higher value and more enduring interest than belongs to many pictures of greater pretensions.

WILLIAM FAIRBAIRN.

"Power to let." Such were the words which some quarter of a century since struck our eye as we traversed the streets of Manchester for the first time. "Power to let?" What could the words mean? We had just left college, and were fresh from the discussions of the schools respecting the origin of man's idea of power, and all the metaphysical jargon connected therewith. Power, therefore, to us meant mental and moral power, a quality inherent in the soul. How, then, could power be "to let?" Light soon dawned on our mind, and by "power" we found steam-power was intended. And veritably the steam-engine is a power, a great social power; nay, if viewed in its remoter results, a great moral and spiritual power; for the steam-engine, by facilitating intercourse, economises time, abridges space, wears down prejudices, enlightens minds, and unites while it enlarges hearts.

Our age is the age of the steam-engine. The steam-engine is the symbol of the age. The fact has been made use of to the disparagement of this generation. But the fact has its bright side. The augmentation of man's material forces is in itself a good. What in the whole history of the world has augmented those forces so much as the steam-engine?

In the sphere of material forces, as in other spheres, like requires and begets like. Discoveries come in a group; improvements go forward hand in hand. The steam-engine would have been of small service without the railway: the existence of the former called the latter into being. Other applications of steam-power ensued us a natural consequence. Hence the rapid and amazing change which has taken place in our means of locomotion within the last hundred years. This change, so very easy to set down on paper or to express in print,

WILLIAM FAIRBAIRN, OF MANCHESTER.

has been effected in the face of innumerable difficulties. The progress and the transition have been well sketched by Mr. Thomas Bazley in his "Lecture on Cotton."

"Up to the seventeenth century, goods passing between Liverpool, the destined port of the cotton-trade, and its manufacturing capital, Manchester, had been carried by pack-horses and in waggons; but in 1720 an act of Parliament was obtained for rendering the idle waters of the rivers Irwell and Mersey useful and navigable, though much opposed by the pack-horse and waggon interests. In 1758, however, the Duke of Bridgewater engaged that most practical and distinguished engineer, Brindley, to construct works in harmony with the other achievements of his time; and he was empowered to disembowel the estate of the duke at Worsley of coal, and to construct a canal to convey that welcome fuel to the profitable market of Manchester. This engineer, with singular boldness, directed his canal at a low level, to penetrate the very mines which were to be excavated, and he proposed to cross the river Irwell, at Barton, with it, by an aqueduct at a considerable height; but before he would proceed with his design, he desired his patron to consult some experienced engineer upon the difficulty to be surmounted; and on the duke applying to such an one, the sarcastic reply was, that 'many a castle in the air had been projected, but the place which one was intended to occupy was only then pointed out;' but with unbounded confidence in Brindley, the duke ordered the work to be executed; and the first canal of our country started into successful existence. Assured of the success of a new and great principle, and seeing, with prophetic penetration, that the growing wants of an infant manufacturing and commercial community would require facilities of transit, in addition to the retiring pack-horse, to the waggon, and river conveyances, and that a canal might be constructed with great advantage, to place Liverpool and Manchester in more direct and immediate communication, in 1762 was begun the celebrated Bridgewater Canal, which became another triumph of that energetic age; but it may be well to remark, that before the legislature sanctioned this last projection, the interests of the old carriers, including the river company, were fiercely directed against this innovation upon vested privileges. Conveyance was of indispensable importance to the industry which had continually enlarged its productions; it was requisite for the transport of fuel, food, raw materials and manufactured goods; as well as for those business visits which merchants and manufacturers had to exchange, and which were then effected by that novel agent a stage-coach. Subsequently the career of progress decreed that the mighty power of steam should be the impelling principle of traffic and locomotion; and here again the energy of Lancashire was displayed, for the first efficient railway in the kingdom was established between Liverpool and Manchester, continuing to their trade and commerce the onward impulse of rapid progress. Was this railway established without difficulty? No. The engineering difficulties were said to be insurmountable; but before these were permitted to be grappled with, the legislature, through the combined and powerful interests of the carriers upon the old roads, the proprietors of coaches, canals, the river navigation, and of extensive landowners, who had not the penetration to discern that a new path of progress was projected which would enhance the value of their own property, and also benefit the public, RESISTED THE PROPOSITION; and it was only when selfish interests were made to succumb to the general good, that an act of Parliament was obtained for the first railway. Yet so jealous had the legislature been of every innovation, that the Sankey Canal, of some six miles long, near Warrington, had only been allowed to be made with the express condition, that the boats intended to ply upon it should be propelled by no power except that of human labour: but in derision of antiquated contrivances, and all obstacles, the railway admonishes the advocate of retrogression; for on passing along its line, the traveller may survey the comparatively deserted old high road, that conserved canal where men are still beasts of burden, the Bridgewater Canal, and the old river; and steam, the schoolmaster of improvement, now leaves behind the slow boats and slow coaches of former days."—Pp. 20-24.

An engineer of the same class as Brindley is here presented to the attention of the reader. Of all the generators of motive power, none occupies a higher place than Mr. Fairbairn. Endowed by nature with the fervid genius and the indomitable perseverance characteristic of Scotchmen, he has by his inventive and constructive skill conferred on the world incalculable advantages, and made for himself a name whose repute is limited only by the four quarters of the globe.

The subject of this sketch was born at Kelso, in Roxburghshire, on the 19th of February, 1789. He received the rudiments of a very defective education, first at the parish school in that town, and afterwards at the school of Millachy in the Highlands of Scotland, where he resided from his tenth to his fourteenth year. From this training he acquired some skill in reading and writing, accompanied with a very limited knowledge of arithmetic and a slight acquaintance with bookkeeping and mensuration. On quitting school he was bound an apprentice to an engine-wright in Northumberland. During his period of service he extended his knowledge to the earlier books of Euclid, a few algebraic problems, and the more popular works of English literature. On these subjects, by untiring perseverance in a rigid system of self-instruction, he acquired some useful information, and laid the foundation of those tastes and habits which up to the present hour have been his sole means of relaxation, and proved to him a ceaseless source of increasing usefulness. Prompted by impulses which were felt rather than understood, the apprentice, after the labours of the day, spent his evenings in the recreations of study; and now that he has risen to a very high rank among men of practical science, William Fairbairn still occasionally looks back on this period of his early history with no small degree of pride and satisfaction.

On the termination of his apprenticeship, the young engineer went to London, where he worked for two years as a journeyman millwright; and during his leisure hours constructed several machines of considerable merit. After a roving excursion over most parts of England, South Wales, and a part of Ireland—working his way the whole time—he finally settled in Manchester, in October, 1814, and shortly after commenced business on his own account, with no capital and very few friends. Forming a partnership with Mr. James Lillie, a man of strict integrity, he began in a resolute spirit to struggle with the difficulties incident to his position.

At an early date in his mechanical career, Mr. Fairbairn's attention was directed to the very great defects which existed in the machinery of transmission, or the system of millwork then in use for driving cotton factories. The mills of Lancashire and other districts were then moved by ponderous square shafts and large wooden drums, making seldom more than forty revolutions per minute. Assured that he could effect a great improvement, Mr. Fairbairn prevailed on one of the largest spinners to consent to the complete alteration of his mill-gearing: the whole factory was gutted, and in lieu of shafts seven to eight inches square, and wooden drums four feet and upwards in diameter, Mr. Fairbairn boldly introduced light cast-iron pullies with wrought-iron shafting, varying from two and a half to three inches, and increased the speed so as to obtain from 100 to 160 revolutions per minute. Here was a gain of power four-fold! This improvement was followed by an entirely new principle of coupling the shafts, since denominated "the circular half-lap coupling." A natural consequence was a great augmentation of business; and from that day may be dated Mr. Fairbairn's success in life. Steadily pursuing the useful and honourable career on which he had now entered so satisfactorily, he accomplished several important improvements in the construction of millwork, water-wheels, and other hydraulic machines.

Towards the end of the year 1829, Mr. Fairbairn's attention was directed to the possibility of increasing the speed of boats in their passage through canals, and at the request of the Forth and Clyde Canal Company, he instituted a series of experiments to determine the tractile force at velocities

varying from three to fourteen miles an hour; and further to ascertain how far and with what advantage steam could be applied either as a tractive or propelling power instead of horses. These experiments were published at the expense of the company; and although the objects for which they were undertaken were not fully realised, they led the author's mind to a subject of higher importance, namely, the employment of iron as a material for shipbuilding. Iron boats were indeed in use previously, but they had never been constructed on principles fitted to enable them to resist the violence of storms, and to meet all the requirements of vessels intended to navigate the open sea. Mr. Fairbairn, aware of the importance of this new field of inquiry, bestowed thereon the full energy of his powerful intellect, and was rewarded with great success. Among the earliest improvers of this branch of practical science, he embarked largely in the manufacture of them both in London and in Manchester, and has since constructed above 100 iron ships, some of them war-frigates of nearly 2,000 tons burden.

During the years 1834-1835, the use of a hot blast for melting iron ores became prevalent, and along with this important improvement a very inferior description of iron was introduced. To relieve the public mind, and determine the relative merits of the new manufacture, Mr. Fairbairn and Mr. (now Professor) Hodgkinson were requested by "The British Association for the Advancement of Science" to investigate the cause of certain supposed defects; and after a most laborious experimental research, the reports of both gentlemen were published in full in the "Transactions" of the Association.

Almost simultaneously with this investigation into the properties and comparative value of the hot and cold blast-iron, Mr. Fairbairn instituted an experimental inquiry into the relative values and properties of all the British irons. The valuable results were published in the "Memoirs of the Literary and Philosophical Society of Manchester." These papers were at intervals followed by others on scientific subjects, which were honoured with the approval of learned societies, and published in their "Transactions." Whilst these investigations were going forward for the purpose of discovery and improvement, Mr. Fairbairn was involved in the multiform and engrossing duties of large engineering establishments, the successful conduct of which has largely increased his reputation and augmented his wealth.

The most distinguished and lasting monument which Mr. Fairbairn has hitherto erected to his fame, is his construction of the Britannia and Conway Tubular Bridges. The conception of the grand and novel design, as Mr. Fairbairn has unreservedly stated, belongs to Mr. Stephenson, who also deserves high praise for the share which he took in the labour as a colleague with the subject of this memoir. The respective shares taken in the construction by these two eminent men have unhappily been brought into dispute. While we maintain the just rights of the one, we have no wish whatever to derogate from the merit of the other; and an impartial review of the controversy authorises us to say, that without Mr. Fairbairn's practical knowledge and skill, Mr. Stephenson's idea would not have been carried into effect.

The reputation acquired by Mr. Fairbairn generally as a constructive engineer, has led to his services being put in requisition in all parts of Europe, whether for the heavier sort of mill work, iron shipbuilding, or locomotive engines; he has also successfully erected more than one hundred public bridges from forty to two hundred feet in span.

These eminent services have brought him honours from many quarters. Learned societies and crowned heads have bestowed on him tokens of their sense of his great and numerous merits.

While thus reaping the appropriate rewards of his genius, enterprise, and industry in the highest walks of life, Mr. Fairbairn, glad to help others to rise, occasionally devotes the resources of his richly-furnished mind to the instruction of the humbler classes. Two lectures are before us on "The Construction of Boilers," and on "Boiler Explosions," which he recently delivered before the Leeds Mechanics' Institution. From this pamphlet we make a quotation:—

"The modifications of the steam-engine which have been adopted since its introduction by Watt, three-quarters of a century ago, have been very numerous and varied; and although the progression in its applications and improvements has been most rapid and wonderful, we are still undecided as to the best form of its construction. Sound principles, scientifically applied, and the gradually increasing excellence of our workshop, have enabled us to attain the great perfection which characterises the working parts of the modern steam-engine. The steam-engine itself may be regarded as a comparatively perfect machine, and I shall, therefore, confine my observations almost exclusively to that very important and necessary adjunct, *the boiler*, which is the source of all its power. With this limitation a very wide field of inquiry is opened out, and in the earliest steps of the investigation we become perplexed with the endless variety of forms and constructions which at different periods have been adopted by engineers, and which have never, unfortunately, received the same judicious attention that was paid to the steam-engine. This is an anomalous and much-to-be-regretted fact, for the boiler being the source of the motive-power, is one of the most important parts of the whole machine. Upon its proper proportions and arrangements for the generation of steam depend the economy and regularity with which the engine can be worked; and upon its strength and excellence of workmanship depends the safety of the lives and property of those who come in contact with it. Regarding the steam-engine as one of the most active agents in the extension of our prosperity, and in the civilization of the world, and seeing how it is mixed up with the daily duties and workings of society, the safety and efficiency of every part, and more especially the boiler, are subjects of national importance; and I feel gratified by being called upon to lay before you such knowledge and experience on this subject of deep interest as I myself possess."

EARTHLY HONOURS.

(*A Sonnet by Edward Bolton, published in* 1610.)

"As withereth the primrose by the river,
As fadeth summer's sun from gliding fountains,
As vanisheth the light-blown bubble ever,
As melteth snow upon the massy mountains;
So melts, so vanisheth, so fades, so withers,
The rose, the shine, the bubble, and the snow
Of praise, pomp, glory, joy—which short life gathers.
Fair praise, vain pomp, sweet glory, brittle joy,
The wither'd primrose by the mourning river,
The faded summer sun from weeping fountains,
The light-blown bubble vanished for ever,
The molten snow upon the naked mountains,
Are emblems—that the treasures we up-lay
Soon wither, vanish, fade, and melt away."

THE CASCADE OF THE ROCK.

Some of the most romantic and picturesque scenes in all fair France are to be found in the department of the Haute-Loire. Geologists tell us that, in days gone by, the district was torn by volcanic eruptions, and the traces of the lava are still to be found. This gives to the place a wild and somewhat terrible grandeur. Elevated peaks bristle over a black and yawning gorge, which, branching off into deep and mysterious recesses, forms the upper basin of the principal valley, in which two mountain rills, the Dor and the Dogue, unite, and give their joint names to a noble river. The rocks, lifting their craggy peaks on high, the fissures in those rocks, the unknown depths which they disclose, the giant trees, the roar of the falling waters, all combined, present a picture of remarkable interest, such an one as Salvator Rosa would have loved to paint. It is a singularly suggestive spot to the imaginative temperament. We people the towering rocks and beautiful green valleys with creatures of our own fancy, weave out a story for each

locality—now of violence and terror, now of calm security and sylvan solitude; and, indeed, connected with the place are many strange eventful stories of the days when the Huguenots enrolled their names among the noble band of martyrs, and when all France was shaken with the first revolution, and legitimacy struggled to the death. Hence, irrespectively of its own natural grandeur, there is peculiar interest attaching to the place—a land of poetry and romance, a region of woods and waterfalls.

The view from the Pic de Sancy is very striking. The Pic is 6,171 feet above the level of the sea, and the prospect which stretches out before the observer is a labyrinth of valleys and gorges, with peaks bristling around on all sides, while numerous small lakes are glittering in the depths.

The waterfalls are the one great characteristic of the place. Some of them are of no great elevation or grandeur, others present a magnificent appearance. Such an one is represented in our engraving. The water has rent the rock, and forced a passage through it, and from the rugged summit pours down its flood into the river, its fall now broken by a projecting rock, its course now turned by some impediment, but still fighting bravely, as if instinct with life and passion, in a noble struggle to be free. An artificial arch erected over the waterfall, the luxuriant foliage, and the graceful trees and herbage around, add to the beauty of the scene. Man is absent, but life is present; for there is life in the struggle and the leap of the mountain stream—life in the leaves that quiver on the boughs and in every blade of grass.

Not far from the Cascade of the Rock is the forest of Murse, one of the finest and most extensive in Auvergne.

THE CASCADE OF THE ROCK, IN THE DEPARTMENT OF THE HAUTE-LOIRE, FRANCE.

JAPAN AND THE JAPANESE.

CHAPTER II.—MARTIAL WEAPONS AND EXERCISES OF THE JAPANESE.

A KNOWLEDGE of the Japanese weapons is equally important in an antiquarian and historical, as it is in a military point of view,—for the inhabitants of Japan, separated as they undoubtedly were from all intercourse with the opposite continent of Asia, must have preserved intact the primitive forms of their weapons for a much longer period than the inhabitants of the Old World, where so many various nations and tribes, in a more or less advanced state of civilisation, as

JAPANESE CAVALRY.

the case might be, were continually meeting one another upon the battle field, and, as a natural consequence, adopting whatever in their adversaries' mode of arming struck them as superior to their own.

From whence the inhabitants of Japan may first have come, it is pretty certain that they were a nation of hunters and fishermen, who either brought their weapons with them, or else fashioned them after the model of those used by their forefathers. Insulated as the Japanese islands are between two continents, we may, with propriety, be allowed to assume that the weapons of the ancient inhabitants will help us to form a correct idea of those of the most primitive nations of the earth, since the remains of the knives, axes, and other instruments of warfare, which have been found in the graves and caverns of Japan, are exactly similar to those discovered in the graves of the early Germanic races, as well as in Siberia and North and South America, and which are, even at the present day, to be met with among the islanders of the Pacific Ocean and some of the tribes on the north-west coast of America.

Until the seventh century of the Christian era, the inhabitants of the Japanese islands preserved their primitive weapons. Even after *Zin-mu-ten-woo* had succeeded in establishing his authority, there was but little change observable in the arms of the people. The large bows which procured for the Japanese, in the writings of the Chinese historians, the designation of "Robbers with large bows," are still retained by them, at the present day, and their sword-blades are highly prized both by the Coreans and Chinese.

About the middle of the sixteenth century, the Japanese first became acquainted with the fire-arms of Europe, which were soon afterwards almost universally adopted by them. It is a remarkable circumstance, however, that this did not cause the ancient weapons of the country to fall into disuse, as had been the case in Europe. On the contrary, while the former have continued to be improved by every successive generation, the latter still present us with a true picture of the matchlock of olden times, such as the Portuguese introduced when they first discovered Japan.

The most ancient offensive weapons of the Japanese consisted of bows and arrows, javelins, and lances. The bows are, as we have before remarked, larger than those used by the inhabitants of the opposite continent. They are not composed of a single piece of wood, as is the case with those of most other nations, but of three or even more pieces, which are very skilfully placed, layerwise, over one another, glued together, and covered with a thin veneer of bamboo. The middle piece is thicker than the other two, and is generally made of candleberry-myrtle or willow. After it has been scraped smooth, the bow is carefully bound round with the fibres of the hemp plant and rotang* bands, two or three inches broad, at certain regular intervals. Lastly, it is very artistically lacquered white and red. Bows thus formed assume a peculiar and most pleasing form when they are bent. This seems to arise from the fact of the rotang bands being placed at certain intervals from each other; for the greater the intervening spaces, the greater, also, will be the elasticity of those parts of the bow not so bound round with the rotang bands.

The arrows of the Japanese are composed of bamboo, with feathers at the lower extremity, taken either from the wings or tail of the hawk and other birds. Among both the Chinese and the Japanese, the bow-makers and arrow-makers constitute two separate professions. This is natural: countless arrows are shot away and lost, as powder and bullets are with us; while, on the contrary, a single bow, which a man often inherits from his forefathers, lasts for years.

The arrows which are used for amusement or exercise have wooden, horn, or iron heads, which are blunt, and sometimes quite flat. They are of every imaginable shape, according to the fancy of the owner, and are mostly attached to the shaft by a long prong running into the wood, or else fit it exactly as a percussion cap does the nipple of a gun. The last method is the one adopted for arrows used for exercise or amusement. Before leaving this part of the subject, we may mention that the Japanese believe in charmed arrows, as the Germans of the present day, and the Scotch of former times, in charmed bullets. These magic weapons are supposed to belong to the gods, or kamis, whose invisible hand guides them; for this reason they are never feathered.

The quivers answer a double purpose. They are either used by the huntsman and warrior to keep his arrows in, when he is engaged in hunting or war; or together with the bow and arrows, they are set up for show in the entrance-halls to the houses of the great, or in the tents of officers of a superior rank. Like the arrows, the quivers are divided into numerous sorts.

Besides his bows and arrows, the Japanese huntsmen will sometimes employ an instrument very much resembling a common pea-shooter, only much longer, and formed either of bamboo or some other reed. Out of this he shoots a small, sharp, little javelin, about an inch in length, and such is the dexterity which practice gives him, that he seldom or ever fails to bring down his mark. The Japanese amuse themselves by casting this same kind of spearlet at a target made of boards, with a rough portrait of one of their kamis, or of a human face drawn upon it. In our engraving (p. 432) these amusements are shown, as well as the peculiar costumes of the people.

According to the Japanese account of the creation, the world was a mass of mud and water, which their diety *Kuni-soko-talsino-mikato*, stirred round with his spear. Now, as the legends and traditions of every people have always some foundation in their manners and customs, we have every reason for supposing, that, at a very early period, their princes were in the habit of wearing spears formed of the precious metals. At present, the use of the spear or lance is strictly confined to the soldiery, and those nobles who hold office under government. The lance is to be seen displayed in the halls of such nobles, and is always borne, in an upright position before the princes of the empire and officers of the highest rank; before those of a lower class it is carried slantingly.

According to the historical accounts, Rime Inisiki, who lived between the 29th and 71st years of the Christian era, was the first person who manufactured swords in Japan. Those now in use are of various kinds. The principal ones are the *Tatsi* or *Jebano-tatsi* and the *Zindatsi*, large sabres, worn on state occasions; the *Katana*, a long sabre for ordinary use, and the *Wakisasi*, a smaller one of a similar description. The literal meaning of its name is, a weapon stuck by the side; and this appellation was, no doubt, given to it from the fact of its being stuck in the girdle by the side of the larger one. Besides these, there are also the *Sasisoye* and the *Kivaiken*, two kinds of daggers, the first of which is worn by the men and the second by the ladies of rank. The state sabre, like all others in Japan, has no basket to the hilt, which is covered with shagreen, and wound round with silk cord. It is so long that it can be grasped with both hands. The *Katana* and *Wakisasi* are the swords used by the military, who wear both at the same time. This is esteemed a great privilege, and is enjoyed only by them and the nobles of the highest class. This privilege, however honourable it may be thought for the soldier, is exceedingly troublesome when he is on duty, especially to the boys, some of them scarcely ten years old, who are allowed to serve as substitutes for their fathers. It is a most ludicrous sight to see one of these juvenile heroes strutting about with his two monstrous swords, which, according to the imperial edict, must only be stuck half way in the girdle. The observer might, indeed, justly exclaim, with Cicero: "Quis te gladio allegavit?" Persons of the middle classes, peasants, officials, watchmen, and servants, are allowed to wear one sabre only, either straight or curved, according to taste, and resembling the *Wakisasi*, but with a smaller hilt. The custom of wearing side-arms is, as the reader perceives, a general custom, the only persons who have not the privilege

* Calamus rotang: one of the articles imported into the country.

of doing so being monks, shopkeepers, beggars, and leather-dressers. The latter are an abject, degraded race, like the Indan pariahs. The Japanee is proud of his sword: he feels for it a kind of veneration, which is taught him almost in his infancy, and the permission to wear it, which is granted him as early as his fifth year, is looked upon as a great event in his life, and accompanied by festivities and rejoicing. The fact of a sword having belonged to some celebrated personage, or having been made by some famous sword-smith, enhances it immensely in the eyes of connoisseurs: such a weapon will sell for two or three hundred pounds. The blades are of the most admirable quality, and it is the boast of the Japanese that they will cut through an iron nail, without the least injury to the edge. They are always kept very sharp and fit for immediate use. Battle-axes and clubs, also, were formerly used by the Japanese; but, at the present day, they have entirely fallen into disrepute. The Japanese are, likewise, acquainted with the use of cannon; but they have not, as yet, soil. At any rate, it is certain that, if conquered, they would never survive their defeat, as every Japanese, of whatever rank he may be, will always prefer death to disgrace. Although they have but little actual service to perform, their principal employment being to keep guard along the sea-coast, and increase the splendour of the two courts at Miyako and Yedo, they are tolerably active and well disciplined. Our large illustration shows the dress of the Japanese cavalry, which consists of greaves for the legs, and similar defensive coverings for the arms and shoulders. He has also a helmet, with vizor and neck-piece, and a gorget of chain armour. As a general rule, the helmet, breast-plate, greaves, and arm-pieces are made of leather, fastened together by silk cords, and covered with metal plates. It is very seldom that these objects are composed of iron. Entire coats of chain armour are also very frequently worn, and are worthy of being especially mentioned, as they are very similar to those in use among many of the warlike tribes of Asia. The colour

JAPANESE SWORDS AND SCABBARDS.

succeeded in becoming very expert artillerymen. According to Shunberg, they only discharge those in the neighbourhood of Nagasaki once in seven years, to assure themselves that they are still fit for use, and, at the same time, for the purpose of cleansing them. The gunner ties a piece of tinder to the end of a long stick and generally turns away his head when he fires his gun.

The Japanese army consists partly of troops immediately belonging to, and raised by the ziogoon, and partly of those furnished by the princes of the empire and the more powerful nobles, each of whom is required to send a number proportioned to his means. The total number thus raised, is about 400,000 foot and 80,000 horse; 100,000 foot and 20,000 horse being raised by the ziogoon, and the remainder by the princes and nobles. Although the Japanese soldiery have for so long a period enjoyed the most profound peace, they are still brave and hardy; both willing and capable to repel a foreign invader should he attempt to land upon their native

of that part of the costume which consists of leather, as well as of the silken cords and tassels, varies according to the family to which the cavalier belongs. For instance, the powerful house of *Mina-moto* has adopted black; that of *Taira*, purple; that of *Tudsi-wàra*, pale yellow; and that of *Tatsi-bana*, bright yellow. The vassals all wear the respective colour of their lords. Whenever a cavalier wears any other colour than that of his own family or lord, it is because he has adopted the colour of the family into which he has married.

The cavalry are very well mounted. The horses are not very large, but, as a general rule, they are strong, clean-made, and spirited, equalling in beauty and intelligence the Persian horses. The military are the only persons who guide their own horses. Riders of all other classes have them led by one or two servants. The saddles are very similar to those used in our own cavalry regiments: the stirrup leathers are rather short, and a kind of rough skin, rounded off at the bottom, hangs down on each side of the leg for the purpose of protect-

ing it. The stirrups are like the Turkish or Tartar stirrups, and the reins, instead of being made of leather, as is the case with us, are composed of silk.

JAPANESE SPORTSMAN, WITH TUBULAR WEAPON AND DART.

JAPANESE EXERCISE OF THROWING THE DART.

Whether the Japanese army, as it is at present constituted, would ever successfully oppose troops disciplined and armed in the European fashion, is a point which, in our opinion, admits but of one opinion. The Japanese soldiery, like the Swiss of later ages, were once so highly esteemed, that they were eagerly engaged to serve in the armies of the princes of the opposite continent.

THE IRISH INDUSTRIAL EXHIBITION.

On the obverse of the title to the Catalogue of the Irish Exhibition, there is a most appropriate quotation from Cowper, which commences thus :—

"The band of commerce was designed
T' associate all the branches of mankind ;
And if a boundless plenty be the robe,
Trade is the golden circle of the globe."

At no period of Irish history has the truth of the poet's dogma been so fully felt and understood as in this glorious summer of 1853, when crowds of visitors from all parts of the world are flocking into Sir John Benson's beautiful building in Merrion-square. How well every line of Cowper's famous verse seems to hit the time and the occasion :—

"Each climate needs what other climes produce,
And offers something to the general use ;"

and

"Ingenious art, with her expressive face,
Steps forth to fashion and refine the race."

It would almost seem, too, as if Cowper had had a prevision of our modern successes in art and commerce—for the poet is the true prophet—rather than that he spoke from the experiences of his own time. Art, he goes on to say,—

"Art thrives most
Where commerce has enriched the busy coast.
He catches all improvements in his flight,
Spreads foreign wonders to his country's sight,
Imports what others have invented well,
And stirs his own to match them or excel.
'Tis thus, reciprocating each with each,
Alternately the nations learn and teach ;
While Providence enjoins to every soul
A union with the vast terraqueous whole."

In resuming our notice of the Irish Industrial Exhibition, it will not be expected of us that we should attempt anything like a regular and succinct account of all the remarkable objects prepared for the gratification of Ireland's visitors, or that we should report, in newspaper fashion, the amount of money received, up to a certain date, from the holders of season tickets, or taken in half-crowns and shillings at the doors. Information of this kind, however interesting, must be sought elsewhere. But, on the other hand, it will be our pleasing task, in our various walks through the beautiful, and now completed, bazaar, to seek out its most novel and pleasing features, and, by aid of pen and pencil, present them to our readers.

We pause a moment on the threshold of the building and look around us. Here in the metropolis of a country, scarcely yet recovered from the torpor of famine, we have a building, in every respect worthy its progenitor of 1851, filled with the results of thought and labour in a thousand varied forms. From the original conception of an Irish International Exhibition to the triumphant 12th of May, when, to the sounds of music and under the patronage of the great and noble, the building itself was opened, nothing has occurred to damp the enthusiasm of the patriotic men who undertook the direction of the affair. On the contrary, the example of the able and enterprising men who so successfully surmounted the difficulties of the Great Exhibition of 1851, appears to have been constantly kept in mind,—so that, in the end, Mr. Dargan, the noble-minded founder of the Irish Exhibition, and Mr. Roney, its indefatigable secretary, had the proud consciousness of having achieved a triumph greater and more enduring than any achieved by Irishmen before,—the triumph of Industry and Peace,—without imperial assistance and by simple force of energy and talent. Like the glass palace in Hyde-park, the Irish Industrial Building has had its difficulties to surmount, its dangers to avert, and eventually its triumph. Like the Exhibition of 1851, it stands forth a monument of peaceful energy and well-directed capital; and long may it be ere the genius and generosity of our Irish fellow-subjects are devoted to less praiseworthy objects. Writing, in 1851, of the show which the exhibitors from the sister island made in Hyde-park, we expressed a hope that the day was not far distant when Ireland, with an Industrial Exhibition of her own, might make real advance as a manufacturing nation. The day has almost arrived. Already are the differences between the Celt and the Saxon almost forgotten; already have thousands of Englishmen found warm welcome in Irish homes—for every visitor to the sister island is received there as a friend; and already does the aspiration of the queen's representative appear to be answered—that God Almighty will bless and prosper the undertaking, and that the Irish Exhibition will be the means under Providence, of uniting the people of England and Ireland in one bond of brotherhood and love.

The various objects exhibited in the Dublin Exhibition are arranged according to the classification adopted in the Great Exhibition of 1851, but in the catalogue the names of the exhibitors are numbered consecutively from 1 to 1833. The paintings, sculptures, castings, &c., in the Fine Arts court bear a distinct set of numbers, from 1 to 1366; as also do the East Indian and other collections of curiosities. This arrangement, though it makes no provision for the probable increase of both exhibitors and objects exhibited, is one which is directly understood by the visitor. We find that there are 1,460 exhibitors from the United Kingdom, and about 400 from the other parts of the world. The foreign nations, which figure most conspicuously in the Irish Exhibition, are France, Belgium, Holland, and the several States comprised in what is called the German Zollverein. In our former notice we spoke briefly of the contents of the exquisite building ; it will now be our task to go somewhat more into detail of the various objects exhibited. And here, at the outset, we must be allowed to remark that the ornamental is greatly in excess of the useful, even among the contributions of the Irish themselves. It has been thought necessary to apologise for the admission of paintings to a place in this Industrial Exposition, and in the introduction to the official catalogue we have the question ably argued. "It has not been without consideration," says the writer, "that the claims of the Fine Arts—in their abstract character, and viewed apart from utilitarian industry (if, indeed, they can ever be justly so viewed)—have been recognised. The difficulty of exclusion appeared at the least as great as of admission. It is not easy often to draw the line of demarcation between objects which come within the strict limits of the Fine Arts, and those Arts which are strictly utilitarian in their character. There are few of the latter which do not, to a greater or less extent, include or intimately ally themselves to the former; and, therefore, were the boundary to be defined with a scrupulous determination to exclude every article whose object is solely utilitarian, the result would be to reject from the Exhibition much that now finds a place within it. When the mere necessities of life have been satisfied, civilisation superadds to the useful the ornamental, and soon learns to recognise it as a necessity of life also ; for the perception of the beautiful is innate to the mind of man, and when the useful has been achieved, the cravings for the beautiful will seek to be satisfied. Hence Sculpture, in the most extended acceptation of that term, enters into the composition of a vast proportion of the articles designed for utilitarian purposes. The same may be said of Painting. In truth, it is difficult, when once we have emerged from the rudest and most elementary state of society, to deny that the Fine Arts are themselves utilitarian. The desires of the eye for that which is beautiful in form and colour, if not essential to mere existence, assuredly are so to the enjoyment of life; and hence sculpture and painting, in the abstract, may, it is presumed, be fitly exhibited without transgressing the strict limits which should be assigned to an Industrial Exhibition. Under this conviction the Committee have admitted works of Fine Art which are not utilitarian, in the ordinary sense of the word ; and they have done so the rather that the study of sculpture and painting is essential to perfection in the ornamentation of almost everything in ordinary

use. Nor let it be forgotten, as one of the *uses* of the Fine Arts unconnected with industrial objects, that the statuary and the painter contribute to the pages of history as well as the Scribe or the Printer. The former perpetuates and diffuses the forms and the character of historical persons and events, of natural history, scenery, and costume, as the latter cannot do."

In furtherance of these views, a Fine Arts Court has been constructed in the extreme southern aisle, between the Archæological and Mediæval courts, principally for the reception of Paintings; and the Committee have been enabled to bring together a considerable collection, at once interesting, as exhibiting the progress of the Art in modern times, and instructive, as containing some superior specimens of the Ancient Masters of the Art. Classification in relation to ages and countries rather than to schools has been adopted; but the collection will be found to contain examples of the earlier schools of Italy—the Lombardic and Venetian, the Raphaelite and Bolognese, of the ancient Flemish school, and of the modern schools of France, Belgium, Germany, and Great Britain. Many of the works of these modern schools exhibit the great progress of the Art of Painting towards another grand development in its history.

In addition to Paintings of the character mentioned, places have been assigned to Pictures which are the product of mechanical skill and the application of scientific discovery; such as specimens of Heliography, or the process whereby the actinic rays of the sun produce permanent pictures of objects upon metallic plates. Encaustic Painting, Cromo-Lithography, and uncoloured Lithography, may also be classed under the general head of Painting.

The application of all these various branches of Painting, as ornamentation, to articles of use—upon ceramic manufactures, as china, porcelain, earthenware—upon glass, slate, enamel, wood, japanned goods, papier machè, paper-hangings, and decorative furniture of all sorts, have their appropriate places in the various manufactures under which the decorated articles are classed.

In the Fine Arts Hall have also been placed some objects of Sculpture—statues and busts in marble; the greater portion, however, of the Sculpture, including marbles, bronzes, casts in clay and other materials, have been dispersed throughout the nave and aisles in a manner which adds greatly to the interest and effect of the general exposition. Amongst them are to be found, in the casts from the bassi-relievi Sculptures of the Metopes of the Parthenon at Athens, the finest exponents of the Phidian era of the art, exhibiting the unrivalled excellence of the Greek sculptors, resulting from their perfect acquaintance with anatomical structure and mechanical balance, and their true perception of form and sentiment. It will be instructive to contrast these with the specimens of the Etruscan school, as exhibited amongst the ceramic manufactures, and mark the absence of flow in the draping, the meagreness in the treatment of details, the exaggeration of attitude and action which characterise the latter.

Several good illustrations of Greek and Roman Sculpture during the post-Phidian eras may also be seen throughout the nave, some of them possessing high merit. There are some specimens of the Italian school, after the revival of Sculpture in the eleventh century, one of which, as the work of the painter Raphael, commands attention. The Sculpture of British artists of the present age is abundantly and creditably exemplified, and the works of some foreign Masters give a favourable impression of their progress in the Art.

GENERAL VIEW OF THE BELGIAN COURT.

Besides the subjects already adverted to, Sculpture embraces within its limits the Modelling and Plastic Arts, and includes works in Stone, in Metallic and Mineral productions, in Ceramic and Vitreous compositions, in Animal and Vegetable substances; in fine, whatever is capable of being wrought into form by the tool or the finger of the Statuary; and that, whether in relief, as in medals, coins, gems, or in intaglio, as in die-sinking, seal-cutting, &c. The application of Sculpture to the useful Arts takes a range of vast extent. Wherever the form or outline of articles is not rigidly prescribed, the Sculptor and the Modeller are called in to give variety and beauty to figure; such is the case in gems and jewellery, in vases, urns, tazze, drinking-cups, and other vessels, in candelabra, and in ornamented furniture, &c. When Sculpture

is found in these combinations, it is transferred to the particular class of manufacture to which the decorated article belongs.

In connexion with the Fine Arts Department, the Mediæval and Archæological courts are to be classed and studied. The former contains within it a large development of the Fine Arts—of Sculpture and Painting—as monumental brasses, coronæ lucis, and windows of stained and painted glass. The latter possesses a rare and valuable collection of objects of ancient art, principally Irish, highly important, illustrating the state of the arts, sciences, and manufactures in this country during several centuries.

The visitor to the Irish Exhibition will, most naturally, be attracted to

THE CENTRAL HALL,

by reason not only of the central situation and superior size of that noble apartment, but also from the fact that the most prominent objects are here exhibited. In the centre stands the grand equestrian statue of the Queen, by the Baron Marochetti (p. 439). This beautiful statue is intended for erection in the city of Glasgow, and is exhibited by the permission of the committee under whose direction the work has been brought to its present state. His Royal Highness Prince Albert exhibits a Grand Centre Plateau, which has been executed under his directions by the Messrs. Garrard of the Haymarket. The Coalbrookdale Iron Company have a large iron summer-house, almost in the centre of the hall; and Messrs. Houldsworth of Manchester have a fine show of furniture and objects for ecclesiastical decoration. The Earl of Eglinton has sent the two fine pieces of plate, called the Emperor's Vase, and the Goodwood Cup, which were won by his lordship's race-horse Van Tromp, in 1848 and 1849. The Earl of Cardigan, and the officers of the 11th Hussars, have kindly lent to the Exhibition the silver equestrian statue which was executed for them by Cotterel for presentation to their late colonel, the Prince Consort; and the officers of the 7th Hussars likewise send the silver statue which was presented to them by the Marquis of Anglesey. It is executed by the same clever artist, Cotterel.

Facing the grand entrance, a Fountain, in cast iron, designed by Lienard for M. André, of Paris, has been appropriately placed; while in a corresponding situation, at the other end of the centre avenue, is erected a fine terra cotta Fountain, executed by Messrs. Ferguson, Millar and Co., of Glasgow (p. 439) Messrs. Pain, Brothers, have their Jacquard loom at work; while near at hand the Messrs. Atkinson and Co., Fenton and Co., Todd and Co., make rich displays of figured poplins, tabinets, &c. There is also a Jacquard loom shown by Messrs. Keely and Leach, which is adapted for weaving figured and plain poplins, in various colours. The "Royal Society for the Promotion and Improvement of the Growth of Flax in Ireland" exhibit a series of specimens illustrating the preparation of the flax plant for manufacturing purposes, and the different processes incident to the manufacture of flax for the loom. Here we have bunches of the flax straw with the seeds on, there various specimens of the same kind of straw after steeping; besides varieties of different kinds of flax, seeds, capsules, &c. Then the flax is shown in its various conditions after being "scutched," "heckled," "roved," "bleached," and, finally, woven into linens, damasks, lawns, cambrics, and other plain and printed fabrics. As we shall have occasion again to refer to Irish flax and its products, we may briefly observe that, besides flax grown in Ireland, the Royal Society exhibit various specimens of Russian, Dutch, Belgian, Egyptian, and English grown flax, all of which are used in the manufacture of that incomparable material—Irish linen.

ENTRANCE TO THE STATIONERY AND BOOKBINDING COURT.

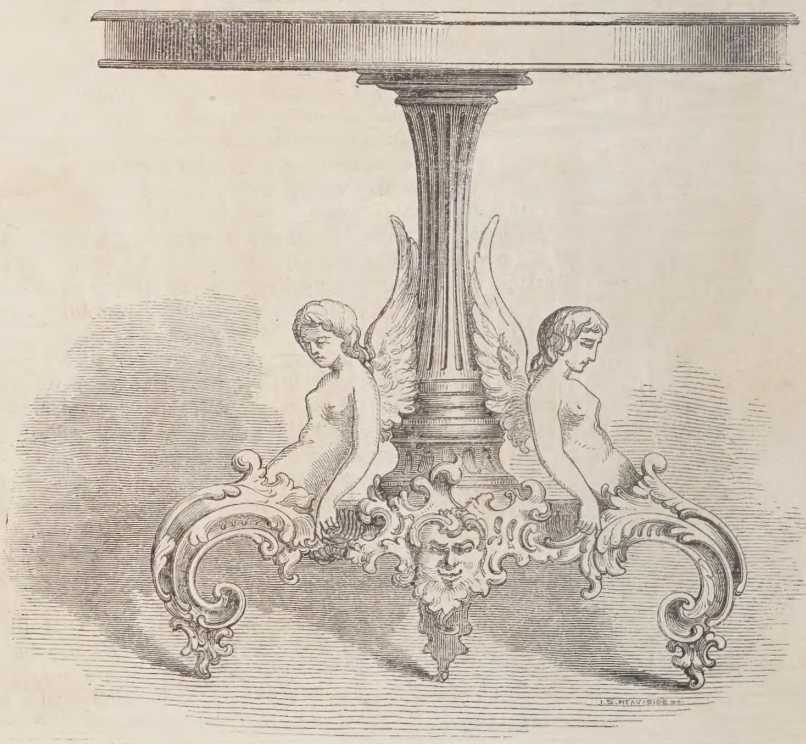
In the Hyde-park Exhibition, Messrs. Chance, of Birmingham, and Mr. Wilkins, of Long Acre, had each specimens of optical glass, in the shape of lighthouse lanterns; and in the present Exhibition the former firm also show an excellent series of lighthouse apparatus, consisting of the most powerful concentric polygonal lenses, filled with dioptric revolving lights, according to the system propounded by Augustin Fresuel. The importance of a first-class lighthouse apparatus on coasts like those of the British isles, cannot be too highly estimated. We understand that the first order of lighthouse lamps shown by Messrs. Chance, are fitted in with lenses, &c., in such a

manner that the light can be discerned in clear weather from a distance of fifty miles.

Mr. Lombard, of Leinster-street, has a gilt table of beautiful design and execution, of which we give an illustration below.

Mr. J. Classon, of Dublin, shows carvings in bog oak, in a variety of forms; Mr. H. Williams has an ivory model of Sir John Benson's original design for the Irish Exhibition Building; Mr. T. Grubb, of Dublin, exhibits various ingenious specimens of improved clock-work, equatorials, &c., adapted for carrying telescopes; Messrs. Kirkman, of London, and Messrs. Marcus, of Dublin, are great in pianofortes, harps, and other musical instruments; while Messrs. Waterhouse, of Dublin, and Mr. R. Phillips, of London, exhibit an immense and splendid variety of articles in gold and silver, to which we shall have further occasion to allude. Mr. T. Bennett, of Grafton-street, Dublin, has several large and beautiful specimens of Irish silver, consisting of salvers, tea and coffee services, centre pieces, candelabras, &c, excellently wrought. A group, selected from Mr. Bennett's stall, appears in page 393. Besides these, the exhibitor shows a large number of articles in electro plate, and various examples of the manner in which gold, silver, and gems, may be made to combine with bog oak carvings. Altogether the display made by Mr. Bennett is highly creditable to his taste and skill.

The collection of busts of distinguished persons in the great hall forms not the least interesting feature of the Exhibition. Visitors are thus afforded an admirable opportunity of studying the features and becoming acquainted with the personal appearance of men who have rendered themselves renowned as warriors, statesmen, and patriots. The founder's own countrymen naturally compose the majority of this interesting collection, and we believe that nearly all the busts were executed by Irishmen—the largest contributors being Moore, Jones, and Kirk. Commencing with the bust of that distinguished warrior, Lord Gough, we recognise in succession those of Major Edwards, Sir Philip Crampton, Lord Clarendon, Lord Brougham, Mr. Jonathan Henn, Q.C. (a splendid likeness by Moore), Lord Denman, the Marquis of Anglesey, the late Tom Steele, and the late John Lawless; Dr. Henry, Provost of the Belfast College; Sir John Herschel, Mr. Cogan, M.P., Sir R. Peel, the Duke of Wellington, Catherine Hayes (by Barter), the Nepaulese Ambassador, Captain Williams, Louis Napoleon and the Earl St. Germans (both by Mr. Jones), Mr. Dargan, Mr. Colley Grattan, Lord Dunboyne, the Dean of St. Patrick's, the Rev. Dr. Todd, another bust of Sir R. Peel, Richard Brinsley Sheridan, O'Connell (by Hogan), and the Duke of Cambridge. Under these, on lower pedestals, there are a number of other marble busts. Between the columns which support the great organ loft five elegant pedestals of carved wood have been placed, on which are erected a series of marble groups, illustrative of mythological subjects, and supposed to have been executed early in the sixteenth century. One of these represents Jupiter destroying the giants, and consists of four or five figures, which were all carved out of a solid block of marble. The figures are very small, but display wonderful boldness and originality, with great correctness of design and exquisite finish of execution. They will attract much curiosity and admiration.



GILT TABLE, EXHIBITED BY MR. LOMBARD, LEINSTER-STREET, DUBLIN.

Messrs. West and Son, of College-green, have an elegant show of Irish manufactured plate. One of the most remarkable specimens in their very beautiful case is a testimonial presented some years since to her Grace the Duchess of Northumberland, and executed under the immediate inspection of the Messrs. West, at their establishment in Capel-street. The lower part of this beautiful work is a group, composed of an Irish elk's head in black oak, and two stag hounds in silver; the antlers of the elk are gold, which, conjointly with the trunk of an oak tree in silver, support a highly embossed ornament, on which rests a vase of Irish diamond, and from which springs two rich consols or brackets united by festoons of antique ornaments, and attached to the vases by shields, around which is a profusion of shamrocks. One of the brackets supports a chair of state, or throne, in which is an allegorical figure of Hibernia with a harp; over the figure is a canopy with a phœnix at the top—the back of the seat is friezed gold ornaments, with rich silver scrolls—on the upper part rests a double coronet, in enamelled gold, over the initials C. C., entwined round the letter N in Old English,

under which is a compartment with a bouquet of the "Forget me Not" flowers. On each side of the throne are dolphins in silver; the opposite bracket supports a group composed of an Irish wolf-dog, the toga, or Irish mantle, sword, and shield, &c. &c. The entire work is studded over with Irish jewels, consisting of pearls, amethysts, garnets, and beryls; and, round the base, in letters of gold, are the words "Hibernia grata."

We must pass as rapidly through the Grand Central Hall, as the well dressed crowd will allow us, and just glance at the many beautiful objects around, promising ourself a more particular examination of each during our future visits. Thus, on this beautiful June morning, with the sun shining gaily down upon the moving mass of happy people, and tinting with many colours the glass lighthouse and the splashing waters of the fountain, and feeling ourself in a mood to enjoy and admire all that comes before us, we look upward and around. The graceful lines of the domed roof meet those of the galleries at the northern end of the hall, where, from below, they appear to terminate in the great organ; and then our thoughts revert to that auspicious 12th of May, when, in the presence of thousands, the pealing notes went forth—

"All men, all things, all that has life and breath, sing to the Lord;
Praise the Lord with lute and harp; in joyful song extol Him,
And let all flesh magnify His might and His glory."

At the entrance to the hardware court (p. 438), standing just within the centre avenue, there is erected a statue of William Dargan, the patriotic founder and father of the Irish Industrial Exhibition. Having already given a portrait and biographical notice of this patriotic gentleman, little remains for us to say in connexion with this true patriot and lover of his country. Risen from the people, his whole career has been one of usefulness and persevering industry. As our readers are aware, the offer of a baronetcy has been formally made to Mr. Dargan, in acknowledgment of his high personal character and the great services he has rendered his country. This, however, Mr. Dargan has gratefully and gracefully declined to accept. Nor are we surprised at this determination, for those who know Mr. Dargan best are aware that he has uniformly avoided all kind of display and distinction in connexion with his great work; and that he looks for no pecuniary profit from its results. Under these circumstances, the national testimonial, which is in progress, will be a graceful recognition of the singleness of purpose and greatness of mind which could conceive and accomplish so great an undertaking as the Irish Industrial Exhibition. It is anticipated that the design for the Dargan testimonial will be submitted to our beloved Queen, during her visit to the sister island.

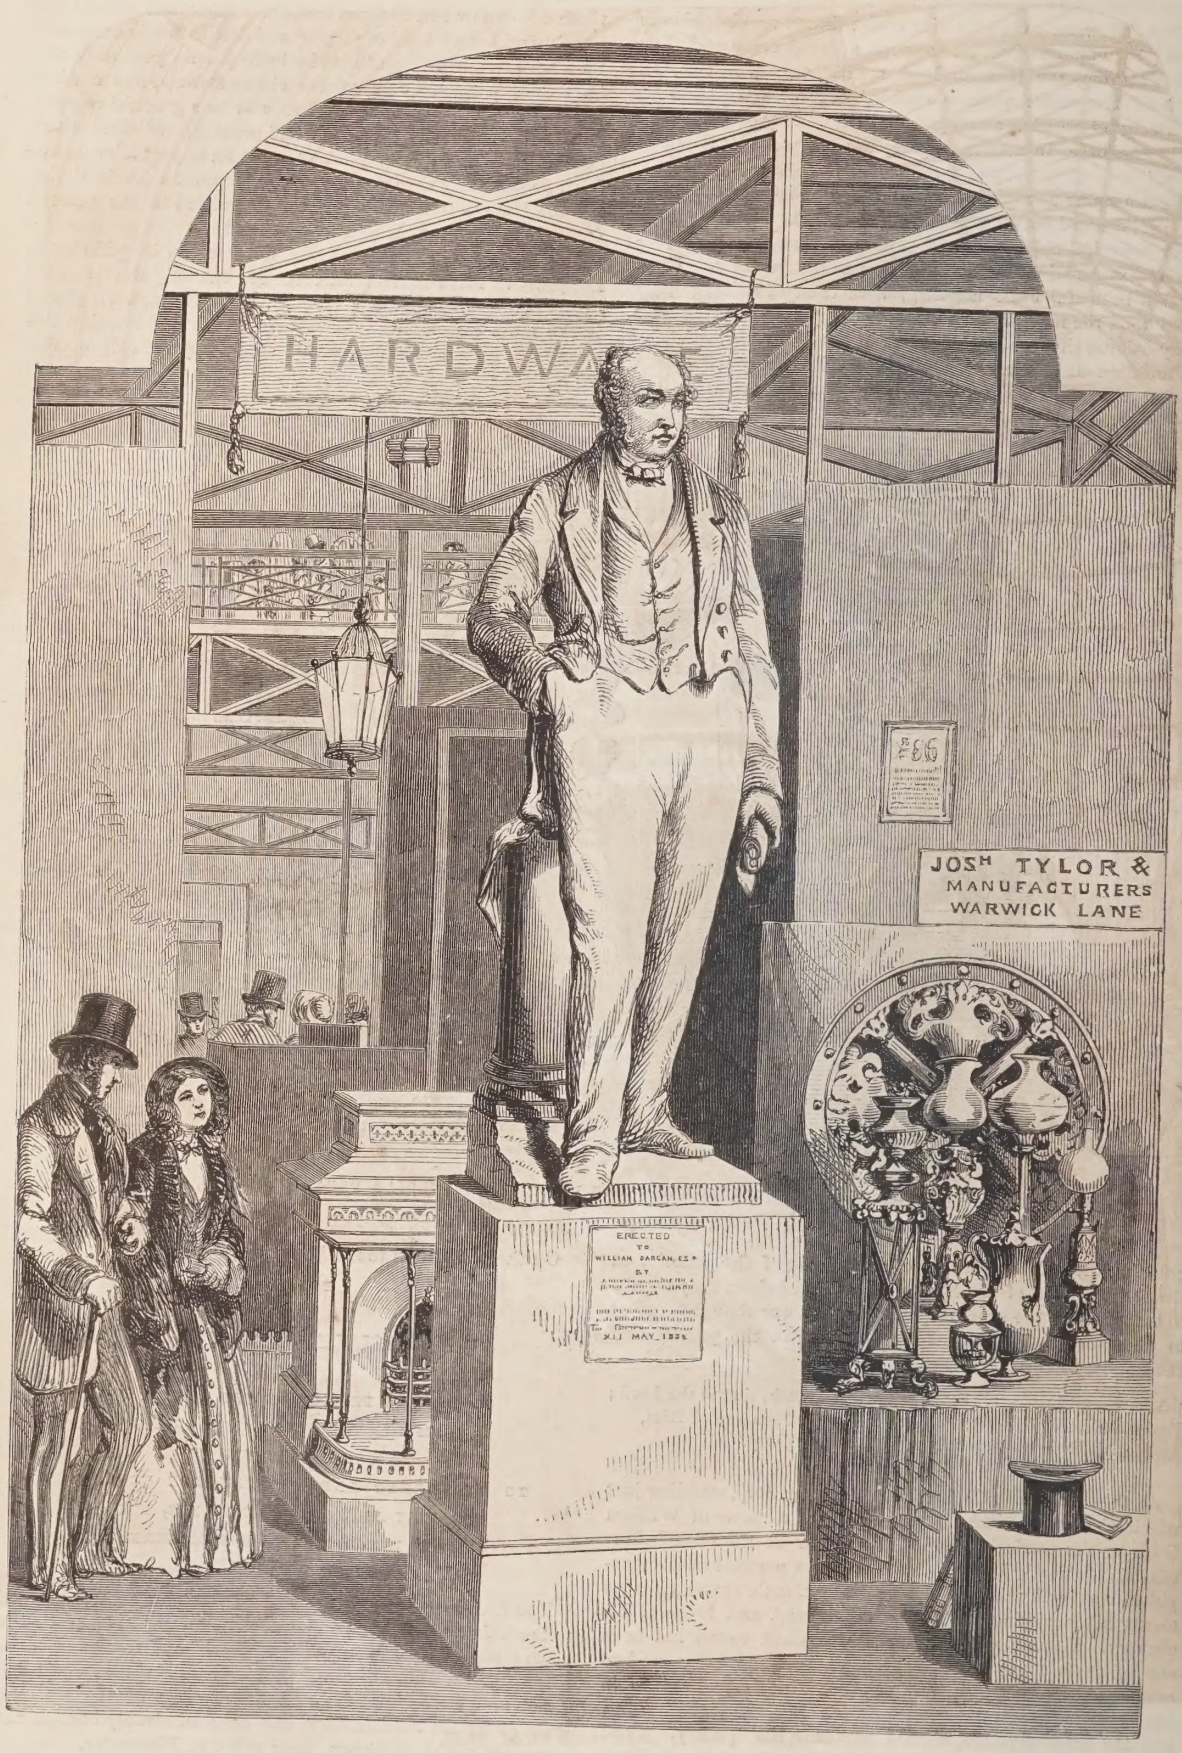
With regard to the statue itself, nothing can be said that is not praise. Mr. Jones has succeeded in catching the "manner of the man" with extreme felicity; and, although not placed in the most conspicuous situation, we doubt not but that this statue will be the most frequently-sought object in the beautiful building.

TAZZA AND VASES, SELECTED FROM THE FRENCH AND BELGIAN DEPARTMENTS.

On the pedestal is the following inscription:

ERECTED
TO
WILLIAM DARGAN, ESQUIRE,
BY
THE PERSONS ON THE STAFF
OF HIS VARIOUS UNDERTAKINGS,
AS A TRIBUTE
TO HIS GREAT AND INESTIMABLE QUALITIES,
NOT ONLY AS A PUBLIC EMPLOYER, BUT AS
THE BENEFACTOR OF HIS COUNTRY.
12th MAY, 1853.

The friends and countrymen of Mr. Dargan will be pleased to learn that a bust of this distinguished patriot is prepared in Irish statuary porcelain, and is sold at a moderate price in the gallery of the Exhibition, Class 25, as well as in Dublin and London. This beautiful and appropriate monument of a great event in Irish history, has been admirably cast at the porcelain works of Messrs. Kerr and Co., Worcester.



STATUE OF WILLIAM DARGAN, ESQ., BY E. JONES. ENTRANCE TO HARDWARE COURT.

VIEW OF THE GREAT CENTRAL HALL.

THE GRACES, BY E. BAILY, R.A.; COLOSSAL HEAD OF NIOBE, BY M. AURILIUS; TERRA COTTA FOUNTAIN; EQUESTRIAN STATUE OF HER MAJESTY, ETC.

The objects, however, which must be esteemed of a more peculiarly Irish character are distributed over the building in certainly not the most conspicuous situations. On the right-hand side of the Great Central Hall we have a splendid display of

IRISH POPLINS, TABINETS, ETC.

These are exhibited by several well-known Dublin firms, amongst whom may be mentioned Messrs. Atkinson, of College-green; the Messrs. Pim, of George's-street; Messrs. Fry, of Westmoreland-street; and Messrs. Todd and Burn, of Mary-street. As trophies of national skill and industry, these beautiful silks, damasks, tabinets, &c., are peculiarly interesting. The patterns of some of the choicest of these figured tabinets and poplins have been furnished by pupils belonging to the School of Design lately established in connexion with the Royal Dublin Society—an admirable institution, which has already justly excited great public interest, and which promises to become an important instrument in developing the latent genius of our Irish fellow-subjects. Adjacent to those stalls, Mr. W. Dunn, and Mr. Moran, of Mark's-alley, Francis-street, display specimens of their silks and poplins.

The silk manufacture is generally supposed to have been introduced into Dublin by the French Huguenot refugees, and to have been established shortly after their residence in that city. In the year 1764, an act was passed which placed it for some time under the direction of the Dublin Society. For its encouragement the Society established a warehouse in Parliament-street, which they placed under the superintendence of persons, annually returned by the Corporation of Weavers to examine the quality of goods sent in by manufacturers, to whom the Society paid a premium or discount of five per cent. on all sales made in the house. Under this management the sales rose to an average of £70,000 a-year. Another act of Parliament followed, however, by which the Dublin Society was prohibited from disposing of any part of its funds for the support of any house in which Irish silk goods were sold by wholesale or retail.

History tells us that China was the first country in which man availed himself of the labours of the silk-worm. From thence silk spread to other countries of the East; and the Romans, who had it in general use, were supplied with it by the ingenious artificers of Tyre and other cities of Phœnicia. Later, the Persians monopolised the supply of the raw material; and, by prohibiting the passage through their country of travellers to and from China, entirely stopped the importation of silk into Europe. Two Nestorian monks, however, are said to have contrived to smuggle some eggs in a hollow cane, which they afterwards hatched by heat, and presented to the Emperor Justinian, whom they likewise made acquainted with the art of manufacturing silk. In the fifteenth century the manufacture was established in England. The countries from whence we chiefly import the raw material are China, Italy, Malta, and Southern France. It is said that in time the British market will be almost exclusively supplied with the raw silk from our Indian possessions, as labour is not only excessively cheap there, but three "crops" of silk may be taken in the year, while in any country west of India only one can be obtained. All attempts hitherto to produce the raw material on an extensive scale in these islands have failed. In 1835 a company commenced operations in the county of Cork by planting 80 acres with 4,000 mulberry trees, but they soon after abandoned the experiment.

The visitor who may wish to witness the process of manufacturing tabinet, can here gratify his curiosity, as the Messrs. Fry have a loom at full work in their stall. Here we behold those extended simple threads of silk and wool converted by the art of the manufacturer into the beautiful fabric, which all the skill and perseverance of the English artisan, and the delicate taste of the French one cannot rival. Among the tabinet patterns exhibited by this firm, is one of the dress wrought expressly for Mrs. Dargan.

In the glass case of Messrs. Todd and Burns, there are exhibited many other specimens of Irish skill. These take the shape, however, of

SEWED AND EMBROIDERED LACE, ETC.,

A branch of industry peculiarly interesting to contemplate, as being entirely the handiwork of the female peasantry of Ireland. The successful carrying out of this kind of cottage labour seems to realize the wish of those philanthropists who object to the congregation of large masses of individuals in factories and close buildings. The introduction of home manufactures of this kind among the rural population of Ireland is of recent date; and it certainly contradicts the assertions of those who call the Irish an idle people, to see with what extreme avidity this work is accepted by the poor. It is gratifying to be able to record the fact of the rapid increase of the sewed muslin and lace work. In the province of Ulster the countrywomen and girls are almost universally busied with this kind of work; and we learn that "in a small town in one of the most distressed parts of the county of Donegal, and the district immediately around it, several hundred pounds have been paid weekly; and by it alone the entire population of the barony may be almost said to have been kept alive. One promising feature of the speculation is, that the supply of hands is not nearly equal to the demand." Throughout Connaught and Munster this branch of female industry is likewise happily extending, and there is not a thread of the delicate tracery before us which does not speak touchingly and hopefully of miseries relieved, and of intellectual and moral faculties developed. We trust that this employment may be made, what it has to some extent become already, a lever for bettering the general condition of peasantry. What more delightful duty could devolve on the wives and daughters of the Irish resident gentry than the task of planting this occupation in the poor cottages around them? There is no pecuniary outlay requisite. Inquiries are very easily made through male relations, if need be, and a communication is very easily opened with the mercantile houses requiring the manufacture.

The exquisite specimens of lace displayed in an adjacent case, by the house of Forrest, in Grafton-street, and brought from their manufactory at Limerick, command attention, as likewise the specimens exhibited by Messrs. Todd and Burns. In fact one impression irresistibly forces itself on the visitor's mind, after contemplation of the different and contrasted articles of Irish manufacture, viz.:—that delicacy and refinement of taste is, as phrenologists say, a Celtic characteristic, proceeding from a large development of the ideal faculty, and that in the display of it the Irish manufacturer and the French one are very closely allied.

Several other specimens of what may with propriety be called "Women's work," are also exhibited by Messrs. Marsland and Co., of Manchester, consisting of crochet, tatting, guipure, embroidery, and other kinds of "needle labour," which, in England, is practised by young ladies at home, but which is here made profitable to thousands. But besides these, various objects in ornamental flower and feather, and hair work, among the latter are a set of ornaments made for her Majesty, consisting of brooch, bracelet, and pair of ear-rings, and a tiara, designed and executed with remarkable taste and skill. The whole of this work is produced by the peasantry of Ireland, in which we are informed this firm affords employment to between two and three thousand persons. It is gratifying to us to hear that, through the influence of Messrs. Marsland, a trade has been created, not only in England, but in America, Australia, and other places abroad, for the fanciful productions of our peasantry. Messrs. Marsland are the manufacturers of the cotton from which most of this work is made, and they also exhibit in their case, samples of it in great variety. Among those samples are some of variegated crochet cotton, intended to supersede Berlin wool and coloured silks for embroidery purposes, and for which they have obtained a patent.

SPECIMENS FROM THE IRISH MINES.

At the entrance of the Northern Hall, are deposited various specimens of minerals, contributed by the Mining Company of Ireland. Nicely arranged in a glass-case are specimens of coal and culm from Cork and Tipperary, lead and silver from

Ballycorus lead works, county Dublin, lead ore from Wicklow, copper, and argentiferous lead ore from the mountains of Waterford. Those contributions from such various localities afford reasonable grounds for belief that the apathy which has so long prevailed respecting the mineral resources of Ireland will soon be dissipated, and that the vast and all but unbroken field of her varied metallic riches will be extensively worked ere long. It is not the least pleasing feature in such a collection that there is no gold included in it. The Mexicans, who have a tolerable experience in such matters, have a popular proverb, that a gold mine ruins a locality, while a copper one makes its fortune; and indeed when we consider the attraction which the discovery of the most precious metal holds out to the influx of the lawless and vitiated of every nation, we are well content that Ireland should not become an Australia or California.

Close at hand to the mineral specimens are some of peat charcoal, manufactured by Thomas Sadlier, Esq., of Tullamore. They include specimens for deoderising and manure, for casting and household purposes. Mr. Sadlier's manufactory has been above three years in operation. Close at hand, we pause before a small mahogany case, containing a number of glass bottles, neatly stoppered and labelled like the phials in an apothecary's shop. These unassuming little glass jars contain that long-sought condiment

IRISH SALT;

a condiment which Swift lamented Ireland's want of, and which Sir Robert Kane did not even anticipate her possession of. This salt has been lately discovered in Antrim, on the Marquis of Devonshire's estate at Duncrue, near Carrickfergus. The fact of such a discovery is considered as of first-rate importance, as hitherto nearly all the salt and coal consumed by Ireland has been imported from this country. A cheap and abundant supply of salt is a great desideratum; for what article does civilised man possess which is available for such numerous useful purposes as salt? Besides its services as a condiment, and in curing provisions, it is now valuable, and in extensive use, as a manure. From its affording chlorine, it is a fundamental necessary for all bleaching processes in manufacture. From its affording soda, it is an indispensable in the fabrication of glass, soap, &c. It is calculated that each adult of us consumes, annually, at least 16 lbs. of salt as a matter of food. As before stated, the chief supply of coal and salt to the sister country is from England; though those peculiar-looking vessels, with unseemly rigging and low hulls, which any lounger may see from the quays and wherries, bring with the wine and fruits of Spain and Portugal, a small quantity of salt. In England, the sources from whence the supply of salt is drawn are said to be inexhaustible. Mr. Porter, in his "Progress of the Nation," calculated, some years since, that the annual production of salt in England reached 500,000 tons, at which time the capital employed in the manufacture was said to be about one million sterling, and the population engaged in it about 12,000 persons. The United States, British North America, Russia, Belgium, and Prussia, were the principal of the distant markets to which those manufacturers exported; and, if the surmised modification in the government of British India should take place, that country will become an additional field for the trade, as the salt monopoly will be almost certainly abrogated. The cost of production of the finest Cheshire article is about 3½d. or 4d. a bushel.

We may also in this place refer briefly to the collection of

PEAT OR TURF

as among the raw materials exhibited. Many specimens of turf and artificial fuel are shown; and considerable attention has lately been bestowed upon its destructive distillation, as most of our readers know, various useful articles may be produced from the bog peat of Ireland,—such as sulphate of ammonia, naphtha, acetate of lime, several fixed and volatile oils, and a substance called paraphine, which greatly resembles bees-wax in outward appearance, and is applicable to the same uses. The chemical products of peat are also shown; but whether the bogs of Ireland can ever be profitably worked for their production is a question for time.

COAL AND ANTHRACITE

are exhibited by Messrs. Butler, Fawcett, Morgan, Mandesforde, &c.

In Ireland there are seven principal coal mines, lying nearly equally to the north and south of the metropolis. They differ materially in their geological circumstances — those to the north of the capital yielding bituminous, or flaming coal; and those to the south, stone coal, or anthracite, which burns without flame. Notwithstanding the abundance of turf, coal was worked in Ireland at a very early period; and pits have been discovered that bear evidence, from the rude stone and wooden tools found in them, of having been worked by a race far anterior to historical records. But from the ignorance displayed formerly, and from the present want of capital or enterprise, or something else, the produce of her mines is far less than they could yield with ease; and Ireland, that possesses sufficient resources to supply her own wants, and to become, moreover, an exporting country, imports a large quantity of coals every year, said to exceed in value a million sterling. The principal coal-mines are seven: one in Leinster, occupying large portions of Kilkenny and the Queen's County, with a small part of Carlow; two in Munster—one of them in Tipperary, bordering on that in Kilkenny, and the other spread over large portions of Clare, Limerick, Cork, and Kerry, being the most extensive coal-field in the empire. All these beds yield anthracite. Of the northern coal-fields three are in Ulster:—one at Coal Island, near Dungannon; the second in the northern extremity of Antrim; and the third in Monaghan. These last are small, with narrow seams; and are, consequently, of little value. The Connaught coal-field extends over a space of sixteen miles in its greatest length, and lies in the counties of Leitrim, Roscommon, Sligo, and Cavan. The total area of these coal-fields is estimated at 140,000 acres. It is impossible to cast the eye over some interesting maps showing the geological formation of Ireland, and exhibited by the Chairman of the Board of Works, without feeling surprise at the mineral treasures that lie neglected, scarcely below the surface of the soil on which the unemployed labourer drags his weary steps.

But it is not only in the quantity of her ores that Ireland is rich, their position is even more fortunate. No river in the empire can compare with the Shannon. Its majestic stream winds through a course of 247 miles, through fields whose fertility cannot be excelled. Here and there it expands into lakes, or more properly into inland seas. Lough Allen, in the centre of the iron-fields, covers an area of 9,000 acres, and is still very inferior in size to Lough Derg or Lough Ree. Here every opportunity is offered for inland navigation, and the cheap carriage of goods. This splendid river rises among the coal-fields of Connaught, and cuts through the Munster coal formation. But still greater advantages exist. It frequently happens that the iron ore, the limestone used in smelting it, and the coal, and, if necessary, turf (for the manufacture of charcoal), all exist in close contact, divided in the centre by a river that affords at once cheap transit and water power. This is the case with the Arigna mine.

IRISH LINENS, DAMASKS, CAMBRICS, AND COTTON FABRICS

should be spoken of at length; we therefore content ourselves with remarking in this place, that the show which the Irish manufacturers make in their country's Great Exhibition is highly creditable to them. The names of many firms might be mentioned, in all the branches of these trades, whose contributions are both large and well selected. And this may also be observed of the hosiery and glove trades.

Of the famous Balbriggan hosiery a fine show is made by Mr. Glenny, of Lombard-street, to whose perseverance and talent the Irish people may be said to owe this now well-known and possibly matchless manufacture. Mr. Glenny obtained a prize medal at the Great Exhibition of 1851, for the excellence of his hosiery, and such has been his success in introducing the stockings and gloves of the poor loomsmen of Balbriggan among his weekly customers, as to have largely benefited the peasantry of Ireland.

THE SCULPTURE IN THE IRISH INDUSTRIAL EXHIBITION.

The "Lesson Interrupted" by Barter, deserves special notice. The group represents two sisters and their young brother—one of the sisters has been in the act of teaching the boy—the other holds over him a cup and ball, which diverts his attention from his book. On the ground are scattered music-books, manuscripts, pens, and other auxiliaries of a domestic academy—near the preceptress is a guitar, upon which the frolicsome sister seems to have beem playing, and to have left aside for the enjoyment of this girlish whim. This is one of those pleasing delineations of social incidents that modern sculptors deem not unworthy their genius. "The Young Musician" by Burnet, is a charming production. A pleasant little boy is engaged in the act of playing an accordian, his mouth wide open, as if intently listening to the sweet sounds he has himself evoked. "The Wrestlers," by J. Lawler. A bird has been caught in a net, and the boys are wrestling to decide the ownership of the prize. The discontented face of the boy who is almost vanquished contrasts admirably with the happy, exulting countenance of the conqueror. "The Dove's Return," by J. Farrell. This is executed in marble. A dove is perched on the right hand of a youth. The work well merits praise

A group, by J. E. Jones, also attracts the eye. An interesting girl holds in her hand a bird—her little sister is at her side, looking up into her face with that expression of curiosity and pleasure which the face of childhood wears, and an expectant terrier is eagerly watching the bird, apparently quite convinced that the young ladies design it for his especial gratification. In the Exhibition are many works which, though small, possess considerable merit—gems that have been executed with great care and genius.

Our space will allow us merely to indicate even the more prominent groups. The illustration of the Great Central Hall will give a better idea of the appearance of some of the sculptures than could any words of ours. Besides these, we may mention the "First Born," by Frances McDonnell, a deaf and dumb artist; J. Lawlor, of London, who has four elegant objects; Mr. Noble, whose statues of "Sir Robert," and the "Duke," are very admirable; Christopher Moore, who has no fewer than seventeen statues and busts; Mr. Papworth, Mr. Williamson, of Belfast; E. C. Physick, of London; Lord Cloncurry, Sir Henry Bruce, and many others; and, in addito these, there are a variety of articles in bronze, contributed by Messrs. Elkington, Mason and Co., the patentees of the electrotype process; and numerous groups and single figures from France, Belgium, and Germany.

THE LESSON INTERRUPTED. A PORTRAIT GROUP IN PLASTER, BY R. BARTER, DUBLIN.

CHRISTOPHER GLUCK, THE MUSICIAN.

It is almost universally affirmed in histories and biographies that the future greatness of celebrated men has been predicted before their talents were fully developed. The authenticity of some of these prophecies may be questioned, but, doubtless, in many cases they have originated in the manifestions of innate, though untutored genius, which some acute observer would discover predominating over the levity of youth. Our engraving represents a scene in the life of Gluck, the celebrated musical composer, in which a monk is predicting to him his future fame.

THE FUTURE SUCCESS OF GLUCK PREDICTED BY A MONK.

Christopher Gluck, generally known under the name of Le Chevalier Gluck, was born in the Palatinate, in the year 1714. His father dying when he was still very young, his education was totally neglected; but he had an instinctive love for music, and travelled about from town to town supporting himself by his talents, until he reached Vienna, where a nobleman, becoming aware of his great genius, patronised him, and took him into Italy, where he received lessons from San Marini. He made such rapid progress in his art, that some dramas which he composed being very highly thought of, he was recommended to Lord Middlesex, as composer to our lyric theatre of the Haymarket.

Soon after this he returned to Italy, where he united with the Italian poet, Culsabigi, in decrying the cynic style of both the music and poetry of the Italian Opera. Culsabigi wrote his "Orfeo" in a different style, which, in the year 1764, Gluck set to music, attempting a new species of dramatic composition, which met with great success. This celebrated opera was successively performed in Parma, Paris, Bologna, Naples, and, in the year 1770, in London. In 1769, Culsabigi and Gluck together produced the opera of "Alceste," and two years later that of "Paride ed Helena," at Vienna, where they received much applause.

Gluck, thinking the French language peculiarly adapted to dramatic composition, set Racine's "Iphigenie" to music; after which he went to Paris, where he caused quite a revolution in the musical world. His operas of "Orphie" and "Iphigenie" were consecutively performed, and enthusiastically received by the Parisians. The latter, being taken from their favourite author, Racine, and set in the style of their favourite composers, Lulli and Ramcan, was peculiarly successful. So much is he the national musician of France, that, since the days of Ramcan, no dramatic composer has excited so much enthusiasm. It has been said in the *Journal de Paris*, that each of his pieces had supported two or three hundred representations. From Paris, Gluck returned to Vienna, where he died, after a lingering illness, in the year 1787, having attained the age of seventy-three.

THE ERDERMÄNNE, OR EARTHMEN OF SOUTH AFRICA.

The Great Exhibition of 1851 made its visitors acquainted with a larger number of strange people, and a greater variety of curious facts, than could have been calculated upon by the most sanguine searchers after novelty. During that eventful year, thousands were brought face to face with the inhabitants of nearly all the civilised countries in the world. Few, however, of the inhabitants of the uncivilised parts of the earth were represented at that great gathering of the nations.

But if the year 1851 was distinguished by the meeting together of the natives of continental Europe, teeming Asia, and rising America, 1853 is remarkable for the visits of various members of those families of men with whom we have hitherto cultivated but slight acquaintance. A man, now-a-days, need not encounter the perils of the sea and the dangers of the land to make himself acquainted with the varieties of the human race, for there are at the present moment exhibiting in London a party of Zulu Kafirs,—those apparently unconquerable enemies of the Cape colonists,—consisting of eleven men, a woman, and a child, who go through their wild dances and fantastic customs with a fervour and energy quite dramatic; a company of Bosjesman from the country beyond Port Natal; two Australian Aborigines; and, lastly, a pair of interesting children, the representatives of a singular tribe,—the most singular, probably, in the world,—from the neighbourhood of the Orange River, in South Africa. These latter, a girl and boy, of the respective ages of sixteen and fourteen, belong to an almost extinct tribe of savages, called the Earthmen, who inhabit a range of country to the north of the Drakenburgh mountains. They are the first of their race who have ever been seen in this country; and we have recently paid them a visit at their temporary residence in Regent-street.

We were prepared to find them uncouth, ugly little savages, but, to our pleasure, we soon ascertained that they were both interesting and intelligent. The tribe to which they belong were called *Erdermänne*, or Earthmen, by the first Dutch settlers in Southern Africa, from the fact that they build no houses, but burrow in the ground like moles.

The Earthmen are regarded as the last link in the human chain (the penultimate being the Bosjesman). They are distinguished, amongst other peculiarities, by their diminutive size, the tallest among them seldom exceeding four feet in height.

We were greatly delighted to find that the little people to whom we were introduced on this occasion have wonderfully profited by their introduction to civilized society. Both *Flora*, the girl, and *Martinus*, the boy, the former fourteen, the latter sixteen years of age, are well formed, agile, and graceful; and they dance, sing, and play about the room with the most perfect freedom and sociality imaginable. They are about 39½ inches high, with skins of a bright bronze hue, intelligent features, and limbs as round and straight and active, as those of any well-bred English children. There is a peculiarity in the countenance of the Earthmen which somewhat mars its beauty; the nose seems to be entirely deficient of a prominent cartilage, and the nostrils are rather largely developed. Their hair, too, instead of being harsh and straight, like that of the Kafir, is of a soft and silken texture and grows in detached spiral tufts, leaving the scalp quite bare in the interstices. Their lips are soft and pulpy, with the mouth rather large, and the chin round and finely formed, their teeth white and regular, their ears small and delicate, and their heads circular and anatomically well-shapen—the phrenological organs of benevolence and acquisitiveness being fully developed. Altogether, the expression of their countenances is mild and pleasing.

The circumstances under which they were brought to this country are thus stated:—The agent of a mercantile house at Natal having occasion to travel over the Drakenburgh mountains for the purpose of trading with the Dutch boors and Kafirs for ivory, &c., encountered a tribe of Erdermänne. Among these he was especially interested with the singular intelligence of this boy and girl; and, ascertaining that their parents had been murdered by the Kafirs—between whom and the Earthmen there appears to exist an intolerable feud—he purchased them, and took them with him to Pietermaritzburgh. Observing their gentleness, docility, and aptness for instruction, he resolved to send them to England to be educated; and, confiding them to the care of Captain Wetherall, of the brig Hannah, they arrived in this country in 1851. They were consigned to the care of Mr. George, of Croydon, who determined to educate them, in the hope that they might become ultimately useful as agents of civilization among their benighted countrymen.

On their first arrival they exhibited the utmost fear and timidity, crouching down in the corners of rooms, and leading a solitary and, apparently, miserable existence. But Mr. George, observing their unsophisticated and simple natures, did not despair of ultimately winning their confidence. For many months his efforts seemed quite fruitless, and the companionship of his own children appeared to exert no good influence on the minds of the little strangers. However, by gently leading them to converse with him, he overcame their timidity, and ultimately won their love. They are now quite domesticated in his family, and the object of their present exhibition is to obtain the means for their further and more complete education, so that at last they may return to their native land as missionaries to the heathen.

The little girl and boy appear to have a good ear for music, and they both play the piano and dance with about as much skill as English children of seven or eight years of age. What is singular, while acquiring the English language—which they speak with great ease, and with far less of foreign accent than is observable among the natives of the continent—they have altogether forgotten their own tongue. It is gratifying, however, to perceive, that in the short time in which they have been in England, the humanising influence of civilised society has effected so complete a change in their moral and physical appearance, that they no longer present any of the disagreeable characteristics of savage life. They still retain the costume in which they arrived, and have never yet appeared in an English dress. They never complain of the cold though they are almost naked; but the heat of a close

apartment appears occasionally to render them languid and dejected. As soon as they arrived, they were vaccinated; and, with the exception of a slight cold which the boy caught in the winter, they have hitherto enjoyed perfect health, and appear to improve daily under the gentle care and tuition of their friend and guardian. They have been examined by several eminent medical men and physiologists, and all agree that their ages are correctly stated.

Though they do not differ in any remarkable degree from the children of the Bosjesman, Bechuanas, Kafirs, and other nomadic races of the South African continent, there is no doubt that they belong, as has been stated, to a distinct, though fast disappearing, tribe. Considered as a portion of the last link in the chain of the great human family, their exhibition must be highly interesting to all observers; but, regarding them in the light of, probably, future pioneers of civilisation to their benighted countrymen, and looking to the influence of cultivated society as tending to instil into their minds the great truths and gentler feelings of Christianity, their appearance among us must be hailed as a fact of more than ordinary interest. Their countrymen have, it appears, no idea of a First Great Cause, and no notion of a spirit of love or friendship. "Of the earth, earthy," they appear to live only to gratify brutish and selfish instincts. A distinct race from the Bosjesman and Kafirs, at whose approach they earth themselves with great rapidity, like mere reptiles, they derive a scanty subsistence from such of the lower animals as are easily captured—rats, mice, locusts, the eggs of birds, and the larvæ of insects—though sometimes a little game varies their rude and filthy cuisine. The tribe is found along the entire range of the Orange River, though they carefully avoid approaching the settlements of the Boors and Kafirs, the latter of whom deem it a very sportsmanlike feat to bag an Earthman. As before stated, the tribe is very diminutive; and it is a singular fact, that the nearer we approach the poles, the darker is the complexion of the natives, and the more diminutive their stature. Indeed, it would appear that the inhabitants of the extremities of the earth are universally poor, feeble, helpless, and degraded, and subject continually to extermination and bondage on the approach of their white brethren. The pigmy tribes of the poles—the Lappes, the Hottentots, and the Earthmen—seem indeed destined to succumb to the forward march of the races placed by nature so much nearer to the sun! The Earthmen must surely be that race of men spoken of by Pomponius Mela: "Troglodytæ nullarum opum domini, strident magis quam loquntur"—The Troglodytes, who possess no intellectual faculties, and make a shrill noise rather than speak!

FLORA AND MARTINUS, CHILDREN OF THE EARTHMEN TRIBE.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER V.

"Throw away Thy rod,
Throw away Thy wrath,
O my God!
Take the gentle path,
O let wrath remove,
Love will do the deed;
For with love
Stony hearts will bleed."—*George Herbert.*

"In every word there is a magical influence, each word being the breath of the internal, moving spirit. Where is he who is proof either against words of blessing or of curse?"—*Dr. Ennemoser's "History of Magic."*

"TELL them I can sée NO ONE, that I am ill—NO ONE! Thank the gentlemen for their kindness—but see them I CANNOT!" spoke Leonard, the next moment, through his locked door to the servant-girl outside.

"But it is not the gentlemen, sir, as comes generally; but somebody, sir, as wants very particular to speak with you—very particular indeed, they says; and says, sir, I must give this here card. If you was well enough to read the card, they says you'd maybe see 'em. I'll shove the card under the crack of the door, sir, they is so very pressin'." And the card duly appeared beneath the door.

With a mechanical listlessness belonging to a soul's musing, Leonard unconsciously bent down and picked up the card, and mechanically he read the well-known name—

"Mr. Andrew Gaywood."

As a drowning man clings, it is said, to a straw, so in a great misery does the sinking soul snatch madly at the faintest ray of comfort held forth towards it. Andrew Gaywood was the sole loving heart of that hard Stamboyse; the name foretold only love and sympathy. Leonard opened the door. There, close upon the threshold, stood—not the poor deformed, mild clerk of Michael Stamboyse's office—but a tall, mild woman!

"Who is it dare pry upon my misery?" exclaimed Leonard, with a harsh, grating voice, and with the blood rushing into his haggard face. The servant-girl glided away down the stairs to lean over the banisters, duster in hand, and listen. But the tall, mild woman, whose gentle eyes filled with sudden tears, stood yet more erect, and calmly holding forth her hands, seized those of Leonard. "Leonard," spoke a voice deep and mild as the eyes; "Mr. Leonard, I know your bitter misery, therefore am I come to you. I am Andrew Gaywood's sister; no human heart must be left, in this great London, friendless, desolate; human sympathy and aid are God's angels upon earth: long have we sought to obtain a clue to you—my brother in Nottingham, I here. Your letter to Mrs. Mordant gave that clue so long required. Mr. Ellis Stamboyse was little aware of the importance of his information when he commanded the intelligence which he had received from you to Andrew." As Lucretia Gaywood continued to speak with an earnestness of love and sorrow indiscribable permeating her every word—the anger died out of poor Leonard's heart. He had again entered his room, and had sunk his head upon the table. Lucretia drew near him, laid, for a moment, her cool hand upon his fevered brow; and as she stood, calm and yet filled with a deep compassion for him—strength, refreshment as from the presence of an angel, seemed to go forth from her, and raise up his fainting spirit. Sunshine fell in through the window, which Leonard, in his fevered panting for any external alleviation of his misery, had flung wide open. It brightened and brightened, filling with almost summer's gleams and spring's mildness the desolate room.

"We believed that you would wish at all events to see your poor mother," said the compassionate tender voice; "and we knew that the life of an art-student was hard and bare of means, therefore if you will permit Andrew the favour of begging you to accept a few pounds of ready money from him—he has received so many and so great favours for these years from your home, and he has such earnest respect and affection for yourself, that you cannot pain him by a refusal. It is here," she pursued, laying a small purse upon the table; "and if there is the slightest thing in which I could aid your immediate departure, believe me it would be a relief to my heart; for your affliction has long been a vast anxiety to us. Were alone yours the sufferings of a stranger I should be earnest in my offers of sympathy; but with *you* I am still more earnest, for you are no stranger to me; and as the son of Augustus Mordant, you have a claim upon all reverers of beautiful poetry.

Leonard accepted this gracefully proffered aid with that warm acknowledgment of a generous sympathy, which is its truest reward.

The following evening Leonard started by coach for Nottingham, Lucretia having in numerous ways, which alone can be divined by any affectionate woman's heart, rendered the preparations for his journey painless as possible to poor Leonard. She had also written, begging her brother to meet Leonard at the coach-office; which he did. And, though but little more than a tight pressure of their hands passed between the two, and but brief words were spoken, Lucretia's thought had produced its good fruit.

Mrs. Ellis Stamboyse and her sister, and good, bustling Mrs. Strudwicke were marvelously busy with the heaping up of rich bridecake in a silver basket, with gossip, and with preparation of the drawing-rooms for the reception of wedding visitors, during the hour that Leonard, with hurried footsteps but lagging heart, hastened out of the town in the direction of the asylum. The sunshine gleamed upon its many windows, as he neared the house of woe. A clear blue sky circled over it, and a flight of pigeons, with wings gleaming as the wings of angels, soared up in whirling flights above its red prison-roofs. Leonard's eyes noticed every thing, every grass-blade tipped with rime, which nodded along his pathway; every fleecy pile of cloud which rolled through the azure heaven. And now he was waiting in a small sitting-room, where the patients received their friends. With the same dull, mechanical perception, Leonard here noticed the cards stuck in the frame of a ground-plan of the establishment hung above the mantelpiece, and also he noticed that the fire-irons were chained to the stove, and that the window was very high and closed in with bars.

And then the door opened, and mechanically turning round, he saw, whilst a great trembling seized his soul—that his mother entered. Except that she was so very thin, and a certain mist hung within her restless eyes, he felt no change in her as she approached him—for she looked but little older, and had always, in years past, a certain wildness in her dress. But it was as a stranger that she addressed her son. This cut poor Leonard, as with a sharp knife, to the very bone. He, it was he, whose features were convulsed with emotion.

"You have done me the honour, sir, of calling upon me—pray be seated;" said the poor mother waving her hand with a strange grace towards a chair. "Visitors are unfrequent now in the world—but I do not wonder that they should not come HERE to see me, though I am the widow, sir, of Augustus Mordant—the poet's widow—for there are sad and terrible things done here. Had my son lived, sir; but, we won't talk about THAT—he was murdered—MURDERED—

MURDERED!" and hoarsely muttering to herself the terrible word, she sunk upon the floor oblivious to all but her anguish, and her frame quivered, as if she were seized with ague.

"Mother, dear—he is here!" said the stifled voice of Leonard, and he pressed his white lips to her poor thin hands; "I am your Leonard, only look at me, mother." But springing up like a tigress, the heart-broken mother seized her son fiercely by the shoulders, and with flashing eyes uttered a wild yell—"*You*—YOU MY son! YOU are his murderer!" The door flew open—a tall man seized upon Mrs. Mordant, and holding her poor hands tightly in his grasp, motioned with his head for Leonard to retire.

Leonard waited no longer; the last drop of misery was added to his cup, and in truth it flowed over. Pacing up and down the hilly fields around the asylum might Leonard have been seen during the whole of that day—he seemed unable to tear himself away from this place of woe—such a mighty pity for that suffering soul, swallowed his own misery. Doubts of all that is holiest at times assailed him—bitterest scorn of his own impotence stung him—all anchorage seemed lost for his soul. To have believed in utter annihilation after death, and to have sunk into a dull oblivion, was all that he desired. The beauty, the perfection, the cheerfulness of nature seemed a cruel mockery of man. No oasis showed itself in the desert of his life—yet, as in the house of death, the mourners rise up and lie down, partake of meat and drink, and take heed of the morrow—so did the body of Leonard mechanically pursue its course, whilst the soul lay dead. Back to London went the body, re-entered the dingy lodgings, and recommenced a dull, soulless, existence—ambition had vanished—hope—love; he never asked himself whether they would any day return.

Leonard sternly refused all intercourse with his acquaintance, and changed his lodging, desiring to be lost in the great vortex of London. Much astonishment did his sudden disappearance after his triumph occasion among the academy students and the professors, and especially in good Lambelli's heart. But in London the greatest wonder only remains a wonder its proverbial length of time—nine days. "He was always a queer fellow, was Hale, he'll be turning up again some of these days, never fear," was the consoling reference to the wonderments of his acquaintance.

Lucretia Gaywood, however, could not so easily be silenced. Leonard, on his return, was too unobservant of external things to notice an air of freshness and of order which reigned in his room,—that all his book had been dusted and arranged; that all his brushes had been beautifully washed, and his paint-box put into nicest order; that sketches, tumbling about, had been cleaned and laid together,—that a fresh cloth was laid upon his table, of a beautiful dull crimson; and that various rents and rags had disappeared from the hearth-rug. Neither did he notice that a new black tin coffee-pot stood on the accustomed spot of a leaky old one, which, for several years, had been a comforting friend of his. Alas! grief, which so often renders the kindest of hearts unkind, had rendered him blind to the ministration of two bright angels, who, during the days of his absence, had worked with busy fingers and sorrowing hearts for him—the angels Lucretia and her little sister Mary.

A great crisis had arrived in the life of Leonard,—he was suddenly become the grave and fully developed man, treading the path of earthly sorrow which our Blessed Lord deigned to tread,—our poor hero had become in due time "a man of sorrows and acquainted with grief." Gradually through that dull time loomed forth the truth of many things—and with truth a certain hope. "Knowing what pain is, having involuntarily caused a pain unutterable, if there be a God of love and mercy, may that God avert from me the bitter curse of further increase of pain—may my life become not a curse—but each day, each hour exist innoxious, if not blessed, through the power of creating joy," thought unceasingly the soul of Leonard. Unceasing ponderings upon these things absorbed his spirit; the seeds of the peculiar nursery of his own and his parents miserable fate, he traced down to their earliest source, seeking with prayers and an agony, as of "bloody sweat," to disentangle the mournful skein of their lives.

The only remaining motive of his soul, during those long months was a stern resolve to avoid causing a pain or injustice towards any human being, and this alone impelled Leonard to exertion. In order, honestly to pay for the slender requirements of his life, he unceasing made the description of designs for the publisher whom we have already mentioned. To begin any great work of imagination seemed to him a mockery—the glory of his earlier aspirations was gone, and he remembered his fervour of but a few months back with a sort of pity. How long this frame of mind might have continued, had Leonard been left undisturbed in this strange and brooding life, we know not. But the seeds of earnestness having been sown by the angel of Pain in his soul, now came the angel o Pity to call them into life by her warm smiles, and by her tears of sympathy.

Leonard was drawing, as usual, one April afternoon, with a dull monotony of hand, and with his thoughts far away, when suddenly once again the angelic vision stood in his room.

"You must pardon our intrusion," said Lucretia's mild voice, "but we have been very anxious about you, and Andrew has insisted upon our disturbing you. We have brought you a little bit of nature, Mr. Hale, to tempt you to come out with us and see what pleasant things are going on in the world, which we are all of us apt to forget. Where is it, dear Mary?" And Mary, a girl of fifteen, with the most modest of deep hazel eyes, brought up from beneath the soft folds of her cloak a rustic basket brimful of clusters of the freshest primroses, and bright gleaming arum leaves, and dark-green dog's merny, and ivy trails, with bushes of violets here and there peeping out of moss.

"How very beautiful! Miss Gaywood," exclaimed Leonard, with such an expression of pleasure in his voice and in his whole countenance as had not been there for many a long month; "and what a kind, gentle thought of yours—beautiful as the flowers themselves!"

"Oh, it is not *our* thought," said Mary, speaking for the first time, and a bright colour spreading over her face, till she looked almost beautiful; "it was Andrew's thought, yesterday, when we were all together down in those beautiful Esher woods—how beautiful they are!—and the birds singing like mad, and Lucretia repeating her favourite lines of Mordant's about the summer grass, we all at once exclaimed how much we wished indeed that you could have been with us,—for Andrew always connects you with thoughts of flowers, and moss, and ivy; and he said, 'Take him some flowers, and try to persuade him to come here—to these Esher woods I mean.' And so, this morning, after we had been with Andrew to the coach, and bade him good-by, we came over here."

As the bright young girl spoke, the dull mist over Leonard's soul was withdrawn for a space, and rays of celestial light fell with a warmth upon him. But he remained quite silent, and there was almost an unresponsively cold look on his face.

"We were so sanguine," resumed Lucretia, "as to believe that, together with these flowers, our words might avail some little with you, and that you might be prevailed upon to take some change. I know myself so well the deadening effect of these London rooms, and especially the reluctance that grows upon one living alone, to break through the charmed circle of solitude, the influence of which grows upon one with the strength of an enchanter's spell. I wonder whether you would ever so far break this spell, as to come out to us at Kentish-town; we've no Esher woods there, nor anything even to be properly called a garden—not what we country folks, Mr. Hale, should call a garden—but we have quiet, and a few trees, and beautiful sunsets from our sitting-room window, and we are near to really lovely strolls at Highgate; and, above all, we have a truly hearty welcome for you? Will you believe this, and will you come and test it?" And such truth and purity lay in every accent of the sisters' voices, and in their kind countenances that Leonard, spite of himself, said, "Yes, I will, indeed!"

(*To be continued.*)

THE PRADO.

The Prado is the great promenade of Madrid. In Spanish comedies and in Spanish romances it is the chief scene of the story—the most fashionable quarter, the busiest and bravest locality, where Spanish grandees swagger, and Spanish beauties smile. It is in the interior of the city, and begins at the convent of Atocha, a staid, sober-looking building, very dim and dreary, and continues at a right angle to the gate of the Alcala. It is more than 2,120 yards in length. The spot has always attained a high celebrity, higher than Venetian Rialto or Parisian Boulevard, or our own Rotten Row, and has been tastefully adorned from time to time by the reigning monarchs of Spain. Charles III. planted it with trees, and decorated it with fountains and marble statues. Once it was a great place for duels, and many a don has fleshed his sword in that honourable quarter; but its near proximity to the court put an end to this sort of gallantry, and now, in the evening, the place is thronged with all the nobility, beauty and fashion of Madrid. Colour upon colour, crowd upon crowd, in one grand moving panorama, which no tongue can tell, no language can describe.

The Prado is divided into two grand avenues, both overshadowed by trees, and both ornamented and refreshed by fountains. One is appropriated to vehicles, the other to foot-passengers. One of the most beautiful among the ountains is represented in our engraving. The art of the sculptor has been effectively exerted, and the graceful outline of the whole is well adapted to the place. The light falls brightly on the water as it is cast upwards in the air, and falls again in a shower of spray. The fountain is situated in close neighbourhood to the gate of the Alcala, in a spot known as the Saloon, surrounded by some of the finest buildings and fairest gardens in all Madrid. And as it is one of the fairest, so it is one of the most thronged in the city. There the concourse is prodigious. The equipages are very brilliant, chiefly drawn by black mules ornamented with bells, whose ceaseless tinkling is by no means disagreeable. The ladies, in their mantillas of black and white, do not descend from their carriages, and as vehicle after vehicle rolls on its way, the scene is extremely animating. The water-sellers busily ply their trade, and their musical cry is incessantly heard. The scene which the Prado presents is unrivalled in the world. The stately trees, the well-cultivated gardens, the architectural beauty of the buildings, the marble statues, the graceful fountains, the gay groups, the tinkling bells, the murmur of light laughter, the tramp of feet, and the sound of the falling waters—all unite to present us with a picture such as Spain alone can give.

FOUNTAIN ON THE PRADO, MADRID.

MAGAZINE OF ART.

THE DISCOVERY OF THE PACIFIC OCEAN BY VASCO NUNEZ DE BALBOA.

The adventures of the early explorers of the American continent furnished to the wonder-lovers of the sixteenth century the same rich delights which the knights and dames of an earlier age found in the exploits of Charlemagne and his peers, of Roland at Roncesvalles, and of Amadis de Gaul. Even the old black letter men who pored in solitude over the accounts of the Argonautic expedition, or the adventurous rambles of Perseus, and believed them all, because it was impossible to prove them false, began to doubt as they heard of the dazzling conquests of the Spaniards, whether the classic age of marvel, was yet passed. There certainly never was an age in which rude physical courage and energy gave more striking manifestations of their power, and we have now only to lament that the sense of justice and humanity was not at that time so fully developed as to make them subservient to the wants and happiness of mankind, instead of pandering to lust and covetousness.

In the character of Columbus himself, and in all his acts, there is everything to admire. There was in him that devout simplicity, that humble aspiration, that chastened and refined enthusiasm which animated the artists of his day, and made art not so much a profession as a religious faith. He followed out his convictions with an earnestness and single-mindedness, which were in themselves the best guarantees of success, and sought his reward, not so much in personal aggrandisement, as in the advance of science and the diffusion of knowledge. It might have been said of him with no less truth than of our own great hero, that no woman ever feared to mention his name with honour, and no priest to couple it with prayer.

The men who followed in his footsteps were of a widely different stamp. They speedily took from the stories of new world exploration all the show of noble daring and disinterestedness which gave to the earlier voyages an air of epic grandeur, and changed an iliad of sailors into a series of marauding expeditions, full of romance, valour, and audacity to be sure, but tainted by the constant overflow of all the blackest passions of the human heart.

A Spanish colony existed in 1510 at St. Domingo, under the government of Admiral Diego Columbus, and from it bands of adventurers issued at various times, for the purpose of exploring the interior of the southern continent, and in the hope of meeting with rich booty. One of the most daring, most romantic, and most unfortunate, was Alonzo de Ojeda, a model of fiery courage, untempered by one grain of prudence or caution. During one of his visits to St. Domingo, when full of hope and enthusiasm, but sorely pressed for money, he so dazzled the imagination of a rich lawyer, whom he there met, named Martin Fernandez de Enciso, by his glowing pictures of the riches and fertility of the forests of the continent, that he induced him to invest all his riches in fitting out an expedition, with a part of which Ojeda started directly himself, leaving Enciso to follow with the remainder. Ojeda passed through wondrous perils and hair breadth escapes, to find himself, at the close of his strange eventful history, a ruined and broken-hearted man. It is not our purpose, however, to follow him through his romantic career. Our attention must for the present be confined to Enciso and his party, who prepared to follow his confederate with supplies and reinforcements. When he was on the eve of sailing, all the gentlemen of "doubtful reputation," debtors, swindlers, and other unfortunates, with whom St. Domingo already abounded, became most anxious to accompany him, finding, naturally enough, the vicinity of their creditors highly disagreeable. The latter, however, getting wind of their intention, placed a close watch around the coast and harbour, and obtained an armed vessel from the admiral to escort Enciso's ship out of the port. The would-be emigrants were thus grievously disappointed, but one among them was determined not to be baffled, and we all know that where there is a will there is a way. He concealed himself in a cask, which he caused to be carried on board, as if containing provisions for the voyage, and when the vessel was fairly at sea, he emerged from his hiding-place, and presented himself to the astonished gaze of the commander on deck. The latter was at first in a great rage, at the deception which had been practised upon him, fumed, shouted, and swore roundly that he would place the delinquent on shore on the first inhabited island they met with. The intruder, however, was a fine tall muscular fellow, bronzed by the sun, and well inured to fatigue, and there was a look of quiet daring in his eye, which made him, after all, no very unwelcome visitant to the leader of an expedition directing its course to unknown and barbarous shores.

The name of this new recruit was Vasco Nunez de Balboa. He was a native of Xeres de los Caballeros, and of poor but noble family. He had been brought up, according to the custom of the time, in the service of a nobleman named Don Pedro Puerto Carrero, and had enlisted amongst the adventurers who accompanied Rodrigo de Bastides in his expedition to America. Peter Martyr, in his Latin Decades, speaks of him as an "egregius degladiator," a skilful swordsman, or, as some say, an adroit fencing-master; and gives him the character of a soldier of fortune, of loose, prodigal habits. He had for a short time taken up his abode at Hispaniola, and had commenced to cultivate a small farm at Salvaterra; but he soon found himself involved in debt, and at last made his escape in the way we have described.

Enciso had expected to find Ojeda comfortably settled in a strong fort called San Sebastian, surrounded by treasure and lordly abundance; but alas! instead of this, he found but a howling wilderness, the fort a heap of blackened ruins, and its garrison gone he knew not whither. The Indians were timid or hostile, and, to add to his misfortunes, his vessel was wrecked on the coast, and the crew escaped with difficulty. His supplies were soon exhausted, but where to seek assistance he knew not. In this dilemma, Vasco Nunez, the contraband passenger, came to his aid, by informing him that he had formerly sailed along the coast, and knew an Indian village on the banks of the river called Darien, where they would find plenty of everything they needed, gold and food. They followed his guidance, attacked the village successfully, and found an immense booty. The soldiers were delighted; their hardships were over. Enciso here fixed his head-quarters, assuming the title of alcalde mayor, and Vasco Nunez became a general favourite. But the first edict of the alcalde forbidding all trafficking with the natives for gold on private account, upon pain of death, produced general dissatisfaction. It was in accordance with the king's command, to be sure; but men who had risked their all for gold were not to be baulked in the acquisition of it by any squeamish loyalty. They murmured openly, and Vasco Nunez encouraged them in their murmurings; and at last a powerful party, of which he was the head, denied Enciso's right to the position he had assumed, and at last formally deposed him from his authority. In his place, Vasco Nunez and one Zemudio were elected joint alcaldes, and a cavalier named Valdivia, regidor. Nunez was now in his element, in

the prime of life, tall, well-formed, and vigorous, and with an open prepossessing countenance, and in possession of an authority all but supreme. He determined to carry matters to the extreme against Enciso, and therefore summoned him before him to answer the charge of usurping the powers of alcalde mayor. As might have been expected, he was found guilty, thrown into prison, and his property confiscated. By the intercessions of his friends he was soon liberated, and permitted to return to Spain. As Nunez knew well, however, that he would plead his cause ably before the king, he sent one of his own friends to argue his own cause against him.

Vasco Nunez now (1511) strained every nerve to distinguish himself in his new government, and thus remove any unfavourable impression regarding his proceedings which the home government might be disposed to entertain. His first object was to collect as large a quantity of gold as possible, and for this purpose he instantly sent out exploring parties into the neighbourhood. One of these, under the command of the famous Pizarro, then a subordinate in the army, met with a severe reverse in a conflict with the Indians. Nunez, at last, set out himself at the head of 120 men, and attacked a place named Coyba, surprised the cacique, made him prisoner, and plundered his village. The unfortunate chief finding himself a captive in the hands of his enemies, implored mercy, offered to supply the Spanish troops with provisions, and to reveal the riches of the land, and as a pledge of his good faith gave his daughter in marriage to Nunez. The prayers and tears of the cacique might doubtless have knocked in vain at the door of the conqueror's stern heart, but the beauty of the Indian maiden quite vanquished him. He released the prisoners, entered into an offensive alliance with her father, and on receiving a supply of provisions started on his march for the chastisement of some of his father-in-law's enemies. From some of them whom he awed into subjection, and from whom he extorted vast sums of gold, he first heard of a great ocean which lay beyond the mountains to the westward. He continued his explorations for some time with varied success, suffering terrible hardships from cold, hunger, fatigue, and watching; nightly harassed by vigilant enemies, and daily worn out by toilsome marches through trackless forests, and across precipitous and dreary hills. In the midst of such difficulties any but "men of iron," who carried with them nothing of civilisation but its ingenuity in destruction, and whose sole hopes lay in their valour, must have sunk down in despair. But such spirits as Vasco Nunez had at command were daunted by no perils, and dismayed by no difficulties, and he was advancing from conquest to conquest, when news arrived from Spain, that for the moment paralysed and unnerved him, and seemed to blast every one of his hopes for ever. One of his private friends informed him by letter that Enciso had lodged his complaint before the king, and after a long trial had obtained the condemnation and deposition of Nunez, who was at the same time sentenced to pay costs and damages, and that he would in all probability be shortly summoned to Madrid to answer other criminal charges in person. This was a heavy blow, and Nunez's ancient firmness seemed to have deserted him. But it was only for the moment. He had as yet received no official intimation of the result of the trial, and until that arrived, he was still his own master, and might still hope for extrication from his perils. His only safety lay in the achievement of some striking exploit which should atone for all his past offences, and restore him to the king's favour. Now or never! The choice lay between glory and a prison, and there was little time for deliberation. A thousand men, it is true, would have been necessary for such an expedition as he contemplated, but where were they? Vasco Nunez was not the man to be baulked by unpropitious circumstances; so when a thousand men were not to be had, he determined that one-fifth of that number should do their work. Of the hardy and reckless crew that surrounded him, he chose 150 of the most daring, and devoted, to whom danger, mystery, unknown and frightful hazards, were sweet as women's kisses, and arming them with swords, targets, crossbows, and harquebusses, informed them that he was to put their and his fortunes on the cast, and set forward in search of the great unknown ocean beyond the hills, accompanied by a large number of bloodhounds, long trained in Indian warfare.

On the 6th of September, 1513, he took solemn leave of the main body of his forces, and after a prayer, suitable to the occasion, struck into the wilderness with his little band of explorers. For ten days they pursued their way amidst almost incredible hardships and fatigues, suffering intensely from hunger, torn by briars in the thickets, half drowned in the swamps, and daily exposed to the fierce attacks of the Indians, who hung on the march in great numbers, and every hour threatened to overwhelm them. Often the Spaniards had to fight their way for miles in the face of the most fearful odds, but their unconquerable valour, their fire-arms and bloodhounds, generally brought them unscathed through every encounter. At last they arrived, laden with booty, at the foot of the great mountain range, beyond which they were told lay the object of their search, and after resting here for one night, Vasco Nunez prepared to ascend in the morning early, to get the first glimpse of his new discovery. But of all his followers sixty-seven only were strong enough to climb the mountain to gaze upon the object of their toils and struggles.

When the day dawned, they set forth from the Indian village, in which they had passed the night, and by ten o'clock, by a toilsome ascent, through thick forests, they emerged upon the bare and rugged region, which lay below the summit. The Indian guides here pointed to a craggy eminence, from which the first view of the ocean might be obtained. Nunez commanded his men to halt, and now proceeded alone. With a throbbing heart he ascended the bare mountain top. The crisis of his fate was come, and he trembled with anxiety. At last he stood upon the summit and gazed eagerly westward. Below him lay a vast chaos of rock and wood, and pampa, and roaring torrent, and, oh, joy unutterable! away in the distance, the long sought ocean danced and glittered in the morning sun.

"A les, O desiderabilis,
Quem petiebamus in tenebris!"

Vasco Nunez fell on his knees on the spot, and poured forth his heart in thanksgiving to God, who had so abundantly blessed him. Here was the great Indian Sea, which washed the isles of spices and of gems, where the golden dreams of the old world poets were living, palpable realities, and Vasco Nunez was the happy discoverer. His followers soon joined him, swore to follow him to death, and having chanted a *Te Deum* on the spot, they made preparations for descending to the sea coast. The way was long and difficult, and the tribes through whose territory they had to pass were fierce and hostile, and before he reached the end of the journey, Nunez was forced to leave behind most of his men to take rest after their fatigues, and advanced himself at the head of a small band of the bravest and best armed, accompanied by the cacique who reigned over the adjoining district, and some of his chosen warriors. The thick forests which covered the mountains descended to the very margin of the sea, surrounding and overshadowing the wide and beautiful bays which penetrated far into the land. The whole coast, as far as the eye could reach, was perfectly wild, the sea without a sail, and both seemed never to have been under the dominion of civilized man. They had arrived on the borders of one of those vast bays to which he gave the name of St. Michael, the saint on whose day it was discovered. The tide was out, and so gradual was the incline of the strand, that the water was full half a league distant. Nunez seated himself under the shade of a tree until it should come in. At last it came dashing on to his very feet with great impetuosity. He started up, seized a banner on which were printed a Virgin and child, and under them the arms of Castile and Leon. Then drawing his sword he advanced into the sea until the water was up to his knees, and waving the standard, exclaimed with a loud voice,—

"Long live the high and mighty monarchs, Don Ferdi-

nand and Donna Juanna, sovereigns of Castile, of Leon, and of Arragon, in whose name, and for the royal crown of Castile, I take real, and corporal, and actual possession of these seas, and lands, and coasts, and ports, and islands of the south, and all thereunto annexed, and of the kingdoms and provinces which do or may appertain to them, in whatever manner, and by whatever right or title, ancient or modern, in times past, present, or to come, without any contradiction; and if other prince or captain, christian or infidel, or of any law, sect, or condition whatsoever, shall pretend any right to these islands, or seas, I am ready and prepared to maintain and defend them in the name of the Castilian sovereigns, present and future, whose is the empire and dominion over these Indian seas, islands, and terra firma, northern and southern, with all their seas, both at the arctic and antarctic poles, on either side of the equinoctial line, whether within or without the tropics of cancer and capricorn, both now and in all times, as long as the world endures, and until the final day of judgment of all mankind!" His followers hailed this pompous declaration with loud acclamations, and declared themselves ready to defend his claims against all comers, and advancing to the brink, having tasted the water, and found it to be indeed salt, they returned thanks to God once more. When these ceremonies were concluded Vasco Nunez drew his dagger, and cut three crosses on trees in the neighbourhood, in honour of the Three Persons of the Trinity, and his example was followed by many of his soldiers.

The after history of Nunez was melancholy in the extreme. After going through unparalleled hardships and dangers in exploring the coast of the Pacific, he once more crossed the isthmus, and returned to Darien laden with treasure. During his absence a new governor had arrived, who was animated by the bitterest enmity against him, and although the magnitude of his discoveries had restored him to favour at Madrid, his foes in the colony were numerous and determined. A trumped up charged of treason was brought against him, and he was arrested in the midst of his glory and prosperity; tried hastily and condemned, and executed in the square of Acla, amidst the tears and lamentations of the soldiers and people. He died as he had lived, with undaunted courage, in the forty-second year of his age, and in the prime and vigour of his life, and Spain long mourned him as one of the bravest, the most intrepid, and most enterprising of her great captains.

HISTORY OF SUGAR.

I WAS led to investigate the history of sugar by a casual remark of the late Sir Joseph Banks, one day at breakfast. I forget now how the conversation arose, but he inquired whether I had met with any of the remains of the sugar-cane in Sicily, mentioning that it had been previously produced in the island of Crete, but the sugar manufactured in that island was more crystallised than ours, and was called, from the the place where it was boiled, sugar of Candi, otherwise sugar Candy, and it seems never to have been prepared better there than in that form.

It is certain, however, that in the year 1148 considerable quantities of the article were produced in the island of Sicily, and the Venetians traded in it; but I have met with no evidence to support the "Essai de l'Histoire du Commerce," in which the author says that the Saracens brought the sugar-cane from India to Sicily.

"The ancient Greeks and Romans," says Dr. William Douglas, "used honey only for sweetening." And Paulus Ægineta, who calls it cane-honey, says it came originally from China, by the East Indies and Arabia, into Europe. Salmasius says, however, that it had been used in Arabia 900 years before. But it is certain that sugar was only used in syrups, conserves, and such like Arabian medicinal compositions, when it was first introduced into the west of Europe; but Mr. Wotton, in his "Reflections upon Ancient and Modern Learning," says that the sugar-cane was not anciently unknown, since it grows naturally in Arabia and Indostan; but so little was the old world acquainted with its delicious juice, that "some of the ablest men," says he, "doubted whether it were a dew like manna, or the juice of the plant itself." It is, however, certain that raw sugar was used in Europe before the discovery of America.

About the year 1419, the Portuguese planted the Island of Madeira with sugar-canes from Sicily; and Giovanni Batero, in an English translation of his book, in 1606, on the "Causes of the Magnificence and Grandeur of Cities," mentions the excellence of the sugar-cane of Madeira, for which it was transported to the West Indies; and there can be no doubt that Madeira was one of the first islands of the Atlantic Ocean in which this important article was earliest manufactured.

It was about this time (1503) that the art of refining sugar was discovered by a Venetian, who is said to have realised 100,000 crowns by the invention. Our ancestors made use of it as it came in juice from the canes, but most commonly used honey in preference.

From the Brazils and the Canaries sugar-canes were brought and planted in the Island of Hispaniola, and in the same year sugar was brought from the Brazils into Europe. The commodity was then very dear, and used only on rare occasions, honey being till then the general ingredient for sweetening of meats and drinks.

When sugar was introduced into this country first is doubtful; but in 1526 it was imported from St. Lucar, in Spain, by certain merchants of Bristol, who brought the article which had been imported there from the Canary Islands.

In the year 1641 the sugar-cane was imported from the Brazils into Barbadoes, and being found to thrive, sugar-mills were established. A Colonel James Drax, who began the cultivation with about £300, declared that he would never return to England till he had made £10,000 a-year; and Colonel Thomas Modyford was still higher in his expectations.

It was from the island of Barbadoes that the slave trade began. The first planters finding such immense profits, induced the merchants at home to send ships with assorted cargoes for the product of the island, but they found it impossible to manage the cultivation of sugar by white people in so hot a climate. The example of the Portuguese gave birth to the negro slave trade, and it flourished till abolished by Act of Parliament; but in that age it was a most flourishing business, and the ports of London and Bristol had the main supply. Barbadoes, in the year 1569, attained its utmost pitch of prosperity. In a pamphlet entitled "Trade Revived," it is spoken of as "having given to many men of low degree vast fortunes, equal to noblemen; that upwards of a hundred sail of ships there yearly find employment, by carrying goods and passengers thither, and bringing thence other commodities, whereby seamen are bred and custom increased, our commodities vended, and many thousands employed therein, and in refining our sugar at home, which we formerly had from other countries."

In 1670 our sugar colonies drew the means of support from what were then our North American colonies, particularly New York, Pennsylvania, and the Jerseys; and the first time that sugar was made subject to taxation at home was in 1685. Like other merchandise, it was previously subject to a five per cent poundage.

In 1739 the importation of sugar from the West India Islands was so great, that there was a relaxation of our colonial policy towards them; and they were permitted to carry their sugar to any part south of Cape Finisterre, without being obliged to land them first in Great Britain. From this time sugar has continued to increase, and it is needless to pursue its history further; it was then a great article of trade, and, as an ingredient, the consumption has been continually increasing. Whether the cultivation has exceeded the wants of the commercial world, or that the new colonies have been found more fertile than the old, I cannot pretend to say; but at this moment the proprietors of the sugar estates are suffering at all hands, and their greatest calamity is not the emancipation of their slaves.—*From Mr. Galt's Literary Autobiography.*

MORE ABOUT THE DIGGINGS.

FOREST CREEK, HALF-WAY BETWEEN THE MIDDLE DIGGINGS AND GOLDEN POINT.

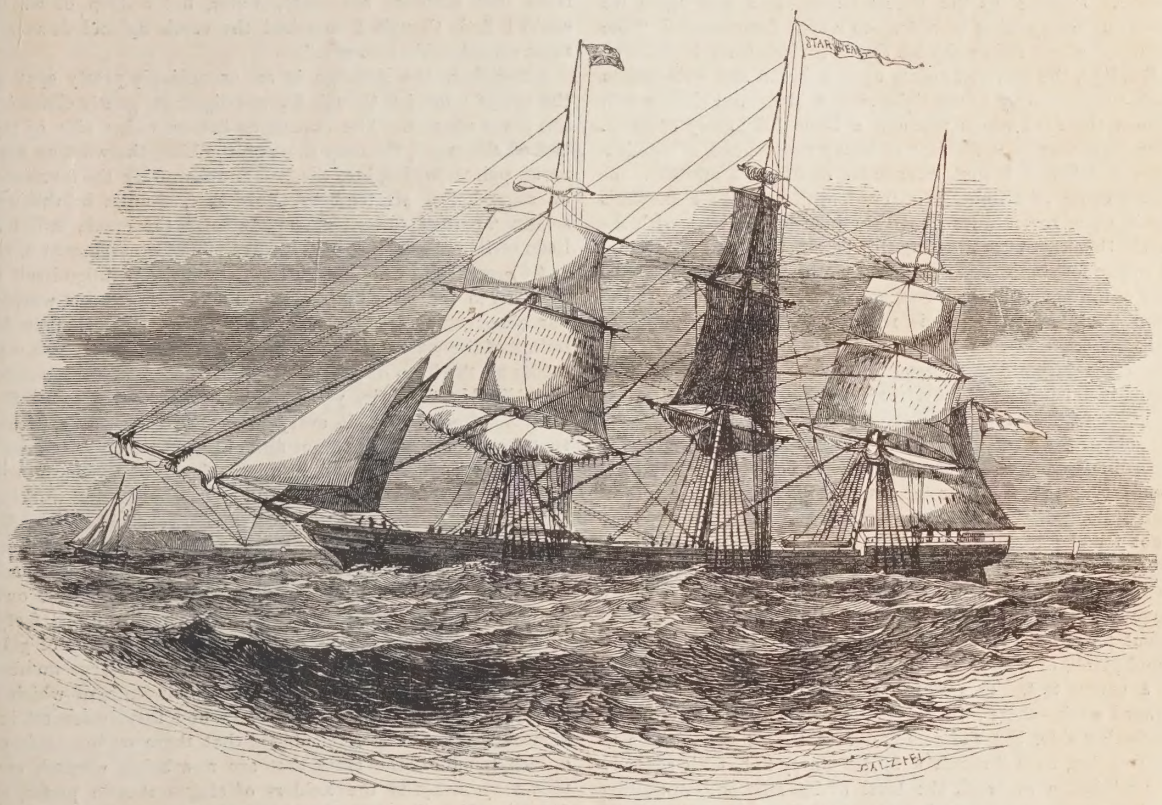
WATER HOLE IN THE FOREST CREEK DIGGINGS.

"About the 20th of last month, a prospector at the Forest Creek Diggings was fortunate enough to find a nugget of gold, weighing upwards of 40 lbs. The lucky individual immediately sold it to a speculator for £1,600, and is now on his

way to England." Some such paragraph as this is every now and then copied from the Sydney or Melbourne newspapers, and speedily makes the "round of the press." As a matter of course, it is read by tens of thousands of people, and—equally as a matter of course, it would seem—out of these tens of thousands, many hundreds of "enterprising young men" find their several ways to the ship-brokers and the docks, and thence across the great Pacific to that wonderful El Dorado in the south. And so it is always: the young and ardent find a home in any land to which fortune may chance to take them; but when they grow old, and weary of the toil of riches, they turn their faces lovingly back to the scenes of their youth, and long to rest their bones in the churchyard,

"Where the rude forefathers of the hamlet sleep."

Our readers know something about Mount Alexander, from the sketches, both pictorial and literary, which have already appeared* in this work; from the same source—the facile pen and pencil of a lucky digger—we are enabled to present



STAR OF THE EAST, BELONGING TO THE GOLDEN LINE OF AUSTRALIAN CLIPPERS.

them with a couple of views of the almost equally celebrated Forest Creek. This river has been a famous place of deposit for the uncertain gold. In the winter it is a roaring, boiling torrent; but in the summer,—the November and December of Australia—when our artist made his admirable sketches, the hot sun had dried up the waters, and the diggers had filled the abandoned "holes" with the refuse of their cradles. They were thus enabled to work and to carry on their mining operations in the dry bed of the river.

Upwards of a mile of the creek is here seen to advantage. The washers are busily engaged in the various operations of "puddling" the rich clay in tubs, of "washing in the cradles," and the ever-present "tin dish." The drying up of the creek has enabled the miners to carry on what is called "dry diggings;" which is, to excavate until they come to the "gold deposits" of dust or "nuggets." The miners work with a spade or large knife, and this operation is also called "nugget-ing." By this method of working, all the small gold is lost for want of water; but at the various dry diggings many parties have "done wonders." In this way the solid lump of gold found three months ago—October 12th, 1852—at Mount Alexander, weighing 27 lbs. 8 oz., was turned up from a hole a few feet below the surface. "Many of the digging parties have been accumulating heaps of rich earth to be washed when the rains fall, and there can be little doubt that hand-some fortunes were made from the soil which was thus stored up during the summer, for the rain has long since come down in great abundance."

Many persons, supposed to be fully competent to form an opinion, have stated that great as has been the quantity of gold brought to Melbourne and Geelong, there is a much greater quantity left in the soil. Indeed it is a well-known fact that those wily diggers have done very well who have been "fossicking," as it is termed; that is to say, going about the deserted holes and heaps of refuse, and washing the soil over again in a tin dish. "All who have any idea of gold diggings," says our Australian friend, "will allow that the soil must be rich indeed to pay in this way, but it has been very common for men to get from half an ounce to two ounces a day each."

Fears have been expressed by many that the rich deposits may fail altogether, and that then an immense number of individuals will be suddenly thrown on the labour market of Australia; but scientific men, who have visited Mount Alexander and the other diggings, fear no such result. Gold is known to exist in large quantities all along the banks of creeks and in the river flats, miles from "the mount," and some express an opinion that "Victoria" will be exporting the precious metal in abundance when California shall fail, or have become, comparatively speaking, exhausted; "in fact," exclaims our enthusiastic artist, "for hundreds of years it will pay the labouring population to seek for gold. The various diggings at Mount Alexander are already extended over a

* Magazine of Art, Vol. I. p. 349-352.

length of forty miles, and during the winter it is expected that many rich diggings will turn up in the "Gullies" in the ranges and spurs of "the mount."

But to return to our engraving, the tall straight tree on the left, in the foreground, is the "stringy bark," with which the banks of Forest Creek are principally wooded; at the foot is the "honeysuckle," a tree seldom growing to a large size. On the right, in the midst of the tents, is seen the "red gum," with its twisted and gnarled trunk and branches. This wood has been much used in the colony for furniture, picture frames, work-boxes, &c. It has a very fine grain, and is capable of receiving a high degree of polish. A little to the left we have the "white gum," easily recognised by its smooth white bark. In the distance is seen the light and graceful "she oak," with its long wiry leaves sighing in the breeze.

The second engraving is a view of a water-hole in the Forest Creek diggings. Here also much gold has been found. It should have been stated that the Forest Creek and Bendigo diggings form part of what is known as the Mount Alexander district. Passing up the Forest Creek—and here again we quote our enterprising traveller—to a spot denominated "the Springs," where the road joins the direct line from Melbourne to Bendigo, the traveller comes upon a broad and well-beaten track running away to the right over a steep and sliding hill. Thence the road winds through a beautiful grassy country, lying immediately at the foot of heavy ranges, one of which is the world-famed Mount Alexander itself, and another, the Mount Byng of Mitchell, until at length he reaches Barker's Creek, some seven miles above the junction of that with the Forest Creek. After crossing this creek, the road follows up its course for some distance, and then breaks off over the tail ends of innumerable short broken ridges, for about four miles, when the Porcupine inn is reached. It is astonishing to mark the change that has taken place in this locality. No longer the insignificant hostelrie, known only to those well versed in bush life and travel, it has now become a spot whose name, fame, and reputation have travelled as far as those of the gold of the country around. From this point the road is exceedingly hilly and broken for six or seven miles, and the scenes that the traveller witnesses with jibbing horses and irate bullock drivers would be amusing in the extreme, were it not for the torture inflicted upon the poor dumb beasts to force them to breast their way up the fearful gradients before them. At one point, in particular, a gap in a high stony range has to be crossed, by a road which presents an unbroken ascent for close upon a mile, diversified only by an occasional pinch, every one of which puts the mettle of the teams to a severe test. This range once passed, all is straight forward work—there is, of course, a corresponding descent on the farther side, but the remainder of the road, right up to the Bendigo, runs through a broad grassy flat, with scarcely an undulation to break the level of its surface, continuing until the white tents which form part of the outposts of the diggings are seen glistening through the trees. Not a quarter of a mile further on, the road enters upon the Bendigo itself, just at Black's store, at the end of Golden Point—every Diggings has its Golden Point. From Black's store, for about three miles up the creek, the great body of the tents are pitched, as within that distance the larger portion of the gold that has reached Melbourne from Bendigo has been dug out. Beyond this limit, going still up the creek, the tents become more scattered, and after a while terminate suddenly. At this point the character of the scenery becomes more rude and broken, approaching nearer to that of the Forest Creek, though still not so bold or striking as many of the spots in the latter place. Descending the creek from Black's store, we find the flat which borders it on either side gradually expanding, being in many places upwards of a mile in width, whilst the ranges become less and less elevated, less stony and more grassy, until at about a distance of six miles from Golden Point, where the last outlying tent is to be found, a scene such as is to be witnessed only in Australia meets the eye. The points of gentle undulation—they can scarcely be called hills—well grassed and lightly timbered, fall gracefully down upon the broad and open plain with which they blend, breaking the monotony that might otherwise pervade the view. The flat itself presents the very *beau ideal* of what is known to bushmen as an open forest country; the timber heavy, but the trees only lightly scattered, whilst the rough grass having been eaten off by the half-starved horses and cattle of the diggers, has allowed the young shoots to push forth vigorously and abundantly, forming a verdant and closely-matted covering for the earth. "In addition to this, it was during a sunny moment, after several heavy showers, that I visited the spot, and the old gums were decked out in their brightest livery, in honour of my visit, whilst the parrots and gillimockers in the trees sang out, as well as their unmusical voices would let them, a song of welcome. I can assure you, that for fully half an hour, I luxuriated in the view before me, my old mare, meanwhile, filling her stomach upon the short sweet grass at her feet, quite as complacently as I fed my eyes upon the landscape. Altogether, it was one of the most delightful spots that I have ever come across, but it lacks that absolute necessary, water, not a drop of which could I find, though I searched the creek up and down for some considerable distance."

Altogether, the Bendigo is an exceedingly pretty spot in the eye of a tourist, though for the digger its gentle character has fewer charms. The expansive flat on either side of the bed of the creek, the easy slope of the hills, the want of bold rocky points jutting into the bed and favouring the formation of water-holes, all tend to show that, though in the wet season a perfect torrent may pour down the creek, still but little of it will settle, or become available for permanent use.

At present the whole of the digging on the Bendigo itself is confined to the old claims, which have not yet been worked out, since comparatively few holes have been opened since the failure of the water. "And where," methinks I hear you say, "does all the heap of gold that reaches us from Bendigo come from?" My dear sir, you may take a circuit of two miles from Bendigo, and visit every gully and watercourse within that range, and you will not find one into which the miner's pick has not entered; and in the majority of them you will find a band of hardy diggers snugly ensconced and working away, as usual, with varied success. However, in every gully that has been so pierced, without a single exception, there have always been two, three, or more parties, who have made a rich haul out of their holes. I visited several of these out-of-the-way spots, and was shown holes whence thirty, forty, sixty, and even a hundred and thirty pounds weight of gold had been extracted. In many of these gullies a large number of the owners of claims have pitched their tents, of which I have counted upwards of a hundred and fifty in several instances. When it is remembered that there are hundreds of gullies lying off the creek that are now being worked, and that very many of the holders of claims therein prefer, as diggers ordinarily do, to live as near to their work as possible, some vague idea of the number of persons scattered over this portion of the country may be arrived at. This scattering may also account for my disappointment on reaching the Bendigo; as having just come from the most thickly located portion of Forest Creek, I expected to find as large an assemblage of tents and stores as I had left behind me. This, however, was very far from being the case at the time of my visit, though I am led to believe that, before the want of water drove away the numbers of persons that are now sitting down on the neighbouring creeks, there must have been a larger mass of persons congregated together in one spot, of limited extent, than ever there was either at Forest Creek or any other Australian digging.

A friend of mine, in whose opinion I can place every reliance, assured me that, in the palmy watery days of Bendigo, fully fifteen thousand souls were camped on the banks of the creek within a length of a mile and a half. One spot was pointed out to me, that had obtained the name of Bendigo Terrace, which some short time back formed a long street of some four or five hundred yards in length, running between

regular lines of closely packed tents. The remains only of the terrace were visible on my visit, but the numerous pegs left in the earth showed me plainly what it must have been in its days of glory. That so large a number of persons should be packed in so small a compass, may seem strange; but when it is remembered that all the most richly productive ground lay within the length of a mile and a half along the creek, and that all the diggers were consequently congregated immediately around this spot, the fact may be readily accounted for. However, when the water at Bendigo failed, the Sheepwash Creek had to be resorted to for washing. Many persons engaged in carting or washing, &c., removed there, and thus took from the numbers at the Diggings. At the Sheepwash again, the numerous cradles that were worked soon turned the water holes into mud holes, and a push further a-head to the Emu Creek had to be made. At this latter place there are now some five or six thousand souls located. Both these streams lie easterly from Bendigo. Bullock Creek, on the western side of the Bendigo, was also taken up by the diggers about the same time as the Emu Creek, and boasts of a population very nearly equal to that of the latter. Altogether, taking Bendigo and the adjoining gullies, the Sheepwash, Emu, and Bullock Creeks, there cannot be less than fifteen thousand diggers thereon, and counting women and children, there are over twenty-five thousand souls upon them.

HOW TO GET TO THE DIGGINGS.

Seek out the best house, the house of the highest character, in the Australian emigrant trade, at whatever port you intend to start from, and be guided by them in all things. In all the large ports, there are some four or five ship-brokers to any one of whom it is hardly possible to give the preference over the others of its class, and in selecting the great Liverpool house of Millers and Thompson, it will be seen that the priority we assign them arises not so much from any peculiar advantage their arrangements possess, but because of the new features introduced by them in the employment of vessels of a highly superior class. Elaborate tables of fares and scales of dietary might be furnished, but our present object is to show the spirit of emulation that has seized upon the shipowners engaged in the Australian trade; and for that purpose we give a representation of a vessel that is regarded as an excellent specimen of marine architecture.

This really splendid-sailing clipper-ship was built by Messrs. W. and R. Wright, of St. John's, New Brunswick, and she arrived at Liverpool a few months ago, where her appearance created quite a sensation among nautical circles. Her registered tonnage is 1,219 tons. Her dimensions are:—Length of keel, 206 feet; on deck, 221 feet; from figure-head to taffrail, 237 feet; breadth of beam, 40 feet 10 inches; depth of hold, 22 feet; register, new, 1,219 tons; old, 1,650; depth of keel and keelsons, through and through, 8 feet 8 inches (17 inches, sided); mainmast, 41 inches diameter, extreme length, 84 feet; topmast, 19 inches diameter, extreme length, 53 feet; topgallant-mast, 14 inches diameter, extreme length, 75 feet; bowsprit, out-board, 27 feet; gib-boom, 55 feet; length of mainyard, 89 feet; topsail-yard, 70 feet; topgallant-yard, 52 feet; royal-yard, 36 feet; skysail-yard, 27 feet. Her bending suit of sails, exclusive of studding sails, comprises a little over 5,000 yards of canvass.

The Star of the East had not been in Liverpool a week before she was purchased for £16,000 by Mr. James Beazley, the ship-owner. She has been chartered for Australia by Messrs. Millers and Thompson, of Liverpool, the owners of the "Golden Line" of Australian packets, who have lately also despatched the Miles Barton, a sister ship, but on a smaller scale. In accordance with her first-class character, they have fitted her out with a view to prove that a fast and well-found vessel is also a paying vessel. She sails early in July for Sydney, and will call at Melbourne to land passengers, all of whom will be well accommodated, as the number she takes, for her size, will be rather limited. From Sydney she will proceed to China, for a cargo of teas, silks, &c.; and she is expected to bring home the first consignment of new teas.

A CHINA "PLATE."

In looking at a picture of the superb structure which is known as the Palace of the Emperor of China—a building erected at an uncertain date, for the chief of a country of which we have but an indistinct kind of knowledge, belonging to no regular order of architecture, and reminding us rather of some youthful dream of the Tower of Babel than of anything else—we begin to entertain a degree of respect for the Chinese surpassing any that we ever felt before.

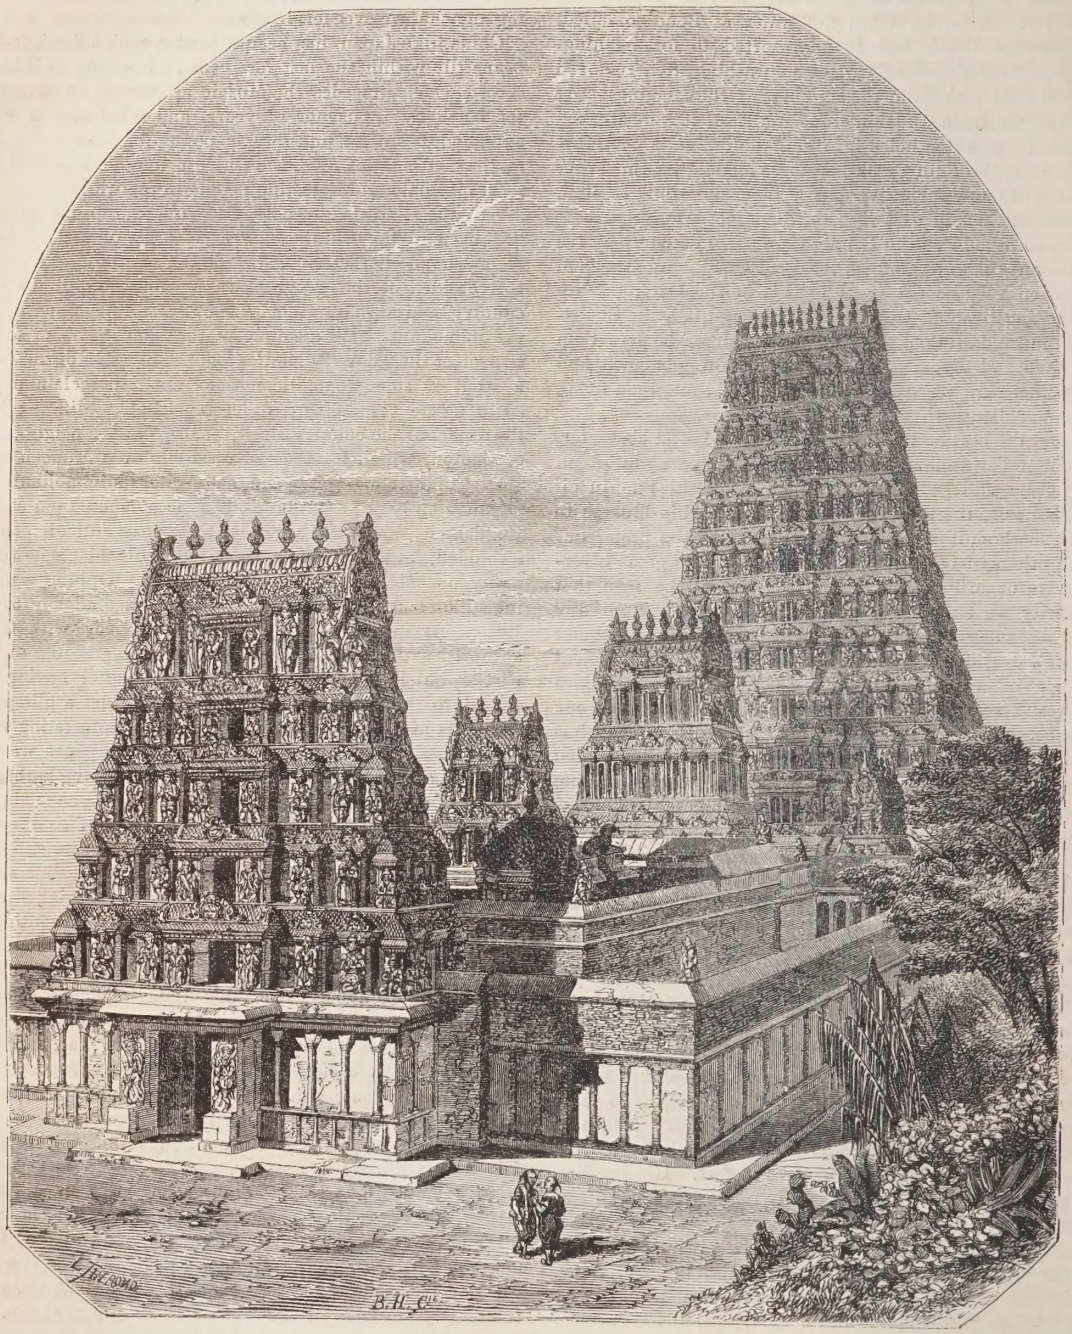
China, like Japan, has been almost a sealed book to Europeans till within the last few years. Boasting an historical record which precedes the Mosaic account of the creation of the earth by thousands of years, and inhabiting a widely-extended, beautiful, and thickly-populated land in the centre of the continent of Asia, the Chinese may be regarded as the most original and interesting people in the world.

All the knowledge possessed by Europeans regarding "China and the Chinese" is necessarily of a doubtful and second-hand character. It is true that we possess a tolerably correct idea of the geographical outlines and limits of the country, and have dim fancies about the stupendous wall that the inhabitants built a couple of thousand years or so since, to protect the "flowery land" from the invasion of the Tartars, as well as some romantic notions about porcelain pagodas, earthenware towers, and other remarkable edifices; but of the aspect of the country itself,—except in the neighbourhood of Canton, which is made to resemble an European city as much as possible,—and of the manners of its inhabitants,—but for such stray information as can be gleaned from "roving Englishmen," who *will* be poking their noses into all manner of forbidden, and-to-other-people inaccessible places,—we have really no special and reliable records. Opium wars and intestine struggles have, doubtless, had a tendency to bring Europeans into a somewhat closer intimacy with Chinese authorities than was perhaps altogether agreeable to either parties, but it is nevertheless a fact, that after having just a peep into the book of Oriental manners, just a glimpse of a few of its pretty pictures, the covers of the interesting volume are suddenly and ruthlessly closed, and the pages we would fain read are no longer visible to the eyes of "the barbarian."

And of the history of the Chinese nation we have almost as little real knowledge. How the vast extent of country came to be first inhabited, and how many distinct races and dynasties have lorded it over the contented and impassible natives, it is difficult, perhaps impossible to tell. During the long series of ages that have elapsed since the vast continent of Asia was peopled with wandering tribes, it has repeatedly happened that a multitude of warlike barbarians have issued forth from their homes in the inhospitable regions of the north, and poured down upon the more prosperous, but less hardy, nations of the south, overpowering them in war, and taking possession of their homes, to be themselves dispossessed in their turn by some subsequent immigration from the same quarter. The history of China presents numerous instances of this kind of invasion and subjugation. In the early part of the thirteenth century, the Tartars in full assembly unanimously resolved to follow one of their most eminent leaders, named Tchingis-Khan, whithersoever he went, and to fulfil all his commands. He turned his arms against China, and met with great success in his expedition. But it was not till after his death, in the year A.D. 1227, that China was completely subdued by the Monguls. In the year A.D. 1279, Kublar-Khan, a descendant of Tchingis-Khan, was crowned emperor of China. But the Tartar dynasty was soon overthrown, and the emperor Schunti was compelled to flee for refuge to his native regions, where his son Bidusar afterwards founded the kingdom of the Kalkas-Monguls. Cher, the leader of the first insurrection against the Tartars, then ascended the Chinese throne, and founded the Ming dynasty, which continued through a series of sixteen powerful monarchs, down to the year 1614. In the history of China this period, during which the Ming dynasty swayed the sceptre, is considered the golden age. The seat of empire was at

Nankin. Repeated invasions were made upon the Chinese territory by the Tartars during this interval; and in spite of every attempt to prevent them from gaining a footing on the borders, they at length became powerful enough to commence a formal war against China. Under the last king of the Ming dynasty an insurrection broke out, in which Litshing, the leader of the rebels, got possession of the capital, and the emperor committed suicide. The Chinese general then appealed for assistance to a neighbouring Tartar tribe, by whose aid the rebels were dispersed. But shortly afterwards, in the year 1645, this tribe, under their king Taitsong, took Nankin, murdered all the descendants of the Ming dynasty, and got complete possession of the empire. The son of Taitsong, a youth named Shintshi, was placed upon the throne, though only about six years of age; and from him is descended the present occupant of the imperial throne.

As we all know, the revolution at this moment going on in China is fomented by what may there be called the "national party," who are seriously endeavouring to overturn the Tartar dynasty, and restore the ancient race to the throne of China. By the latest intelligence received, we learn that the "rebels" have been driven from Nankin, after having made an attempt on the palace of the emperor, and that the "court party" are again paramount. Whether this revolution will be a successful one, and, if successful, whether it will be likely to open up the vast kingdom of China to the enterprise of commerce-loving Englishmen and go-a-head Americans, Time, as the proverb says, alone can tell!



THE PALACE OF THE EMPEROR OF CHINA AT NANKIN.

A WATCH OF THE SEVENTEENTH CENTURY.

Our design represents a watch invented by Beaumarchais in the seventeeth century. It is accompanied by the key, seal, and chain, and is a very interesting specimen of horology at that period. In those days watches were formed after the strangest possible fashion, sometimes like an acorn, at others like an olive, a shell in a Latin cross; watchmakers racked their brains to devise a new, and in most cases, incommodious article, something that should be of the most costly and at the same time the most conspicuous. Utility and convenience were things they did not consider in those good old times. There is a watch of Oliver Cromwell's still preserved which is about as cumbrous a machine as one could well imagine, but which was doubtless once considered a very fine specimen.

WATCH AND APPENDAGES OF THE SEVENTEENTH CENTURY.

In the eighteenth century the watchmaker Lepine invented a new method of regulating watches. It was a grand secret. His fame and fortune were both made. Watches constructed on the new principle were called Lepine watches. At the same time a young man, Pierre Augustin Caron, after much labour and expense produced a new method of escapement, one which was remarkable for its completeness and simplicity, and which created a great sensation among all the watchmakers of that epoch.

When Lepaute, another skilful horologer, knew of the escapement of young Caron, he set to work to modify the new plan, and by some slight alterations to make it his own. Hardily he maintained his pretensions to originality, Caron indignantly protested; Paris was divided between the two claimants: the matter was referred to the Academy of Science. The evidence was very carefully prepared, and examined with the utmost attention. After a most minute inquiry the illustrious company declared that Pierre Augustin Caron was the inventor of the escapement, and pronounced their decision entirely in his favour.

This was the first step and the first triumph of Beaumarchais. He profited by the opportunity afforded him in being called as a witness upon the trial to exhibit his own skill in horology; and so well pleased was Louis XV., that he named him henceforth as his watchmaker. Beaumarchais was employed in the construction of a watch for Madame de Pompadour, which was the admiration of all the court. He had now the means of bringing forward his own improvements, and his unrivalled skill and constant perseverance rendered very great service to the art of horology, both in his days and in ours.

In our engraving three views are given of one of those watches for which Beaumarchais was so justly celebrated. They present, together with the chain and other appurtenances, a very beautiful appearance, being richly engraved after the fashion of the period.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER V.—PART II.*

"You will; that is right and kind! but when—let us fix now?" said Lucretia. "You would not come back now with us, would you? This is a very sudden thought, I grant—and startling perhaps to you; but never mind, the sooner, the more suddenly, the better for such a hermit as you are. If we left you time for consideration of the subject—we never should see you!"

Leonard smiled. "I will return with you now even, if you really invite me!"

"We do! we do!" repeated the sisters. Mary especially looking greatly pleased. "Meet us," said Lucretia, "in twenty minutes at the corner of Tottenham-court-road. Mary and I have to call at a shop in Oxford-street; and so, until then, good bye." And the sisters were gone.

It was certainly a clever stratagem of the sisters to have thus suddenly taken poor Leonard at his word, and thus arrange this meeting. For no sooner had their bright presence vanished out of the dusky room, than our hero repented him of his promise. The remembrance of his worn clothes rose up with an importance which they never before had had in his eyes—the pain ever in his soul, seemed to return with a bitter violence, as if to reproach him; thus even for a few moments he had enjoyed respite from its gnawing tooth. But the fresh odour from the primroses and violets rose up towards him with the vernal gentleness of the sisters' voices, and their mild eyes seemed full of reproaches. "They are too pure to trouble themselves about my old coat and hat," thought Leonard, with a smile creeping over his sad face. "What a marvellous world this is, where the sternest griefs can even for a moment be mingled up with such ridiculous trifles."

A respite to Leonard's dull grief came whilst he sat in the tiny little sitting-room of the Gaywoods' cottage at their bright little tea-table. Lucretia pouring out the most fragrant tea; and Mary, bringing forth from a Japan cabinet, much too large for the room, all imaginable dainties from the East and the West—preserved ginger, Guaina jelly, and other delicious condiments and confectionaries. "We have long been wanting a guest of especial honour to enjoy all our dainties," laughed Mary, as she dived still deeper into the cabinet, and bringing forth fresh jars and quaint baskets. "Those good brothers of ours, Thomas and Robert, keep our old cabinet always so full, that we really often propose—don't we Lucretia, dear?—to set up shop with our stores. I fancy I could drive a prosperous trade, if Lucretia would only let me have a stall at the Kentish-town gate, near to the old apple-woman's. Every month, almost, Thomas sends us some beautiful things to look at, or some good things to eat; and Robert, who is in India—poor Robert—"with a sigh"—is quite as bad in cramming our poor little cottage with stuffed birds, wonderful shells, shell-baskets, ivory boxes, and Indian idols. This is the reason why Lucretia and I have to live like a couple of 'Nellys' in an 'Old Curiosity Shop!' But do try some of this beautiful jelly; its colour is lovely, is it not? there always seems to be a tropical sunshine glowing within it;" and Mary floated about like sunshine herself.

But not alone were the dainty foods and marvels of the "curiosity shop"—which, by the bye, extended throughout the whole house, from scullery to attic—the sole entertainments offered by Lucretia and Mary to their guest.

Mary glided like a sunbeam out of the room shortly after the disappearance of the tea-tray—in fact, to "wash-up" the tea-cups down in the most ideal of little kitchens—for the Gaywoods kept but one little maid, and such delicate china cups, the gift of "poor Robert," were never entrusted to any unskilful hands. Lucretia and Leonard fell into discourse, such as Leonard had rarely ever enjoyed, and, contracted as was his acquaintance with women, certainly never before with a woman. Of poetry they talked; of Keats, and Shelley, and the new poet Tennyson as the overture. Then Lucretia's little book-shelves having attracted Leonard's eye, the discovery within it of various periodicals containing fugitive pieces of his father's, all carefully marked by Lucretia's hand, surprised him with a mingled thrill of joy and pain.

"How much," said Lucretia, without looking up from the delicate needle-work at which her fingers were industriously stitching—Lucretia was always seen employed at *idle times*, as she would term them, upon the most delicate of needle-work—needlework which helped out the very slender income of the two sisters—"How much, and how often, I have desired that the poems of your father should some day be collected into a worthy form. Those gems of poetry, scattered as they are through the periodicals of the time, are lost entirely, except to the earnest seeker of his rare genius. Were I rich, that is a labour of true love in which I would indulge; and I should consider that to unite in one great blessing the scattered fancies of such a mind, would be as benevolent an act as the digging of a well in the desert for the reviving of fainting travellers—and, indeed, the draughts of refreshment to my own spirit which I have quaffed from his poetry, would render such an act but a simple one of earnest gratitude."

"I have frequently desired such a thing myself," said Leonard, with his old mournfulness stealing shadow-like over his face; "and one of my thousand fancies has been to sketch a few designs, suggested by various of the poems. It would truly to me be a labour of love, Miss Gaywood; for, with all my unhappy father's weakness, to me he ever appears surrounded by a wondrous glory of even celestial beauty, and——"

"Is it then possible that *you*,"—suddenly interrupted Lucretia, looking up at Leonard with an almost stern reproach in her tone—"that *you* echo the cruel injustice of the world, and fling a stone against the memory of a man certainly more sinned against than sinning, and that man your *father*. Words such as *his* lips have uttered it were faithless indeed to believe proceeded from any but the most generous, the most noble soul. Oh! Mr. Leonard, let us cultivate an unbounded charity and faith; they alone enable us to pass with joy through the earth. Trust me that, believing in perfection, perfection reveals itself to the believer." Lucretia's usually calm manner was momentarily ruffled, her fingers trembled as she resumed her needlework, and a flush passed over her Madonna-like countenance. "Pardon my warmth," she resumed, with a heavenly sincerity looking forth from soft eyes as they rested upon Leonard's mournful face; "I owe your father too deep a debt of gratitude lightly to hear a shadow of reproach cast upon him, and especially by a son. Whatever strength may be given me to perform the duties of existence—whatever sunshine is cast over Mary's and Andrew's life, and mine—we may in a great measure attribute to your father's influence. Years ago—years before you were born—Mordant was an inmate for one whole summer of our father's house. Our father was the schoolmaster of a village upon the borders of Sherwood Forest. I was quite a little child then, but each word, each look of the poet, remains engraven for ever upon my memory. What a marvellous power did he not possess as the interpreter of nature! With a child's simplicity with a woman's love, and the knowledge of a philosopher, he unfolded the marvels of beauty and joy contained in every natural object around him. He stretched forth his hand and removed the seal; he opened his lips, and behold, the hieroglyphics of God glowed in living fire before even the eyes of an ignorant child! Each acre of the old forest became an acre of paradise, over which the feet of angels eternally paced, leaving the impress of glory, mystery, and joy, behind them. I was, through his teachings, ever hearing the still, small voice of God in the trees, in the murmur of the waters, in the

* Continued from Vol. I. p. 447.

hum of the bees, in the rustle of the flowers—everywhere I beheld "the Burning Bush," and, removing my sandals, adored, prostrating myself upon the holy ground. And when I tell you that your father's words, and gentleness to man and bird, and beast and worm, sinking into the child's heart, as seeds sown in a willing soil, came up in after years and put forth flowers of still deeper thought and purport, do you not acknowledge that *that* child owes a deep debt of love and gratitude towards the sower of the good seed?"

Lucretia's eyes rested, with warm tears of emotion swimming in them, upon Leonard; but he did not reply, as he sate with a bowed head. "Incomprehensible, Protean nature of the Poet," mused he; "what human being can compute the balance between the good and the evil which thou hast produced?" But it was balm to the wounded soul of the son to recognise the lovely fruit brought forth by his father in one human life at least. And this might be but a single sheaf from a vast harvest.

Mary had returned during Lucretia's unusually excited address; and, sitting upon a low seat at her sister's knee, was gazing earnestly and silently up into her face. Twilight was stealing into the quaint little room, and no sound for a few seconds was heard but the quick and monotonous click of Lucretia's needle, as, sitting at the window, she still mechanically pursued her work.

Suddenly a cab, laden with luggage, stopped before the gate of the little garden; there was a violent ringing of the bell. A gentleman's face looked inquiringly out, and a child was seen convulsively to cling round his neck. Lucretia and Mary starting suddenly up, cried, as with one voice, "That is not Robert—that cannot be little Cuthbert! No, it is *not* Robert," cried Lucretia, a sudden paleness spreading over her face; and she flew out of the room, and was seen standing beside the cab door; and the gentleman was seen speaking hurriedly, and Lucretia stretched her arms towards the child endeavouring to untwine his little hands, clasped tightly round the gentleman's arm. But the child clasped them ever tighter and tighter, and a sad wail of childlike misery pierced even into the little parlour. Mary, who breathlessly had watched this scene through the window, now also flew to the cab. But no endeavours of the sisters could induce the child to untwine his hands; he fell sobbing upon the breast of the gentleman, who appeared to become more and more impatient. At length he raised the little boy in his arms and bore him, still violently sobbing, into the sitting-room; Lucretia and Mary, with distressed countenances, following hurriedly.

"I regret, ladies, that I cannot stay with this poor little fellow, but it is of vital importance that I start to-night for Scotland; we have already, in seeking you, lost only too much time. Strange, unaccountable, that neither Gaywood's letter nor mine, sent from Marseilles, should have reached you! But Cuthbert!—Cuthbert, my man, these are your aunts—this is your house—be a brave little Cuthbert. These ladies love you very much." And as he spoke, the strong sun-burnt man, with a mother's tenderness, kissed the boy's beautiful curling locks, and even the slender little fingers so intricately clasped round his arm. Lucretia and Mary, their loving faces bathed in tears, sought by every possible means to soothe him and attract his attention; but the boy, staring with large mournful deep violet eyes at them for one moment, uttered a sad cry, and once more buried his face upon the stranger's broad chest.

"It is very painful to resort to force with the poor child," said the gentleman, in a voice of emotion. "Nothing but this severe illness of my poor mother could induce me to leave my poor little companion in such distress, but we *must* release his hands;" and the strong man's hands unclasped the tender fingers of the child; and Lucretia and Mary holding him in their arms, the stranger hurried out of the room, jumped into the cab, and rapidly rolled away.

Little Cuthbert struggled violently, burst from the sisters, and, looking round in wild amaze, caught sight of Leonard, who was gazing at him from the window; he flew to him, clasped Leonard's hands, and imploringly looked up into his face.

"You, you'll take me! They frighten me—you are a good man! They frighten me—Papa—Mr. Rutherton—" and the poor little fellow once more burst out into violent sobbing, and clung to Leonard.

"How very extraordinary!" exclaimed the two sisters greatly distressed. "What an unaccountable thing, poor, poor little fellow! It must be that he is not used to women; his father wrote us word that almost from his birth he had been little Cuthbert's nurse, and that he feared he would grow up very strangely; he has no mother, poor, poor little fellow!" And they looked at each other, and then at Leonard, with a strange uncertainty.

Leonard, sitting upon a sofa, had taken little Cuthbert on his knee; and the child, flinging his slender arms around his neck, sobbed as though his very heart would break. Leonard made no attempt to soothe him, beyond stroking his soft hair and winding his arms tenderly about him. But a sudden, deep, and marked sympathy, had permeated the souls of the unhappy man and the unhappy child. All remained in deep silence. "May I carry Cuthbert into your garden, Miss Gaywood?" at length spoke Leonard. "I fancy, someway, that that might do him good."

"Oh, certainly, certainly," exclaimed the sisters. "Poor, poor little fellow!"

Leonard bore the child, still weeping, out into the twilight garden. The stars were already peeping forth here and there in a silvery grey sky; and long streaks of orange and violet lay upon the horizon, gleaming through the budding trees. All was hushed, except the distant murmur of the city. Leonard seated himself upon a rustic chair beneath a weeping ash upon the little grass-plot, and pressing the weeping child yet closer to him, began in a low voice to speak of this kind Mr. Rutherton, and of the long voyage, and of his home in India. Gradually the little breast heaved less violently, and the child, listening and becoming spell-bound by the tenderness of the voice, began, with convulsive sobs ever and anon breaking through his replies, to freely talk with his new friend. Leonard's keen sympathy had discovered the key with which to unlock the little heart. Cuthbert's highly excitable and nervous temperament responded to the imaginative nature of Leonard, and the boy's eyes opened with eagerness, and his lips poured forth a stream of hurried words whilst he filled up the pictures of his Indian life, the outline to which had been suggested to him by Leonard. And thus the two sat in long discourse till the large full moon rose shining through the trees, and Leonard felt the little figure shiver as it lay nestling up to his breast—his soul all eagerness about "that beautiful, beautiful day when papa took him out to ride with him on Mr. Langton's beautiful white Zippi—that's the elephant, sir—such a beauty; and, you know, white ones are very rare, even in India; and——" "But you are cold, dear Cuthbert; let us now go in and tell your aunts about all these wonderful and beautiful things," urged his friend. "But—but—they make me feel quite—quite afraid, sir; they are strange—all is strange," whispered the poor child, half weeping, as he crept up to Leonard's ear, and laid, with an indescribable trustingness, his little cheek upon Leonard's shoulder. "Am *I* not strange, also?" inquired Leonard. "No!" said the child, quite boldly; "I've often seen you in my dreams—*you* are an old friend quite—*they* are not; and all you say is so nice, and you love India as I do. I'll always obey *you*—I know instantly those people I'll obey. I'm very bad and wicked at times; even papa says so: and then, if people don't love me, I wish I was dead, like my beautiful mamma, whom I never knew, but who lies buried beneath the great Banian tree. I wonder, now, whether your mother is dead?—I know, though, she is."

"Let us go into the house," again urged Leonard; and with slow steps towards the house the two friends walked. But Cuthbert, when he approached the door, was not so easily persuaded to enter. "It's so dark, and like a box," he said; "I think it as bad as a ship; now don't you, sir? I sha'n't, I'm sure, like this England—I always dreamed I hated it, and that I was always wishing to go to sleep with my mamma

under the great Banian-tree." "But you will like your aunts if you don't like England," remarked Leonard. "Shall I? Do you like them, dear, kind man? Oh, then, perhaps *I* shall; only I never had any women about me—papa said always it was a great pity there were no women about me."

Meanwhile, the two poor aunts had been most busy in preparing a bed for the traveller; in having his foreign-looking boxes unpacked, and then in spreading a little repast to tempt the poor child to forget his miseries. Mary had brought out all their Indian dainties, in their native jars and baskets, and arranged them prettily upon the table before the sofa; had lighted the candles, and brought up out of the kitchen, as an attraction to the child, a beautiful parroquet which Robert had sent them over a year or two previous, and whose harsh and jarring cry had caused him to be banished, spite of his gorgeous plumage, to the lower regions. Several times had the sisters glided to the garden door; but seeing Leonard and the child quietly seated beneath the weeping ash, they wisely returned, leaving the pair undisturbed.

The child was now more courteous to his aunts, yet still very shy, and clung with a convulsive grasp to Leonard's arm, sitting beside him upon the sofa, and only choosing to eat such things as he placed upon his plate. But the Indian baskets and jars, and the parroquet especially, reconciled Cuthbert to his new home; and after various lively sallies, the little head sank upon Leonard's breast, and the heavy, swollen eyelids closed in sleep. It appeared, however, as if in slumber the child's anxiety returned shadowly into his soul; for he clung yet closer to his new friend, and heavy, sob-like sighs heaved his little frame.

Dreading to re-awaken such a sad grief in the little unhappy one, Leonard besought the sisters to leave him reposing within his arms yet a little while. "I fear," said he, "it is growing late, and that I may be intruding; but for the sake of this dear child you will, perhaps, pardon such intrusion. In a half-hour or so, perhaps his sleep will be deeper and calmer."

"Oh, we are only too grateful to you!" cried both the sisters. "But with your permission, Mr. Hale," said Lucretia, "we will now perform our little evening duty; for the reading of the beautiful words of Scripture I need not apologise to you; and we endeavour, for the sake of our little maid, to strictly adhere to time and season. Mary, dear, ring the bell for Margery."

The holy hush of the room, through which Mary's deep, earnest, and soulful voice, fell like a quiet blessing as it read:—

"Blessed are they that mourn, for they shall be comforted;
"Blessed are the meek, for they shall inherit the earth;
"Blessed are the pure in heart, for they shall see God;"

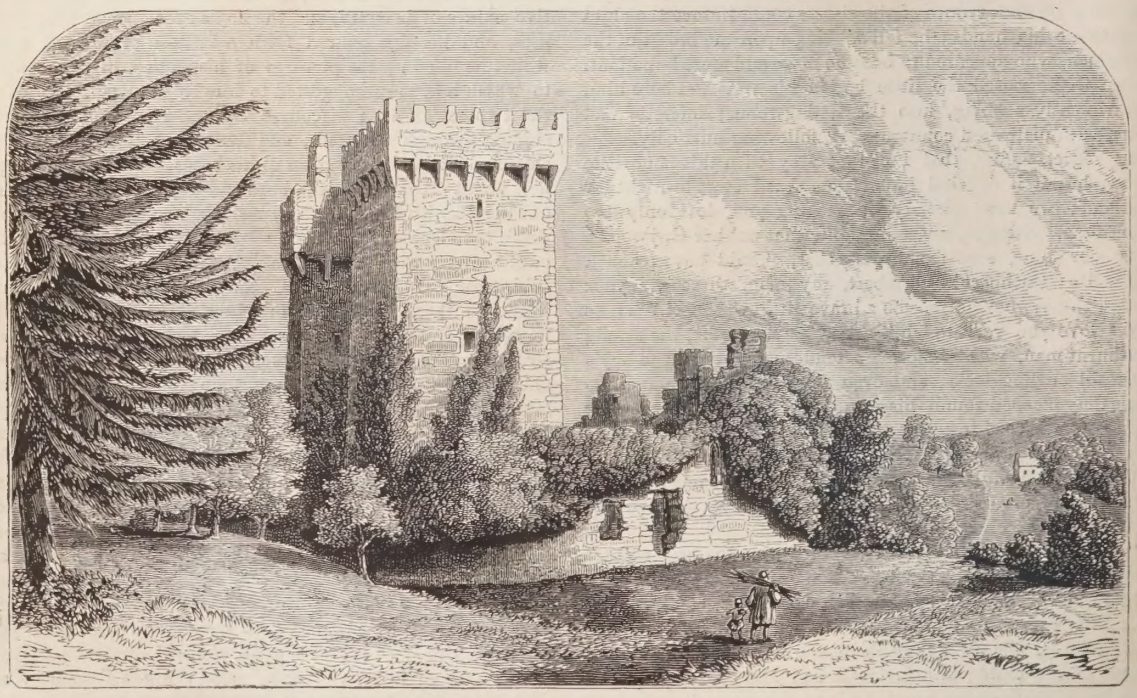
the gentle aspect of the three women, and the warm grasp of the little slumbering mourner, sent a gush of peaceful love through poor Leonard's heart, as though an angel from God had laid upon it his gentle, beneficent, healing hand. And when the three women, kneeling, repeated with a low, deep, fervent murmur, the sublime and tender words of the Lord's Prayer, Leonard sank his face upon the child's head, and bedewed the soft locks with a few trembling, warm tears, such as had not for years gushed up from his soul. It was the sanctification of a fresh chapter in Leonard's life.

ANCIENT CASTLES IN IRELAND.—BLARNEY CASTLE, ETC.

All the world—that is to say, all those "good folk in comfortable circumstances," who are in the habit of making short summer trips into the country—are hastening to Ireland to view the wonders of the Great Exhibition; and, mayhap, to wander along the banks of the lovely lakes of Killarney, and make thoughtful, but pleasant, pilgrimage into the wilds of Connemara and the west, and philosophise upon the past, present, and future of that

"Emerald set in a golden sea,"

which has so sorely troubled the politicians of the last century or two. For such kindly-disposed travellers—if any there be among our "world" of readers, as doubtless there are—all



BLARNEY CASTLE, COUNTY CORK.—VIEW FROM THE MEADOW.

political allusions to state quackeries and solemn shams, as Carlyle would have it, must be distasteful; and, as the line at the head of this paper invites us to a more pleasant theme, we gladly pursue it.

"The antiquities of Ireland," says the well-known author of "Cork and the South of Ireland," "afford a rich and extensive field for research. Her isolation and sequestered position, her freedom from Roman conquest and subjugation, in the period of Rome's highest power, has left to the character of her Celtic archæology features peculiarly her own; undiscriminating enthusiasm at one side; and again, on the contrary, an over-sceptical theorising rationalism, embarrassing and obstructing its useful culture. What effect the vicinity of Roman civilisation produced on the arts and social condition of this country we have no present evidence to determine. The vast variety of implements, utensils, and objects of art disinterred from time to time, and the numerous monuments which still subsist, afford no means to inform us as to the extent or nature of such influence, if any. The character of Irish remains, indeed, is more impressed with an Oriental than

BLARNEY CASTLE, FROM THE PEEP HOLE ON THE BRIDGE. DRAWN BY MAHONY.

whilst the acquaintance of her early pagan population with letters, and the large amount of extant literature which has descended to us, capable of throwing so much light on the condition of her ancient races, have invested the whole subject with an importance and interest surpassing that of the antiquities of any other western nation in Europe.

"This broad and inviting field of research has been hitherto but imperfectly and partially wrought, seldom indeed by the scientific inquirer, and but too often only by incompetent or prejudiced labourers. There has been abundance of wild and a Greek or Roman origin, and tends to sustain the eastern descent claimed by the Irish senachies (or clans) for their ancestry. Some few Roman coins alone, sparingly discovered, tell of a limited Roman intercourse. In like manner the actual presence of the northmen on the Irish soil seems to have been nearly as ineffective. Occupying, for above two centuries, a considerable portion of the island, and especially of its maritime cities, it is strange that they have left hardly any traces or vestiges behind them. Beyond a solitary tower in Waterford, and a few silver coins, the Irish antiquary

cannot really point to a single memorial (save the record of their devastations) on the page of his history. Whilst in England and Scotland, and even in the Isle of Man, the sculptured cross and the Runic inscription still remain to identify their sway, in Ireland neither the one nor the other throughout the whole breadth and length of the land can be found.

"Ireland, then, has no remains of Roman magnificence to exhibit, no vast temples, amphitheatres, or aqueducts; nor does she possess any of those antiquities which the northern archæologist could identify as of Scandinavian origin; but she has, on the other hand, many relics of early Phœnician intercourse—vestiges of a religion, an architecture, a language, and a literature, claiming derivation and affinity with the remote East.

"The antiquities of Ireland may be classified into three grand divisions—the primæval or pagan, early Christian, and mediæval. In the first are comprised stone monuments appertaining to the Druidical religion, such as circles, cromlechs, pillars, holes, and rocking-stones, rock-basins, &c., raths, cahirs, duns; the fortified residences of the ancient inhabitants, consisting of great earth works, or Cyclopean stone enclosures, lofty round towers, used at once for sepulchral and religious purposes; stones inscribed with the virgular character, called Ogham, dome-roofed structures, round, oblong, and square, with massive walls constructed of uncemented stones. The Cromlech, or Druidical altar, is a monument well known in these islands and in northern Europe, and not unfrequently found in India and America. It is occasionally met with placed within circles of pillar-stones, but it is often difficult to distinguish between it and the kistvaen. The latter monument, when divested of its covering of earth or stones, is to all appearance a perfect cromlech; but there are many of the latter which, from the nature of their sites and peculiarity of construction, could never have served this purpose. It is right to say that the term cromlech seems to be of modern origin; it does not occur in any ancient Irish MS. hitherto examined; the native name is that of *leabba* or *leacht*, a bed or stone monument.

"There are varieties of the circle, some which must undoubtedly have served for religious or judicial purposes, and others found encompassing tumuli. There can be no precise limits to the number of the stones composing these monuments, but several circles are known to contain only *five*, which seems to have been a favourite number. There is no doubt but that the cromlech (not the kistvaen) and the circle were used sepulchrally, as remains of interment have been frequently found within them. Ireland contains no circles of equal magnitude to those of Stonehenge and Avebury in England."

But if Ireland may not boast of many Roman antiquities and Druidical circles, she has, on the other hand, some of the most picturesque old castles—many of them, alas! in ruins—which are to be seen in Europe. All over the island, from Dunluce to Bantry, these remains of Ireland's days of glory are to be found. At one time the tourist in the Sister Isle finds himself beside the "treaty stone," in King John's castle, that storied pile in the city of Limerick which was so gallantly defended by the remnant of the Irish army, in 1690; at another, he wanders musingly around the silent and deserted halls of Tara, or moralizes on the littleness of human grandeur within the cold and saddened domain of Dangan. In the very heart of the western mountains, he pauses to think over the ruins of Ross castle, which surrendered to Lord Muskerry in 1652; and still further west, he may remember the deeds of the great Duke, while pondering over the ruined walls of Carbury castle, which once belonged to, and is said to have been built by, his ancestors the Cowleys.

For the present, however, a brief notice of two of the most famous of old Ireland's castles,—or, more properly speaking, of Ireland's old castles,—must suffice.

Blarney Castle, the Blarney Stone, and the "Groves of Blarney," are well known by reputation all over Europe—and indeed, wherever Englishmen and Irishmen chance to travel. A four mile ride by the railroad, or a walk through pleasant fields will take the visitor from Cork to Blarney. The castle, we are told, comprises a vast square tower erected in or about 1530, by one of the potent sept of the M'Carthy Mores, records of whose prowess are everywhere to be met with in this part of Ireland and some evidences of which the tourist will discover as he proceeds further south. But of those of our readers who would at once satisfy themselves on this head, in reference to a spot so renowned as that of which we are now treating, may consult, with great profit, the local historian, Windle, whose "South of Ireland" will be found very valuable, containing nearly fifty pages devoted to Blarney, its castle, stone, cromlagh, tunnel, lake, glen, round tower, and immortal "groves," the authorship of which deathless lyric has begot almost as many claimants as cities erst contended for the birth-place of "the blind old man of Scio's rocky isle." These stanzas have been given in nearly all the tongues of the earth by the laureate of the Lee, Padre Polyglot Prout, whose liquid triplets to that limpid stream we shall presently quote. We need not occupy our space with the original of Millikin's half-dozen verses descriptive of how "the trout and salmon play at backgammon," as no one can be in Cork and find himself at a loss for the song, with *ad libitum* variations, including, of course, Prout's supplemental lines;—

> "There is the stone there, that whoever kisses.
> Oh! he never misses to grow eloquent;
> 'Tis he may clamber to a lady's chamber,
> Or become a member of Parliament."

> "A clever spouter he'll soon turn out, or
> An out-and-outer—'to be let alone.'
> Don't hope to hinder him, or to bewilder him—
> Sure he's a pilgrim from the Blarney Stone."

Which is the identical pebble, or real Blarney Stone, is somewhat difficult to point out to the downright plain-dealing English visitor, for the Irishy redundant reason that there happen to be *two* portions of the edifice to which the miraculous power of conferring mellifluous and mesmeric eloquence is attributed by conflicting local authorities. One stone is pointed out to visitors as the veritable *osculatorium;* and we incline to this opinion, inasmuch as it is much more easy of access, and seems to have suffered from previous devotion in being much worn and broken. Another stone is also indicated, but this is held to be a *lapis offensionis* and a *petra scandali;* and with some reason, for it is situate in the wall just below the edge of the parapet, and requires the party performing the kissing business to be let down by the heels in order to do so, over a parapet some hundred feet from the ground. This perilous predicament, however is not always insisted upon; for Mr. Barrow, in his piquant manner, describing how he went through the process, says:—"I ascended to the summit of the tower, on a corner of which is placed the famous Blarney Stone, which I was very gravely assured possessed the power of making those who kiss it ever after agreeable in their conversation to the ladies. 'A consummation devoutly to be wished,' thought I. 'Och, your honour must kneel down and kiss it three times,' quoth the guide; 'and shure you'll be able to coax the ladies—fait, there's never the gintleman that misses!' 'Now, my friend, tell me truly if you don't mean by "talking blarney," the impudence of telling "mighty big lies" without blushing?' 'Fait, and I believe your honour has just hit it; and shurely don't the gintlemen talk blarney to the ladies, and do it all the better for kissing the stone?' I found there was no resisting the virtues of the Blarney Stone, so down I popped, and the stone having been well washed by the rain, I bestowed upon it three kisses, which, however strong their virtues may be in warming the hearts of the ladies, struck icy cold to my lips." Mr. Windle, whose local *amour propre* might be supposed to incense him against the flinty-hearted Saxon satirists of his slab, ingenuously says himself: "The touch of the Blarney Stone makes a liar of the first magnitude, but a smooth and graceful liar—its eminent perfection is a sweet and graceful tongue in whispering the softest words into the ear of woman, full of guile, and blandishment, and potential flattery, and uncontrollable in its

sway over the credulous. Miss Plumptre translates Blarney into the single word 'Rhodomontade,'—a faculty of speech marvellously perceptible in the vicinage around, whose inhabitants, it is said have been mistaken by Boullaye le Gouz and Latocnaye for a colony from Gascony. They are, of a truth, a swaggering, vain glorious, wheedling population." Flattering this, and from the Herodotus of the place too! All these imputations, however, can hardly be true; for even the proprietor's kiss of the stone itself, like the Wonderful Lamp in the hands of the old magician in "Aladdin," did not confer happiness, inasmuch as the castle and all its contents had not very long ago to be sold by public competition—a profanation bemoaned in an appropriate strain by Prout in an inimitable parody on Moore's "Eveleen's Bower," beginning—

"Oh! the muse shed a tear,
When the cruel auctioneer
With a hammer in his hand to sweet Blarney came!"

In 1821, Sir Walter Scott, with his son-in-law, Lockhart, Miss Edgeworth, and other celebrities, paid the homage of their worship to the load-stone, much to the chagrin of the citizens, who were eager that the Wizard should in preference inspect their noble harbour and the lions of "the spreading Lee, that, like an island fair, encloseth Cork with his divided flood," as is said in the "Faërie Queene;" or, as a more modern bard describes it:—

"As crystal its waters are pure,
Each morning they blush like a bride;
And when evening comes grey and demure,
With the softness of silver they glide.
"Of salmon and grey speckled trout
It holds such a plentiful store,
That thousands are forced to leap out,
By the multitude jostled on shore."

Surprisingly enough, however, Lockhart confounded this famous Spenserian stream with the Shannon!—a blunder which forms the text of one of those most instructive "Essays of an Otogenarian," by the erudite and amiable "J. R." of a thousand periodicals—James Roche, formerly a banker, and lately a retired citizen of Cork, which justly and affectionately regarded him as one of the most worthy of her many honoured sons, and now sorrows for his death, since April in the present year.

Renvyle Castle, in the county of Tipperary,—a remarkable ruin overlooking the sea—has a fame of another kind, however. Here again history and romance with their thousand recollections spring up to people the *locale* with the phantoms of the past, as if specially to heighten, as it were, the present charms of that singularly lovely landscape, by reminiscences of the turbulent and bloody deeds of which it was the site, and which are here recalled by the presence of Renvyle Castle—

"Beneath whose battlements, within whose walls,
Power dwelt amid her passions:—in proud state
Each feudal chief upheld these armed halls,
Doing his evil will, nor less elate
Than mightier heroes of a longer date:"

a kind of recollection, however, much more suitable for antiquarians and bookworms, than for quiet Irish tourists in the summer of the famous Exhibition year.

TUBULAR BRIDGE OVER THE WYE.

The engineering achievements of modern times have been so singularly characterised for originality and boldness of conception and success in execution, that the word "impossible," as applied to anything which may be required, appears, if not to be repudiated, yet practically, to be ignored. The difficulties which presented themselves in the formation of that mighty and elaborate system of locomotion, which has been established in this and in other countries, seem to have challenged the dormant energies of our engineers only to be vanquished; and one after another noble structures have been reared, not simply to promote in a high degree the welfare of men, but to declare with silent yet impressive eloquence the dignity of the intellectual endowments which have been conferred upon him, for the dominion of the material creation, by the Father of all.

One of the most remarkable and interesting engineering works of modern times is the railway bridge crossing the Wye at Chepstow, which has just been completed. In the planning out of the South Wales Railway, which is to unite Gloucester with Milford Haven, and has already been opened as far west as Carmarthen, it was found necessary to cross the Wye, near Chepstow; and the problem to be solved was not an easy one. As it is a navigable river, the admiralty required that the space over the mid-channel should not be less than 300 feet, and that a clear headway of fifty feet above the highest known tide should be secured; so that across this "tidal chasm" an iron bridge had to be hung, capable of supporting the heaviest burdens that passing trains could impose. The work obviously demanded the highest efforts of mechanical and constructive skill, but the bold and experienced mind of the engineer was not overtasked by the exigencies of the case; and Mr. Brunel has produced a work which is believed to combine perfect efficiency with singular economy of material. In proceeding to describe this remarkable structure, as the two lines of railway are supported by separate though perfectly similar means, it will be necessary to make particular reference only to one.

The bridge, which Mr. Brunel has erected, consists of four spans, three of about 100 feet each, and one of 290 feet, extending altogether from bank to bank for 610 feet. The three smaller spans rest upon iron piers, filled with concrete, sustaining cast-iron girders, on which the railing is laid. The fourth and chief span, which is on the suspension principle, is supported by means of a tube more than 300 feet in length, and 9 in diameter. The tube itself rests on the summit of piers erected on the east bank and in the centre of the river, and to the ends of the tubes are attached the suspending chains. Now, in an ordinary suspension bridge, the chains hang in a festoon, and are free to move according to the weights passing under them, which are not in general great. This flexibility, however, would be altogether inadmissible in a railway bridge, for the continuity of the rails would be destroyed if a very small deflexion took place when traversed by a heavy locomotive. With a view to supply the necessary rigidity, Mr. Brunel has introduced at every third part of the tube a stiff wrought-iron girder, firmly connecting the tube with the roadway girders, and, with the aid of other adjusting screws, the suspension chains are stretched as nearly straight as is desirable. Other diagonal chains connect these points, so that at whatever part of the bridge a train may be passing, its weight is distributed over all the tube and chains by these arrangements.

In the operations connected with the sinking of the cylinders which form the piers of the bridge, some curious facts came to light. The workmen had first to pass through nearly thirty feet of blue clay and sand, below which they met with a thin bed of peat containing timber, some solid oak, hazel nuts, and other substances of the same kind. They next came to several feet of fine blue gravel, and then they found the bed of boulders upon which the cylinders were originally intended to rest. After this was a bed of red marl, beneath which they discovered solid rock, resembling what is known as milestone grit, into which the cylinders were sunk. The mode in which this part of the work was performed was

ingenious :—"The cylinders were placed on planks to prevent them cutting into the soft mud. One by one, cylinders were added, until they had reached the top of the stage, about forty feet in height, which had been erected for the purpose of sinking the cylinders. The weight of this column then cut through the plank, and the cylinder sank about six feet into the mud. Men then descended into the cylinder, two or three working there at a time; and as they excavated the soil, so the cylinder gradually sank, and as the column descended, fresh cylinders were added at the top. The excavation then continued, without interruption, until a depth of about seventeen feet was attained, at which point the water broke in from below in such force as to require the constant operation of two thirteen-inch pumps worked by an engine. The water burst in at a moment's warning, as soon as the spring was tapped; and the most remarkable phenomenon attending this occurrence was the fact, that the spring-water invariably rose in the cylinder exactly to that height at which the tube was standing in the river at this moment. That it was not an irruption of the water of the Wye is considered to be beyond dispute, inasmuch as the river at this point is, from the action of the tide always tainted with mud, which is held in solution in great quantities at all times, while the water which rushed into the cylinder from below was of exceeding purity, and contained not a particle of salt." *

From the time of the first tapping of the spring, the pumps of a thirty-horse power engine had to be kept at work until the cylinders had been sunk to the rock; they were then filled with concrete. This irruption of water, at the depth of seventeen feet from the level of the bed of the river was the same in the sinking of all the cylinders for the centre or principal pier; but the water did not interrupt the work to so great an extent in making the other piers, and the workmen proceeded to a greater depth. The spring appeared to be in the bed of gravel, about twelve feet from the point where it first burst into the cylinder. One fact, which demanded special provision in the computations of the engineer was, that the spring tides on the river Wye rise here from fifty to sixty feet—a greater elevation than in any other river in the kingdom.

Interesting as is this remarkable structure in itself, it is still more important as a link of union between the west-centre of England, and the increasingly prosperous districts of the south of Wales. For some months after the opening of a considerable portion of the South Wales Railway, there was a hiatus at Chepstow, till the bridge could be completed, and while passengers found that it was no small inconvenience to be conveyed by omnibus over a rough country, and then over Chepstow town-bridge to the station on the other side the river, there was even more serious difficulty as regards the goods and mineral traffic, to carry on which was impracticable on any large scale. In the summer of last year the first tube connecting the line was opened for traffic, and within a few weeks the second tube has been raised, the final arrangements completed, and the bridge finished. And now, by one of the most delightful rides which can be found, the traveller is borne along the banks of the glorious Severn till he reaches a land of surpassing beauty, and far away from the toil and turmoil of business may fill his mind with scenes of loveliness and delight, and store his heart with memories of happiest hours, which he will ever love to recall as he thinks of Chepstow, Tintern, and the Wye.

SECTION OF THE CHEPSTOW TUBULAR BRIDGE.

The proportions of this colossal structure may be inferred from the large amounts of material consumed in its erection, of which the following are the principal items :—

	TONS
Wrought-iron used in three spans of 100 feet each, double line	277
Wrought-iron in girders, &c., of main tube, of 300 feet span, double line	278
Two wrought-iron tubes	302
Suspending links in main chains and diagonals	256
Total employed, including nails, not mentioned above	1231
Cast iron	1003

Masonry in abutment and pier, 3,240 cubic yards.
Total cost above £65,000.

* "Our Iron Roads."

UNION OF ENGLAND AND FRANCE.

UNION OF ENGLAND AND FRANCE.

We cannot in adequate terms commend the idea of universal brotherhood without doing honour to its originators. Amidst all the wild excesses which have now for long enough desolated the European continent—excesses of despotism no less terrible and destructive than the licence of democracy—this principle has sprung up and flourished like an oak cradled by tempests. The wild hordes who sacked the capitals of Europe in 1848, and kicked crowns and mitres about like boys playing at foot-ball, cherished, in the midst of all their orgies, a vision of universal happiness, in which the rights of weakness should be recognized and respected, in which the long and disastrous alliance of poverty and crime should be dissolved, in which education, gratuitous and obligatory, should become the birthright of every child of the meanest proletaire, and in which standing armies, the tools of lust and ambition, should melt away before the dawn of knowledge and the spread of commerce, and each citizen become the guardian of his own hearth. That they failed in realising it is a blot, not on their theory, but on human nature. Theories are at all times worthy of reverence, because they are the elaborated productions of human reason, but alas! it is not by forces of this kind that nations are governed. How many passions and prejudices, how much blind bigotry, how much sordid selfishness, battle fiercely against the fairest and best planned schemes of the enthusiastic philanthropist, of which he in his overflowing goodness of heart had taken no account! The lamentable events of 1849 have taught us the bitter lesson that this consolidation of nations separated by seas and mountains, laws and language, is not to be the work of a single revolution, and will not spring from the convulsed and aching body politic, like Minerva from the brain of Jove. Beautiful and glorious it will be when we see it, but like everything else which derives its worth from human hands, it must be the work of labour. The Venus of Phidias was not chiselled in an hour. To have conceived it even is a mighty step in advance. To form a proper estimate of its value, let us only remember the notions which France and England—the two nations who can and will do most to hasten this desirable consummation—entertained regarding each other a century and a half ago.

There is still in France a class of men known as *feuilletonistes*, who earn a livelihood by compounding stimulants for the readers of the journals under the shape of short, spicy, but impossible stories. The only limit to the fecundity of these writers is the mechanical labour of inscribing their effusions upon paper. To pay them by the yard would be as fair a way as any. To say that Sheridan's retort applies admirably to them, "that they refer to their memory for their jokes, and to their imagination for their facts," would be only saying what everybody may guess. Their one great aim is to make out the needful quantity of matter, provided always that it be of an exciting kind, and they consequently give themselves little trouble regarding the accuracy or correctness of their statements. When any of them visit England, the results of their observations are transmitted to their readers in Paris in the shape of amusing absurdities, in which many of the old and time-honoured fallacies appear in a new and more attractive form. M. Jules Janin, one of the gayest, happiest, wittiest, most mendacious, and most showy of his class, honoured us with his presence during the Great Exhibition of 1851. He saw written up on the front of the Royal Exchange—"The Earth is the Lord's and the fulness thereof;"—and he forthwith took a note of it, and transmitted it to Paris as proof of an assertion which he then and there made, that such was the intensity of the aristocratic feeling amongst the English, that they inscribed on their public buildings an acknowledgment that all the land of the country belonged to the lords. His peregrinations through the metropolis called forth many statements as laughable and as ill-founded as the foregoing, but our space will not permit us to record them. They are so many proofs of the amount of evil influence which flippant and careless romancers may work in originating and perpetuating prejudices and false notions of the manners and character of other nations, if the poison which enters in at the imagination be not counteracted by the diffusion of sound and correct information.

Happily, we have now an antidote to this poison—for poison it is—in the vast and striking increase of intercommunication between all the European countries, but particularly between France and England since the close of the last war. When we remember what a journey to Paris was in the days of our grandfathers—the time it took, the trouble and expense it entailed, and the dangers that surrounded it,—we can hardly wonder at the existence of the prejudices and misconceptions on both sides. To contrast it with the ease, speed, and comfort with which a journey to the French capital can now be accomplished, would be a repetition of what everybody knows. Who is not tired of seeing a statement in huge letters upon all the walls in London and upon the sides of a host of ponderous vans, to the effect that the journey from London to Paris can now be accomplished in twelve hours, or, as it is concisely, though eliptically, expressed, "Paris in twelve hours?" Or if time be not so much a consideration with you as money, not to know that you can get there and back for 27s. argues you a man of uncommon bluntness of perception or weakness of vision, for there is no fact of which the inhabitants of the metropolis are so frequently reminded. In the transmission of intelligence we have made still greater strides than in creating increased facilities for travelling from the one country to the other. The heading, "By Submarine Telegraph," which precedes those short announcements of the latest news in the morning papers, is pregnant with meaning. It states a fact of more momentous import than any that was ever set forth in the intelligence which usually follows them—the annihilation of distance and of time, the equipment of words with the wings of thought to fly over the land and under the sea, invisible as a dream, but quick as the lightning. Why are we said to have lost our romance? Are we not daily touching every transaction of life, whether of business or of pleasure, with its golden light? Was the conveyance of your letters, a century ago, to your friend in Paris by that slow old coach, and dirty old packet, and the long and wearisome delay which ensued before you could possibly receive an answer, half so romantic think you, as making your love, and hope, and sympathy your kind thoughts, your sad regrets, throb along the iron pulse which lies amongst the pearls and amber, and traverses the caves of old ocean? Where was the romance of intelligence brought by a mud-bespattered courier on a jaded horse or signalled by the ponderous wings of the old semaphore? Did not news of the overthrow of a dynasty, the outbreak of a revolution, the loss of an army, the winning of a victory, lose half its mighty significance, its awfulness, its grandeur, by travelling in the pocket of such a messenger as this—the sublime in the keeping of the ridiculous? If you want to give us an idea of romance, of the romance of power, of science, and knowledge, tell us of events that change the destinies of the world by transmitting the news to us in a flash of lightning along the bed of the ocean; tell us in London all that happened in Paris an hour before; keep up an ever-flowing current of intercommunication, of sympathy, of progress, of new ideas in art and commerce and literature, and weary us not by groundless lamentations over the death of chivalry, of the picturesque, and the romantic.

If we were asked where we see the best guarantees for the peace, and liberty, and welfare of Europe, we should reply, in the cordial union of France and England, undoubtedly,—in the multiplication of the ties of commerce and of social intercourse. We look at this question altogether apart from any considerations regarding the government of either country. No man who has been born and bred on English soil can have either sympathy with, or admiration for, the power which now rules the French nation; but it is not with it, but with the

people that we have to do. It is of yesterday—in a year it may have passed away, and have been forgotten like its predecessors; but the people will last, we believe and hope, as long as the world shall last. They are France—the France of Louis XI., and Louis XIV., and Napoleon the Great, to be sure; but still, in each advancing year, a wiser, and a better and abler France, full of noble aspirations, of high thoughts and deep sympathies with all that is good and great in humanity, enthusiastic in the pursuit of science, brave, generous, and courteous, with thousands of great names on the roll of her history which we ourselves would be proud to own. For centuries we have combated her by land and sea, urged on by the wicked and detestable teachings which pointed her out as our natural enemy, and led us to believe that our glory, safety, and welfare lay in conquering her. We now know better. The railways have taught us a new lesson. The French have come here in shoals, and examined us for themselves. They have found in us much to love and admire, have discovered that we don't sell our wives, are generally moderate in our cups, and don't constantly keep exclaiming "gottam," and occasionally taste other food than *rosbif*. Feuilletonistes may fabricate and blunder, but they will not get many to believe them. We, on our part, have got over our infantine creed on the subject of wooden shoes and brass money, frogs, and starvation, and cowardice. We like French cookery, we admire French genius, we study the French literature, and we speak the French language. To confirm and promote the good feelings which have thus been generated, every effort has been recently made. The submarine telegraph is a bond which will do more to promote the solid unity of the people than any schemes of social regeneration, which propose to shut men up in huge barracks, and make them live in a sort of Agapemone, where everybody will have everything in common,—a capital plan, we should imagine, for making everybody as morose and as uncomfortable as he could be.

It is undeniable that men often need only to be known that they may be loved. If you wish to make people hate each other, keep them apart. If you wish to promote union and sympathy, make railways, give freedom to trade, let them travel, see one another, and trade with one another, and the good genius of humanity will do the rest. This is a truth which governments are at last beginning to recognise. We already see the results. We see England and France more and more banded together, aye, and despite the plans and policy of despots or diplomatists, banded for liberty and right. Their united fleets now thunder defiance against the grasping and detestable injustice of Russia. The two nations have come forward as the guardians of international faith—as the police of the public law of the world. A constant interchange of good offices is kept up between them in every quarter of the globe, while the energies of each, instead of relaxing under the influence of peace and harmony, are stimulated by a generous rivalry which has for its object the happiness and well-being of mankind. A copyright convention has secured to the authors of both the fruits of their industry, in whatever part of each country his works may penetrate. A larger public is thus opened up, and genius and intellect are stimulated and encouraged by the thought that the two greatest nations of the world will peruse their creations, but that neither will peruse without rewarding.

He who does not see in all this omens of untold blessings for the whole world, must be a dweller in Cimmerian darkness. While two great peoples are in the advanced guard of the army of progress, we may look forward with hope and confidence to the day which so many martyrs and patriots have died to hasten. The doctrine of brotherhood between all mankind, which Christ came on earth to preach, finds its best support, not in the cold discourses which fall heavily on dull ears, but in the promotion of material enterprises. Strange and providential adaptation of means often base, and often unworthy to a noble and glorious end! The covetousness, or avarice, which causes a railway to traverse a neglected and isolated district, proves the harbinger of knowledge and enlightenment and comfort to thousands, who might otherwise have sat in darkness. Let not, therefore, the *gens d'esprits*, and the "idealists" rail too fiercely against the money-hunting *bourgeoisie*—against the *concessionaires*, and *rentiers*, and *agens de change*. These men are hastening the fulfilment of their best hopes, it may be in a way that seems roundabout, or mischievous, but it is the way appointed by Providence, and in the long run its wisdom will assuredly appear.

In concluding, we are glad that all we have said is illustrated and enforced by an engraving from a cunning hand, that will, perhaps, convey to the eye of the reader a more vivid picture of what we rejoice over in the present relations of France and England, and look for in their future intercourse, than we have been able to portray by the pen. Peace sits enthroned in light, and grasping in her right hand the Union Jack and tri-colour, war-worn flags, consecrated by a thousand triumphs by land and sea, surrounded by a thousand ennobling memories of bravery, generosity, and heroism. Both flags of liberty and glory, so long divided and hostile, are now mingling their folds peacefully in the sunlight; at the feet of the goddess, the workman and the *ouvrier*, representatives of classes which all the world over are unrivalled, in courage, endurance, and intelligence, ingenuity and skill, clasp their hard hands in friendship across the hive of the busy bee, the emblem of their strength and boast, and their only escutcheon, though full as proud a one as that of the Montmorencis or the Percys. Below them are the youth of both countries, their *jeunesse dorée*, surrounded in profusion by evidences of the taste and ingenuity of their fathers, and engaged in the pursuit of the arts, sciences, commerce, and literature, with an ardour which promises to make them, like Homer's heroes, abler men than they. On the one side we see the curtain being drawn over the Past, and on the other the shadow which hitherto veiled the landscape is rapidly passing away and revealing the light beyond. While one shrinks with horror from the contemplation of the battle-field, where the smoke of the destroying cannon, and the scent of carnage linger even yet, another points exultingly to the promise of the Coming Time, when swords shall be beaten into ploughshares and spears into reaping-hooks. The ocean, covered with the ships of both nations, bearing hither and thither the fruits of the replenished and subdued earth; the railroad annihilating distance, and acquainting men one with another; the electric telegraph, a band of union which, it is to be hoped, will never be broken asunder; free-trade in all that is necessary to the welfare of either nation—verily, these are as fit emblems of the Present as tilts and tournaments, men-at-arms, and knightly prowess in blood-stained fields, were of the mighty Past. The ripe harvest of golden grain is a better representative of national prosperity and national content than was ever "flag that braved a thousand years," be it tricolour, or Union Jack, or any other. These are the foundations on which enterprise and industry shall rest. These are glorious emblems, but the "bow of promise," which hangs in the cloud, is full of still nobler meaning,—for it points to an epoch, in which the thousand ills which still afflict us, which blast our best anticipations, disconcert our best planned schemes, and oftentimes cast the best and greatest of us back into despair—despair of mankind and his destiny—shall pass away like a cloud, and leave behind nought but light—the light which shall "shine more and more unto the perfect day."

The Future is truly the idol of our souls.

> "To thee the Martyr looketh, and his fires
> Unlock their fangs, and leave his spirit free;
> To thee, the poet, 'mid his toil aspires,
> And grief and hunger climb about his knee,
> Welcome as children; thou upholdest
> The lone Inventor by his demon haunted.
> The prophet cries to thee when hearts are coldest,
> And gazing o'er the midnight's bleak abyss,
> Sees the drowsied soul awaken at thy kiss,
> And stretch its happy arms and leap up disenchanted."

THE MOSQUE EL MOYED.

MAHOMET is one of the men whom history is forced to commemorate. Everywhere in the east you are reminded of his life and doings. Centuries have rolled away since he inscribed his Koran on the shoulder blades of mutton, but all day long the priests still read his strange old book, and the traffickers in the busy market bow down when the voice of the priest is heard—"to prayers, to prayers, God is the true God—to prayers, to prayers—Mahomet is his prophet." What a wonderful change that wild son of the desert effected in the habits and feelings of those eastern people—how changed are they since they went on pilgrimage to the black stone and worshipped at Kaaba!

Strange places are the eastern mosques; speaking of those of Cairo, Bartlett, in his "Nile Boat," says, "Among the four hundred mosques in the city, many of which are in a state of decay, very beautiful specimens may be met with." One of them our engraving represents. The Mosque-el-Moyed, or Medrecet-el-Moyed, was erected at the beginning of the fifteenth century (in the year 807 of the hegira), by the sultan Abou-el-Nars, Sheik-el-Mamoudy, surnamed Melik-el-Moyed, of the illustrious family of the Daherites, upon the spot formerly occupied by a prison, where the Emir Mentech was detained captive. The interior decorations of this religious edifice are very costly and beautiful. The ceiling is divided into different compartments by rich mouldings, painted and gilt. Within the most sacred portion of the mosque there is a gorgeous display of valuable jewels set in gold and silver, while curiously wrought tapestries of the finest material, arrayed in graceful folds, add to the magnificence of the scene.

Three minarets are erected on the mosque, one at the north-west angle of the building, and the other two at the south-east angle. These two last abut upon the gate of the Bazaar el Soukarieh. From the galleries of the minarets the priests call the faithful to prayers. A number of shops are attached to the exterior walls of the mosque, and the tenants have to keep the place in good repair. It is a fine old specimen of eastern architecture, perhaps one of the finest in all Cairo. In the Mosque-el-Moyed there is great care displayed for the accommodation of the priests in ascending the minaret at the time of worship, as one of the most important parts of their religious economy is this public declaration of the hour of prayer, and of their faith in Mahomet, who fell like a spark on black unnoticeable sand, "but lo, the sand proved explosive powder, and blazed heaven high from Delhi to Grenada!"

VIEW OF THE MOSQUE EL MOYED, AT CAIRO.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

BIANCA, GIULO, AND JACQUES, IN THE BOUDOIR.

CHAPTER VIII.

Herm. "——— Pray you sit by us,
And tell 's a tale.
Mam. Merry or sad shall't be?
Her. As merry as you will.
Mam. A sad tale's best for winter;
I have one of spirits and goblins.
Her. Let's have that, sir;
Come on, sit down, come on and do your best
To fright me with your spirits."—*Winter's Tale.*

The day was far spent when the two youths, Giulio Polani, and the Sieur de la Mole found themselves, once again in the streets of Venice. The spot at which the former arrested the steps of his companion was one which might well command the attention of a stranger. It was close to the north-western angle of the grand-ducal palace, and the spectator could obtain a full view either due westward along the great piazza, terminated by the church of St. Giminiano, or, turning his head southward, survey the piazzetta through its whole line, till the eye rested on the waters of the Giudecca. The lower story of the palace was supported upon arches that sprang from massive pillars, and thus formed a magnificent arcade down the whole western front. This was the favourite promenade of the Venetian nobility, both in the morning between six and eleven o'clock, and in the evening between five and eight. The "Broglio," as it was called, was in fact the exchange of Venice for the nobility, quite as much as the Rialto was the exchange for the merchants; and in good truth as much business was done in the one locality as in the other; and though the actors were of a different class, the transactions themselves were often very similar in their character. If at the Rialto the merchant sold his merchandize to the best purchaser, so too at the Broglio, the noble often sold his influence, his vote, it might be his honour, to the highest bidder, the only difference in the two transactions being the openness with which the one, and the secrecy with which the other made his bargain. If the usurious money-lender overreached or oppressed in the one place, the greedy aristocrat circumvented and ensnared in the other. In the one there were frauds, and chicane, and the tricks of trade; in the other, corruption, and intrigues, and the specious deceits of polished life. Each had their class-vices, and venalities, whether practised beneath the gown of the patrician or the cloak of the merchant.

But no such sentiments as these were suggested to the mind of the foreigner as he viewed the scene before him. Notwithstanding that the vast majority of the nobility was now absent from the city, serving in the army and on board the fleet at Palestrina, there were still left a sufficient number, especially of those to whom the regulation of the state was committed, and whose presence in the city was indispensable, to give brilliancy and effect to the concourse. Beneath the arcade might now be seen groups of nobles, some in couples, others, but less frequently, in larger numbers, promenading to and fro. It was noticeable, too, that the mechanics and artisans, and indeed all classes of the citizens who were not noble, did not venture to intrude themselves beneath the sanctity of the arcade; while a closer observer would have discovered that, even among those who assumed the right to walk within the pillars, a certain etiquette was observed, which separated even the nobles into classes; and distinct portions of the promenade seemed to have been conventionally appropriated for each class, upon which the others carefully abstained from intruding.

Outside the line of the arcade, the piazzetta was crowded with persons of every grade of the citizens below the rank of noble, and in addition were to be seen the denizens of most of the nations of the world, whom the commerce of Venice brought constantly to the city. Persians and Turks, Dalmatians and Greeks, Jews from every region, and Christians from all parts of Christendom. These, as they passed to and fro, or stood in groups, added infinitely to the picturesque effect of the scene, by the variety and contrasts of their costumes, and the brilliant colours of their atire, compared with the sobriety and sameness of the garb of the Venetian citizen.

It was not without some excusable pride that Giulio noticed the manifest admiration of his friend, as he looked around him and contemplated one of the most imposing spectacles of the kind that even a travelled man could then behold, for assuredly in no country could one see more architectural magnificence grouped together—a nobler square, a purer sky, or a richer assemblage than the piazza and piazzetta di San Marco exhibited on a fine evening in the end of spring, or during the early summer. At length the young stranger turned to his friend and said:—

"In good faith, my Giulio, thou hast done well to bring me hither at such an hour as this. He who should miss this sight would carry away with him but an imperfect idea of your fair Venice."

Giulio made no reply, but his smile showed that he appreciated and enjoyed his friend's remark: the latter resumed:—

"Come now, thou shalt explain to me the significancy of the various robes which I perceive the nobles wear. In truth, I thought your citizens affected but little distinction in dress, deeming all denizens of the republic on an equality—is it not so?"

Giulio smiled once again, but with an import different from before—it was the smile of one who cared not to answer a question when he scarce knew whether it was prompted by naivetè or a pleasant malice.

"The mere citizens all wear the cloak of Paduan cloth, as you may perceive," he at length replied. "But the clarissimi who bear any office in the state wear their gowns of office."

"Ah! I comprehend. Well then, who may that distinguished person be who wears the long gown of red damask, with the full sleeves, and the flap falling over his left shoulder?"

"What, he with the red hose and shoes? oh, that is the chief of the Council of Ten. The other with whom he walks in such earnest conversation is one of the secretaries of the council,—he with the gown of blue cloth with blue flaps edged with taffeta."

"Truly a mysterious-looking pair they seem," said the foreigner, laughing gaily: then checking himself as he observed the serious visage of his friend, he continued: "Pardie, I forgot, dear Giulio, that I am in Venice, and not in La Belle France. Well, there is a fine, martial-looking fellow in the gown of black damask, within which, as it opens, you can see his crimson doublet and hose. He is not one of your city *savi*, surely?"

"No," replied Giulio; "that is a knight of the Terra Firma."

"Ma foi! Say you so, indeed? In good sooth I should not care to get upon my war-horse in such a cumbrous garment, if I were the good knight. It would be sorely in the way of a demipique saddle, and one would scarce be able to put lance in rest or flourish a brand with these long sleeves trailing about."

"But thou shouldst see our knights of the Terra Firma *upon* the terra firma, Jacques," retorted Giulio, with some show of irritation; "thou wouldst then know how they can lay aside the long gown for the hauberk, and the felt hat for the camail de fer."

"Ah, I cry you mercy," said the Frenchman, interrupting

him, with an apologetic bow. "I forgot that you have no horses in the city of the lagune."

In observations such as these the young men continued to indulge for a space as they walked down the piazzetta towards the water's edge.

"And now, Giulio," said his friend, "thou hast shown me much to-day, but there is one sight which I would fain see beyond them all."

"Name it, dear Jacques."

"And thou wilt promise to gratify my wish?"

"Assuredly, if it be within my power."

"Well, that is reasonable. Dost remember, Giulio, one lovely moonlight night, when thou and I lingered in our pinnace by a fair villa upon the banks of the Seine?"

"Ah, yes, Jacques: but what of it now, I prithee?"

"Why this, Giulio. Thou didst then speak of thy own home and thy own kin, and, in chief, of one whom thou didst call sister, though sister she was not at all; and I thought then, that if ever I should come to Venice, I would ask thee to show me a woman such as thou didst then describe. And I told thee, Giulio—did I not?—how that brothers were but partial judges. And thou didst maintain that our Gallic maidens were not fair as she of thine own Venice. Then, Giulio, we made a sportive wager of I forget how many crowns, each maintaining the beauty of his own land; and thou said'st that if I should come to Venice I should be convinced by my own eyes, and should give judgment against myself with mine own lips. Was it not so, Giulio?"

"In truth, dear Jacques, it was even as thou sayest. But the matter passed altogether from my mind, even until thou hast now recalled it."

"Well, art thou prepared to yield the palm to our French demoiselles, or art thou still as confident in Venetian beauty?"

"Nay, it is thou, Jacques, that shalt yield. What sayest thou? Shall we leave the noise of the city and seek the placid lagunes, as the sun is sinking? Most gladly will Bianca receive as her friend one who is the friend of her brother."

"Be it so, then," said Jacques; "and now let us lose no more time."

There was then, as there is now, and we make no doubt will ever be, while one stone of Venice remains upon another, a traghetto, or boat-stand, at the foot of the steps of the piazzetta. Several gondolas were lying at the water's edge, the gondoliers stretched lazily along the benches waiting for some chance fare.

"Antonio!" cried Giulio, hailing one of the boatmen.

"Eccomi, eccomi, signor. Son pronto io," responded a young man, springing upright, and with a sweep of his oar-blade sending his little craft right up to the foot of the stairs.

The young men entered. Giulio pointed with his hand beyond the Giudecca in a north-easterly direction.

"Ah, si, si, eccellenza: capisco ben," said the young gondolier, with a sly smile, and a stroke of his oar that drove them swiftly along the water.

"Well then, Antonio, if thou dost know whither thou art to go, I shall have the less to tell thee. And how is thy mother?"

"The Virgin be praised, eccellenza, the old woman bears up bravely, especially when she can get half an hour's gossip with a friend, as she did yesterday, when good mistress Giudetta called to see her."

By this time the gondola had cleft its way into the middle of the Canale di Giudecca, and was nearly opposite the Island of San Giorgio Maggiore. The noble church which now stands upon the island had not yet been reared, but the convent and ancient chapel of the Benedictine monks were to be seen casting their shadows eastward upon the water.

"How calmly the water laves the shore of yonder isle," remarked Jacques, "what a picture of that dreamy repose which one can fancy is never broken by a ruffle."

"And yet," replied his friend, "at times the wind sweeps across its surface, and the waves roll in from the Adriatic, so that few gondolas would venture to cross the water."

"Ah! true, eccellenza," said Antonio, "unless the blessed San Giorgio himself should take it under his protection, as he did when the city was saved."

"And how was that, pray?" asked Jacques.

"What! has the signore never heard of the miracle of the three holy saints?"

"Never," said Jacques.

"Oh, che crederia?" exclaimed the boatman in surprise; but pardon,—the signore is perhaps a stranger?"

"It is even so; but thou shalt tell me the tale."

"Nay, signore, it is no tale, it is as true as the blessed Gospel. I heard my father tell it a thousand times—and he heard it from old Domenico himself, for they were great friends."

"Well, then, Antonio, thou canst tell it to the signore all the better, I suppose," said Giulio.

"Ay, eccellenza, I have it as pat off as if it were written out for me in a book and I could read it."

"Commence then, good youth, for I am anxious to hear it."

"Volontieri, signore?"—and so Antonio proceeded with

THE LEGEND OF THE THREE SAINTS.

"Well, then, good gentlemen, it is about forty years ago, as well as I can count, that what I am going to tell your excellencies took place. The season was a terribly wet one: the rain fell, fell day and night, just as if the clouds had no bottom to them; and then the Brenta, and all the other rivers that flow into the lagunes, were swoln to the top of their banks, and poured down in oceans. For thirty days the flood continued to increase, and the waters to rise all round the city and the islands, till people began to think that God was going to destroy the world once again with a deluge. Well, signori, on the thirtieth day, as it was coming on towards midnight, a tremendous tempest of wind sprang up all of a sudden, so awful, they say who heard it, that it seemed as if all the devils in hell had broken their chains and come howling and sweeping through the air. Just at this very time, a poor old fisherman, that went by the name of Domenico, was drawing up his little boat as well as he could to the bank of the Terra Nuova—"

"Nay, there thou art going astray, assuredly, Antonio," said Giulio, interrupting the chronicler. "It was at the Riva of the Canale di San Marco that old Domenico chanced to be when the tempest caught him,—so they who knew best affirm."

"Under favour, signore," replied the gondolier, "he who knew best where old Domenico made fast his boat that night, was, I should suppose, old Domenico himself, and he told my father 'twas at the Terra Nuova—and my father told me 'twas at the Terra Nuova, and I tell your excellencies 'twas at the Terra Nuova, and—"

"Proceed, in the name of the Virgin, then, after your own fashion," cried the youth, cutting short the discussion.

"Sicuro, signore: one should not commit any mistake in so important a matter. Well, then, the poor fellow was in a sad plight, drenched to the skin, and hungry, and weary; for he had been toiling all the day, trying to catch a few fish, but the fish were all frightened and would not take any bait. So when he had moored the boat in the best shelter he could find, he was just stepping upon the bank when he perceived a man standing in front of him.

"'You are in luck,' said the stranger; 'just in the nick of time.'

"'As to luck,' replied Domenico, 'I never was in luck in my life; but I am just in time, I believe, to save myself from spending the night in the bottom of the canal.'

"'Thou art in luck,' repeated the other; 'thou shalt earn a good fare, and ferry me across to San Giorgio.'

"'Diavolo!' cried Domenico, 'come si puo andare a San Giorgio? How the devil, signore, could one get across to San Giorgio such a wild night as this? Noi ci annegheremo. By the blessed San Marco, we should be drowned to a certainty.'

"'By the blessed San Marco,' said the other solemnly, 'not a hair of your head shall be wet. Come.'

"The stranger spoke with an air of authority that Domenico found himself unable to resist, and stepping in he sat down at the stern, while the fisherman pulled away with all his might for the island. The will of God so appointing it, he reached the shore in perfect safety. Then the stranger, who during the time had neither spoken nor moved, arose, and ere Domenico could demand his fare, he was on the bank.

"'Aspettate qui un poco,' said he to the old man, with a wave of his hand, 'wait for me here for a moment;' and so he vanished in the darkness.

"Domenico was very angry, for he thought that the stranger had played him a slippery trick, cheating him of his fare as well as putting his life in jeopardy. However, when he looked back across the dark and troubled waters, he thought the best thing he could do was to stay where he was for the night. He had scarcely made up his mind to this, when he saw the stranger returning with another person, seemingly a young man of a warlike appearance. The two stepped into the boat, and the former, turning to Domenico, said in the same authoritative voice—

"'Va verso San Nicolo di Lido.'"

"'To San Nicolo di Lido!' repeated the old man in astonishment. 'Chi mai potrebbeci andare a un remo? In the name of the Holy Virgin, who would be able to row to San Nicolo di Lido?'

"But the other said in a very quiet calm voice, 'Va Sicuramente che tu potrai andare. Be well assured that thou canst accomplish the task. And then, he added, seeing Domenico still hesitating, 'e sarai ben pagato.'

"Well, off he pulled lustily, commending himself to God and the Virgin, and though the water was rough, and the night as wild as ever, they reached San Nicolo in safety. The two men now left the boat and quickly returned with a third, a venerable-looking person, who seemed, as Domenico told my father, like an ecclesiastic. They were no sooner seated than the same who had heretofore spoken, directed Domenico to pull away out as far as the two castles. This seemed the strangest order of all, nevertheless he felt somehow as if he had no power to refuse: so he took to his oars once more, and made the direction of the castles. All the way the storm was at the highest, and as they were just getting out into the open sea, they beheld coming towards them from the two castles at a marvellous speed, as if flying along the waters, a galley full of devils; such, at all events, Domenico took them to be, from their terrible looks and their awful curses and denunciations; and as they came close up to the little boat, he could hear them vowing that they would inundate all Venice, and plunge her for ever in the abyss. Suddenly the sea, which up to this time was tossing in the most turbulent manner, as the old man used to declare, became as calm and tranquil as it is this moment. Then the three men stood up, and making each the sign of the cross, they addressed the demons, and they conjured them in the name of Christ to depart and go their ways. No sooner had they done this, than in an instant the galley disappeared and was never again seen or heard of. Then the three men caused Domenico to row them back again to the Lido, where the ecclesiastic got out, and thereupon his first acquaintance said to the boatman, 'Now for San Giorgio Maggiore.' Away pulled Domenico, for by this time he felt that he was in company with those whom it would not be very safe to gainsay: besides, he had lost all sense of danger, so away he pulled till he ran the boat up beside the very self-same spot on the island of San Giorgio Maggiore, where he had taken in the soldier. No sooner was the boat at rest than out stepped the second of his mysterious fares, and disappeared as strangely as he had come. There was now only the original person left in the boat. Domenico looked at him for further directions, whereupon he merely said, 'A Terra Nuova.' To the Terra Nuova accordingly the old man shaped his course, and at last arrived at the very post where he was about to moor his boat when he met with this singular adventure. The stranger was just stepping ashore as the others did, when old Domenico bethought him that it was now high time to remind him of his promise. With somewhat of a fearful heart, for, as he said, he knew well he was dealing with no ordinary person, he ventured to say,—

"'Eccellentissimo. I have seen a great miracle, no doubt. Nevertheless, miracles will not fill a poor fisherman's belly now-a-days. Your worship will, I humbly hope, pay me as you have promised for my hard night's work.'

"'What thou sayest is just enough,' replied the other. 'Tu hai ragione. Go then in the morning to the Doge, and to the Procuratori di San Marco; tell them what thou hast seen and heard, and desire them to pay you.'

"'Ah, Dio, noble sir,' said the old man, 'were I to tell them all these marvellous things, they would not believe a word of them, and they would, I fear, pay me with the lash or the prison.'

"'They *shall* believe thee,' said the other. 'Tell them thou hadst San Marco in thy boat, and the cavaliero San Giorgio, as likewise the holy bishop, San Nicolo, and that Venice would have been drowned, but for us three and thyself, who served us so bravely!'

"The old man knew not what to say when he found himself in the presence of the great patron saint of our city. At length he shook his head and said,—'Evangelista Santissimo, eglino non me crederanno. Alas! they will not credit such a one as I.'

"'They shall,' said the saint, 'I tell thee, they shall. Here, take this ring and show it to them in the morning, and say I gave it to thee.'

"Thereupon he departed, leaving the old man full of perplexity, not well knowing whether the whole was not a dream —except that he really had a rich gold ring in his hand, studded with precious stones. So when the morrow came, the old fisherman presented himself before the Doge, and told his tale, ending it by showing the ring. Nothing could exceed the astonishment of his highness at this, for he knew the ring in an instant. However, he sent off to the sanctuary of San Marco, to find if the ring was in its place, and lo, it was missing from its place. Just at this moment intelligence was brought that the water was falling rapidly in the lagunes, which gave such confirmation to the fisherman's narrative, that no one was impious enough any longer to doubt a word of it. His highness gave the ring, forthwith, to Ser Marco Loredano and Ser Andrea Dandolo, who were then the Procuratori of Saint Marks, and they lodged it in its place in the sanctuary, where it is, they say, up to this day!"

"Well, and what became of Domenico? was he paid his fare in the long run?" asked Jacques.

"Ah! Per Bacco, his fortune was made. The signory did not neglect the saint's directions, but they settled a state pension on the old man, which made him comfortable for the rest of his life. So that, eccellenza, is the true account of how the *three saints* saved the city of Venice."

Ere Antonio had concluded the legend of the three saints, the gondola had passed from the lagunes and entered the Adriatic. A short time sufficed to bring the party to the point of the shore, near which stood the villa with which the reader is already acquainted—that in which Bianca Morosini now resided. In that same sweet boudoir, with its balcony looking out upon the sea, was the maiden seated when the young men entered the house. What was the subject of her thoughts just then, one would scarce have needed to ask who could have seen the *abandon* of that graceful form half reclining on the couch, and marked the long black lash of the closed lid as it reposed on the upper part of the cheek, whose paleness was not invaded by the faint blush that tinged the face a little lower. He would have at once pronounced the subject was one in which the fancy was busily at work, and which engrossed the heart much more than the intellect—and that smile upon the scarce parted lips betrayed that the pictures of the fancy and the speculations of the heart were both pleasurable. At the farther end of the apartment a young

maiden, apparently about her own age, was employed arranging some flowers in a vase. She was attired in a variety of bright colours, and in a costume somewhat fantastic, and as she moved about, the toss of her head and the coquettish expression of her eyes announced the lady's maid—such as she was in Venice—one who, by her own freedom of manners, amply made up for the reserve in those of her mistress, one who, in the church, or at the public gardens, or passing through the public streets behind her mistress, was ever on the alert to watch every favourable opportunity to facilitate the little love adventures of herself or her mistress, to tell young gallants *by accident* where they were to be found in the evening, what mask her lady appeared in at the ball, and learn in return the colour of the gentleman's *domino*, and to make assignations at the *ridotto*, or at the chapel, or in the saloon of some common friend, who might be favourably disposed towards the young people. In no part of the world, not excepting Spain, had the ladies' maid more arduous functions to discharge than in the fair city of Venice. Nor will this be wondered at when it is remembered that nowhere were the daughters of noble houses watched with more strictness than in Venice. The greatest possible horror of *mesalliances* was entertained by those proud aristocrats, and parents who could not obtain suitable matches for their daughters preferred to consign them to convents rather than to the protection of husbands beneath their own rank. To guard against any mischance of this nature was, therefore, a principal object with those who had the care of the young Venetian ladies, and so they contrived to keep them as much as possible from that free intercourse with the other sex which was more or less liberally accorded in other countries. To counterplot parents and guardians in this respect was, after all, a natural, though certainly not a very commendable, consequence of the over strictness which was exercised, and hence a thousand ingenious devices and contrivances were resorted to by clever lacqueys and smart ladies' maids, to forward the love affairs of those whom they served. One had only to look at the sparkling black eyes of Giovanna, and the quick and restless glances with which they roved about from object to object, to be convinced that she was fully endowed with those qualities of intrigue, sagacity, and readiness that were necessary for a lady's maid; and yet never were such inestimable qualities more totally useless, at least so far as the mistress was concerned than in the present instance. Dear, simple-hearted Bianca! She had no lovers, no gallants—no heart affairs—save one, and that one was too sacred for the intermeddling of a waiting-maid; and so Giovanna was forced to content herself with rendering the ordinary and more legitimate services of her station, and of cultivating her talent for intrigue in the affairs of her own heart only.

The entrance of Giulio and his friend caused, of course, some little excitement in the boudoir. The faint flush deepened and mounted on the cheek of Bianca, as, after welcoming Giulio, she received the courtesies of the stranger. The serving-maiden did not fail to admire the fine figure and fashionable attire of the foreigner, and to fall into instant speculation as to who he was, what he was, and why he was here. She contrived to throw the flowers out of the vase, that she might have the excuse of waiting in the apartment to re-arrange them; but this was at length accomplished, and she retired, leaving the three to enjoy their own society without the surveillance of others.

And why should not we follow her example? Why should not we permit one episode in the social existence of three young people to pass without recording every word, anatomising every sentiment, moralising upon every action? Already have we given our readers an insight into the heart of one of the three—that clear, pure heart that one might look through as he would look through the translucent water, or the clear crystal. The heart of man is less easily read, for there are many things to tincture its purity, to make opaque that which should be transparent—complex feelings, conflicting master-passions, contending interests. What, then, were the sentiments which the two others of the party entertained for the beautiful girl in whose presence they sat, it would be premature to say. One of them, Giulio, felt at least all the love of a brother, all the pride of a brother; but did he feel anything more? Was his love stronger, tenderer, more exacting than the love of a brother? Did he feel even a momentary pang of jealousy as he witnessed the admiration of his friend, which the latter did not even seek to conceal? Did the gallantries of anyone but himself to the girl seem misplaced, and did he long for the hour when he should enjoy her converse without the presence of a third; and, above all, of a third of his own sex, and of attractions such as he could not help admitting Jacques was possessed of? All these questions we shall not now answer; nor shall we speculate on the precise nature of the feelings which Jacques entertained towards the lady. Certain it is, however, that upon the return of the two youths that evening to Venice, their conversation was by no means as unconstrained and as animated as it was wont to be of old. Giulio was abstracted, moody, and for minutes together totally silent. Jacques appeared less gay and careless in his manner; and, at times, Giulio surprised him gazing upon his face with an expression of melancholy, yet kind, interest, as if he had penetrated the young Venetian's secret love, even before the latter had fully acknowledged it to himself. It seemed as if the memory of the ciarlatano's prediction of the morning came upon the young men like a dark shadow, from whose gloom they could not altogether emerge.

It was not till many hours of the early night had passed over their heads, as they sat in the Palazzo Polani, recounting over the wine-flask some of their pleasant days, that their wonted cheeriness of tone and manner returned to either. At length they parted with a cordial embrace at midnight, each returning to his apartment, having planned the pleasures of the succeeding day.

In the morning, when Giulio had dressed, he sought his friend's apartment, but it was empty. As he was returning to the salone, wondering at the early movements of his guest, Tomaso handed him a letter: breaking the silken thread that tied it, Giulio read the following words,—

"It is necessary that I leave Venice without delay. Till we meet again, accept my thanks and confide in my love. I have lost the wager, dear Giulio, and thou hast won. Be it so. I shall pay thee, assuredly—perhaps when thou least expectest it.

"Adieu.

"Jacques."

Giulio was both surprised and grieved at this sudden departure of his friend. To all his enquiries he could get no other answer than this, that early in the morning his guest had gone out, but returned shortly after, apparently in haste with a packet in his hand, which looked as if just received. He announced to Tomaso that he had suddenly received information which required his immediate departure, and ordered his cloak-bag to be put in the gondola which awaited him at the water-gate of the palazzo. He then wrote the few lines which he left for Giulio, with directions to give them to him when he left his chamber, but by no means to disturb him in the meantime. And so he departed.

After turning the matter again and again in his mind, the young Venetian came to the conclusion that his guest had gone to the osteria, and there found a letter for him, which required his presence speedily elsewhere. What the nature of this summons might be he had no means of forming any idea, but the fact of Jacques having been seen with a letter in his hand upon his return to the palazzo seemed to justify the conclusion to which he had come. At length he dismissed the subject, with the belief that a little time would clear up the matter, as he had no doubt that Jacques would soon write to explain it; and so, when he had taken his morning's repast, his thoughts turned not unnaturally to the scene of the previous evening, and then he thought of Bianca, and then—he stept into the family gondola, and desired Beppo to row to the Villa Morosini.

PROFESSOR FARADAY'S EXPERIMENTAL INVESTIGATION OF TABLE-MOVING.

The "new power," which table-moving has been thought to disclose, has at length been investigated by an experimental philosopher. The conclusion to which he has arrived is, that tables are moved simply by unconscious muscular action, having nothing to do with electricity, magnetism, attraction, or any unknown force whatever, much less, as some have boldly asserted, the motion of the earth, or supernatural agency. The morbid state of the public mind, both in Europe and America, on the subject of table-moving, required some corrective; and Professor Faraday, with a view to banish false notions respecting it, has taken considerable pains to discover the real motive-power by which the various phenomena of table-moving are produced. The results of his ingenious and successful experiments, and the methods by which he arrived at them, have been communicated to the public by that eminent scientific authority. That our readers may retain in a permanent form that which otherwise might exist only in the pages of a newspaper, we present them with a brief epitome of the professor's experiments.

After explaining his reasons for making the inquiry—not that his own doubts on the subject of table-moving might be satisfied, for he never had any, but that he might be enabled to give a decided opinion, founded on facts, to the many who applied to him—the professor proceeds to show by what steps he arrived at the conclusion that the table, or any other inert matter, had no power of moving except that which was communicated directly to it from the hands of the operators. He associated with him several honourable, but sincere, believers in the table-moving mania; and, after a few experiments, in which abundant motion was communicated to the pieces of furniture operated upon, he clearly saw that the table moved under the action of ordinary mechanical power, when the parties did not intend, and did not believe, that they moved it by any such means.

But he sought to *prove* to these honourable believers, and through them to the public, that they really did move the table in this way, and that the influence of expectation on their minds was the actual cause of their hands moving the table, and that the table did not move their hands. His first object, therefore, was to remove all suspicion of electrical agency. Hence plates of the most opposite electric affinities, namely, sand-paper, millboard, glass, moist clay, tinfoil, cardboard, gutta-percha, vulcanised india-rubber, wood, &c., were made into a bundle and placed on the table under the hands of the operators. The table turned, nevertheless, though no electric or magnetic effects could be produced. Bundles of other substances were used and placed under the hands of different persons, but still the table turned. Neither during the use of these substances, nor at any other time while the experiments were in progress, could any apparent motion be observed in the hands of the operators; and no form of operation or mode of observation gave the slightest indication of any peculiar natural force. No attractions or repulsions, or signs of tangential power, appeared—nor anything that could be referred to other than the mere mechanical pressure exerted moderately by the operators. The tables went round, forwards, backwards, and sideways, at the will of the turners, and nothing of either "collusion, illusion, or delusion" was apparent.

But this cursory examination did not satisfy the professor. He therefore proceeded to analyse the kind of pressure exerted, at first unknown to the operators. Several pellets of a cement made of wax and turpentine were fixed on the under side of a piece of cardboard, and then placed on the table. The table turners laid their hands on the cardboard, and the professor waited the result. The table moved as before; but on examining the under side of the cardboard it was easy to see "by the displacement of the pellets that the hands had moved further than the table, and that the latter had lagged behind; that the hands, in fact, had pushed the card to the left, and that the table had followed and been dragged by it." It was evident, therefore, that the table had not drawn the hands and persons, nor had it moved simultaneously with the hands. The hands had left all things under them behind, and the table evidently tended continually to keep the hands back.

"The next step was to arrange an index which should show whether the table moved first, or the hand moved before the table, or both moved or remained at rest together." Various ingenious contrivances were invented and applied, "the result of which was," says Professor Faraday, "that when the operators saw the index it remained very steady; when it was hidden from them, or they looked away from it, it moved about, though they believed that they always pressed directly downwards; and, when the table did not move, there was still a resultant of handforce by which it was wished the table should move; which, however, was exercised quite unwittingly by the party operating. This resultant it is which, in the course of the waiting time, whilst the fingers and hands become stiff, numb, and insensible, by continued pressure, grows up to an amount sufficient to move the table or the substances pressed upon. But the most valuable test of this index apparatus (which was afterwards made more perfect and independent of the table), is the corrective power it possesses over the mind of the table turner. As soon as the index is placed before the most earnest, and they perceive—as in my presence they have always done—that it tells truly whether they are pressing downwards or only obliquely, then all effects of table-turning cease, even though the parties persevere, earnestly desiring motion, till they become weary and worn-out. No prompting or checking of the hands is needed—*the power is gone*; and this, only because the parties are made conscious of what they are really doing mechanically, and so are unable unwittingly to deceive themselves. I know that some may say that it is the cardboard next the fingers which moves first, and that *it* both drags the table and the table turner with it. All I have to reply is, that the cardboard may in practice be reduced to a thin sheet of paper weighing only a few grains, or to a piece of goldbeaters'-skin, or even—in principle—to the very cuticle of the fingers itself. Then the results that follow are too absurd to be admitted; the table becomes an incumbrance, and a person holding out his fingers in the air, either naked or tipped with goldbeaters'-skin or cardboard, may be drawn about the room, &c.; but I refrain from considering imaginary yet consequent results which have nothing philosophical or real in them."

The professor's conclusion is, that the mind becomes absorbed, and the muscles follow the will of the operator without his being aware of it; just as, in the process of walking, the legs move without a direct appeal to the senses, the mind having once determined that they *shall* walk. It is not insinuated that the experimentalists in table-moving are not perfectly honest in their desire to arrive at the truth; all that the professor declares is, that they are self-deceived. "Persons do not know," says this authority, "how difficult it is to press directly downwards, or in any given direction against a fixed obstacle; or even to *know* only whether they are doing so or not, unless they have some indicator, which, by visible motion or otherwise, shall instruct them; and this is more especially the case when the muscles of the fingers have been cramped and rendered either tingling or insensible by cold or long-continued pressure. If a finger be pressed constantly in the corner of a window-frame for ten minutes or more, and then, continuing the pressure, the mind be directed to judge whether the force at a given moment is all upward, or all downward, or how much is in one direction, and how much in the other, it will find great difficulty in deciding; and will, at last, become altogether uncertain."

It is proper to observe that, notwithstanding the high position which Professor Faraday deservedly occupies in the scientific world, both the fairness of his experiments and the soundness of his conclusion have been called in question. Facts have been communicated to the public which certainly do not, at first sight, appear easy to be reconciled with his theory. The subject must be still further investigated before it can be considered as satisfactorily settled.

ENGLISH WATERING-PLACES.—LOWESTOFT.

We need only look into the periodicals of the last century —the "Spectators," "Ramblers," and "Freeholders"—to get a tolerably true idea of the way in which our ancestors spent their summers. Then, as now, town-bred ladies and gentlemen, professional men and merchants, authors and shop-keepers, soldiers and sailors, and tinkers and tailors, were glad enough to get away from business in the city and to enjoy a little fresh air "out of town." But their choice of retreats was rather circumscribed; for, with the exception of Bath, Tunbridge Wells, and Cheltenham, there were few places which possessed sufficient attractions for the Lord Harrys and Lady Bettys of the time, and fewer still which had sufficient energy to call public attention to their beauties, much less to provide for any sudden influx of holiday-makers. The meeting of frilled and powdered gentlemen and hooped and furbelowed old-young ladies in the pump-rooms at Cheltenham, or the assemblies at Bath, where a system of stiff and formal courtesy, very suitable to the disciples of Beau Nash, solemnly carried on, was the extent of fashionable recreation—varied now and then by a little scandal, gambling, and love-making. In fact, the genteel folk of that day, as of this, invariably carried their town manners into the country with them.

Bath, and Cheltenham, and Tunbridge Wells have gone out of fashion, and no one now-a-days thinks of meeting the "best society" in those very clean and exclusive watering places; but the halo of their former glory hangs about them still, and it is not difficult, standing at one end of the Long Walk at the wells, to imagine burly Dr. Johnson holding a conversation with Steele and Goldsmith at the other, with a well-dressed group of delighted listeners standing under the shade of the old elm trees.

The growth of the population—more than doubled within fifty years—necessitated, as it were, the discovery of new Meccas and Medinas for the toil-stained pilgrims from London; and the rapid extension of the railway and steam-packet system has enabled thousands to get out of town for a day or two, who, under the old *regime* of post-horses and mail coaches, would have died, perhaps, without so much as looking at the sea from Margate Jetty.

And so now—thanks, again, all-powerful steam—we are enabled, in an hour or two, if not altogether to

> "Breathe the fresh air of the mountains,"

at least to recreate our bodies, and refresh our minds amidst the delightful scenery of Devonshire, or the Isle of Wight; or, if not inclined to go quite so "far away from home," we may "get a blow" on the Thames to Gravesend or Ramsgate, or, quietly dropping down to Bishopsgate-street, or London Bridge, find ourselves speeding away, at forty miles an hour, in the direction of Brighton or Lowestoft.

Both these towns have achieved popularity in comparatively recent times. George the Fourth, as became the "finest gentleman in Europe," brought old Brighthelmstone into fashion, and Mr. Kemp, a merchant and builder, munificently completed what the sovereign had begun, by building an entirely new town, which has been called after his name. Lowestoft, however, has not had the advantage of princely patronage, but mainly owes its present importance as a watering place to the desire of the Eastern Counties' Railway directors to make it a packet station for Denmark and the North of Europe.

Various opinions prevail as to the derivation of the word Lowestoft. By some it is supposed to be derived from Lodbrog, a Danish king who, it is said, having jumped into a boat to save a favourite hawk which had fallen into the sea, was carried across by a storm up the mouth of the Yare to Reedham, in Suffolk. Here he was kindly received by the inhabitants, and conducted to king Edmund who was then with his court at Caistor, about ten miles off. After having resided with the king for some time he was murdered by his falconer through jealousy of his success in hawking. Another derivation of the name is that it comes from *Lother Wistoft*, a *toft*, or cluster of houses, by *loth* or slow river—a description peculiarly applicable to the Waveney, which flows with a languid stream strongly contrasting with the rapidity of the *Gor*, or *rapid* near Gorleston. These questions, more interesting to antiquarians than general readers, we cannot enter into at present. Similar, though not perhaps equal, obscurity veils the early history of the town, in consequence of its destruction by fire in 1606, involving the loss of the town records, which were preserved in the vicarage. Little is known beyond the fact that is was perpetually at war with Yarmouth, on account of the attempt of the corporation of that town to monopolise the sale of herrings. The enmity between the two places was exhibited in the time of Charles the First, when they took opposite sides, and contended with great fury and alternate success.

In point of position, there are few towns within a few hours' railway journey from London, which can rival Lowestoft. The most easterly point of land in England, this little town is rapidly rising into public favour, on account of the extreme salubrity of its atmosphere, notwithstanding its apparently exposed situation, and the easy means of access it possesses with the metropolis, and the whole eastern division of England, through its connexion with the above railway,

> "Enthroned upon an ancient hill it rests,
> Calmly it lifts its time-worn head; and first
> Of all old England's busy towns, whispers
> Its orisons, and greets the rising morn."

Although only recently erected into a "watering-place," Lowestoft is one of the most ancient towns in the empire; or, to speak in more strictly correct language, there is little doubt that the Romans had a station on or near this spot. The present town consists of a single street, directly facing the beach, and "commanding an extensive prospect of the German Ocean," as an auctioneer would say, if he had to advertise Lowestoft as "a snug little property in the Eastern Counties." But in this one long street there are to be found "all the conveniences appertaining to the most complete" watering-place; together with—to carry on the auctioneer's phraseology—"that splendour and elegance" which belongs to the new town, and "that quaintness and bustle" peculiar to the old. Wide sands extend from the sea-shore almost to the pathways of the street; and the bathing on the shelving coast is both safe and practicable at all times of the tide. Of course there are the usual hotels,—the Royal Hotel taking the lead in public estimation,—a banking house, and the usual number of churches and chapels proper to a well-frequented and rapidly rising town. Fortunately for the peace of both the visitors and the inhabitants, Lowestoft has not yet arrived at the distinction of a parliamentary borough, or even of a mayor and corporation, like Gravesend and Garratt. But it has attractions of a far weightier kind in its beautiful Marine Parade, opposite the beach; and a couple of piers, each running about a quarter of a mile into the sea. From the esplanade, the sea view is very fine; for there is scarcely an hour in the twenty-four in which the aspect of the scene remains the same. Now a gay yacht or two skim lightly over the waves; now the offing is crowded with foreign-looking craft from France and Holland and the North of Europe, jostling with a mosquito fleet of fishing-boats on their way to the opposite coasts, in search of cod and whiting for the London markets; and again, light wherries, impelled by brawny arms, shoot across the way of black, heavy-looking colliers, and row-boats full of merry-looking girls and boys—young men and women they call themselves—disporting about the harbour in all the luxury of summer idleness.

And then the fishmarket, and the lighthouses, and the chalk-cliffs, and the harbour, each claim notice—had we space; but the artist's pencil is more eloquent than the writer's pen, and so let that suffice.

SIGNS OF OLD LONDON.

TRADESMEN'S SIGNS.

The rapid strides which have taken place, in the form of renovations, to accord with the tastes of the present race of the citizens of London, have conspired to erase almost all trace of the curious signs which formerly occupied so prominent and conspicuous a place in their streets. These signs may fairly be regarded as a species of heraldry or symbolism, and as such are deserving the attention of the antiquary, not only in exhibiting peculiar features in the appearance of the city, but as illustrations of the manners and customs of our ancestors. Although as a rule these distinguishing marks have been abolished, we have still types of the custom preserved. The gold-beater still exhibits his "Golden Arm and Hammer" projecting from the wall of his house; the fishing-rod maker, the trout dangling at the end of a line, the "Barber's Pole," the "Virginian Black" and the roll of the tobacconist, the "Black Doll" of the rag shops, and some few others, are met with in most of the streets; neither ought we to omit the more costly, and sometimes elegant, signs of the insurance offices, and which in many cases add greatly to the embellishment of our streets. But while this is the case, even the lowest description of our public-houses and inns, with their stuccoed renovations, appear to aim at an entire change from their former appearance, and carefully conceal their original sign.

The introduction of devices and signs against houses appears to have been a very early custom; indeed, it was the only mode of identification before the introduction of numbering, which was not adopted till the middle of the last century. These distinguishing marks were not only used by tradespeople and places of resort, but by private families. At the same time, the practice was not universal in either case, as we find in the descriptions of houses as "over against the Condyt," "neer to the May Pole," next Paull's Cross," "adjoining St. Dunstane's," &c.

Some of these descriptions appear to us of very inconvenient length, and in some instances exceedingly elaborate, as in the case of the address of William Faithorne, the engraver, in 1691, "at the sign of the 'Ship,' next to the 'Drake,' opposite to the 'Palgrave Head Tavern,' without Temple Barr," and in an advertisement, in 1701, of a public exhibition, "at the 'White Head,' near Pall Mall, facing the Haymarket, within two doors of the glass lamps." In the early part of the last century, we find, by the different communications to the newspapers, that the state of the streets caused great dissatisfaction to the public, not only from the encroachments made by the shopkeepers, who vied with each other in trespassing on the public way by their bow-windows, and who emulated to thrust each new one beyond his neighbour's. Notwithstanding the many complaints that were constantly made, it was not until 1766, that the subject was entered into by the corporation, who determined to remove many of the inconveniences and obstructions. By the evidence then published, it appeared that they chiefly consisted in projections or penthouses, and these, when loaded with flower-pots, often occasioned accidents, from their falling into the streets, and were exceedingly unpleasant to the passengers below, when these hanging gardens were over-watered. A writer of the period describes the extravagance of the signs, as "very large, very fine, with gilding and carving, but as very absurd. Golden periwigs, saws, axes, razors, trees, lancets, knives, salmon, cheese, blacks' heads, with gilt hair, half moons, sugar loaves, and Westphalia hams, repeated without mercy from the Borough to Clerkenwell, and from Whitechapel to the Haymarket."*

* The old song records them thus:—

"I'm amused at the signs
As I pass through the town,
To see the odd mixture—
A Magpie and Crown;
The Whale and the Crow;
The Razor and Hen;
The Leg and Seven Stars;
The Axe and the Bottle;
The Tun and the Lute;
The Eagle and Child;
The Shovel and Boot."

London was not the only city decorated with signs. In the beginning of the reign of Louis XIV., the inhabitants of Paris made a successful appeal to the king for their removal. It appears that their city was in a very sickly condition, and the mortality very great. The report made by the faculty was to the effect, that the signs prevented a free circulation of air through the streets, on which an edict was published, that no sign should be more than eighteen inches by twelve, and the weight limited to four or five pounds. At this time many of the iron signs in London weighed 400 or 500 pounds, and some a great deal more. In 1718, the front of a house, opposite Bride-lane, Fleet-street, fell down, and killed two young ladies, a cobbler, the king's jeweller, and several others, besides many maimed. This was occasioned by the wind blowing hard against the large sign and iron. The newspapers of the period recount many instances of accidents from the signs becoming detached from their frail supports, and it is even within the memory of many now living, that this was the case. Amongst the many objections which were then raised against them, and called for their removal, was that of the owners not always keeping them in proper repair, and allowing them to be blown down on the heads of the people. Besides this, those which swung, suspended by projecting poles or from hooks, kept up, in windy weather especially, a constant grating, creaking, squeaking, and other inharmonious and discordant noises, to the special annoyance of strangers sojourning in the neighbourhood.*

The court of Common Council appointed a committee in the same year, to consider the subject of the removal of these nuisances, which were ordered henceforth to be fixed to the front of the houses, flat against the wall. The spirit of improvement did not stop here; the water spouts, which had contrived to distribute their contents over the passengers, were removed; the streets were for the first time inscribed at the corners with their names; brass plates were introduced on the doors of the gentry, and the numbering of houses completed this portion of the great work of amendment.

From this time the streets wore a different aspect. The shops, which before had, for the most part, been little better than cribs for storing away goods, and in many instances without glass sashes, now adopted them, and exhibited their different wares. Many of the shopkeepers abandoned their signs altogether, while others adopted the plan suggested by the authorities, by having their signs painted on boards or flat pieces of iron, and nailed against the wall. These, in their turn, vanished, when the front of the old wooden projections decayed; and the signs themselves found their way to the old iron shops, or in a few cases were preserved by the owners as relics for the gaze of future generations. All that has been left to us are a very few and scattered examples.

The signs adopted by the tradespeople of London almost set at defiance a hope of achieving anything approaching to a satisfactory classification. At first sight, they appear to have been selected without reference to the trade or occupation of the owner of the house. We find the old sign often retained

* Gay, in his *Trivia*, in reverting to this subject, says:—

"But when the swinging signs your ears offend,
With creaking noise, then rainy floods impend;
Soon shall the kennel swell with rapid streams,
And rush in muddy torrents to the Thames."

And in his directions to the stranger walking the streets of London,—

"If drawn by business to a street unknown,
Let the sworn porter point thee through the town;
Be sure observe the signs, for signs remain
Like faithful landmarks to the walking train."

by a new tenant selling totally different wares, and sometimes a joint occupation of different callings, as in the case of Isaac Walton, who sold his goods in the shop of another, in Fleet-street, at the sign of the "Harrow."

While some signs were taken from the crest or heraldic bearing of the family owning the business, as in the case of the "Grasshopper of the Greshams," others have a reference to that of their patrons, as in the case of William Seres, a bookseller, in 1566, in St. Paul's Churchyard, who lived at the sign of the "Hedgehog," the badge of his patron, Sir Henry Sidney. The crests of various noble families are constantly met with, as, for instance, the "Eagle and Child" of the Stanleys, in several parts of Westminster, as well as in the city; and a still more common practice of adopting the entire arms or supporters of the different companies owning the property, or to which the tradesman belonged, and which accounts for the constant recurrence of the "Three Tuns" of the vintners. The "Queens' Heads," which form the crest of the mercers and others, are still found in stone inserted in the brickwork in many parts of the city.

In the investigation of this subject it is curious to remark upon the little assistance there is to be obtained by the most careful examination of engravings and drawings of that period. In many cases the signs were either omitted altogether, or so carelessly drawn, as rather to mislead than guide us in our researches; amongst other channels for information, and not the least valuable, will be found in the tradesmen's tokens, the subject on the obverse being mostly chosen from the sign of the house from which they were issued. The majority of these interesting evidences emanated from inns, coffee-houses, and other places of public resort. A list of several hundred tokens relating to London, has been published in an admirable work by J. Y. Akerman.* Another source of information is the titles of books; but this, of course, relates exclusively to the trade of bookselling and stationery. Of all the motives which induced a selection of subjects for signs, perhaps, the most singular is that of a play upon the name. We find, for example, William Norton, the printer, used the rebus of a sweet-william growing out of a tun, with the word "NOR" upon it. Pelham More, at Moorgate; his sign was a blackamoor's head and sun. John Day, the well-known printer, lived by the Little Conduit in Cheapside, at the sign of the "Resurrection," and which represented a boy being aroused from sleep, the rising sun, and the motto, "Arise, for it is daye." The sign of Grafton, the publisher and chronicler, was a branch or graft of a tree growing in a tun, and which gave rise to a witty remark of his rival, John Stowe, who said, in allusion to his chronicle, that it was the noise of empty *tonnes* and unfruitful *graffes*," to which Grafton replied by calling Stowe's work "lyes foolishly *stowed* together." Numerous other examples are found in the "Salmon and Bowl" of John Salmon, in Spitalfields, the same sign of Mrs. Salmon of the well-known wax-works in Fleet Street; the "Heart" of Jane Hart, in Southwark; the "Bell" of John Bell, in Wood Street; the "Key" of Jane Keye, in Bloomsbury market, and many others. The booksellers often seemed to aim at appropriate signs in reference to the works they sold. The sign of the "Evangelists" often occurs. Robert Wyer, in 1527, kept a shop "in Saynt Martyns Paryshe, at the signe of St. Johan Evangelyste," and perhaps the signs of the most frequent occurrence are those of the signs appropriated to the Evangelists, as the "Eagle" of St. John, the "Lion" of St. Mark, the "Bull" of St. Luke, and the "Angel" of St. Matthew. Others, more common, have the same reference. Abraham Veal, the printer, in 1548, kept a shop "in Paule's Chayne, at "John Baptist," and Henry Smythe, at the "Holy Trinity," without Temple Bar. In 1509, Henry Pepwell kept the "Trinity," and Michael Lobby the sign of "Saynte Mychell." Reynold Wolff at the "Brazen Serpent," which was supported by a "Fox" and a "Wolf," in allusion to his names, and it may be here worthy of remark that by his will he bequeathed his sign to his son Robert, a proof of the value of these objects, as well as of the estimation in which they were held. In the same locality, Gabriel Cawood had for his sign the "Holy Ghost." Others of a more terrestrial conception, and savouring of Romish ascendancy, were used, as the "Mitre," "Crosier," "Cardinal's Cap," and "Golden Cross." Hewghe Singleton dwelt at the "Dobblehood," in Thames Street; Thomas Hacket, at the "Pope's Head," in Lombard Street; and Julian Notary, the well-known bookseller, kept his shop, as he tells us by his titles, "Juxta Templum-barre, sub intersignio trium regum," and another shop in "St. Paules chirche yarde, at the west dore, besyde my lorde of London's Palayse, at the sign of the 'Three Kings.'" These were doubtless meant for the three kings of Cologne, of which tradition we have other indications in London. The sign of the "Keys" and the "Cross Keys" are common, and which may have reference to the keys of St. Peter. Bernard Kintot had his shop between Temple gates, at the sign of the "Cross Keys." The titular saints have also contributed subjects, as the "Wheel of St. Catherine," and the "Dragon of St. George," as well as these saints themselves. "The shyp of folys of the worlde, emprented by me Richard Pynson, in Flete Strete, at the sygne of the George, MCCCCCVIII.

> Our shyp here levyth the sees brode,
> By the help of God Almyght, and quyetly
> At anker we lye within the rode;
> But who that lysteth of them lye,
> In Flete-streete shall them fynde truly,
> At the George in Richarde Pynson's place,
> Prynter unto the Kyng's noble Grace."

William Middleton, in 1541, who succeeded Pynson, kept up the same sign, and used, as his rebus, a *tun* in the middle of a shield between two angels. The gridiron of St. Lawrence is another example; and we cannot omit the "Devil" of St. Dunstan, which was the sign of a well-known house in that parish, the resort of the wits of the last two centuries. In the same parish was the "Little Devil," where the members of the embryo society of antiquaries were wont to meet, before they removed to the "Mitre," which is still in existence.

The sports and pastimes of the people have contributed their subjects; for instance, the "Maypole" was to be found in the immediate vicinity of the spots on which they erected them, as well as the objects with which they were decorated. Robert and William Copeland, the former of whom was servant to Wynkin de Worde, kept a shop, in 1515, at the sign of the "Rose Garland," in Fleet-street. The old scrivener, "Ihon Waylande, at the signe of the Blew Garlande," in the same street. "Lilies, Violets, Sunflowers, and Marygolds," were not uncommon; while sports in the arena have provided us with "Bears, Bulls, and Cocks," without number; as well as the "Horn" of the huntsman. The "Falcon" was a favourite sign. Wynkin de Worde set up a press on the spot now occupied by No. 32, Fleet-street, and afterwards by Griffiths, "at the signe of the Faucon, in Saincte Dunstone's churchyarde, in the west of London, 1565;" as well as by a succession of printers and publishers, including John Murray, the publisher of Byron's works, and Samuel Highly, the well-known medical bookseller of our time. The court at the side of the house still goes by the name of this sign. John Harrison, who published the first edition of "Venus and Adonis," and "Rape of Lucrece," dwelt at the sign of the "White Greyhound;" and the first edition of Richard II. was printed at the sign of the "Fox." The celestial bodies furnished subjects: "Suns, Moons, and Stars" were interminable. Wynkin de Worde, "at the signe of the Sonne." Richard Tottel and Richard Pynson both lived at the "Hande and Starre," which is the house now occupied by Butterworth, the publisher; the site of their printing-office being now occupied by Dick's coffee-house. At the "Star," on Snow-hill, at the house of his friend Mr. Strudwick, John Bunyan died, in 1688.

* "Tradesmen's Tokens current in London and its Vicinity between the Years 1648 and 1672, by John Younge Akerman, Fellow and Secretary of the Society of Antiquaries." J. R. Smith. London, 1849.

JAMES WATT.

James Watt was born at Greenock, on the 19th of January, 1734. His great-grandfather owned a small estate in Aberdeenshire; but having joined in Montrose's insurrection, he was killed in battle, leaving an infant son to be brought up by relatives. When the orphan child grew to manhood, he showed great capacity for mathematical pursuits, and followed the profession of a teacher of mathematics in Greenock, where he died at the age of ninety-one. Two sons survived him: the elder, John, adopted his father's profession, to which he added that of a surveyor, and was much employed in Ayr and Glasgow, but died a few years after his father; the younger, James, was a block-maker and ship-chandler in Greenock, engaging occasionally also in ship and house building and general trading. He was an active and enterprising man, much esteemed by his fellow citizens, who chose him to fill some of the municipal posts of honour. Latterly, however, his concerns did not prosper—perhaps he had too many trades—and he retired from business with reduced means and impaired faculties, some years before the close of his life. His family consisted of two sons—James, the subject of our sketch, and John, who was drowned at sea in his twenty-third year. Of the mother, Agnes Muirhead, little is known, farther than that she belonged to a respectable family, so that we have not the means of discovering whether this case affords confirmation or the reverse of the assertion so often made, that the mothers of great men are almost always found to be persons of superior mental endowments.

When a child, James Watt's health was so delicate, that his school education was much interrupted. His mother taught him reading, his father writing and arithmetic. As is often the case with children compelled by ill health to a sedentary life, he became an incessant reader, and likewise formed habits of reflection far beyond his years. Some anecdotes of his childhood, which have been preserved, show how early the peculiar bent of his genius developed itself. A gentleman one day calling upon his father, observed the child bending over a marble hearth, with a piece of coloured chalk in his hand. "Mr. Watt," said he, "you ought to send that boy to school, and not allow him to trifle away his time at home." "Look how my child is employed before you condemn," replied the father. The gentleman then observed that the child had drawn mathematical lines and circles on the hearth. He put various questions to the boy, and was astonished and gratified with the mixture of intelligence, quickness, and simplicity displayed in his answers. He was then trying to solve a problem in geometry Another story tells how his aunt, Mrs. Muirhead, sitting with him one evening at the tea-table, said, "James, I never saw such an idle boy! Take a book, or employ yourself usefully; for the last half-hour you have not spoken a word, but taken off the lid of that kettle and put it on again, holding now a cup and now a silver spoon over the steam, watching how it rises from the spout, and catching and counting the drops of water. At the same time the boy showed other talents of a very dissimilar kind. Nobody could tell a story like James Watt. His mother once left him in Glasgow, at the house of a friend, and was astonished, on her return, by a request from the lady whose guest he was, to take her son home; for, said she, "I cannot stand the degree of excitement he keeps me in: I am worn out for want of sleep. Every evening, before ten o'clock, our usual hour of retiring to rest, he contrives to engage me in conversation, then begins some striking tale, and, whether humorous or pathetic, the interest is so overpowering, that the family all listen to him with breathless attention, and hour after hour passes unheeded." This accomplishment he retained in an extraordinary degree through life; and those who went into his company with the expectation of finding a grave, reserved man, absorbed in his own peculiar pursuits, were astonished to meet instead, one of the most genial, humorous, and fascinating companions. The lad had a taste for all kinds of knowledge, and everything he took up he studied with characteristic enthusiasm. On the banks of Loch Lomond, whither he was often sent for health, botany and the traditional lore of the neighbourhood were his delight. At home, chemistry, and natural philosophy in various branches, with medicine, surgery, and mechanical contrivances, filled up his busy hours.

At the age of eighteen he went to London, to learn the business of a mathematical instrument maker; but in little more than a year was compelled, by ill health, to return home. The two following years he spent under the paternal roof or in visits to his mother's relatives in Glasgow. He was not idle, however, but diligently occupied in perfecting himself in his business. In 1757, he determined to settle in Glasgow, but some of the trade's corporations stood on their privileges, and would give no place to the new comer. In this dilemma, the professors of the university kindly came to his relief, and naming him mathematical instrument maker to the university, gave him apartments within their premises, in which to carry on his business. The University of Glasgow could then boast of Adam Smith, Robert Simson, Dr. Black, and Dr. Dick, and it may be inferred that the person who could at twenty-one secure their zealous aid, must have given no doubtful indications of ability. Here Watt formed a lasting friendship with Dr. Black, and about the same time commenced his friendship with Robison, who was then a student at Glasgow, and afterwards professor of natural philosophy in the University of Edinburgh. The intelligent young instrument maker's shop became a favourite resort with the choice spirits of the place, in which to discuss all curious questions in science, art, or literature. "Whenever any puzzle came in the way of us students," says Robison, "we went to Mr. Watt. He needed only to be prompted; for everything became to him the beginning of a new and serious study, and we knew that he would not quit it till he had either discovered its insignificancy, or made something of it. He learnt the German language in order to peruse Leopold's 'Theatrum Machinarum.' So did I, to know what he was about. Similar reasons made us both learn the Italian language. When to his superiority of knowledge is added the naïve simplicity and candour of Mr. Watt's character, it is no wonder that the attachment of his acquaintances was strong. I have seen something of the world, and I am obliged to say I never saw such another instance of general and cordial attachment to a person whom all acknowledged to be their superior. But this superiority was concealed under the most amiable candour, and a liberal allowance of merit to every man." Here is an instructive picture. A young tradesman, most diligent in his workshop labours, yet finding time to learn foreign languages, and acquire so much general information as to be the superior companion of men, whose lives were spent in intellectual pursuits. And how charming, too, the modesty and candour which accompanied his great attainments. This is the crowning grace of all.

In 1763, he left the college, and opened a shop in the town, previously to his marriage with his cousin, Miss Miller. The steam engine had been a frequent subject of conversation with his friend Mr. Robison, who had suggested the possibility of applying steam power in moving wheel carriages. In the year 1761 or 1762, Watt had tried some experiments on the force of steam in a Papin's digester, but it was not until the winter of 1763-4 that the incident occurred which led to his great discovery. The history of this event had better be given in the words of his son, taken from the memoir of his father, furnished by him to the Encyclopædia Britannica. A working model of a steam-engine, upon Newcomen's construction, had been sent him for repair by Anderson, professor of natural philosophy. "When he had repaired it and set it to work, he found that the boiler, though large in proportion to the cylinder, was barely sufficient to supply it with steam for a few strokes per minute, and that a great quantity of injection water was required, though it was but slightly loaded by

the pump attached to it. It soon occurred to him that the cause lay in the little cylinder (two inches diameter, six inches stroke), exposing a greater surface to condense the steam than the cylinders of larger engines did, in proportion to their respective contents. By shortening the column of water in the pump, less steam and less injection water were required, and the model worked at a proper speed. Thus the purpose for which it was put into his hands was accomplished, and with this mode of accounting for the defect, and this result, most artists would have been satisfied ; but the case was different with Mr. Watt. He had now become aware of a great consumption of steam, and his curiosity was excited to a more accurate investigation of the causes, in which he proceeded in a truly philosophical manner. The cylinder of his small model being of brass, he conceived that less steam would be condensed by substituting cylinders of some material which would transmit heat more slowly. He made a larger model, with a cylinder (six inches diameter and one foot stroke) of wood soaked in oil and baked to dryness. He ascertained from experiments made with boilers of various constructions, that the evaporation of boiling water is neither in proportion to the evaporating surface nor to the quantity of water, as had been supposed, but to the heat that enters it, and that the latter depends chiefly on the quantity of surface exposed to the action of the fire. He likewise determined the weight of coal required for the evaporation of any given quantity of water. Being convinced that there existed a great error in the statement which had been previously given of the bulk of water when converted into steam, he proceeded to examine that point by experiment, and discovered that water converted into steam of the heat of boiling water was expanded to 1,800 times its bulk, or, as a rule for ready calculation, that a cubic inch of water produced a cubic foot of steam. He constructed a boiler to be applied to his model, which showed, by inspection, the quantity of water evaporated, and consequently enabled him to calculate the quantity of steam used in every stroke of the engine. This he now proved to be several times the olume of the cylinder. He also observed

that all attempts to improve the vacuum, by throwing in more injection water, caused a disproportionate waste of steam; and it occurred to him that the cause of this was the boiling of water in vacuo at very low heat (recently determined, by Dr. Fuller, to be under 100°), consequently, at greater heats, the injection water was converted into steam in the cylinder, and resisted the descent of the piston. He now perceived clearly, that the great waste of steam proceeded from its being chilled and condensed by the coldness of the cylinder before it was sufficiently heated to retain it in an elastic state, and that, to derive the greatest advantage, the cylinder should always be kept as hot as the steam which entered it; and that when the steam was condensed, it should be cooled down to 100°, or lower, in order to make the vacuum complete. Early in 1765 the fortunate thought occurred to him of accomplishing this by condensing the steam in a separate vessel, exhausted of air, and kept cool by injection, between which and the cylinder a communication was to be opened every time steam was to be condensed, while the cylinder itself was to be kept constantly hot. No sooner had this occurred to him than the means of effecting it presented themselves in rapid succession. A model was constructed, and the experiments made with it placed the correctness of the theory, and the advantages of the invention, beyond the reach of doubt.

In the course of these trials he was much struck by the great heat communicated to the injection water by a small quantity of steam, and he proceeded by a very simple experiment to satisfy himself upon that subject, when he discovered that water converted into steam will heat about six times its own weight of water at 47° or 48° to 212. He mentioned this extraordinary fact to Dr. Black, who then explained to him his doctrine of latent heat, to the support of which Mr. Watt had afterwards the satisfaction of contributing his experiments. From some of these he was led to suppose the latent heat of steam to be above 1,000°, but he afterwards considered 960° a more accurate determination. From others he deduced the important conclusion that the sum of the latent and sensible heat of steam, at different temperatures, is a constant quantity, the latent heat increasing as the sensible heat diminishes, or, in other words, that a given weight of water in the state of steam contains nearly the same quantity of heat, whatever may be the bulk or density of the steam.

The invention now complete, the next consideration was how to obtain funds to execute it on a large scale. At length Mr. Watt applied to Dr. Roebuck, of the Carron Ironworks, and a partnership was formed, by the terms of which Dr. Roebuck was to receive two-thirds of the profits of the improvement. A large steam-engine was then constructed by Mr. Watt, at Kinneil, near Borrowstonness, Dr. Roebuck's residence; the trials with which realised their most sanguine anticipations. Soon after, however, Dr. Roebuck's circumstances became embarrassed, and this, along with Mr. Watt's engineering engagements, delayed for some time the introduction of his discovery to the public.

A patent was obtained for it in 1769, but for some years nothing further was done in regard to it. In the meantime Watt had relinquished his business of mathematical instrument maker, and adopted that of civil engineer. In 1767, he made a survey for a canal of junction between the rivers Forth and Clyde, by what was called the Lomond passage, but the bill for it was lost in Parliament. He surveyed and superintended the making of the Monkland Canal. For the Crinan and Caledonian Canals, also, surveys were made by him at different times; the former was executed several years afterwards by Mr. Rennie, and the latter by Mr. Telford, on a much larger scale than was originally intended. He was employed likewise in improving the harbours of Ayr, Port Glasgow, and Greenock, in deepening and improving for navigable purposes the Clyde and other rivers, in building bridges at Hamilton and Rutherglen, and other works of public utility. While engaged in one of his surveys, in the end of 1773, he received the afflictive intelligence of the death of his wife, who left him a son and daughter.

Not long after, Mr. Boulton, of Soho Foundry, near Birmingham, a man of great intelligence and enterprise, and possessing large capital, bought Dr. Roebuck's interest in the steam-engine patent, and took the inventor into partnership—a connexion fortunate for the parties immediately concerned, and most important in the history of the world's material progress. Watt now removed to England, and obtaining an extension of the term of his patent to twenty-five years, the making of steam-engines was commenced at Soho by the firm of Boulton and Watt. About this time he entered into a second marriage, with Miss M'Gregor, the daughter of an old Glasgow friend, and in her we are told he found "a zealous and able coadjutor."

The engines made at Soho were at first only used for mining purposes. They were soon introduced into Cornwall, and found of the greatest value. The saving in fuel amounted "to three-fourths of the quantity consumed by those of the best construction previously in use." The patentees were entitled to a third of this saving. Many attempts, however, were made to defraud them of their dues, as well as to pirate Watt's inventions. From 1792 to 1799, they were engaged in vexatious law-suits in defence of their rights. Watt jocularly writes to his friend, Dr. Black:—"We have been so beset with plagiaries, that if I had not a very good memory of my doing it, their impudent assertions would lead me to doubt whether I was the author of any improvements in the steam-engine, and the ill-will of those we had most essentially served, whether such improvements have not been highly prejudicial to the commonwealth." All the proceedings terminated in the full confirmation of Watt's claims. During these years enterprising men were engaged in various quarters in attempting to adapt the steam-engine to water conveyances. Long before Watt's time, indeed, the practicability of employing steam power in navigation had been frequently suggested. Towards the close of the seventeenth century, both Savary and Papin indicated the possibility of some such use being made of their engines. In 1730, Dr. John Allen "proposed to give motion to vessels by forcibly ejecting a stream of water or current of air from their stern;" and seven years after, Jonathan Hulls published an account of a steam-boat invented by him. "In 1757, the celebrated Daniel Bernoulli, in an essay which obtained a prize from the Academy of Sciences, after demonstrating the effects of many mechanical contrivances which might be substituted for oars in moving vessels, suggests paddle-wheels moved by steam power or the force of gunpowder." About seventeen years later, experiments with steam-boats were made on the Seine by the Comte d'Anxiron, under the auspices of a company formed for the purpose. They failed, and a year or two after were repeated by M. J. L. Perien, with improved machinery, but not much success. All similar attempts showed the same results, till Watt's engine, with its wonderful power of universal adaptation, was brought into use.

The first really successful steam-boat experiment was made in Dalswinton Lake, Dumfriesshire, in October, 1788, by Mr. Miller, of Dalswinton. This gentleman had been experimenting for some time on the best mode of impelling vessels by the power of men and of horses applied to the paddle-wheels. The idea of using steam power he owed to the tutor of his family, Mr. Taylor. The difficulty was, how to apply the engine to the boat, and Mr. Symington, an engineer, who was at that time endeavouring to adapt the steam-engine to wheel carriages, was consulted. By the joint exertions of the three, a plan was formed, and a twin or double pleasure boat built with the engine in a strong oak frame placed on one side, the boiler on the opposite side, and the paddle-wheels in the middle. The success of the experiment was complete, and the boat went at the rate of five miles an hour. Mr. Miller had a larger boat built soon after, which was tried in the presence of many spectators; but unfortunately the paddle-wheels broke. A second trial was made with stronger wheels, on the 26th of December, 1789, when it was found that the vessel sailed at the speed of seven miles an hour.

In 1801, Mr. Symington was employed by Lord Dundas to

make a tug boat for dragging vessels on the canal. The Charlotte Dundas was accordingly constructed, which "took in drag," says Mr. Symington, "two loaded vessels, each upwards of seventy tons burden, and with great ease carried them through the long reach of the Forth and Clyde Canal to Port Dundas, a distance of nineteen miles and a half in six hours, although the whole time it blew a very strong breeze right ahead." Its use was relinquished from an opinion, held by some of the canal proprietors, that the paddle wheels injured the banks of the canal.

A year or two after, Symington was visited by an American, Mr. Fulton, who had been engaged in steam-boat experiments on the Seine, under the patronage of Mr. Livingstone, the American chancellor. Symington took him on board the Charlotte Dundas, had it put into motion, and furnished him with all the information he desired. Fulton then ordered an engine of Boulton and Watt, it is said under an assumed name, had it conveyed to America, and, in 1807, the Clermont with the Soho engine was launched in the Hudson river, to sail between New York and Albany—the first American steamer, and the first steam ship anywhere, regularly employed for commercial purposes. The Americans have also the credit of being the first to venture on deep sea navigation in steamers; this bold feat—as it was then accounted—being accomplished by Mr. Stevens of Hoboken, who had his vessel taken from the Hudson to the Delaware by sea.

In 1813, the Cornet, a vessel of about twenty-five tons, was built at Port Glasgow, by order of Mr. Henry Bell, and was the first steam passage ship in Britain. It plied on the Frith of Forth. By and bye, others were started, and such sea voyages as between Great Britain and Ireland, and from Leith to London, or Glasgow to Liverpool, were ventured upon.

The next great advance in steam navigation was made by Mr. Napier, by whose means a regular steam communication was established between Greenock and Belfast, and to him is due the praise also of getting post-office steam packets established. In 1822, the "James Watt" steam vessel was built, to ply between Leith and London. "With the exception of the low proportion of its power to its tonnage," says the historian of steam navigation in the Encyclopædia Britannica, "the 'James Watt' possesses almost all the qualities of the most improved vessels of the present day."* In 1826, the "United Kingdom" was built, the first of the Leviathan class of steamers; and, in 1838, notwithstanding the outcry as to its impracticability, regular steam communication across the Atlantic was established, thus bringing the old and new worlds into close neighbourhood.

It is time to return from this digression to Watt's personal history. He had been peculiarly happy in the choice of a partner, for Mr. Boulton, in the most judicious manner, took all the cares of business on himself, so as to leave Watt free to devote all the energies of his inventive mind to the advancement of science and the useful arts. The application of the powers of steam to give a rotary motion to mills, occupied much of his attention. After various unsuccessful attempts, he was induced "to turn his thoughts to the adaptation of the reciprocating motion to the production of a continued regular rotary one. This he accomplished by a series of improvements, the exclusive property of which he secured by successive patents in the years 1781, 1782, 1784, and 1785; including, among other inventions, the rotary motion of the sun and planet wheels, the expansive principle, the double engine, the parallel motion, and the smokeless furnace. The application of the centrifugal regulating force of *the governor* gave the finishing stroke to the machine."* Thus perfected, how truly is it found to justify Lord Jeffrey's remarks, that it "has increased indefinitely the mass of human comforts and enjoyments, and rendered cheap and accessible all over the world the materials of wealth and prosperity. It has armed the feeble hand of man, in short, with a power to which no limits can be assigned, completed the dominion of mind over the most refractory qualities of matter, and laid a sure foundation for all those future miracles of mechanic power, which are to aid and reward the labours of after generations."

In 1780, Watt invented a machine for copying letters and drawings; and in the winter of 1784 contrived an apparatus for heating the room in which he wrote by steam. In 1786, he and Mr. Boulton went to Paris, by invitation of the French government, to suggest improvements in the mode of raising water at Marly. While there, Berthollet communicated to him his discovery of the bleaching properties of chlorine. On his return, Watt informed his father-in-law of the process, and under his direction it was successfully tried at Mr. M'Gregor's bleach-field, near Glasgow. The introduction of this valuable improvement into Britain must, therefore, be numbered amongst the many benefits bestowed upon it by means of this great man.

From early youth he had been fond of chemical studies, and in this department, likewise, he was destined to be a successful inquirer. In a letter, written to Dr. Priestley, on the 28th of April, 1783, he announces his hypothesis as to the composition of water, to which he had been led by some of Priestley's experiments. Cavendish, as is well known, came to similar conclusions about the same time, and verified them by experiment. We do not enter on the vexed question as to whom the honour rightly belongs of being considered the discoverer of the composition of water, "the greatest and most prolific discovery," says M. Arago, "of modern chemistry;" but it is certain that Watt did not borrow his theory from any other person.

On the expiration of his patent, in 1800, he retired from business, with abundant wealth, full of years, and loaded with honours, an active, prosperous, cheerful old man. But even he had to feel, that in his best estate "man walks in a vain show." Death entered his family and snatched from the affectionate parent the dearly-cherished youngest son. Gregory Watt, who had, with his elder brother, succeeded to his father's business, was a young man of high mental endowments, distinguished attainments, and brightest promise, when disease and death came to withdraw him from all earthly occupations. It was a sore stroke to the aged father, and reads a salutary lesson to all.

Although no longer in business, Watt was still busily and usefully employed. Having been applied to by a Glasgow company for advice as to the conveyance of water across the river from a well which afforded a natural filter, he proposed to lay across the bed of the river a flexible main with ball and socket joints, the idea of which was suggested to him by a lobster's tail; and some time after it was effected with entire success.

He paid his last visit to Scotland in 1817, when his friends were delighted to find him active and cheerful as ever. The next year Mr. Watt invented a machine for copying pieces of sculpture. Though never finished, several specimens were executed by it, which he distributed amongst his friends as "the work of a young artist just entering his eighty-third year."

Early in 1819, symptoms of declining health alarmed his friends, and on the 25th of August his long and useful life closed, at Mr. Watt's own residence, Heathfield, in Staffordshire. His health had been delicate from childhood, and during a large portion of his life he suffered greatly from headache; yet, notwithstanding his incessant labours, he lived to see his eighty-fourth year. No doubt the simplicity and temperance of his habits tended to counteract the natural debility of his constitution. In life many honours had been bestowed upon him. He was a member of the Royal Societies both of London and Edinburgh, and a corresponding member of the Batavian Society. The University of Glasgow bestowed on him the honorary degree of LL.D. in 1806, and he was one of the foreign members of the National Institute of France. After death, filial affection and public gratitude awarded him such homage as monuments and statues can give. A marble statue, by Chantrey, rests on his tomb; another, by the same artist, was presented by his son to the University of Glasgow; and, far better, £3,500 was expended by the younger Watt

* Encyclopædia Britannica.

in a handsome building for a library in his father's native town, in which the inhabitants have placed a statue of their distinguished townsman. Every one who has visited Westminster Abbey will remember the colossal statue of Watt, also the work of Chantrey, which stands there, bearing an inscription from the pen of Lord Brougham.

Mr. Watt was no less beloved for his private virtues than respected for his public services. He is another instance, added to the many already on record, of greatness and amiableness combined,—of a man with intellect sufficient to conceive and execute the greatest designs, and the plain, practical good sense and good temper which give security to friendship and happiness to all around. He claimed no right of genius to infringe the laws of social life, and indulge his own whims at the expense of the feelings and convenience of others.

THE SACRED IBIS.

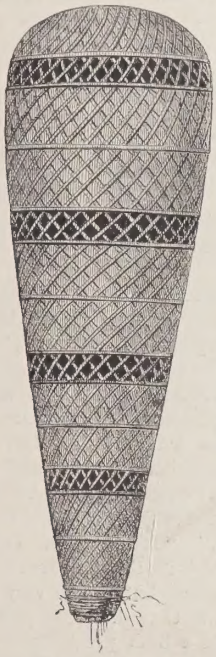
The ancient Egyptians rendered divine honours to the Ibis. They religiously preserved it in their temples, and esteemed it as the incarnation of deity. They attributed to it the most exalted virtue, associated it with the mysteries of Isis and Osiris, recognised in it the guardian of the land, and made it the object of idolatrous service at all their solemn banquets. The priests of Hermopolis preserved in their temple an ibis, which was said to be immortal. The reason for worshiping this peculiar bird was that it had rendered great services, true or supposed, to the land of Egypt; so it was reared with the tenderest solicitude, wandered unmolested through their towns, and he who killed an ibis, though inadvertently, was punished with death.

THE SACRED IBIS.

Herodotus tells us, that the ibis saved Egypt from the invasion of a host of winged serpents, and that in consequence, the Egyptians entertained a great veneration for their deliverer; and different ancient authors after Herodotus,—Cicero in his "Nature of the Gods," Pomponius in his "History of the Universe," and others,—relate the same story. It was commonly believed that the ibis not only killed but devoured the serpents, and as these fiery flying creatures were deadly foes to man, the bird who became their enemy was the friend of man, more than a friend—a guardian—a god.

Other reasons which may have given rise to the honours anciently bestowed upon the ibis, have been suggested in modern times. The bird inhabiting the borders of the Nile would become associated with that sacred river. The inundations of that stream, which fertilised the surrounding districts and secured plentiful harvests, was, and still is, one of the greatest blessings of the land; and in those distant times, when to man's untutored intellect all was godlike or God, the bird which found its home near the fructifying river, may

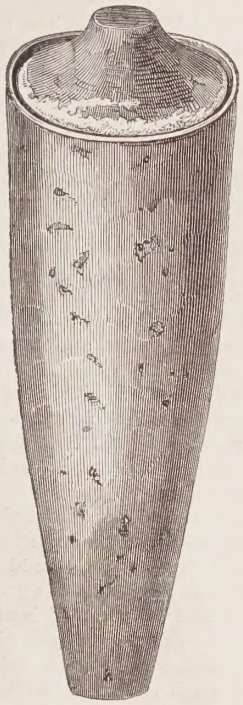
have been regarded as the guardian of the stream, and so, the benefactor of the country. As to the story of the winged serpents there is nothing, it was formerly argued, in the habits, the conformation, or the propensities of the ibis, to warrant its acceptance and belief, and by many, the narrative of Herodotus is regarded as a fable; but fable or not, the thing



MUMMY OF THE EGYPTIAN IBIS.

was once devoutly believed, and so great was Egyptian veneration for the bird, that when an alien army besieged an Egyptian city, the inhabitants durst not resist them, because in their company an ibis was seen.

In our own time, antiquarian research has discovered many curious remains of this holy bird of the Egyptians. Perfect specimens of the ibis have been found in the catacombs of Egypt. Very many mummies in a state of preservation have been found at Saccara, Memphis, and Thebes, for the old Egyptians were careful to preserve from corruption even the dead bodies of these birds. The mummies are remarkable for the attention which has evidently been bestowed upon them. Their exterior is composed of fillets of linen-cloth arranged like trellis-work; in the interior the birds are always disposed in one form, being closely packed together, strongly impregnated with bitumen; and the bird, with its linen covering, is then enclosed in an earthen pot, of a peculiar shape, tapering towards the lower extremity. The opening of



EARTHEN PITCHER CONTAINING THE MUMMY OF THE EGYPTIAN IBIS.

the pot is covered with an earthen lid, hermetically sealed. In the catacombs of Memphis there is a large collection of these mummies, systematically arranged, one above the other; the place is called the Bird-pit, and some very interesting specimens have been brought to Europe.

EGYPTIAN SCULPTURE OF THE SACRED IBIS.

The general characteristics of the ibis are: a long beak, bent, almost square at the base, but round and obtuse at the point; the nostrils are small, and situated very near the commencement of the beak; the head and upper part of the neck black, and devoid of plumage; the legs are long and slender, and the claws very remarkable in appearance. There is a

great variety of species, common to different countries, which possess the same characteristics as the ibis, but it has been doubted whether the bird which the Egyptians worshipped as divine is really known at the present day.

The inquiries of the learned have, however, satisfactorily answered the question. The researches of Savigny and Cuvier were not without result. The catacombs of Thebes and Memphis have disclosed the secret. The mummies, which long ago were so carefully prepared by the wise men of Egypt, have afforded the means of ascertaining the nature of the deified bird. It appears that there are two species, perfectly distinguished from one another. They are those which ornithologists designate under the names of the white ibis (ibis religiosa) and the black or green ibis (ibis falcinella).

The white ibis, or sacred ibis, has a full robust body, the head and neck denuded of feathers, the tail short. The general plumage is clear, spotless white, with the exception of the tips of the quill-feathers, which are generally black, reflecting a bright violet or green. Travellers have observed this species on the banks of the Nile, and it is identical with the white ibis represented in old Egyptian sculptures and found in Egyptian tombs.

The black or green ibis is of a black plumage, which reflects in certain lights a green or violet colour. This bird is found in Europe, India, and the United States. It received, as well as the sacred ibis, divine honours, but is less frequently found among the mummies.

The ibis dwells in society. They are found in flocks of six or eight; the flocks of the black ibis sometimes exceed thirty or forty. The parent birds carefully build the nest for the young, and rear the little ones with the utmost solicitude, so that poets have celebrated them as models of tenderness and fidelity, whose love is only destroyed by death. Their habits are peaceable and affectionate. In youth the neck is partially covered with down or small feathers of a blackish tint, which fall off when the plumage is mature, leaving the head and neck bare, which, with the beak and feet, are of a decidedly black colour.

Bruce was the first who broke through the popular errors respecting the ibis, and made it quite clear to all, that the true sacred ibis, such as was of old worshipped in Egypt,—such as is still found in the mummy-pitchers, represented in the pictures discovered at Herculaneum, and sculptured on ancient medals and vases,—was no other than the bird known by the name of Abou-Hannes, or Father John, of modern Egypt. Speaking of two mummies taken from the pits of Saccara, Cuvier says:—"On carefully exposing them, we perceived that the bones of the embalmed bird were much smaller than those of the tantalus ibis of Linnæus; that they did not much exceed those of the curlew in size; that its beak resembled that of the latter, being only a little shorter in proportion to its thickness, and not at all like that of the tantalus; and lastly, that its plumage was white, with the quills marked with black, as the ancients have described it. We found, after some inquiries, that the mummies of the ibis which had been opened before by different naturalists were similar to ours."

It seems that the errors once prevalent regarding the ibis arose from that strange old story of Herodotus about the bird's devouring flying serpents. It was thought that a bird which could do this must be strong and powerful, and armed with a large beak; and naturalists therefore sought for the bird among such as possessed these characteristics. Cuvier, without arguing the truth of the story, says:—"Positive proofs, such as descriptions, figures, and mummies, ought to preponderate always over accounts of habits too often imagined without any other motive than to justify the different worships rendered to animals." "It might," he says, "be added, that the serpents from which the ibis delivered Egypt are represented to us as very venemous, but not as very large. I have even obtained direct proofs that the birds preserved as mummies, and which have had a beak precisely similar to that of our bird, were true serpent-eaters; for I found in one of their mummies the still undigested remains of the skin and scales of serpents, which I have deposited in our anatomical galleries."

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER V.—PART III.*

It is now a considerable space of time that we must hasten over in our narrative. Leonard became a constant visitor at the Gaywoods' little home, and the affection of little Cuthbert grew the strongest bond between them. The child, spite of a peculiarly affectionate nature, was passionate, most difficult to govern, and of such a sensitive temperament—at times, with an occult sense, as it were, showing itself within him by strange dreams and instincts—that Lucretia trembled for his health, either physical or mental. With Leonard she took earnest and deep council. Her brother Robert wrote, urging that his little son should immediately be placed in some school, where, among boys of his own age, the morbid and unusual developments of the child's nature should be ground off by contact with the realities of life. A public school in the city where his friend Rutherton had been educated, he indicated as the school where, when old enough, Cuthbert should be placed. But Lucretia recoiled from such a training for this peculiar child.

Communicating with Mr. Rutherton during his stay in England, and most earnestly (in an interview she had with him before his return to India) entreating him to influence her brother so far as to defer Cuthbert's entrance into a public school, until at least he had attained the age of twelve, Lucretia obtained a partial compliance with her prayers. Cuthbert should remain under his aunt's roof till he was ten; now he was eight. These two years should be most religiously employed for good, she determined, and many were her earnest conferences on this subject with Leonard, who held such singular sway over the child's mind. And in her schemes, also, for Mary's education, Lucretia took council with her friend. But not alone was Leonard's influence felt over Cuthbert, and in Mary's German lessons, but his whole graceful, poetical, and artistic nature flowed forth from him in warm and vivifying radiations—a fresh interest in life had awoke within him, and with it a more natural tone of mind. This period of his life was, perhaps, if not the most full of strong joy, the most painless. The purest and noblest friendship bound these friends together, each influencing the other for good. And Lucretia's influence, though of a different nature to his upon Mary, herself, or the child, was even a more vital one. It was a keen *moral* influence. Lucretia's upright mind, unswayed by specious reasoning, struck directly to the moral heart of a subject. Unceasingly, also, she sought to arouse a spirit of joyful, prayerful activity within poor Leonard, whose misery seemed to have bound him with fetters of listlessness and sloth as regarded all creative labour. She sought to work upon his soul through his moral being. Ambition—fame—never entered into her view of Leonard's career. His affections were the lever by which she sought to raise up his dormant energy.

To her influence, especially, may be attributed Leonard's resolve to spend several years abroad. It was a real sacrifice to Lucretia the loss of his society, but she speeded him forth without one selfish regret. And the cheerful tone of his letters—the eager joy in the great works of great men, who until then had been to him mere words and misty dreams—was a

* Continued from p. 12.

four-fold reward for any pain she herself had endured. It was evident to her, that Leonard's artist soul had ascended into a peculiarly elevated region of thought and feeling.

Two years or more had elapsed from the time of Leonard's departure, when a couple of pictures excited an unusual degree of attention in the exhibition of the Royal Academy. They were hung side by side, and being the works of men whose names were new to the public at large, and each possessing in its way a marked character, were always surrounded by a throng of critics, admirers, and cavillers. The larger of the two pictures contained many figures, and possessed a strangely weird spirit, which instantly arrested the attention. Heavy dim tempest-clouds, with lurid reflections in them, were rolling up athwart a brilliant sunset sky—a sky so translucent, that the eye, penetrating through the jagged fissures of the storm-clouds, felt as though it might pierce to the very gates of heaven. A stretch of ocean, reflecting the dusky shadows of the storm and the dying radiance of the heavens, boiled up against a rocky shore. Upon a promontory, jutting forth into this panting ocean, amid sea-grasses and sea-blossoms, bent and torn by the sudden tempest falling upon the world, lay the dead body of a beautiful and young man. His peaceful white face was turned full towards the sky—a livid shadow falling upon it from the tempestuous clouds. The face was as the face of Christ in its look of a deep love, unutterable; no stamp of pain was upon his mouth or brow, although blood oozed from the breast, staining with clear crimson the broad folds of a white tunic, edged with a deep golden border. The hands had fallen crosswise over the body; the sea-flowers and grasses bent over him, bedewing the poor, beautiful corpse, with their tears. Ravens and doves whirled through the sky in mad grief. Trees upon a distant cliff bowed themselves before the coming sorrow, or stretched forth their huge arms, appealing to heaven with a mighty agony. Not nature alone mourned over the stricken white form, but men also, and women and children. Warriors and sages, of godlike mould, bowed their heads, mourning and pondering over the great misery. One warrior, of especially majestic mien, with a golden shield gleaming as a sun on his broad shoulders, leant upon a huge mallet of iron, and gazed inquiringly, with an enigmatical look in his stern and solemn eyes, upon the face of the slain; whilst another form of yet more godlike proportions, and wrapt in a violet mantle which fell over golden armour, raised his countenance with a sudden and awful joy as the astounding tidings of a far-off future are whispered to him by two ravens, messengers from All-Father, and who, with heavy wings, poised themselves above the silver locks of the sage, which were confined within a circlet of gold.

It was the death of Balder,—the God of Love of the old Scandinavian mythology—gone from the world, where Love and Justice, and gods and men, and nature, must mourn the death of Balder until his final restoration—when there will be a fresh heaven and a fresh earth, and the great harmony of gods and men shall be born.

The other picture was a striking contrast in composition, subject, and colouring. It simply represented Paul and Virginia within the depths of their tropical forest. It was the embodiment of the most pure, the most virginal love—yet a love of the senses as well as of the soul; it was a burning gleam of perfect joy, yet but a gleam—the intenser the more transient. The very vividness of the flame cast a shadow afar off. Lips pressed to lips—the children stood beneath the dim shadows of the heavy fern-like palm-leaves—scarlet and azure passion-flowers springing up from the mossed earth, clustering and entwining with tight tendril clasps; whilst moonlight-tinted blossoms of strange fantastic forms, but pure as the brows of angels, gleamed down, drooping from the verdant canopy. The children's arms encircled each other with a clasp tight as that of the passion-flowers. A flush tinted Paul's brow; but Virginia, with her earnest deep eyes, was white as the moonlight blossoms. There seemed a might of love and purity, binding the two together, which must be omnipotent over fate itself; but already the forboding breath of a hurricane raised the heavy leaves of the palm—already through the tangle of the forest a glimpse of the heavy billows of a tempestuous ocean was caught—and a keen observer read a spasm upon the lips of Paul.

Lucretia, and Mary, and little Cuthbert, as well as the rest of London, often stood before these pictures. Lambelli and Strudwicke, too, and very often Honoria and her friend Agnes Singleton.

"Is it not really glorious, Agnes," said Honoria, with her peculiar swan-like motion, and with her noble eyes beaming with joy, upon one of their visits, "to be the possessor of these two beautiful pictures. How much more glorious, though, to have painted them! I am delighted that John has painted so well, and that this, his first picture exhibited, has done him such credit. It *is* lovely, only a little too sweet and sentimental to be quite to my taste. John must not grow mawkish. There has been enough painting and writing in the world about that *one* phase of love. Love is universal—this is but its commonest phase. And he still wants boldness and strength too, I feel, in many ways: but there is the true stuff in him. Oh, it is a joy to think that the hand and mind which wrought out this picture have been cultivated and developed instead of being left to harden into dulness in a turnip-field. Thanks, dear father, for your faith in the poor little '*Giotto!*' Yes, it is a great and glorious gift is wealth; for now, besides helping on these two fine young fellows, can I cause you, dearest Agnes, great joy through this extraordinary picture of Balder, as you, through your interpretation of the old myth have caused me great joy. You must always consider this picture to belong as much to you as to me. I feel that it must and will influence you greatly in the writing of the Scandinavian portion of your work on the Universal Faith, of which you were speaking the other night. This is, indeed, conceived in the large and broad spirit after which we aspire. We must know this Leonard Hale, Agnes, whenever he returns to England. I feel that he is one of 'the salt of the earth'—a spirit who will do us all good. And his influence upon John will be good. He possesses especially that largeness of conception which I desire to see John possess. But, come, Agnes, the rooms are beginning to fill; and if I see any silly fools gazing with stupidity written upon their faces, whilst their ignorant tongues dare to cast blame upon this beautiful work of art, I may lose all patience, and utter some unpleasant truth, which would be as galling to the poor wretches as a slap in their silly faces. We will enjoy *our* pictures, Agnes, for a few quiet days together at the dear Hellings." Saying which, the beautiful Honoria and her friend, the young authoress Agnes Singleton, drove away from the exhibition towards one of the most squalid quarters of London, where Honoria had various beneficent missions to accomplish.

It seemed as though each external success of Leonard brought with it an internal woe. The great epochs of life often strangely repeat themselves; and thus was it with Leonard. The letters from Lucretia, and the newspapers sent by her kind hand announcing her great joy in his picture, and the universal response to its excellence, were followed with a sharp pain, springing from the old root of his misery.

It was at Innspruch that the sad letter reached him. He was on his way from Italy towards Munich, where he proposed to sojourn a few months. His whole soul had sung a hallelujah for days, as he had journeyed across those marvellous Alps. And the tender flowers, and clear green Alpine waters—the dim pine forests, and the sublime mountain crags and jagged pinnacles crowned with eternal snows, glittering in rainbow glory, or veiled with cloud, had bound him with the deepest spell of joy which his soul ever knew; and with the joy came the impulse of creation, as of old. And now quaint Innspruch, as he entered it from the mountain gorges, with the mistiness of twilight gathering over its fantastic towers and roofs, had

held forth promise of another rich and quaint feast of enjoyment. At Innspruch also he awaited letters—and of letters at the post-office he found a whole packet—the letters announcing the success—another letter, dispatched later, announcing the pain. Glancing over the contents of the earlier letters as he walked back from the post-office to his inn, the last sad epistle remained unopened, till he was sitting, with a combined tea and supper spread before him, in a brightly-lighted *salle* of the great hotel. As he read, his cheek went white as ashes, and a faintness as of death crept over him. Thus ran the letter:—

Kentish Town, June.

Dear Friend,—We have been anxiously waiting news of your receipt of the letters and papers announcing the signal success of your beautiful picture. Of our deep joy in this success I have already spoken. But now I write about something more important still. Your poor mother, dear Leonard, is very ill; and as the powers of her mind seem singularly restored—as so frequently you know is the case before the last sublime and awful change takes place—and as she speaks of you with the most yearning affection, we all desire your immediate return. She is in London. All particulars I will, dear friend, communicate when we meet. I need not *urge* your most immediate return. To my eyes this great change in the poor sufferer is a divine blessing; try, dear friend, so to view it. There are deaths, which we all know, are so much less sad than many a life. I need not assure you that all that our attention and earnest care can do for your poor mother is done. Would that we could send a consoling angel to conduct you hither. With the most earnest sympathy,

Your's ever,

LUCRETIA GAYWOOD.

When Ursula Mordant's son read these words, her sorely tried spirit had passed away from the poor corpse. The mist of madness had been cleared away many days since, leaving the soul a seer, vigilant, and far-seeing even into futurity. Sitting by the pillow of the dying woman, Lucretia had glimpses of a spiritual life so glorious, yet so sublime, both revealed in the flickering of intensest beauty over the dying countenance, and in the scattered words uttered in a voice of soul-thrilling gentleness—that never could she refer to these revelations, even to Leonard, except by hint, and then it was with a great shuddering of joy and awe seizing upon her frame. "Leonard! Augustus! we faint beneath our heavy cross—beloved ones, we faint, we fall! But lo! the crosses are human wings; we mount—we—!" and the head sank, irradiated with a celestial beauty, upon the shoulder of Lucretia.

Ursula Mordant died in one of the great hospitals of the metropolis, and was buried in the burial-ground attached to it.

Leonard travelled as only those travel when life and death are in the scale. Mere death—a death of peace for this poor tortured spirit—he did not dread; but the foreboding angel within his breast whispered that more sad things than death waited to be revealed; and such foreboding voices are only too often the voices of truth.

Lucretia informed Leonard of the spirit's release; and gradually, when the broken heart could endure the sadder truth, communicated the following details:—

Late, one lovely June evening, she, Mary, and little Cuthbert, were returning from a stroll in the fields, when, beneath the hedge of a lane, she perceived in the dusk the figure of a woman lying upon the bank. Suddenly foreboding evil, Lucretia sent on quickly Mary with Cuthbert, fearful lest the child's lively imagination should be excited or distressed. The woman had evidently fainted, and from her grasping a small knife in her hand, and from blood oozing through her dress, Lucretia instantly divined that she had attempted to destroy herself. Of course, as always occurs in such cases, neither Mary encountered a policeman to send to Lucretia's aid, nor yet did a policeman's anxiously-desired figure saunter up the lane. To Lucretia it appeared ages before any assistance arrived, and to leave the woman she did not dare. At length, a young man, evidently returning from painting in the open air, with his sketching materials slung around him, came in sight. Lucretia hailed him as a friend in need. Leaving his picture and paint-box behind him, at full speed he set off up the lane for help, returning, in an almost incredibly short time, with a doctor and a couple of policemen. The woman appeared seriously, although not dangerously, to have injured herself; but from her strange and incoherent speech upon returning to consciousness, her unhappy condition was evident to all. She was conveyed to an hospital, attended by Lucretia and by our friend John Wetherley, again brought into contact with Ursula Mordant by one of those singular fatalities which occur much oftener in life than the novel-reader is willing to grant. John Wetherley, when he called the next day upon Lucretia Gaywood, to offer his co-operation with her in any way for the alleviation of the poor unfortunate's misery, related the circumstance of his having, as a child, encountered a mad woman in the woods above a beautiful old place in Nottinghamshire—the Hellings. The discovery made by the two, John and Lucretia, that Nottinghamshire was the native county of both, became, together with mutual reminiscences of the neighbourhood—Clifton Grove, and Wilford, and the River Trent—quite a bond of extraordinary sympathy between the new acquaintances. And a yet stronger sympathy arose when Lucretia discovered, by glancing again at his card, the name, having been misread by her at the first moment, that *he* was the painter of the "Paul and Virginia," the beautiful picture hanging at the side of Leonard's "Balder." And John then related various circumstances regarding his early history, and spoke of the Pierrpoints' noble conduct towards him, in a manner which altogether charmed Lucretia.

"I fancy we shall like Mr. Wetherley very much, Mary," said Lucretia; "and that he would like poor Leonard greatly; for he has long been—for years, he says—following in the footsteps of the painter of Balder. 'Everywhere have the memory and achievements of this clever artist risen up before me like a beacon from afar, urging me on to greater industry and success,' were his words. Nay—is it not strange?—I have promised that they shall meet at our house upon Leonard's return. But how strange that insanity should bring about his acquaintance with Leonard—how certain spheres seem to unite people, however remotely. Poor Leonard must never know of this origin of our acquaintance; and in all our intercourse with Mr. Wetherley let us most scrupulously preserve poor Leonard's incognito. Let us never refer to Leonard as having a connexion with Nottingham. And yet I cannot but regret concealment."

Still greater surprise awaited Lucretia when, upon her visit that day to the hospital, by the incoherent speech of the suffering woman, she discovered her to be the widow of Mordant and the mother of Leonard. A great and solemn change suddenly showed itself in the dying woman: and Lucretia, communicating her knowledge of the truth to no one but Mary and Andrew, wrote to Leonard, as we have seen.

How Mrs. Mordant had escaped from the asylum, and how she had travelled up to London, always remained a mystery. The belief in her son's existence seemed gradually to have dawned upon her mind after poor Leonard's miserable interview, and to seek for him through the world had become her ruling idea. It was supposed that, in pursuance of this idea, she had wandered up to London. There were laid in her coffin various scraps of childish paintings of flowers and a little needle-book, which she had appeared, in her insanity, to have treasured beneath her pillow, forgetting their existence in the clearness of vision before her death. John Wetherley, in after years, hearing of this singular circumstance, gave his explanation. Little, as he assisted in raising the bleeding woman from the bank, did he imagine that his childish drawings and Honoria's needle-book were concealed among her garments.

LORENZO DE MEDICI RECEIVING THE EXILED GREEK PHILOSOPHERS.

THE MEDICI FAMILY.

Without meaning, in the least, to depreciate historical parallels in the abstract, but being decidedly of opinion that they are by no means sure ground to stand upon when one feels the divine phrenzy coming upon him, and is preparing to utter historical predictions, we think that the thanks of all discoverers of them are eminently due to his present Imperial Majesty the Czar Nicholas, autocrat of all the Russias, &c. &c., for the striking resemblance which he has created between the course of events in European history, in the year 1853, and European history in the year 1453.

In the latter, Constantinople was the capital of an effete empire, which had once spread the terror of its arms throughout Europe, was implicitly obeyed from the shores of the Euxine to the coast of Gaul, and had been renowned for its wealth, luxury, and magnificence. In that year, the luxury, the wealth, and magnificence remained; but the courage, genius, and hardihood which made them had departed. Of all the vast territories in the east of Europe over which Constantine the Great had reigned, his namesake and successor had preserved nought, except a small tract of territory on the shores of the Hellespont, and a nominal rule over the hardy and intractable tribes who peopled the fertile plains of Thrace and Epirus. The Turks had absorbed all the rest. The sultans had fixed their residence at Adrianople; the Ottoman troops, whenever a difficulty arose between the two powers, showed themselves on the heights over the Bosphorus, and Constantinople trembled. The emperor was constantly begging aid from the sovereigns of western Europe, and though often promised it, never by any chance received it. The sultan was perpetually making unreasonable demands from him, and charging him with impossible offences, which he bore with a meekness befitting his fallen state. Who would have thought that this derided, insulted, heartbroken man was a descendant and successor of the ancient Cæsars, who had ridden over the world, conquering and to conquer, who proudly boasted of their mission—

"Parcere subjectis et debellare superbos"?

that this little strip of ground was all that was left of the great empire which stretched in one unbroken sweep from the Occident to the Orient sun, from the Ultima Thule to the gorges of Mount Atlas! that those crumbling fortifications and that gorgeous church were built by the great Constantine! that these effeminate, vain, and debauched nobles, and this poor, crouching herd of vassals, clients, and retainers looked on themselves as filling the place of the turbulent populace and conscript fathers of ancient Rome! that this decayed and worn-out state was the last link between modern Europe and the Europe of antiquity—the bridge across the mighty chasm of the barbarian invasion and the dark ages! And, nevertheless, so it was. Its hour was now come, and it was to disappear for ever. Early in 1453, panic reigned at Constantinople; Mahomet II. was about to assail it with a powerful force. In 1853, panic reigns in it also; but now it is the Turks who are to be assailed, and—strange retribution!—it is the head of the Greek church who threatens to extinguish their empire.

The parallel is complete in all but the closing scene; and this was a scene of horrors, which we would fain hope the wisdom and humanity of the west will never suffer to be re-enacted,—the mounting of all the male inhabitants able to bear arms upon the walls; the hurried repairs of the old and tottering towers; the suspension of all business and pleasure; the agony of suspense, or the terrible calm of despair, in lordly mansions, on which art had lavished all her skill and treasure, and which for centuries had been adorned by wit and beauty; the thunder of cannon against the bulwarks which had been built to withstand the catapulta or balistæ, but not the huge stone balls of the Ottoman artillery; and then the last fearful night: a breach practicable, and myriads of men watching for the dawn—the Turks that they might mount to the assault, and the Greeks that they might perish with their faith and empire; darkness everywhere, except in the churches, where the lights from the altars gleamed on crowds of old men, and children, and beautiful women, prostrate on their faces, praying in terror; and the peasants on the further shore of the Bosphorus listening in awe to the wailing sound of the *Kyrie Eleison*, which was wafted across from the doomed city. Constantine, the last of the emperors, died in a manner worthy of his name and lineage—sword in hand, at the head of his followers; and with him perished the western empire.

Amidst a great many in this overthrow who were by no means to be regretted, and whose extinction was rather a benefit to the world than otherwise, one class was entitled to especial sympathy and regret. It would be doing injustice to the Greek empire to omit mentioning that it still sheltered a large portion of the learning of the ancient world, and that it was the only spot in Europe where the language of Demosthenes was still the mother tongue of the educated and refined, and where the philosophy of Plato and Aristotle were still studied and admired. Driven from every other part of the continent by the ravages of the barbarians, the arts and sciences had taken refuge here, and enjoyed all the prosperity that they could look for in the dominions of a feeble despot.

There were still found in Constantinople a large number of men who preserved, amidst the prevailing corruption, much of the simplicity of an earlier age, and cherished the traditions of the academy, despite the loss of the patriotism and love of liberty, from which it derived half its lustre. The ancient Greek was there spoken in all but its ancient purity. It was only amongst the common people, amongst the islanders and sailors, that it had been debased by intermixture with barbarous dialects; whilst the Latins were feebly groping their way amongst the disputes of the dialecticians, and the mummeries of superstition, many at Constantinople were daily and nightly poring over the works of the classic authors. This devotion to solid learning was adulterated, no doubt, by a great deal of the trifling and finical conceit, which made the Athenian sophists contemptible; but still, when compared with the pursuits of the western monks, it was cultivation of the highest order.

Most of these men fled precipitately on the fall of the empire. The Mussulman conqueror had, or was reputed to have, little sympathy with science or art, and their votaries, consequently, expected little favour from him, even if the difference of faith did not render them obnoxious to his followers. They were nearly all past the meridian of life. Their sober, scholarly, and retired pursuits would have ill-fitted them for the rebuffs and disappointments of a wandering life in foreign lands, even if youth had supplied hope, courage, and vivacity. What they wanted was a quiet refuge, where they could linger out to the close of their career, in calm retirement, and forget in the study of their books and MSS. their own misfortunes and the ruin of their country. This, happily, they soon found in Italy. That unhappy country was then enjoying the only gleam of prosperity which has ever shone upon her since the fall of Rome. She had recovered from the rude shock of the barbarian invasion. The disordered elements of society had gradually assumed shape and organization, and the fifteenth century found her divided into a number of independent republics, built up and supported by commercial prosperity, and in the enjoyment of unexampled liberty and happiness. The arts were flourishing to a degree unknown in the rest of Europe, and in all the graces of life—wealth, refinement, and cultivation, she held such a proud position, that she might still without presumption apply to the Transalpine world the epithet of barbarous.

In these republics, commerce had assumed the place of honour, which, amongst the northerns, was accorded to arms exclusively. Their proud patricians were not knights or barons bold, but wealthy merchants, who gradually assumed the position of merchant princes, and distinguished themselves

as munificent patrons of learning. The proudest amongst these were the Medici of Florence, who, time out of memory, had occupied a high position in the republic, and had filled many of its most distinguished offices. The head of the family, at the commencement of the fifteenth century, was Giovanni de Medici, who added to his already large store of wealth by his close attention to business, and secured the confidence and esteem of his fellow-citizens by his affability and moderation. His son Cosmo succeeded him in his wealth and dignities. The earlier part of his public career was disturbed by some of those intestine broils which seem inseparable from a popular form of government. He triumphed, however, in the long run over the malice of his enemies, and spent the greater part of a long life in uninterrupted tranquillity and prosperity. He had no greater pleasure than the encouragement of learning and the society of learned men; and his efforts raised Florence to the proud position of being the resort of all the wisest, wittiest, and ablest scholars, poets, and artists of the day. The study of the ancient classics had at this period but just commenced. A few—and a few only—of the marvellous productions of ancient genius had been dragged to light from the convents and castles, in which they had slept since the fall of the empire, but by the exertions of Boccacio, who was as famed for his learning as for his humour, the study of the Greek language had been introduced into Italy, and during his lifetime had been cultivated with success. At his death, however, it fell into neglect, but after a short interval was again revived through the exertions of Emanuel Chrysoloras, a noble Greek, who was entrusted with several important embassies to Italy, while Constantinople was threatened by the Turks, and taught it himself at Florence and other cities about the beginning of the fifteenth century. He left behind him many zealous disciples amongst the Italians, who laboured strenuously and with some success, to follow up the work which he had begun. But, though they kept their attention fixed upon their work, and kept alive the interest of the literati in it, it was impossible that they could make much progress. The number of works which they had the opportunity of examining was extremely small, and they were endeavouring to acquire a dead language by the slow and uncertain process of guessing out the meaning, construction, and connexion. They had none of the aids with which every school-boy now finds himself furnished—grammars, exercises, commentaries, keys, notes, and the oral instructions of men to whom, from their earliest years, the dead languages have been an all-absorbing subject of thought and study, based upon the labours of thousands who have trod the same path before them. Let us remember all that we have, and we shall have a better idea of all that they wanted, the countless tomes of every date since the fifteenth century to the present time, the huge heap of annotations, emendations, and various readings, containing so much rubbish mingled with so much sterling thought. With all this, some of us found Greek difficult enough; many of us have lost our little share of it long ago; what then must have been the difficulty of those whose only hope lay in their own brains and industry? It is hardly to be expected that the study would not have flagged and finally died out, had it not received an unexpected stimulus.

The fall of Constantinople filled Europe with terror and astonishment; but whatever scandal it may have caused to the orthodox faith, was compensated by the assistance it brought to the cause of learning. The philosophers, who fled before the swords of the Janizzaries, were received in Italy with open arms, and their welcome was the warmer because they carried with them a large store of rare and valuable manuscripts, some of them containing gems of antiquity which were before unknown to the scholars of the west. The fittest place to bear such treasures to, was the court of the Medici—for court it might be called—where great wealth spent on the noblest objects was backed up by a supremacy over a whole nation, which was founded only in respect and affection, and was not sanctioned by a single law. The exiles were received with characteristic hospitality, and in the pile of manuscripts which they laid at Cosmo's feet, he found himself more than rewarded for all the favours he could heap upon them. Demetrius, Chalcondyles, Johannes Andronicus, Calistus, Constantius, and Johannes Lascris, and many others, whose names lent lustre to the last years of the tottering empire, met with an honourable reception, and by their instructions and example gave learning an impetus which has carried it on without faltering to its present proud position. Libraries, one of which is still, after a lapse of three centuries, a favourite resort of the scholar, were founded, and copies of the various works were rapidly multiplied by the printing press. The Greeks did not fail to trumpet abroad the praises of their benefactor, and the kindness and encouragement he showed them is the best claim to immortality, which the Medici family possess.

The friendship which was shown to learned men by his grandfather was cultivated in a still greater degree by Lorenzo de Medici, that great light of Italian literature and art. Their labours were repaid by his bounty, and encouraged by his smiles; professorships were established for giving instruction in the Greek philosophy and literature, to which scholars from all parts of Europe—from England, amongst others—resorted. Lorenzo was no less remarkable for his political wisdom and commercial success than for the delight afforded him by the society of the learned, and consequently the Greeks were frequent guests at his splendid villa in the environs of Florence. It is a singular circumstance that this great man should have found a biographer worthy of him, after the lapse of three centuries, in the greatest of our commercial emporia.

THE LAND OF GOLD.*

"YOUNG men accustomed only to the desk, and unfitted for any mechanical occupation, will find it next to impossible to procure employment in Australia." Almost every letter that is sent home from Melbourne, and nearly every newspaper published in the colony, repeats this warning. But in spite of warnings of every kind, young men from shops and counting-houses appear to be the very persons who, for the last twelve months, have filled the greater part of the berths in emigrant ships bound for the land of gold. Again and again it has been stated that these are not the class of colonists necessary to the commercial prosperity of the colony, or likely to prosper in it themselves. For many years to come, physical, rather than mental, labourers will be the need of Australia. Melbourne, although the richest city in the world, is, at the present moment, the worst lighted, ventilated, and paved; and its inhabitants, although the most wealthy, taken as a body, are as badly lodged as the peasantry of the poorest villages in Germany, or the dwellers in the most miserable log-huts in the backwoods. Nevertheless, there is abundant employment in Australia, besides gold-digging, for tens of thousands of artizans and labourers. Every man who has the strength and will to wield an axe or a spade may succeed in Australia; for, before the colony is fitted to receive intellectual labourers, houses must be built, roads and railroads made, bridges erected, and other social conveniences supplied. Handicraftsmen of all descriptions, agricultural labourers, and "navvies," are the most likely men to succeed in Australia.

It appears from a paper drawn up for the Melbourne Chamber of Commerce, by Mr. Westgarth, that the colony of Victoria—the modern name for the Port Phillip district—is in a most flourishing condition, both as regards its moral and commercial prospects. The history of the colony, as recorded by Mr. Westgarth, presents the most remarkable instance of commercial progress that, perhaps, the world ever saw. Ten years ago, the towns of Sidney, Melbourne, and Port Phillip

were mere entrepôts for the agricultural produce from the interior of the country; and Australia itself was principally notorious for the lamentable failure of the settlement at Swan River. In 1851, the colony of Victoria contained a population of about 95,000 souls; in 1852, that number had more than doubled, and at this moment it cannot be estimated at less than 300,000. Nothing can be a more astonishing or decisive proof of the advance of this colony than the marvellous rapidity with which its population has increased. Twenty years since the white man was unknown in the districts which he has now made his home: the discovery of the gold took place, and, in a short time, the colony of Victoria—the principal auriferous district in Australia—was unrivalled for the magnificent scale of its wealth and commerce. There is no resisting "facts and figures," so we will make use of a few of them. In March, 1851, the population of Melbourne was estimated at 23,000; at the present moment that city and its outskirts cannot contain fewer than 85,000 inhabitants; two years since the town of Geelong numbered about 8,000 souls; at present it cannot, certainly, have less than 20,000. The shipping entered inwards to the colony of Victoria, in 1851, comprised 669 vessels, with an aggregate tonnage of 126,000 tons; in 1852, the number of vessels had increased to 1,657, with an aggregate tonnage of 408,000 tons—an increase of about 325 per cent. in a single year! In the same period, the value and extent of the imports and exports to and from Victoria had increased in like proportion. In 1851, the imports were valued at £1,056,000; in 1852, they had increased to £4,044,000; the exports for the same years were—in 1851, £1,424,000; in 1852, £7,452,000! But in regard to this latter item, the exports for the year 1852 may be considered as greatly understated when given as £7,500,000; for large as the sum may appear, it has been ascertained to be very far short of the actual truth. Gold is the principal article of export from the colony of Victoria; and the probability is, that almost every person who left the diggings for Europe or America took with him a large quantity of the precious metal, which would not necessarily come into the official records. In 1852, the customs returns gave 1,975,000 ounces as the quantity exported; but 1,600,000 ounces, in addition, have been traced as having been exported from the neighbouring colonies, or otherwise brought from Australia without official cognizance. Taking these circumstances into consideration, and valuing the precious metal at its now ascertainable worth, it appears that gold to the value of upwards of £15,000,000 sterling—twice the amount given in the customs returns—has been dug from the bowels of the earth, washed from the sands of the rivers, or discovered by fortunate "prospectors," in various parts of Australia, in a single year!

In fact, the colony of Victoria is at this moment the richest, and the most varied field for enterprise in the whole world. A man with a little money can buy land and rear sheep; or he can invest it in articles of consumption at home, and make a good profit by retailing them in Melbourne and the diggings. In the interior of the country, every child is a help instead of an incumbrance; and a man with a family, whose ages vary from three years to twenty, is as well off as if he had a large capital. Every kind of manual labour is at a premium in the cities of Melbourne, Geelong, and Sidney; and in the interior the scarcity of hands is very severely felt. All sorts of provisions, likewise, are sold at highly remunerative prices:—sugar, 7d. a pound; flour, 50s. a barrel; wines and spirituous liquors extremely dear; and roots and all other agricultural produce are sold at "a very considerable advance upon previous quotations."

This last phrase, which we take from the *Melbourne Argus* of April the 7th, naturally leads us to the conclusion that farming is a very profitable kind of employment in Australia; and, opening a private letter which has been given us for perusal, almost the first sentence we meet with is—"If you have any friends coming out with capital, advise them to buy land and try their hands at farming."

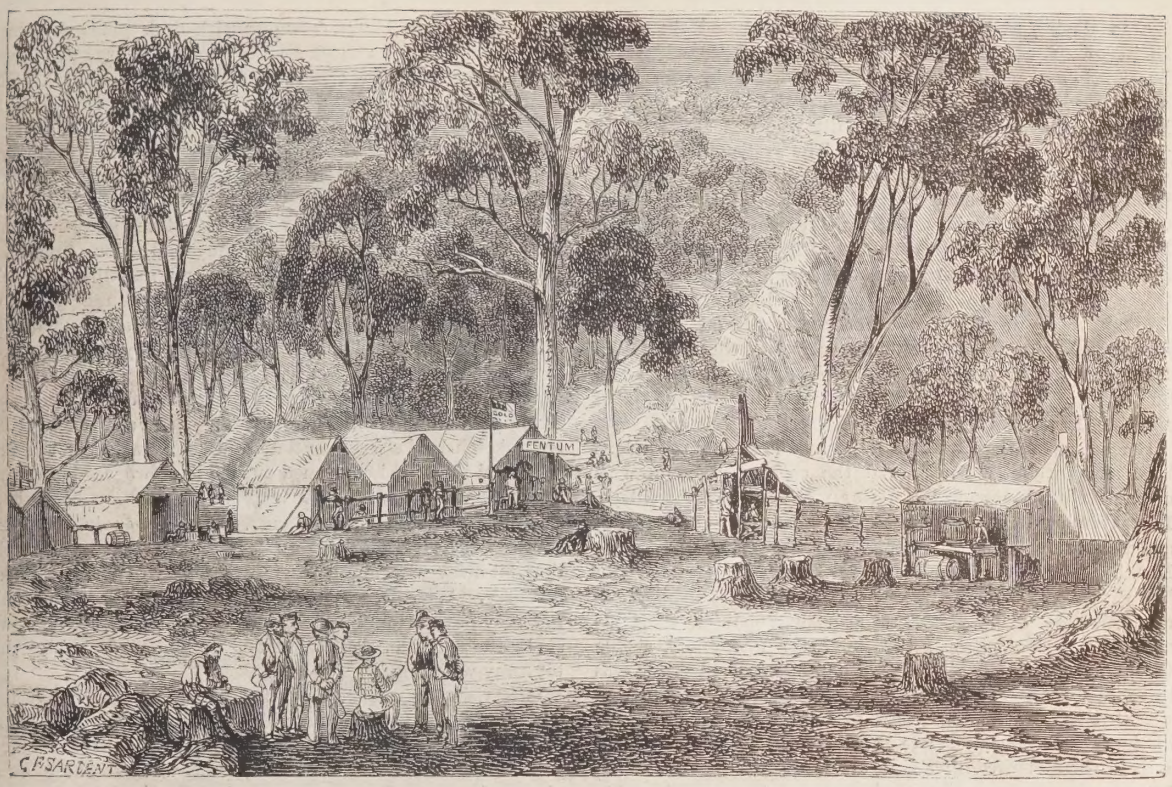
It is well known that Mount Alexander—the district including Ballarat, the Bendigo, and the Forest Creek diggings—is the most auriferous region in Australia. In our first engraving (page 44) we have a view of this celebrated mountain from what is called the Porcupine Road. The next (page 44) is a busy scene, Golden Point Ballarat—every one of the diggings has its golden point—is about seventy miles from Melbourne in a north-westerly direction, and about fifty from the thriving town of Geelong. At this spot it was that the celebrated "Cavenagh find" took place—as thus recorded in the *Geelong Advertiser* of September 27:—"On Saturday night last two brothers named Cavenagh arrived in Geelong with 60lbs. weight of gold, value £2,300, the produce of four weeks' working. The party actually netted £100 per day." The excitement consequent on the arrival of this news was immense, and "doctors, lawyers, merchants, tradesmen, carpenters, bricklayers, masons, shepherds, and labourers, all rushed off to the new El Dorado." In the case of the Ballarat diggings, the speculators were not disappointed, for they still continue to be highly productive.

The two other engravings (page 45) speak eloquently for themselves. The districts all around have proved highly auriferous; and "enterprising men (we quote the own correspondent of the *Argus*) cannot fail to make a fortune." The numerous dry diggings have been very successful of late; and it is by no means uncommon to see a man setting off to work in his hole, the only tool or implement that he carries with him being a large and pointed knife, called a "fossicking knife." The mode of proceeding is by no means uninteresting. "Arrived at the hole, which, by the way, may have taken him and his mates a week or more to sink, he descends, and lighting a candle and his pipe, he lays himself out at full length on the rock which forms the bottom of his hole, and whilst he blows out the fragrant wreaths from his dudeen, he quietly amuses himself, at the same time, by digging out with the point of his knife, such nuggets of the precious metal as may offer themselves to his view. Of course, in this operation, the small specks of gold are not collected, as this would be too troublesome a process; but the earth containing them is gathered up in a pocket handkerchief, and I have more than once seen two ounces washed out from a handkerchief full of stuff, whence the large pieces had been previously picked. By this "fossicking," as it is termed, men have been known to obtain three and four pounds weight of gold in a day; though such cases are not, as a matter of course, numerous. This species of dry digging is now much resorted to, not only on the Bendigo, but on the Forest and other Creeks, the scarcity of water preventing the possibility of washing all the earth that would, were this element plentiful, amply repay the labour. Thus it happens that very much of the earth, now lying at the bottom or around the mouth of many of the holes, having been cast aside as useless during the drought, contains a per centage of gold sufficient to make the washing of it in the wet season highly remunerative. In fact, to prove this, after the recent showers up here, for they were no more than showers, many people were out prospecting amongst the refuse stuff thrown out of the holes, and I have met with persons who have thus collected two and three ounces in a few hours. I myself, not being too proud to dismount and become their possessor, picked up three pretty little nuggets that very handsomely offered themselves to my attention as I rode along past a number of deserted holes. It has often struck me that in many instances where a heavy find of gold has been made, very nearly as much of the precious metal is shovelled out with the earth as is gathered by the diggers; for with two and three ounce nuggets glittering in their sight, they have no eyes for the fine grains, which, in a rich hole, so thickly stud the earth that surrounds the larger nuggets. Besides which, let the digger search as carefully as he will, unless the whole of his good earth be washed, he will almost invariably throw out as much gold as he collects."

The present shipping arrangements enable emigrants to reach the land of gold at a comparatively trifling expense, whether the port of embarkation be London or Liverpool. One word of advice: there is more comfort and economy in a small ship than a large one.

MOUNT ALEXANDER, FROM THE PORCUPINE ROAD.

VIEW OF GOLDEN POINT, BALLARAT—TAKEN FROM THE NORTH-WEST SIDE OF THE CREEK.



VIEW OF THE POST-OFFICE AND THE "ARGUS" OFFICE, FOREST CREEK DIGGINGS.

VIEW AT THE JUNCTION OF BARBER'S CREEK AND THE FOREST CREEK—THE GOVERNMENT CAMP IN THE DISTANCE.

A DAY AT CHITTENNANGO FALLS.

I WAS staying at Casa Novia. I had exhausted the rather limited amusements of that rural place, and time began to hang heavily on my hands. My friend Frank, who is an artist, and had sought the village on a professional speculation, had painted everybody in the vicinity who was at all willing to descend to posterity on canvas. The systematic flirtations which we had carried on with all the belles of the neighbourhood had ended in such a tangled web of jealousies, as to destroy all confidence in us as marrying men. There were no billiards; we had no guns to shoot with, and even if we had, I doubt if there was anything to shoot; we had read the "Life of Washington," the only book our landlady possessed, through three times. Dominoes became painful to us, we had played them so often, and the society of the village bar-room was neither interesting nor select. In short, no two human beings were ever more destitute of the means of amusing themselves than Frank and myself.

It was a clear September morning. The sky was of a deep blue and without a cloud, and the early sun shone with oppressive brightness on the staring white walls of the village. I was standing at the window, tapping listlessly on the panes, and wondering whether the pig, who was trying to get into Mrs. Spreet's garden, would succeed in opening the gate with his snout. Frank was seated at his easel, finishing the eleventh portrait of himself that he had painted since his arrival, and Mrs. Rollit, our landlady, was dimly visible through the half-open door, plucking a large fowl which was to serve for our dinner. Just at this moment my attention was attracted by the appearance of a pedlar who had arrived in the village the day before, bringing his waggon out from a little shed at the other side of the street, and installing between its shafts a clever, short-tailed horse, with a big head, and thick, muscular legs that gave promise of a mile in "two, thirty," if he liked.

"Hallo!" I cried, opening the window, "you're not going to leave us so soon—are you? Why, you ought to get a week's trading, at least, out of such a place as this."

"Well, I guess I'm goin' on a little further," he answered, stowing away sundry boxes under his feet in the waggon. "The folks here don't appear to be very lively, and I calculate I'll make a better trade in Chittennango."

"Chittennango! what a strange name! Where is it?"

"Have you never been to Chittennango?" asked our pedlar, elevating his eyebrows with a glance of rather contemptuous amazement; "why it's just the place for fellows like you, who go poking about after the beauties of natur. There's rocks, and waterfalls, and trees, and it's altogether what people call pictureask."

"How far is it?"

"Five miles, more or less. If you come soon, may be you'll meet me there. Good bye!" And the pedlar gave his horse a chuck with the reins, and went down the hill in the midst of a hot, curling cloud of dust.

"Frank," said I, turning round, "here's luck; let us go to Chittennango."

"Let me finish this eyebrow," answered Frank, peevishly.

"The pedlar says there are waterfalls and rocks there."

"Very probably," said Frank, drily.

"And that there is a factory there with the loveliest girls."

Frank threw down his palette, rushed to the mirror, disposed of his hair to the best advantage, and in half an hour we were on our road to Chittennango.

The road on which we walked wound along the edge of the Chittennango river, a bright, joyous stream, broken into frequent babbling rapids, and full of wild, capricious windings. These turnings and doublings, in which the road shared, were in some places very sudden and abrupt. Sometimes the stream would bend back, and all we could see of it were little blue glintings through the dark trees, like the peeping eyes of some forest maiden.

The river runs on the right side of the road, and on the left rises up a steep bank, frowning with dark pines that hang like a beard upon its cheek; while here and there great jagged rocks gleam out like the tusks of some wild animal. This bank, which is very lofty, is seamed and worn with elemental strife. Great scars are visible on its sides, where the winter torrents have torn away huge masses of earth and rock; and one can see from the tall pines that lie prostrate, but still clinging to their birthplace with a few tenacious roots, that the fierce winds of March have not spared the place. Climbing over all this savage grandeur, one sees the long tendrils of the wild vine festooning the trees and mantling over the rocks; while crowds of wild flowers gleam through the inmost depths of the forest with fragmentary glimpses of blue and gold.

Frank and I could not help stopping every hundred yards to admire some fresh beauty. Each winding of the river, as it were, recombined all the old elements of the landscape, forming another from them entirely new and enchanting. Our sketch-books were continually in our hands for the first mile, and if we had continued our mode of progression during that distance the rest of the way, we should have been about five days reaching Chittennango. Frank was in great ecstasies. "The scenery was so lovely. He must really take that bit away with him. There was plenty of time—no need of hurry. What was the use of being a bachelor if one could not stay out as long as he liked?" And down Frank would sit by the roadside, pencil in hand, to take, as he said, "that bit away with him."

It was during one of those fits of admiration that a new and unexpected feature was added to the landscape. Frank was sitting on a huge stone, which had fallen at some remote period from the cliff above us, and was sketching away vigorously at a solitary group of elms, that stood on a small spur of land which jutted out into the stream. I had taken a small reach of the river to my share, bordered with spruce and maple, and spanned a little way up by a slender rustic bridge. Some tall sedge broke the level line of the margin of the stream, and the whole constituted a charming bit of quiet river-beauty. I was busy making certain dots and lines which were intended to indicate rocks and trees, when an exclamation from Frank caused me to raise my head suddenly. A new feature had obtruded itself upon my landscape, one which I had made no provision for in my sketch, but which, nevertheless, was a most interesting addition to the former charms of the scene. On the slender rustic bridge, which I have mentioned as spanning the stream some twenty yards above where we sat, stood a young girl. She wore one of those wide leghorn hats, with long crimson ribbons streaming over its brim, which undulated gracefully in the gentle wind that stole down the banks. In one hand she held a small basket filled with wild berries, while in the other she bore a branch of green elm which she waved like a fan. It was a charming pastoral picture. Theocritus might have written an idyl upon it. Guercino might have painted it. The girl was very pretty and seemed somehow to belong naturally to the scene. When she reached the middle of the bridge she paused to look at us. We certainly returned the compliment. As to Frank, he stared with all his might and main. But there stood that light, delicate figure, framed in an exquisite natural picture, and balanced on that slender aerial-looking bridge, till it almost seemed as if some wood-nymph had taken a fancy to masquerade and got herself up in leghorn and muslin. While we were gazing with mute attention a shout rang from the opposite side of the river, and a troop of boys and girls all laden with baskets of wild fruit and green boughs issued from behind some trees, and made signals to our nymph. Two or three of the boys ran up on the bridge and seemed, as it were, to take her captive, and bear her back among them. The slight bridge undulated with the struggle, and after a few vain attempts to elude her captors she went slowly back to the noisy throng, and vanished behind a clump of elms.

About two miles from Casa Novia, and close on the river,

are several mills, all of them possessing considerable external evidence of prosperity. They employ a great many of the young people of the vicinity, and we had every reason for supposing that our rural goddess and her companions were *employés* of one or other of these establishments. It appeared to be a holiday with them at these mills; for in the open space before the door, which was well shaded with tall elms, there was a merry party of boys and girls dancing to certain unearthly sounds which a young lad, in a white jacket, drew from a dilapidated violin. The women were generally pretty, and all possessed the most delicately fair complexions, the result of so much in-door confinement in the factories. They appeared very happy and contented, and the dance went on with unflagging spirit. Irresistibly attracted by this rustic jollity, Frank and I stopped to look on. Presently we received a cordial invitation from some of the young ladies to join the festivities, and in another minute we were linked with a couple of partners in the performance of a Virginia reel. While thus engaged a burst of laughter rang through the place, and our dance was suddenly interrupted by another troop of gay rustics with green boughs in their hands, who came rushing down the slope towards us. It was the same group we had seen on the river, and in their midst our eager eyes discovered the goddess of the bridge. Strange to say she was not at all pretty, and her hands and lips being stained a dull purple colour with blackberry-juice did not add much to her attractions. Her figure, that before seemed so aerial and delicate, we now discovered to be bony and angular, and the curles which the wind seemed to play with so lovingly as she stood on the bridge, had, on a closer inspection, a decided tendency towards that fiery hue which people sometimes soften down under the name of auburn. So much for the poetry of circumstance. On the bridge she was all that a romantic imagination could desire. In the mill-yard the charm had vanished, and she stood confessed a lean, red-haired, raw-boned Yankee girl.

About a half a mile further on we came to a reach of the river, the effect of which, with its strongly marked lights and shades, reminded us both of an etching by Rembrandt. The stream has, as it were, cut a semi-circular piece completely out of the wooded precipice before described, forming thereby a sort of dark cove, along the edge of which the road still runs. The cliff, which here faces the west, is so much undermined that it hangs menacingly over road and river, and flings its black eternal shadow far across on the opposite bank. The pines, and spruce, and hemlock trees stand bristling out from this toppling bastion, and seem suspended by their roots above one's head. A terrible and unearthly gloom pervades the spot; the sunlight never falls at any period of the day upon stream or forest. The river runs by in the shade, cold and dusky as Acheron. An unwholesome chill oppresses the heart while in this gloomy sanctuary. Birds do not love the spot, and their song never echoes through the trees. The villagers do not linger there, tempting as its shade may be to brows scorched with the summer's sun. It is a place that seems made for murder and crime. And as if to mock the melancholy darkness of the scene, the river above and below glistens like gold through the trees, and invites the saddened wayfarer to hasten out of this Trophonian gloom.

When we suddenly emerged from this dismal spot into the bright sunshine, and saw the laughing sparkling river and the verdant trees, the change in our spirits was electric. While we were passing through the home of shadow, we had scarcely spoken. The scene was grand, doubtless, but its grandeur was oppressive, and weighed upon us so much, that to utter our thoughts would have cost us a considerable effort. But now that we had left it behind, we felt somewhat as Orpheus must have felt when he arrived on earth after the visit he had been paying to Pluto. Everything seemed to have acquired fresh splendour. The trees were greener than before—the river more golden, and the wild flowers, that lined the bank, seemed to speak to us in a joyful whisper and welcome us back again to the world, which they and the sunlight illuminated.

After loitering in this manner along the road for a distance of four and a half or five miles, the subdued sound of falling water, softened by the trees, apprised us that we were close upon Chittennango Falls. At a little distance, they cannot be said to be very imposing, but I know no place that, on a closer acquaintance, possesses more charms. From the top of the fall to the bottom may be something over 130 feet, but the water does not gush in a direct stream for this distance, but is broken and split by ledges and tongues of rock, which, though they interfere with its sublimity, certainly add to its picturesqueness. We first came upon the fall looking down the river from above, and although the sensation of looking down a height is not so great as that of viewing a vast precipice from the base, yet the view that now met our eyes was striking in the extreme. The river ran winding between lofty pine-covered cliffs until it became, like the track of a hare, lost in doubling. The mid-day sun glared hotly above our heads, and a blue mysterious mist hung over the stream and filled the lower end of the deep chasm through which it ran, veiled thus in vapor; I know not what mysteries connected themselves in my mind with the course of that river.

But bless my soul! what a thing it is to be a dreamer. Here am I keeping the reader all this time on the top of the fall, staring down that mist-haunted valley and wondering what has come over his enthusiastic guide. To make up for lost time, let us seek that pretty rustic bridge which lies about 100 yards above the fall, and cross over to the other side. Here we come upon a fine bit of motion in the shape of that morsel of cataract which gushes close to our feet. It is a fine emblem of power. No stopping it for an instant. It was born to go on, and on it goes. Let us follow its example. At this side of the stream we can clamber down a few yards, and timidly approach that great gush of water which courses down the centre of the fall. But looking down through clefts of rocks and clinging to creepers become tiresome; so crossing the little bridge again, we seek the bed of the stream below, so as to see the cataract in all its grandeur. The side we are now on is entirely inaccessible to either ascent or descent. One can look down through great clefts that exist in the rock sheer to the bottom; and awful, weird-looking chasms they are, filled with that dim blue vapour through which one fancies strange shapes swim and float, like the rising visions in a magician's caldron. To reach the bottom of the fall we have to wind through a delicious wood path filled with wild flowers, where the trees are matted so thickly over head that nothing pervades save a green twilight, while the dense underwood is one impenetrable mass of shadow. This path winding downwards brings us out on the bank of the stream just under the fall. The view here is splendid: straight above our heads rises the tall shaggy precipice, over which the river tumbles foaming: from its steep sides the giddy pine hangs out grappling each crevice with its roots, like some daring invader scaling the walls of a beleaguered city; vines rambled here and there through every hole and corner; and wide, awful looking fissures gaped in the rocky sides, like wounds from which trickled a dewy blood. Over all this rushed the white waters, tumbling, foaming, roaring; flinging up bright globes of spray as conjurors fling up gilt balls, and anon falling with a deep, portentous sough into the sullen pool below. On the right-hand bank of the stream, opposite to where we were standing, was a young elm tree, the most graceful I had ever seen: it stood alone upon a spur of land or rock, and its leaves were as yellow as the ceuci's hair; but up among those golden leaves a crimson foliaged vine had clambered, trailing its blood red splendour over bough and trunk, and hanging in scarlet streamers from the outer branches. The tree looked, with its yellow plumage and slender form, like some fair-haired village maiden in holiday time decked out with a whole haberdasher's shopfull of scarlet ribbons. It was a splendid piece of colouring, and despite his want of material, Frank must needs sit down and sketch it. He had scarce begun, when flop—dop! a great stone fell within an inch of his head, and went rolling among the crags; we both looked up but could see nothing. Again, flop—dop—flap! another stone, hitting the sketch-book fairly in the centre and sending it flying into the

stream. Then a whole shower of stones, one after the other, fell about our ears, and kept us dodging like Indians behind a log. Frank is a philosopher, so instead of getting into a rage, he said simply—

"It is a fact worthy of remark, that most people have a great desire to throw things from a height. Watch a party of people on a bridge or the top of a tower, the first thing they do is to drop pebbles to the bottom, without knowing why or wherefore. There is, evidently, some fool practising this pastime above, so we had better leave this and go up too. We might as well see to whom we are indebted."

"Then who—" commenced Frank, rather angry at his mistake.

"I believe I have been the culprit," said a very sweet voice behind us. We turned and beheld a very pretty woman smiling half sarcastically at us.

"Madam," said Frank, gallantly doffing his cap, "pray do not mention it. If it is at all essential to your enjoyment that there should be a human being underneath the cliff, while you pelt great pebbles over, pray let me know and I shall be most happy to sit in a conveniently unsheltered spot."

The lady laughed at the sarcasm, and in a very short time

CHITTENNANGO FALLS.

On reaching the top, we beheld a gentleman standing on the edge of the fall, looking into the depth below in a contemplative manner. "Just the kind of fellow to throw stones," muttered Frank, as he went up and tapped the dreamer on the shoulder. The man started and turned round.

"Those who throw stones from the top of a cliff," said Frank, with an aphoristic air worthy of an oriental, "should recollect that some day they themselves may be at the bottom."

"I have not thrown even a pebble, sir;" said the gentleman rather shortly.

we were all chatting together as if we had been intimate for years. Our new friends had been just married, and were spending their honeymoon at Chittennango Springs, a place higher up the river, and just becoming fashionable. Heaven preserve the Falls from such a destiny.

Frank and I walked home by moon-light, rather tired, but delighted with our excursion; and for the remainder of our stay at Casa Novia, whenever Frank grew tired of painting himself, or I of singing duets with one of the Miss Minks, we donned thick boots, put some luncheon in our haversack, and set out to spend a day at Chittennango.

SIR FRANCIS DRAKE.

ENGLAND has long held the empire of the sea: this has been her distinguishing characteristic. In times of danger she has not trusted in her fortified cities or her martello towers, but in her wooden walls, which have been to her an invulnerable defence. War has desolated other lands,—fruitful fields have been turned into desert wastes,—labour has been driven from its daily toil,—happy homes have been blasted,—on vigorous youth and blushing maid—on smiling childhood and grey-haired old age—on sacred priest, and mother, more sacred still—has come down a common curse; but here in England our insular position may account for this. Another, and a more potent reason is, that her sons have been brave and daring—full of a resolute courage no adversity could damp—of a lofty hope no disappointment could destroy.

In a humble cottage on the banks of the Tavy, not far from Tavistock, was born one of the men most eminent for the qualities we have named. In that neighbourhood, in the year 1546, lived a clergyman with a large family; and, as is often the case, with limited means. This clergyman was blessed with twelve children, of these the eldest became known to posterity

SIR FRANCIS DRAKE.

we dwell secure—of all these terrors we have only known the name; for England's fleets and England's naval heroes have never failed her in her hour of need. Nor is this all. The British flag has proudly waved o'er every sea and floated on every wind; it has bound up nations by the bonds of commerce; it has carried the English Bible and English civilisation to every corner of the globe. Where the savage wandered it has planted flourishing communities, whose coming splendour bids fair to more than rival our own; it has been, in every corner of the globe, the banner of the free. In some degree, as Francis Drake; the father was connected with Sir John Hawkins, the great naval commander: this would, possibly, account for the fact of young Drake's being destined for the sea. His father's removal to the neighbourhood of Chatham may also be taken as another reason for devoting the boy to that element on which he was afterward to win so fair a renown. But his beginning was humble enough: he was apprenticed to the master of a small trading ship: there he conducted himself so well, that his master dying, the ship and other matters equally acceptable were left to Drake. In this trade Drake

continued and became a money-making man; but this little traffic with the Dutch coast was not to occupy the whole of Drake's existence. Destiny had something greater and grander in store for him. We need not tell the reader how glorious was the reign of Queen Elizabeth—how society was stirred up from its very depths. That age was remarkable for an intellectual activity and a spirit of enterprise and speculation such as we should have never seen. It was the age of Shakspeare—of Bacon—and Raleigh—the powers of the human mind were concentrated on every conceivable subject; the loftiest intellects were spell-bound by the mysterious marvels of the illiterate and rude; men's lives and fortunes were frittered away in search of the philosopher's stone that was to turn every thing it touched into gold, and that was to preserve, to the age of Methusaleh, the life of its fortunate possessor. It was an age that reverenced Dr. Dee as a philosopher, and that was shortly to credit every thing Raleigh penned when he wrote his wondrous tale of nations of Amazons, whose heads were under their shoulders—of El Dorado and its mountains of glittering gold. Over every thing a fervid imagination threw its gorgeous robe: at that time romance had her home, not merely at the Globe theatre, but in all broad England; from the Land's End to the Tweed, she had a local habitation and a name. The enterprise of England was allured by the flattering accounts brought home, by Sir John Hawkins, of the glory and treasure to be met with in the Spanish Main. Accordingly, Drake sold his ship and sailed out with his relative for that attractive spot. The adventure was unsuccessful: it redounded not to Drake's credit, for he somewhat basely deserted his companion, and lost his money besides. He gave proof, however, of his nautical skill, for he safely brought home the "Judith," a small vessel of 50 tons. In accordance with the morality of that age, Drake's next attempt was to compensate himself by a buccaneering expedition against the West Indies, in 1570. In 1572 we again find him in the Spanish Main, taking towns and receiving enormous ransoms. His next engagement was under the Earl of Essex, in Ireland: this led to his introduction at Court by Sir Christopher Hatton, and to the great voyage which won for him his fame as the circumnavigator of the globe. It seems from the Isthmus of Darien he had already looked on the South Sea, and had prayed that he might be the first to sail an English ship there. Drake went the right way to work to ensure the prayer being answered, for he left no means untried for the realization of his daring aim. The queen smiled upon his enterprise; and with vessels, the largest of which was but a hundred tons burden and the smallest ten, in December, 1577, he sailed from Plymouth for the South Sea. In the following June he arrived at the Straits of Magellan; thence he proceeded along the coast of Chili and Peru, coasted California and part of North America, of which he took possession under the name of New Albion; then he sailed across the Pacific ocean, and returned home by the Cape of Good Hope, having completed the circumnavigation of the globe in two years and ten months. This was his crowning glory. The Spanish ambassador complained, but the queen could not resist the popular impulse which had made the name of Drake dear to all his countrymen. She dined on board his ship, the "Golden Hind," and made the circumnavigator a knight. The ship was drawn on shore and sacredly preserved till it fell to pieces, when out of its planks a chair was made which was presented to the University of Oxford.

But now came rumours of war at home. In that age the greatest power in Europe was wielded by Spain. It was true of her, that the sun never set on her dominions. And Spain, with her great riches, with her daring sons, with her imperial powers, with the sanction of the Pope and the prayers of the faithful, prepared to wage war with England's queen. Our country needed stout hearts then: fortunately we had them. Drake was sent to destroy the fleet forming the Spanish Armada: he entered Cadiz, burnt 10,000 tons of shipping; he then burnt 100 ships and took three castles between Cadiz and St. Vincent (this he called "singeing the king of Spain's beard"); and then captured a Spanish carrack, laden with precious booty, which, however, was not all kept by Drake, for part of it he appropriated to supplying Plymouth with water. When the Armada came, he was entrusted with the defence of the country, as vice-admiral under Sir Thomas Howard of Effingham. His name was a word of terror to the Spaniards; they deemed it useless to fight against it. On account of it one ship, at least, surrendered without a blow. The next year, in an attempt to restore Don Antonio to the race of Portugal, he was not so successful.

In 1595, Drake and Hawkins, who had become friends again, sailed to win booty in the Spanish main. It was a strong armament; they numbered twenty-six ships and 2,500 troops. But the battle is not always to the strong. Thus it was in this instance. The scheme failed: Hawkins died of vexation; Drake made subsequent attempts to restore success, but equally in vain. He, also, died of vexation; but he had a sailor's funeral and a nation's tears.

> "Where Drake first found, there last he lost his name,
> And for a tomb left nothing but his fame.
> His body's buried under some great wave;
> The sea, that was his glory, is his grave.
> On whom an epitaph none can truly make,
> For who can say, 'Here lies Sir Francis Drake?'"

Such was the tribute of the poetry of his age to the hero sleeping far away from his home and his fame. We give one more:—

> "The waves became his winding-sheet, the waters were his tomb,
> And for his fame the ocean sea was not sufficient room."

Drake is described as having been low of stature, with a broad open chest, brown hair, fair complexion, and clear large eyes. He was a married man, and served twice in parliament. In his own neighbourhood, and for many an after year, he was considered as a magician and in league with the devil. The popular mind could in no other way account for his unparalleled success. Fable after fable has been grafted on his marvellous career. According to the traditions of the western countries, in order to obtain fresh water with which to supply Plymouth, he mounted his horse, rode about Dartmoor till he came to a spring sufficiently copious for his design, then, wheeling round, pronounced some magical words, and galloped back into town, with the stream in full flow at his horse's heels. His success against the Armada was accounted for in an equally miraculous manner. According to one version, he raised his fleet by taking a piece of wood and cutting it in pieces over the side of his own vessel, when every chip, as it fell into the sea, immediately became a man-of-war.

Tried by the standard of our times, much of Drake's character must be condemned—but in his age divines sanctioned his expeditions. For a man always writing with great religious profession, we think Southey has taken a too favourable view of Drake's character. Of modern writers, Bancroft has taken the fairest view. "The lustre of Drake's name," he writes in his "History of America," "is borrowed from his success. In itself this part of his career was but a splendid piracy against a nation, with which his sovereign and his country professed to be at peace. Oxenham, a subordinate officer, who had ventured to imitate his master, was taken by the Spaniards and hanged; nor was his punishment either unexpected or censured in England as severe. The exploits of Drake, except so far as they nourished a love for maritime affairs, were injurious to commerce; the minds of the sailors were debauched by a passion for sudden acquisitions, and to receive regular wages seemed base and unmanly, when at the easy peril of life there was hope of boundless plunder. Commerce and colonisation rest on regular industry." But we must not be too severe. We must not judge the men of the past as if they were possessed of the light and knowledge of the present. We see in Drake a rude daring energy, which seemed wonderful in his own age. There was in him not merely the greedy love of gain, but a desire to plant the British flag in seas and lands where before it had been unknown. The honour of his nation lured him on. Thus it was, he was buccaneer—discoverer—hero—precisely the character deemed great and noble—held up to admiration in the days in which he lived.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER V.—PART IV.*

More than a twelvemonth has elapsed since the death of Mrs. Mordant, and Leonard is living once more in England. This second shock had passed over him, leaving but slight, yet significant, external sign. The fervour of creation which had fired him among the Alps had never returned; a strange apathy devoured him. Sketches, it is true, were struck off, then days were spent in dreaming; and great works were thrown aside with disgust, after a few weeks' labour. Leonard had received various commissions, among them one from Lord de Calis, the uncle of Honoria; but the very necessity of fulfilling an engagement, in the morbid state of Leonard's mind, deprived him of the power to work. This strange apathy extended not alone towards his own pictures, but towards the works of others. He rarely now felt joy at the sight of picture, statue, or print—everywhere he seemed alone to recognise failure, or weariness of spirit, or conceit, or affectation. His sole impulse was towards nature—his innate, enthusiastic adoration of her became his consoler and joy-giver. Days, weeks, and months, were spent in this worship; and he commenced various studies, elaborated with a patience and love unutterable of her prodigal beauty, even in her humblest walks. He painted masses of lush vegetation down by brook-sides; golden calthas; and, later in the year, the quaint arrow-head, with its broad leaves, mingling with the rose-tinted and graceful butomas; the snowy meadow-sweet waving above an undergrowth of azure forget-me-not, and crimson loose-strife, and majestic typha, and gleaming Aaron's-rod; tangles in woods and hedge-rows, and bits of moor-land, he painted with waving cotton-rush, pale grass-of-Parnassus, and dusky crimson sun-dew; and dry heathery banks, gleaming with their myriad of flowers. But exquisite as were these faithful, loving transcripts, to himself they gave no joy. Rarely even were the studies completed; for his keen perception of nature's perfection sickened him with the imperfection of all human copies. For hours would he lie in the grass, glorying in the marvellous beauty around him, and wandering away by subtle degrees into obscure and mystical regions of thought, which were unfolding their portals to him.

Lucretia marked with the most lively anxiety this alarming apathy; but to her hand seemed to be denied the key with which to unlock his heart. Nay, the very anxiety she expressed seemed but to estrange him from her. We need not say how deep a pain this was to Lucretia; but like all pain, she bore it silently in her heart.

To her infinite surprise, she learnt through John Wetherley, who had become a more frequent visitor at the Gaywoods than Leonard, that their old friend was engaged to be married to Agnes Singleton the authoress! Lucretia believed now that the mystery was solved; and painful in the extreme as Leonard's silence was to her, and as his withdrawal from their old intimacy had been—she with her whole soul now rejoiced in what she believed must work in his life a change for happiness! Yet, she had read Agnes Singleton's books—and clever, brilliant, profound in thought as they were, there was yet a certain character of hardness—an absence of *love*—which excited an astonishment in Lucretia's mind as to the fascination which Leonard could have found in the writer, and as to the sympathy which possibly could exist between her and Leonard. Lucretia knew, both from Leonard himself, and from John, that Honoria Pierrpoint having become the purchaser of the "Balder," had, shortly after Leonard's return, called at his studio, and with a cordiality irresistible, invited him down to her little villa at Box Hill, where Leonard had become a frequent visitor, the whole tone of Honoria's circle, the nobility, and beauty of the atmosphere around her, falling like balm upon his morbid soul. All this Lucretia knew, and wove her own romance upon these slight premises. But the reader must be made acquainted with a little more detail.

* Continued from p. 40.

Lucretia was right in her judgment as to Agnes Singleton's works. A hardness, an intense pride, and a scorn of much that the world considers sacred, were harsh features in the writings of Agnes—and were harsh features in her nature also. Intellect, and not love, had been her divinity. Battling towards a free intellectual atmosphere through the ranks of prejudice belonging to a peculiarly narrow sect of religionists, she had encased herself in an armour of scorn and pride; she had gained immense power of will, self-confidence, and independence in the struggle; but had left behind her her kindred, and the gentle grace which peculiarly belongs to womanhood, and which may render strength the more glorious when united to it. She professed herself to despise all such graces, but within her soul lay the germs of love and of gentleness, spite of the rude, hard encrustation of pride and scorn.

The picture of "Balder" had spoken to her intellect and to her imagination; and expressing her earnest admiration to Leonard upon their first meeting at Honoria's, she had unconsciously waxed more than ordinarily eloquent, and discovering in her listener an unusual intellectual sympathy, the whole powers of her mind had been drawn forth by the magic of sympathy, and Leonard had from the first hour of their intercourse become dazzled and fascinated by a being totally unlike any thing he had previously encountered or imagined.

He had become fascinated, dazzled, filled with a deep interest, was bound by some potent spell; but was it the spell of love? He breathed freer in the presence of Agnes than now in the presence of Lucretia, and cast aside the dark memories of the past—and questioned not of the future—but had Agnes touched the core of his soul, which, overflowing with love for all things, even the humblest should for a bride have flamed up with a fire, even as a fire of sacrifice?

In Agnes the germ of love, within the core of her being, had, as if struck by an enchanter's wand, sprung forth into sudden vigor, and waxed daily stronger and fiercer, surrounding her even as with a halo of gracefulness and tenderness, at least in the eyes of Leonard; whilst, at the same time, her own strong and vigorous life developed itself yet more strikingly through this new impulse. Agnes never once attempted to conceal from herself the affection with which Leonard inspired her.

"It matters little to me whether it be returned," said Agnes once to Honoria; "the fact of a new and powerful influence swaying my spirit as a mighty wind rushing over the earth sways and changes the atmospheric currents, is the great thing. It will have a marvellous influence upon my work, Honoria; all strong passions, all experience—aye, bitterness, martyrdom, are necessary baptisms for the life of the teacher." And Agnes, for the sake of her work and her career, would willingly have gone to the stake. Her affection for Leonard—*his* even for *her*, should that ever exist—was but a secondary object, the one which was of importance as serving the primal object.

Honoria, with all her peculiarly bold opinions—with all her regard for Leonard, and her love for Agnes—was alarmed by the feelings of this singular girl, and often pondered into what course fate would bend these strong wills. And thus months had passed on, and, to the surprise of themselves no less than to the surprise of Honoria and Lucretia, Agnes and Leonard had plighted their troth! In Agnes their engagement had only increased the dominant impulse of her soul—pursuit of success in the career which she had set before herself; in Leonard—his apathy.

John, also, has undergone various revolutions of soul since he and Leonard have met. For years—as we have seen at Lambelli's, then at the academy, and even within the walls of the Exhibition itself—had the genius of Leonard ever been arousing him to action, speaking to him of an excellence yet unattained. At each contact with Leonard's spiritual influence, John had endured peculiar sensations, the most generous acknowledgment of Leonard's superiority, the highest delight in his excellence; yet, as regarded himself, mingled with dogged determination to attain an equal excellence, if not a superior one—the bitterest disgust, self-contempt, and hatred, of what he already had done. In the Exhibition, when he saw his picture, his beloved "Paul and Virginia," he could have torn it down from the wall; he could have trampled it indignantly beneath his feet, as he had done the comforter of his poor old grandmother; a thousand feelings flashed before him, and filled his soul with sickness. Honoria's enthusiastic admiration of the "Balder" he echoed with the most thorough truthfulness; yet each word of praise cut him to the soul, filled him with an agony of jealousy: yet he himself would have been the very first to have yielded the palm to Leonard, and well knew that *his* picture stood far below anything that Leonard would ever paint. He respected Honoria's judgment which did *not* praise the "Paul and Virginia," yet *one* word of praise from her would have been nectar and ambrosia. If such had been the influence of Leonard through his works upon John, how much more intense were the feelings which Leonard in person produced. Leonard's excessive refinement of taste, which rarely permitted praise to escape his lips—his coldness towards John's artistic powers—his criticism so marvellously just, yet so cutting—his breadth and cultivation of mind, and marvellous play of fancy—the perfect ease with which he executed things that were in John's eyes exquisitely beautiful, yet which he himself criticised as keenly as he did the works of others, or flung aside with contempt—and, above all, the respect and admiration with which Honoria regarded him, the evident delight she took in his society, and with which she preached him up to John, aroused storms of the most contending emotions within John's breast. Many a time, leaving Leonard's presence, he has rushed home, pulled forth his pictures or his sketches, gazed at them grinding his teeth, then fling them indignantly from him. Has been known even utterly to destroy a picture or sketch, and, rushing up and down his room in a state of extraordinary excitement, has denounced himself as a blockhead, an idiot, a fool, and terminated his invectives with exclaiming, "Yes, that Hale *is* right; he is a genius, a great, a noble and grand genius; the breath of the divine artist has breathed upon him! I—I?—I'm only a lad taken out of a turnip-field; let me never forget *that*. And what means have I possessed for the expansion of my mind? Miss Pierrpoint? Of course Hale and she can have grounds of sympathy which she cannot have with me. I'm but the lad out of the turnip-field, and am indebted to her for all the little I have learnt; but oh, for one, no not *word*, but expression of admiration, of pride—no—in my work, from her by look or emotion in her beautiful face. Well, Hale is greater than I ever shall be, but that's God's work, and not Miss Pierrpoint's; and if he skins me alive with speaking the truth, I ought to thank him for it, were I only *morally great*. Aye, flay me alive, Hale! I'll profit by every wound you inflict upon me; there is the mighty, the increasing love of nature and of my art within me, and they may achieve for me excellence, though it be a different excellence to that of my tormentor!"

And John's picture's in the next exhibition truly proved, to himself, as well as to others, that he had profited by this "flaying."

Honoria even acknowledged the superiority of these pictures to the "Paul and Virginia;" but the vanity of John suffered, as usual, from Honoria's words. John's soul expanded immeasurably beneath the influence of Leonard, and with this expansion awoke a perception of Honoria's greatness of character and beauty of soul, which swallowed up every lesser emotion. What had been John's love for L'Allegro—a mere romantic dream? He now stood upon the brink of a mighty passion—the more potent, because reason, duty, honour, all admonished him of danger.

Such was the position of affairs when we find assembled at Honoria's Italian villa at Box Hill, upon a lovely autumnal evening, Leonard, John, Agnes, and Honoria, together with Mr. Pierrpoint and Honoria's companion, the elderly lady dressed in black, with the silver hair and quiet smile.

The four had been spending a day, worthy to have been celebrated in the "Decameron." Leonard and John had been painting in the woods, Honoria and Agnes either sitting with them reading aloud poetry, or conversing; or they had wandered away by themselves through the woods, returning to find Mr. Pierrpoint and the old lady arrived, together with an abundant repast, spread out by Honoria's servants beneath the trees—and decorated by the hands of the young painters with garlands of richly tinted leaves. Returning home as evening approached, with sketches and sheaves of leaves and flowers as glorious trophies, Honoria had coffee served up in her little library, the French windows of which opened upon a low terrace, and commanded a magnificent expanse of woodland scenery—now bathed in the warm rays of an autumnal sunset.

The gayest tone pervaded the little circle. John alone was silent. He never yet had been able entirely to overcome the chill which Mr. Pierrpoint's manner struck to his heart; besides which, his love for Honoria throughout this poetical day had waxed even deeper and stronger, and to speak in her presence made his words come thick and incoherent.

"That turn of expression again reminds me marvellously of my old friend, Mordant, the poet. Poor Mordant!" suddenly remarked Mr. Pierrpoint, turning towards his daughter as Leonard ceased speaking with an animation somewhat unusual with him. "At various times have I been struck with a resemblance between Mr. Hale and that gifted, that unfortunate man. Had Mr. Hale, now, been Mordant's son, the world would have exclaimed, what an extraordinary family resemblance! For my own part," pursued Mr. Pierrpoint, "being a believer in the transmission of the same type through many generations, I dare say, could we but obtain the clue, consanguinity might be discovered to account for this resemblance—which is not alone mental, but physical. Yes, the more I recall Mordant's features, the more does the resemblance haunt me. What a termination was his to the most promisingly brilliant of careers!" continued Honoria's father, musingly. Then turning towards poor Leonard, who, with his coffee-cup in his trembling hand, had turne towards the open window, and appeared absorbed in contemplation of the glorious landscape, "I believe you once expressed yourself as acquainted with the writings of the man to whom I refer. Brilliant, caustic, at times rising int sublimity, some of the finest and most eloquent writing in our language, in my opinion, has flowed from his pen; yet he has left behind him merely fragments: still they are gems of the purest water and deserve a setting of the finest gold. It was a favourite idea of mine, years ago, to collect and edit an edition of poor Mordant's works, prefacing it with my own recollections of the man; for circumstances and congeniality of taste had, at one time, brought us much in contact. But more pressing business always interfered. Besides which, one spur was soon lost—the benefit which such an edition might have been to his family; for his poor widow soon became an incurable maniac, and his son, I understood, died. The child was a child of great promise, I remember, but sadly neglected; and you, Honoria, must still recollect having once seen Mrs. Mordant—that poor mad woman—at the Hellings! Yes, she, indeed, had endured enough misery to destroy any reason. Now, Mr. Hale, if ever you should feel inclined, you and Mr. Wetherley there, to undertake the illustration of Mordant's poems, I should feel greatly inclined to carry out my scheme. It would be a labour of love which you, Mr. Hale, can comprehend." Mr. Pierrpoint pausing, as if for a sign of assent from Leonard, and a silence having crept over the little company, he, by an almost superhuman effort, found his lips

replying. "It is singular, but I have already made various sketches, illustrating, or suggested by, these poems. I shall be happy to place them at your disposal, sir." Leonard's voice startled himself, there was such a hoarse sepulchral echo in its tones.

"That man possessed the most extraordinary power of fascination I ever encountered," pursued Mr. Pierrpoint, unobservant of anything peculiar in Leonard's voice. "The actions he was guilty of, had they been performed by another, would have disgusted and alienated his friends a dozen times over, and have been pronounced downright dishonest; but even over his creditors his magic extended itself for years. It was only the old story over again; and I, for one, was always willing to help on the good within him, as it was a rarer good, after all, than the generality of good in honest men. I willingly closed my eyes to the evil, endeavouring to close also the eyes of others, for such a genius does not come among us every day."

"Father," said Honoria, suddenly rising, as if propelled by an unseen influence, and with her whole countenance flushed with emotion, "pardon me, but from *your* lips never should I have expected to hear such words. The evil in a rarely-gifted being, such as men unite in pronouncing this Mordant to have been, called upon all true friends of his—all true worshippers of genius—all high-minded and high-souled men—to have opened their eyes especially to this evil, to have probed it to the core, to have removed temptation if you will from the sorely tempted, but *never* to have sanctioned *two* codes of morality, one for the gifted and one for the ungifted. From Him to whom much is given much will be required: and neither can the personal happiness of the genius himself be secured by deviation from the law of rectitude handed down to us by the Divine, nor yet can the stigma be removed from him in the eyes of the world. We, father, to whom is granted the appreciation of the rare gift of genius—who cherish it as breath from God Himself; who regard the poet, the painter, as a high-priest in the temple of nature—must *require* from the priest purity of an especially high order. What unction in his words—in his teachings—if the seal of conviction stamp not his life! The Cabbalah says that a lower and far more

LEONARD AND HONORIA IN THE STUDIO OF JOHN WETHERLEY.

revolting degree of uncleanness attaches to the moral or physical impurity of a priest, of a holy man, or of a vessel devoted to a sacred use, than to the impurity of a man or vessel of lower sanctity. Especially is this true with regard to the world's estimate of the high vocation of its teachers. Far be hardness of heart and uncharitableness from us; but let a higher code of purity inscribe itself upon the tablet of our souls;—let us not aid in the erection of whited sepulchres, without all beauty, within desolation and rottenness; for the desolation within must come forth, and with its pestilential breath cast horror and contempt upon the beauty! John, Mr. Hale, Agnes—you who are going forth as priests to serve in this temple, to offer up before the Divine, and to raise the Holy of Holies before the gaze of his people—preserve white and spotless your garments, because your *souls* are undefiled!

A strong emotion passed through her listeners, and Honoria, with glowing cheeks, her eyes brilliant with tears, and with the swan-like movement of her round white neck, stepped forth upon the terrace. "Let us breathe a cooler air," said she; "and John, I want to speak with you about something before you leave us this evening."

Mr. Pierrpoint and the old lady, however, remained seated in the library, and exchanging a look of admiration of Honoria as she stepped forth, followed by her friends.

Honoria and John walked on silently side by side till they entered a pleached walk of roses, which stretched across one side of the lawn. Leonard and Agnes had betaken themselves to the banks of a little stream, which flowed through the garden, and across whose glossy darkling mirror a pair of swans approached.

"John," said Honoria, after they in silence had paced side by side the mossy turf of this shady bowery walk, "I am a keen reader of the human soul, and yours I have long read as a book; and for sometime upon its pages, especially throughout this day, I have read there of a great and mighty emotion, which, unless it bend itself into its *true* path, can only render your life a wreck and a mistake. Did a similar emotion live within my soul, John, I should scorn to permit mere worldly considerations to deter my acknowledgment of its existence. True, earnest, and unselfish love, I place among the very rarest and the most sacred gifts of God. This, you know me sufficiently well, instantly to believe. Because I have faith in your candour, your strength and uprightness, do I say all this. I should not say it to an ordinary man, for I have but a very mean opinion of man's moral nature in general. A true, firm, and devoted friendship do I feel for you; and your success in the world, your living out the artist's life, such as I believe this life may be lived out, is one of the most earnest desires of my heart. Do not let us be disappointed in this desire! But to achieve such a life, my friend, no worm of hopeless misery must gnaw at the roots of your life—strength, soul and body, must be yours! Sorrow, and the baptism of fire coming to steadfast souls, bring alone strength and a morrow of joy. I must have you put the curb of reason and truth upon your imagination—she must not, as a demon, drag you down into hell, and then, as an angel, lead you up into heaven; or if she do this, she must alone mirror my image to you in the heaven, as your stern judge and guide! 'Paint each countenance as though it were the countenance of your Beloved!' I once heard a great master say to his scholars—'let each fold of drapery, each flower, each leaf, each gem, be as if it belonged to your Beloved.' So say I to you, John, your passion must wreak itself upon your art; if you have the true artist's soul, the struggle will not be so difficult. Love of your art must be greater than love of me. Were I your wife, John, I would have it so, much more as your friend!"

John walked beside this singular Honoria, a most extraordinary tempest of feeling raging within him. "Ah, if she loved, if she *ever* had loved, how differently would she have reasoned," thought he to himself; "how cold, how unsympathetic her words; how far, far from her calm realm of reason is my soul. Whilst her rich voice fills my ear—whilst I am in her presence—I desire only to feel that one vast bliss. I would learn the universe from her wise lips. I would lay my soul in her hand, and she should guide it as a child—oh, to be of service to her, to remain near her—even as a menial!" And how much he owed her. And had he not always loved her, long, long years? Was it not love which, nursing within his breast, when the ignorant child had bowed his face among the flowers of the Hellings wood? Alas! poor John, were you not almost falling into depths of folly as absurd as in days of yore; are you, then, grown no wiser with years—and with the remembrance of sweet L'Allegro? In a bewilderment John walked, his hands convulsively clasped, and cold, with a great trembling which shivered down him, his face very white, and no voice proceeding from his firmly-set lips. He heard Honoria's words clearly and distinctly pouring forth; and a warmth seemed to flow forth from, and a glory to encircle her whole being; but the words conveyed no meaning to his soul—only at a later time did they, heard and buried within his memory, come forth and show themselves to his understanding, and each word was a word of steel. At length Honoria, suddenly pausing, fixed her noble, frank countenance with her clear eyes upon him, and stretching forth her warm, jewelled hands, took his clasped, trembling ones, and spoke with a voice which trembled for one moment with emotion, then clear as a trumpet awoke his intellect:—"Pardon, pardon, John, for pain caused you so unintentionally, so painfully to myself. Henceforth, we stand upon the rock of truth—our friendship must become purer and stronger; never more doubt my faith in you, or in your genius. I have always been *severe*, because I am ambitious for you. Show me that you can conquer your weakness, your strongest temptation; show me by your work, that I have given you strength—even though I have given you pain. We will avoid meeting for some time; but our friendship shall not, must not suffer!"

It was already dusk, and looking around her, Honoria said, with her usual abrupt decision: "You had better return to town to-night; my carriage shall take you. Master your feelings sufficiently to permit you to bid adieu to my father and Mr. Hale. I will explain in a satisfactory manner your departure. Remember I shall most anxiously await the evidences of your conquest!" And, leaving poor John speechless and heart-broken within the dusk of the beautiful garden, she glided towards the house.

It was towards the end of March of the following spring, that Honoria first acknowledged the battle that the soul of John Wetherley had fought. With a flushed cheek Honoria, clad in her riding-dress, entered John Wetherley's studio. No John was painting there: but Leonard stood before a nearly completed picture upon an easel. He gazed at Honoria's excited countenance, as she entered, without surprise; but with a strange mingling of sadness and almost of sternness. Standing aside, he placed a chair before the picture, motioning her to be seated. Honoria's eyes resting upon the picture, she clasped her hands, and bowing her face, tears of a bitterness such as never before had fallen from Honoria's eyes, fell glittering towards the earth.

Beneath the picture, written as if in letters of blood, she read the words—

"Love is Endurance, Martyrdom, and Victory."

The scene was a dim dungeon. At the foot of a dark row of heavy columns stood a rack; upon its bars reclined the youthful and wan figure of a man. His face shone with the glory of a victorious love, and he raised one hand as if blessing; instruments of torture lay around; an open Bible was pierced with a bloody sword. The two hardened torturers fell aside, covering their faces, as if blinded and stricken by that countenance of love. The other arm of the martyr encircled a woman, who, clinging to him firm and calm, supported her husband in her arms, supporting him through the fierce pangs of his suffering, bathing his parched brain, and kissing his pale cheek—enduring martyrdom of spirit to soothe his pangs by her strength and love.

A PEEP AT COUNTRY COUSINS, AND HOW IT ENDED.—LETTER IV.

Whitehaven, September 1st, 1820.

My dear Father,—You say it is more than two months since I have told you of any country goings on, but there has been less to describe in that way during the midsummer months, and except the pleasures of sheep-shearing and hay-making, I did not hear or see anything worthy of being minutely recorded. Harvest-home was new to me, and as it took place in glorious weather, we were all assembled in the home field, where the reapers finished their work, and a tremendous cheer greeted the falling of the last cut of the falling grain. The fortunate man, who had the honour to wield the final blow, became the hero of the day, and was elevated, in great triumph, on a throne of wheat sheaves, piled up in one of my uncle's largest carts, which bore him away to an immense barn, where a feast of butter-sops and ale was served up, and a riotous dance concluded the festival. The prettiest part of it, to my fancy, was a late serenade, very charmingly sung on the lawn about midnight, and under the light of a splendid golden moon. There were several wind instruments, and the sweet serious character of the thanksgiving-music, which constituted the principal part of the performance, combined with the correct harmony of three or four mellow voices, seemed a fitting and delightful acknowledgment of the bounty which had just been so lavishingly bestowed on His creatures by the Almighty Parent of all. I forgot to mention that, before harvest, we attended Lammas fair, which collected a large number of holiday people, and is peculiarly honoured by the sailors belonging to Whitehaven and the neighbourhood. Very smart they were, new rigged, as they called it, from top to toe in the cleanest of new summer clothing, worn in the most jaunty possible way. In the afternoon we partook of Farmer Dodd's hospitality, and I observed that almost every lass in the room wore a coquettish bunch of blue ribbons in her hair, the gift of one of the light-hearted young sailors, some of whom, I believe, danced seven hours that night without let or hindrance. The wearing of these knots of blue ribbon is considered a sign that a young couple are engaged to be married, and gave rise, I suppose, to the old song, beginning

> "Oh, dear, what can the matter be?
> Johnny stays long at the fair;
> He promised to buy me a bunch of blue ribbons
> To tie up my bonnie brown hair."

When I saw Susannah with one hid in her luxuriant flaxen ringlets, I ventured to offer her my congratulations on her engagement to my cousin William, which I had long suspected, but had not before dared to speak of to either of them. She looked blushingly happy, and you will, I am sure, be pleased with your future niece, whose rusticity is set off by so much true womanly delicacy of feeling, and so much gentle archness of manners, that I expect she would be admired even in our fastidious West End circles. It was strange, at the fair, to see such rows of persons waiting to be hired as domestic servants, the men holding straws in their mouths, which the more dandified stuck into the band of their hats; while the girls carried a green sprig in their hands, to intimate their readiness to enter into service. Well! now I must tell you about last night, when a merry party, that had collected at my uncle's, ended in a way I did not look for; and which makes me fear I shall have to leave the Friars, which I have no inclination to do for some time to come. Among the guests was an old Shropshire gentleman and his lady, who were on a visit to the Rector of Handley-Cross, in this neighbourhood; and as they were very lively and told us of many customs peculiar to their own county, they added much to the pleasure of the evening. When the old lady heard some one say the new moon had just risen, instead of making a curtsey, as many other ladies then present did, she asked for a silk handkerchief, and informed the party that any one, by holding it up between the moon and him or herself, would know how many years would elapse before he or she were married; the number of moons visible through the silk denoting so many twelve-months. I watched several persons try their fate, and was astonished at the different number of moons these good folks declared they perceived. The old lady would not be satisfied until I took my turn at the window; and as I could not make out more than one moon, I had to undergo a prodigious amount of banter, and sly prophecies that I should be married before this time next year. Mrs. Estlin, our good-natured informant, said, that when a child, she never met a snail in the early part of the day without throwing it over her left shoulder, to ensure good luck; and, for the same purpose, she remarked, more gravely, it was always well to have some money in one's pocket when new year's day arose, on which anniversary it seems that the Salopians also consider it prophetic of lucky fortune, if the first person they meet is one of the opposite sex to themselves. Mrs. Estlin asked my aunt if she might be allowed to see the kitchen; and a considerable party following her, she mentioned a Shropshire sport, much liked, she said, in their county, but which could only be played in an apartment floored with bricks or tiles. Every one was anxious to try the new game, which, however, she duly warned us, was not particularly refined; and a bowl of water, a plate of ashes, and the left wing of a goose having been placed along the floor according to her directions, down on all-fours squatted some of the most mad-cap young girls in the company. They were all blindfolded, and the amusement consisted in trying make their way to the bowl of water, in which case the oracle predicted the successful girl would marry a handsome young man; but if the candidate stumbled upon the plate of ashes, it declared she would never be united in wedlock; or if she alighted upon the goose wing, she was destined to become an old man's bride. I must confess I thought the sport rather vulgar, though it was impossible not to laugh heartily at the decrees of fate in particular cases. When it was ended, a true Cumberland frolicking was entered into, called "Peas scalding." A very large wooden bowl was put down in the centre of the kitchen table, round which some twenty couples sat down, and then Sally filled the dish with smoking hot peas fresh boiled in their pods, to which butter and salt were added. Robert had prevented my sitting down with this assemblage, which I was glad of, when, from the high chair on which he had made me stand, I saw that every one was devouring the peas by the aid of fingers and thumbs promiscuously thrust into the bowl. The empty pods were thrown into a basket on the same table, and the peas had just vanished, when I perceived a merry little girl suddenly steal behind William's chair, whence she aimed an empty hull at the nose of the person opposite; and this signal appeared to be the appointed token for the most exuberant manifestations of high spirits. Presently whole handfuls of pods were thrown one to the other, some rubbing the faces of those present with these emerald missives, until I thought it time for me to beat a retreat. The parlour was filled with old folks, who were quietly conversing or playing round games of cards, and I took breath, unperceived I hoped, behind a window-curtain; but I found Robert had not lost sight of me, and having professed a great desire to join me in looking at the stars, which were then very beautiful, he took the opportunity of asking me whether I could be happy to live always in the country. I felt so much surprised, by the unexpected proposal that followed this opening, that I hardly knew how to reply; but, as you know, I returned a civil negative, since Robert, cousin though he be, is still almost a stranger to me; but it gave me real pain to see how utterly wretched he looked as he briefly said, "I might have guessed how invincible would be your repugnance to quit the gay world, which you seem born to shine in, and have only to implore your forgiveness for my folly and presumption." He turned away abruptly as he finished speaking, so that I had no time to assure him that he mistook my reasons for declining his offer; and it so happens that he has not addressed me since. The post-boy is waiting for this; so, in much haste, dear Papa, believe me to remain, as ever, your affectionate daughter, Dora Harcourt.

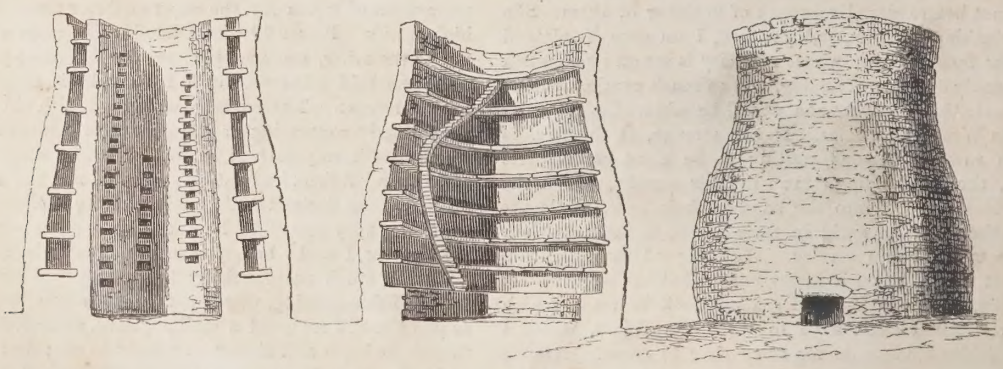
ANCIENT TOWERS IN THE NORTH OF SCOTLAND.

Not far from the ancient residence of the chief of the Clan Mackay, in the extreme north of Scotland, there is an ancient fortress known as the Tower of Dornadilla. This Dornadilla was the fourth king of Scotland, and reigned 250 years before the birth of Christ. His father, Mainus, was a man pre-eminent for wisdom and justice, and loved peace and prosperity above the strife of spears and the triumphs of conquest; and when Dornadilla came to the crown, he found the kingdom peaceful and the people happy; so he devoted his life to the pleasures of the chase; and the chief thing known about him is, that he framed those laws for hunting which prevail to the present day.

TOWER OF MOUSA.

The Tower of Mousa, represented in our engraving, is another ruin of the same description. It is of a circular shape, fifty feet in diameter and forty feet in height, and is constructed of large stones, uncemented. The peculiar form of the building rendered it utterly impossible to scale the walls, and its stony strength was sufficient to bid defiance to the attack of the foe. The walls are fifteen feet thick.

In the islands of the Hebrides similar towers are found; they are discovered in nearly every part of northern Scotland, dotted over the face of the land, the delight of the tourist and the puzzle of the antiquary. They have been ascribed to the Scandinavians, the rough Norse worshippers, the people of Thor and Odin; and again to the Danes, whose piratical invasions and hardy prowess once made all northern Europe tremble; but the most likely hypothesis is that which places their origin in the days of that terrible warfare which continued for so long a period between the Picts and Scots.



INTERIOR OF THE TOWER—AND THE EXTERIOR RESTORED.

The tower which bears his name is constructed of roughly hewn stones, without cement, and is about thirty feet high. The entrance is low and difficult, and the walls immensely thick. Within, a series of stone galleries or benches rise up, one above the other, a ladder, likewise of stone, leading from one tier to another. These galleries, commencing at a slight elevation from the ground, are continued to the summit

GROUP OF ARTICLES IN GLASS, PORCELAIN, AND TERRA COTTA.—FROM THE STALLS OF SEVERAL EXHIBITORS.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER VI.

"Teach me thy love, thou meek philosopher!
Show me thy nightly visions, bright-eyed seer!
Give me thy faith!—why should I blindly err
And shrink with anxious fear?"

Mary Howitt.

But let us return to Leonard. The words of Mr. Pierrpoint had sunk with the sharpness of a dagger into Leonard's soul—the old wound re-opened—the fearful moment had arrived, when, cost him all brightness of the future, Agnes must know the truth. To have so long with cowardice concealed the truth from her was baseness.

Silently Leonard and Agnes paced the terrace, and silently descended towards the little stream. Leonard's eyes never raised themselves from the earth; but in Agnes there was an extraordinary excitement, her large brown eyes flashed with a weird light—her slight form raised itself with an extraordinary vigour, her small white hands were grasped as if she sought to repress some violent internal emotion. She seemed to shrink from all contact with Leonard, and yet, her eyes watched him with an eager restlessness, with a searching, extraordinary gaze.

They descended the sloping banks of the stream—the swans approached, their plumage tinged with the glow of the departing evening, as the eternal snow of the Alps is tinted; but neither of the lovers observed this beauty upon the swans, nor their approach. Suddenly Leonard cast himself down upon the turf, burying his face in hands which trembled like aspen leaves, and bowed his head upon his knees. A vast spasm seemed to shoot through nerve and brain. Agnes watched him, like one turned to stone, except that her eyes became even brighter and keener, and her face seemed to sharpen in the approaching twilight.

"Leonard—*you* are Mordant's son—that poor maniac was your mother!"—slowly, clearly, and sharply ejaculated Agnes—her voice seemed to come forth from her inmost being, and yet her lips scarcely moved; but her hands grasped each other tighter and ever tighter, and her face became more rigid.

"God, thou art merciful," murmured a faint, hoarse voice from between the clasped hands of Leonard; but he neither raised his head, nor ceased to shiver with his strange spasm.

"It was *base*—" spoke Agnes, with a voice clear, low, and sharp—"*base* to have concealed aught of such import from me; you have sunk deep, deep in my esteem; you should have mirrored yourself in my soul, as in a glass, as I have done and ever would do by you. What is your faith in me, Leonard, when you conceal matter of such vital import? But, this will require much consideration on my part, and—reason with me is strong as love. But Leonard, Leonard," cried she, wildly flinging herself down beside him, and drawing his bowed head towards her and pressing it against her breast, and looking down upon the closed eyelids of her lover's white face, with an expression which must have wrung his soul for ever had he seen it, "Why, why, have you done what was base—unworthy of you, of me; of your father's memory?—speak, speak to me, clear yourself. I now know all—it is dreadful, sad; but worst, worst of all, is that cowardice, that baseness! But I love you, Leonard—Oh, God, oh, God, how much, how at times beyond reason, I knew not till this moment;" and Agnes burst into a fit of weeping.

Why did not Leonard take her in his arms, and with words of eloquent truth confess his weakness, unfolding his soul's sickness before this deep, strong love? He neither heard nor saw it. Agnes was a portion of the present—of the future—her words descended not into the dark, troublous Bethesda of his soul as the angel of healing. The wings of the mournful Past were around him—the Past held him chained with the letters of fatalism. Leonard, God had placed a strong, an energetic, a fervently loving soul beside yours, proffering to you a draught of Lethe; unveiling a new heaven and a new earth, and you turned aside, dashing the cup from her hands, and binding yourself yet tighter and tighter in your chains. You said to your soul, these are the chains springing from the graves and the dead lives of Augustus and Ursula Mordant; my life was their life—my death will be theirs. But love, Leonard, is life, is the fulness of life, the creative power, the consoler, the strengthener! Let love lay a hand of magic upon your bruised heart. But no electric thrill passes through you; yours is a death, a darkness, an annihilation!

When Leonard, as if by a violent effort, aroused himself out of his miserable paroxysm, he saw Agnes rapidly pacing up and down the side of the stream; her arms were tightly pressed upon her breast, her profile looked stern and hard. As he approached her, she turned almost fiercely round, and said, "Leonard, I shall set off to Sweden,—I shall now do that which I have long intended to do; you must throw off also this sloth which has crept upon you—which, to a degree, has crept upon me. Now that I know the secret of your life,—which I had certainly every right to have known much earlier,—I shall look at your character from a totally different point of view. This sloth, this morbidness, is to a degree inherited—that is a serious, very serious matter in my eyes, with my knowledge of physiological laws, an awful subject of importance. But you must arouse yourself,—Leonard! Leonard!" cried she with a momentary glow of that deep tenderness passing over and softening her features; "my pride will be bitterly wounded if you do not achieve all that, as my husband, you must achieve. I will not," and a fire flamed up through her whole being, and she stamped her foot violently upon the ground, "marry a man whom I must despise—who is a slave either to circumstance, to fate, to weakness! I will be great, and so must he! My eyes are unsealed, Leonard, you have a stern judge;" and with an indescribable pride she approached Leonard, and laying her quivering hand—a hand quivering with passion, not with weakness—upon his arm, she slowly said, "I never break my word—I have given my troth—I shall not withdraw it; but I shall be your judge—your task-mistress. You must be strong, free, and noble. I will tear out my very heart and trample it beneath my feet sooner than it shall swerve from the dictates of my reason!" And Leonard felt that she would do this. He had not seen the undying love which had looked out of her sad, strange eyes; he always had considered her one of those women in whom the intellect far overbalances the heart,—he had been fascinated, his intellect had delighted in intercourse with her—she had bound him with an irresistible spell—but *love* her he did not; at this moment this became clear to him—and he cast the fault of it upon her. "Where in her is the sympathy," said a cry of anguish in his soul, "before which I could unfold my misery,—she has no love, no pity in her nature,—love, which is the sole pulse, yet waking within me stops, as she with her pride, her stern merciless eyes approaches me!" Yet, why did he not then unbind the chains which bound him to this cold being? "Agnes," he said, in a tone cold as her own, "I am glad you know this *one* secret of my life. I was about to have told it to you when your lips spoke the words—the misery connected with it—the whole blight which it has flung over my life, you with your strong and powerful nature never would or could perceive; you do not conceive the tortures which it and its concealment have occasioned me, could you—even you, dear Agnes, might pardon. Now that you know this secret, and look into the one darkened chamber of my soul, have mercy—pardon if you can. You are right in your determination to pursue your career, and to put now into execution your journey to Sweden. I should bitterly regret to in any way have

placed an obstacle in your path; your energy cannot fail to influence me. Ask anything now concerning my life, Agnes; all lies before you. Publish my real name if you will, to Miss Pierrpoint, to the world; I no longer care. There was at first no more reason in assuming the name than to conceal myself from the pursuits of my poor, poor mother, and to shroud my success—miserable success—from the eyes of my uncle, until it should burst upon him with a perfectly blinding glory. Fool that I was! Then came habit and a hundred small entanglements that rendered it difficult for Leonard Hale to return into Leonard Mordant. But I detest falseness as much as you do. It will be well to have this ended."

"But this cannot so soon be ended, be set right," said Agnes, "yet the way will clear itself up to me—the way will open—but no more untruth—no more shadow of an untruth!"

"There are old friends of mine, kind, loving, and *trusting* friends, whom I have only too much neglected of late, Agnes, and whom I should like you to become acquainted with—Lucretia and Mary Gaywood, and their little nephew, Cuthbert. The Gaywoods have known me from a child; knew my unhappy parents, and yet they still respect and even, I believe, feel affection for me—talk with them, Agnes."

"I shall wish to know them," was her brief reply.

Oh, Leonard and Agnes! a cloud, a phantom, a misery almost without a name has risen up between you! In Leonard was aroused pride, spite of his self-condemnation—and there was no love of the one who had wounded and aroused this pride, rather a terror of her, and disgust began to whisper within the secret and dim recesses of his soul.

In Agnes was aroused suspicion, which would never, never rest, and which, with its lynx eyes, would pierce through long years past and long years to come, and a sense of justice and firmness seized upon this suspicion, making it their servant, their bloodhound, who must hunt out the *truth*, and *then* must come the final struggle of Love and Reason.

The two walked up and down by the dark margin of the brook,—twilight sank duskily over all,—and as they walked they conversed with a strange calmness, and as though no terrible shock had agitated their inmost souls and the whole course of their lives. Agnes had arranged the plan of her journey, she would start within a week.

A sudden gust of wind swept across the water, agitating its placid surface; the swans aroused by the approaching storm fluttered their wings, and uttering a wild cry dashed out into the stream from their lair beneath the reeds. The wind roared through the trees, and heavy rain-drops began to fall; the two returned towards the house where already Honoria was calmly reading aloud an article in the Quarterly Review to her father and the old lady by the brilliant light of the lamp. John was speeding away towards London.

Without one pressure of their hands or lips the lovers came out of the storm and the darkness into the warm and brilliant room, their faces had a ghastly and haggard look, and it seemed even to their own souls as though their lives were for ever riven asunder.

Agnes spent the last evening of her stay with Leonard at the Gaywoods. It was a wretched evening, like the whole of this wretched time. Lucretia, spite of her earnest desire to like Agnes and believe her worthy of Leonard, could not forget her conviction of the hardness of her nature, and secretly disliking the idea of her, was cold and restrained. Agnes immediately set the Gaywoods down as women of the mere ordinary run, of whom in the bottom of her heart she had a decided contempt, and a proud and cold expression sate upon her countenance quite sufficient to authorise Lucretia in her present somewhat hasty judgment. The secret distrust of each other in the minds of Leonard and Agnes rendered their mutual affection no cement with which to unite these elements of repulsion.

Leonard wished the Gaywoods had not seen Agnes; and even little Cuthbert added to the discomfort and ill-omen of the visit, by drawing Leonard aside in the garden, where pulling down his head, he whispered into his ear:—

"Dear friend!" the child was in the habit of so addressing Leonard, "you don't then like *her?* She's not your wife. I'm *sure* then you don't like her!" And the strange child, either from a certain jealousy, or from some of his strange intuitions would not allow Agnes to touch him, and would not look at her.

Poor Agnes; poor Leonard! How those words, "But you don't like her!" rang like a demon's voice through his soul night and day, day and night for many months to come!

Agnes' letters were long and full of detail, her career seemed to be one of unclouded success, although not without its difficulties and its fatigues; but these, to a nature such as that of Agnes, only gave zest to her undertaking. The fresh world of thought opening up to her in the life of the north, and in the rich material for her work on the "Universal Faith," which she discovered in the libraries of Upsala and Stockholm, and in the conversations which she frequently enjoyed with one of the greatest of Sweden's learned men, a professor of Upsala, who had assisted her in her researches with a benevolent and fatherly interest, of which Agnes could never speak in sufficiently warm terms, fired Agnes' soul with a tenfold vigour. All details she communicated to Leonard with a scrupulous care, believing that they would be of scarcely less interest to him than to herself, his sympathies being especially Scandinavian. "I will not weary him," spoke Agnes often to herself, whilst she penned her letters, "with the deep yearnings which fill my heart towards him; my *actions* shall prove my deep, increasing love, which this great absence but reveals. His perhaps is a nature, itself undemonstrative where the deepest feelings are concerned, therefore, a nature pained and annoyed by demonstration in others—still it is a strange anomaly, his unbounded expression of love towards all in the universe, except toward his bride, his betrothed!—But strive unceasingly to arm and warn him against his morbid sloth—I must, whether it pain or not—candour and truth must go hand in hand with my deep love!"

Leonard reading these letters reasoned from his own point of view—"What a proof is here of her cold unsympathetic nature—at this great distance she alone writes of her work, of her success, of speculative intellectual matters—detailing, word for word, conversations with the old book-worm! The dazzling dream gradually vanishes! Where is the love, the tenderness, the sympathy which my soul cries for and nowhere finds! This unmeaning goad, too, of her words, 'how is your picture for Lord de Caelis, progressing? Send me word, Leonard, what you are doing. I shall be a very hard taskmistress, and you must have such and such things completed by my return!' How little can that nature of steel and iron sympathise with the riven nerves and sickening brain! No, Agnes, ours has been a great mistake! Lucretia—who is charity itself—I have always felt did not like Agnes; *she* recognised her as cold and hard—I cannot be mistaken—Agnes is one of those strange and miserable women in whom the life of the heart has become withered up to nourish the brain!" And Leonard brooded and brooded, falling only deeper and deeper into his musing, and believing himself thwarted by fate on all hands.

Lucretia, spite of herself, did Agnes a bitter injustice—both in her own heart and in Leonard's—she spoke rarely to Leonard of Agnes, from many reasons; and Leonard was only too thankful to cease speaking of his betrothed with his old friend, for the thought of Agnes gradually deepened into a sharp pain. The old intercourse between Leonard and the Gaywoods returned, both Leonard and Lucretia tacitly feeling as though poor Agnes had been the enemy who had stepped in between their beautiful friendship—another unspoken thought which strengthened their injustice towards the poor girl. She became a perfect scape-goat with Lucretia for all Leonard's short-comings. "Ah!" sighed Lucretia to herself, "if that Agnes Singleton had only loved Leonard as such a nature deserves—if she had only possessed heart enough to comprehend such a being, what a change should

not we have seen in him! But his life seems eating itself away with misery—she should never, never have left him—she *could* not, had she rightly loved! She it is who should have drawn him forth from his sad dreams, should have been the spur, the vigour of his existence! But she is eaten up by her vanity, and by her heartless ambition! Such beings do not deserve the noble name of woman!—they are even a thousand times, in my eyes, more disgusting than the woman whose whole existence is absorbed in warming her husband's slippers and mending her children's socks!" And Lucretia, with all her charity, in her inmost heart of hearts, gave vent to a vast indignation—and bitter injustice!

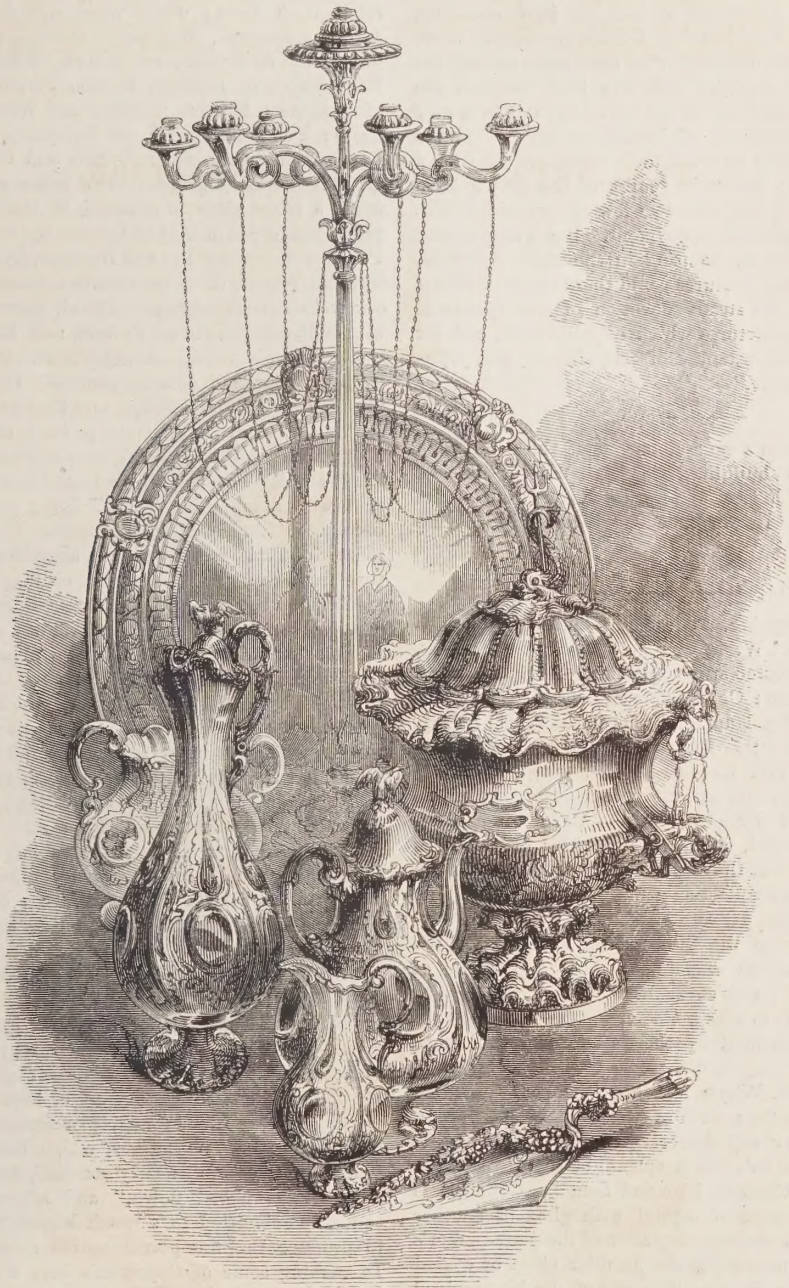
And thus month after month rolled on. Of John Wetherley the Gaywoods saw little—he was so very hard at work, he declared; and "He overworks himself dreadfully, we are sure," often observed they; "he is grown almost as thin and pale as Leonard—what can we do for him?" But their hearts could do him no good; neither could any friendly attention from Leonard, who frequently looked in upon him, always finding John frantically at his work. Leonard's keen sense divined John's secret; and the wonderful power which suddenly developed itself in John's present picture called forth even words of praise from Leonard, and first awakened respect within him both for John and his genius.

THE GREAT DUBLIN EXHIBITION.

GROUP OF OBJECTS DESIGNED FROM THE ANTIQUE.—EXHIBITED BY THE LONDON AND PENZANCE SERPENTINE COMPANY.

In this great international bazaar, as in its glorious progenitor of 1851, we have a vast display of the mental and manipulative powers of man. Here we have laid open to our view the treasuries of thought and labour. On the threshold of investigation—says an acute writer—"we have the produce of the mine and quarry; the abundance that the teeming earth yields to man's industry for his health and sustentation; the raw materials from which he fashions forth all that is necessary to his comfort, his protection, and his luxury; the various tools and machinery which he

invents and adapts to aid the processes of manufacture; the woven fabrics and the objects of simplest construction for every-day use." Thus far, we perceive, that man has been seeking to satisfy the positive recognised necessities of his nature; and we are struck with wonder at the range of science and experience involved in those simple productions, no less than by the marvellous inventions and contrivances for the economy of human labour and the facilities of production.



GROUP OF OBJECTS IN SILVER PLATE.—SELECTED FROM THE STALL OF MESSRS. WATERHOUSE AND CO., DUBLIN.

A new chain of facts and ideas present themselves at this point. The tree of the forest is felled and cut into planks for the erecting of rude houses; but taste and the inextinguishable love of ornament inherent in the mind of man intervene, and the wood is carved, and polished, and fashioned into beauty. The flax plant grows wild upon the moors, and the cotton pod bursts white beneath a torrid sun, and the silkworm plies his busy trade in secret places, and the sheep throws off his winter dress of wool: man comes, and the linen, and cotton, and silk, and cloth, are woven and dyed with many colours, and damasked and flowered with various patterns, and so assume fitness and elegance. Deep down in the dark earth the various metals lie, and beside them are marbles and minerals, which wait only the furnace-fire, and the chisel of the sculptor, and the acids of the chemist, to shape them into bronzes, and statues, and forms of beauty. Earths and clays lie useless on the banks of deep-flowing rivers; but the potter's wheel is quickly turned and the rusts of metals are applied to their surfaces, and the fire hardens and glazes them, and they assume the well-known forms of domestic utensils and articles of luxury. And so also of nearly everything in the Exhibition. Skill and experience, and thought and labour, are brought into requisition, and the rude and the homely, being submitted to the processes of

manufacture, are transformed into the beautiful and the pure.

Thus, then, we perceive that the love of the ornamental—common alike to the naked savage and the most learned *savan*—has a tendency not only to increase the commercial value of the thing manufactured, but to diffuse among the producers and consumers of manufactures a refined and cultivated taste. The art-wealth of the world—that is, the increased value given by art to manufactured materials of any kind—a wealth purely of man's own creation—must be enormous: and the amount of employment thus generated or brought into operation, becomes an important consideration of State economy. How, important, then, is the cultivation of true taste among the people of the sister kingdom; and how high becomes the mission of such an assemblage of the industrial arts as is now to be seen in the metropolis of Ireland—"where," says a national writer, "there is so much to be done, and yet such a dearth of employment; where the genius of the people is so imaginative and artistic, and where so few opportunities exist for its proper and profitable employment. But a new feeling is growing up amongst us, pointing in the right direction, the development of manufactures; and there can be no surer road to success than the steady devotion of our industrial energies to those manufactures which happily exist, and for which the national circumstances of soil, climate, and population are directly suitable."

Having already* given a general outline of the contents of the Great Exhibition building, we have on the present occasion little more to do than to describe the different articles chosen by our artist. In our first engraving (page 57) are various specimens of

TERRA COTTA, GLASS, AND PORCELAIN,

artistically grouped together. These have been selected from the stalls of Messrs. W. Whyte, of Marlborough-street, Dublin; S. Warren, Dame-street, Dublin; Gregg and Son, Sackville-street, Dublin; C. M. Warren, Essex-street, Dublin; Mr. Alderman Copeland, of Stoke-upon-Trent; W. H. Kerr and Co., Worcester; J. Ridgway and Co., Staffordshire Potteries; and the Hon. General Lygon, who has kindly forwarded to the Exhibition various unique specimens of old Sevres porcelain and Dresden, Berlin, Capo di Montes, Vienna, Chelsea, oriental, and old Worcester china. The beautiful Indian bottles at the extreme right of the sketch are also from the general's collection; and for grace of outline, fitness of decoration, and delicate distribution of colour, they are inferior to nothing of the kind in the Exhibition. We may learn much from an examination of the products of Indian taste and skill; and every manufacturer visiting the Exhibition will do well to take a hint from the beautiful, yet simple, objects manufactured by the natives of our Eastern dependencies.

The stalls of Mr. W. Whyte and Mr. Warren are rich in specimens of cut flint glass, such as decanters, candle lustres, engraved vases, dinner and dessert services, crystal dishes, &c. The former firm exhibits a splendid ruby-coated vase, representing Richard Cœur de Lion and Saladin at the battle of Ascalon. The coating of crystal with glass of another colour is a curious and elegant adaptation of the glass-maker's art. The method of producing the peculiar effect of coated glass is, however, very simple. The end of the blowing-rod is first dipped into a pot of colourless glass, and a bulb of the required size withdrawn. This, being allowed to partially cool, is then dipped for an instant into a pot of coloured glass. The two layers unite without intermixing; and when the article is finished as to form, it is white within and coloured without. The effect of coloured and plain glass is afterwards produced at the cutter's wheel. Fluted lines somewhat deeply cut pass through the outer or coloured coat and enter the coloured one; so that when they cross, their ends alone are coloured. In this way, ornamental glass objects may be made of two or more colours, according to the taste of the manufacturer.

Messrs. Gregg and Son and Mr. C. M. Warren also exhibit many curious and beautiful articles in glass and porcelain. The cut crystal centre dish to the left of the engraving is selected from the stall of the latter gentleman. Bohemian coloured vases, cut decanters and water jugs, lustres, opal and snake-handle goblets, cased and engraved crystal, manufactured at the Flint Glass Works, are shown by several wholesale and retail Irish firms; while vases and tazzas, statuettes and garden ornaments, in Dresden china, Parian, stone, earthenware, and terra cotta, are shown by Mr. T. Leetch and Mr. Edmondson, of Dublin; Messrs. Ferguson, Miller, and Co., of Glasgow; Messrs. Doulton and Watts, of Lambeth Potteries; Mr. John Millar, of Edinburgh; Mr. J. Walker, of Larne, County Antrim; J. Bell and Co., of Glasgow; and Mr. Alderman Copeland. The latter gentleman makes, indeed, a fairer show, if possible, in the Dublin Exhibition of 1853 than he did in that of London in 1851. In addition to his Parian statuettes of Ino and Bacchus, by Foley, and his Venus by John Gibson, there are various reductions from the works of our well-known sculptors,—Theed, Baron Marochetti, Gibson, Marshall, Lawlor, Hiram Powers, and Mr. and Mrs. Thorneycroft. These beautiful statuettes in Parian marble are produced by a peculiar and delicate process. Cornish china clay, the plastic clay of Dorsetshire, and flint or felspar, ground, each separately, to an impalpable powder, and mixed together till they come to about the consistency of cream, form what is called the "slip." The clays give the object consistency and the flint whiteness. The "slip" being poured into a mould, becomes in fact the future statuette. The moulds are made of plaster of Paris, which speedily absorbs a portion of the moisture from the "slip;" and the coating immediately next the mould soon becoming hard, the remaining liquid is poured off, thus leaving the Parian in the form of a hollow cast inside the mould. Rapid evaporation taking place, the "slip" is soon converted into a state resembling clay, and is sufficiently hard to stand by itself. The mould, which is made in several pieces, is then opened, and the different parts of the statuette taken out; for it must be remembered that figures in Parian are seldom moulded entire; the head, arms, hands, legs, feet, &c., are generally moulded separately; so that in a group of several figures as many as fifty or sixty separate moulds are required. The next process is to submit the various parts, &c., to the "figure maker," who connects them together by means of "slip," similar to that used in the casting. "Props" of plaster are placed in such positions as to bear a portion of the weight, and thus prevent any undue pressure that might cause the figure to shrink or yield in the final process of "firing." After the edges of the seams, caused by the junction of the mould and the joining of the several parts, have been obliterated,—a process which requires the greatest care and nicety to accomplish—the entire figure or group is submitted to the action of about sixty degrees of heat. This "heating" or "firing" is continued for sixty or seventy hours, according to circumstances. The figures, which have shrunk about one-fourth, or sometimes nearly one-half, during these processes, are then "rubbed down," and afterwards buried in fine sand and submitted to a much higher temperature, in order to produce that fine porcelain-like surface so much admired. In making some of Copeland's best Parian statuettes, three "firings" take place. Extreme care must be observed so as to keep the furnace at an equable heat, and thus prevent one part of the figure from shrinking more than another. In this way are reproduced, in miniature, many of those fine sculptures with which the world became so familiar at the Great Exhibition; and when we consider how cheaply copies of great works can be brought before the public, and how nearly this material resembles real marble in its outward appearance, and that it is even superior to it in its power of resisting the action of corroding substances, we are astonished that Parian statuettes do not become even more popular than they are. Statuary porcelain, as it is now manufactured, is a great

* See "Magazine of Art," vol. i. pp. 24, 389, 443.

advance upon the gypsum casts so commonly used for busts and small figures; and we do not see any reason why it should not be produced at a rate low enough to come within the means of the poor and humble, and thus teach them to understand and appreciate the beautiful. The statuette of "Ruth" in our engraving is one of Mr. Copeland's productions.

Many articles in terra-cotta (literally, baked earth,) are shown at the Dublin Exhibition. Messrs. Bell and Co., of Glasgow, and Messrs. Doulton and Watts, have several well-finished vases, flower-pots, and garden statues in this material; but perhaps the best specimens of objects in terra-cotta are those exhibited by J. Edmondson and Co., of Dublin, Mr. J. Blashfield, of Poplar, London, and Messrs. Ferguson and Miller, of Glasgow. The latter firm, besides the usual show of vases and Gothic chimney-pots, have a fine copy of the Warwick vase, the size of the original, and a well-constructed and nicely-designed fountain, twenty-four feet in height, suitable for a market-place or the centre of a nobleman's park. Though all the works, both ancient and modern, executed in terra-cotta, bear one general character as regards the composition of their material, the taste with which they are executed differs widely. The remains of Grecian and Roman works in the British Museum are, in many respects, unapproachable by the moderns.

We have next some specimens of the peculiar serpentine stone of Cornwall, which appear in the exhibition under the head of

MANUFACTURES FROM MINERAL SUBSTANCES.

These are appropriately placed beside the Irish marbles in the central hall, and we cannot but express our regret that the beautiful green porphyry and the white and black marbles of Connemara, as well as many other of the mineral treasures of Ireland, are not so well displayed. The mineral called serpentine is found near Penzance; indeed the whole of the Lizard Rock is composed of it. This serpentine marble assumes a variety of mottled colours, irregularly veined—red, green, brown, yellow, &c.—and is always picturesque and beautiful. Like all igneous rocks, serpentine is traversed by white-yellow veins of steatite which, when the stone is worked, gives the surface a varied and singular appearance, capable of receiving a high degree of polish. This stone, although its existence has been known for centuries, attracted little attention till the royal visit to Mount Bay in 1848, when Prince Albert expressed his admiration of its beauty and utility, and suggested that its more extensive use might be made commercially profitable. The proprietors of the soil took the hint, and the beautiful mineral speedily became known as admirably adapted for ornamental works, such as urns, tazzas, &c. In the Irish Exhibition the variety of columns, jugs, pedestals, fonts, vases, obelisks, chess and work tables, &c., into which it has been formed, sufficiently show its capability of being extensively applied. In Westminster Abbey the brackets of two monuments, erected in 1710 and 1711, as well as the panelling of Addison's tomb, are of serpentine; and to this day the original polish is as perfect as ever. In chemical composition, this stone may be said to be a siliciate of magnesia,—38 parts in 100 of magnesia and 42 of silica, with small portions of the oxides of iron, chromium, and manganese, and lime, alumina, and water, according to the analysis made for the company. For various building purposes, and for the formation of fountains, it is especially adapted; as it is not liable to decay when brought into contact with water or the atmosphere, and the polish is so permanent as to almost defy time.

In this division of the Exhibition are shown many examples of classic forms in Irish marbles and terra-cotta, as well as a series of 245 specimens of natural rocks, soils, minerals, &c. collected by Henry O'Hara, Esq., civil engineer; a good assortment of Irish marbles from the Museum of Irish Industry, and some good specimens of green porphyry, the black marbles of Kilkenny, and red conglomerate from the estates of the Earl Talbot de Malahide, and other exhibitors. The local committee of the county Kerry have chimney pieces, bust-pillars, and slabs of Kerry marble; Mr. A. Ballantine, of Dublin, exhibits various specimens of Galway black marble; and Mr. B. Blackburn has a large collection of flooring slabs, roofing slates, cisterns, billiard table slabs, and various articles in slate, &c. from the quarries in the island of Valentia.

Under the head of "Furniture, Upholstery, &c.," there are exhibited various articles in

CARVED BOG-WOOD.

The principal exhibitors of this peculiar description of wood are Mr. T. Chaplin, of Kilkenny, who shows a table of bog-oak, well made and beautifully carved, from the demesne of the Right Hon. the Earl of Desart; Messrs. Curran and Son, of Lisburn, who have a richly-sculptured and perforated arm-chair, designed from the antique, in Irish black bog-oak; the Earl of Eglinton, who exhibits a chair of bog-oak, manufactured for him by Messrs. Curran and Son, highly decorated in carvings of roses, shamrocks, thistles, vine-leaves and berries, the seat of which is composed of a beautiful specimen of needlework by the Countess of Eglinton; Mr. S. Hemphill, of Dublin, who has an elegantly-designed fire-screen of bog-yew, with flower-piece and falcon, worked in Berlin wool by Miss English; Mr. J. Egan, of Killarney, who, besides some specimens of bog-oak furniture, has a finely-carved table made from arbutus wood grown on the estates of Lord Kenmare and Mr. Herbert; and Messrs. Jones and Sons, of Stephen's-green, Dublin, who have in their compartment a complete suit of furniture made of Irish bog-yew, besides various articles carved and ornamented in the bog-wood peculiar to the sister kingdom. This firm made a good show in the Exhibition of 1851; but their present display may be said to be superior, if possible, to even that; for it consists of ducal chairs in the style of Louis Quartoze, carved pier tables and glasses in the florid style of Louis XV., Davenport desks and girandoles, omnium of three plateaux with statuette of the celebrated Brian Boroihme, loo-tables with basso-relievos of the Irish kern, or soldier of the tenth century, chairs, tables, ottomans, &c.

The peculiar appearance of bog-wood arises from the fact that it has been for centuries imbedded in the bog-land of Ireland. The ebony colour of bog-oak, distinguishing it from pine, is due to the chemical combination of the gallic acid of the wood with the iron held in solution in the water of the bog. A real black dye is thus produced; just as, in the manufacture of writing-ink, the black colour is made by the addition of copperas or sulphate of iron to a decoction of galls. Pine and yew timber, unlike the oak, present only a light fawn or brown colour, simply because it contains a smaller quantity of gallic acid. The wood thus saturated with iron is effectually preserved from decay and the action of the dry-rot from the fact that the albumen of the tree has been rendered perfectly insoluble by the action of the metallic salt contained in the bog-water. The discovery of the perfectly-preserved woods of the Irish bogs, and the chemical explanation of their singular preservation, have led to an artificial, but scientific, adaptation of the same means of preserving timber, by injecting into the pores of the wood a solution of corrosive sublimate, or creosote oil, or baryta salts and sulphate of iron (sulphate of baryta), which latter process increases the weight of the wood very considerably, and, in fact, converts it into a kind of stone. How long the timber may have lain useless in the bogs of Ireland, or from what cause whole forests became as it were submerged, it is impossible to say; but certain it is that the roots of the trees have remained in their original positions, while the branches have never been found. Besides this, the outer surface of the wood would appear to have been burned or charred—a fact which is probably alluded to in the peasants' saying, that "the devil set fire to the world, but God put it out with the deluge!" Besides furniture, &c., Irish bog-wood has been extensively employed in the manufacture of brooches, watch-stands, bracelets, beads, &c.; the black colour and high polish it is capable of receiving, rendering it very valuable for such purposes. Some of the most beautiful of the latter articles are exhibited by Messrs. Classon and Connel, both of Dublin. In our engraving is

shown an inkstand of bog-oak mounted in Irish silver. The rather curious form of an owl for such an instrument is taken from a similar object found among the ruins of Pompeii. There is also the companion case to that made for her Majesty, mounted in silver and carved with emblematical harp, dog, &c. It was presented to the Exhibition by the Earl of Eglinton. In the foreground are several hair-pins, brooches, and other small articles, manufactured and exhibited by Cornelius Goggin, of Nassau-street, Dublin.

to. Messrs. West and Sons, of Dublin, exhibit the beautiful centrepiece in silver, which was presented to the late Colonel Miller by the constabulary of Ireland; Messrs. Waterhouse, of Dame-street, have also the fine centrepiece which was presented to Joseph Green, Esq.; the Acis and Galatea centrepiece, presented, in 1848, to the Count Streliski by the Poor-law Unions of Ireland; besides several copies of the Tara, and other antique Irish brooches, pins, pixes, crucifixes, beads, &c. in Irish silver. In the objects which we have selected for

ARTICLES CARVED IN IRISH BOGWOOD.—SELECTED FROM THE STALLS OF VARIOUS EXHIBITORS.

Our notice of

ARTICLES IN SILVER AND ELECTRO-PLATE

must be very brief indeed. Mr. Goggin, of Nassau-street, Dublin, and Mr. Johnson, of London, exhibit various articles in silver plate—centrepieces, and copies of tazzas, &c. in electrotype; Mr. Bennet, of Grafton-street, has a variety of plate of native Irish silver, well-designed and manufactured, with candelabra, tea and coffee services, salvers, jugs, &c. Most articles of this description are plated by the electro process, but occasionally, the old plan of white plating upon copper and raising by the hammer of the workman is resorted

illustration much taste and skill have been displayed. The presentation trowel in front is exhibited by permission of the Lord Bishop of Armagh, by whom it was used in laying the foundation of a church lately. The nautical race-cup and silver tea-service also deserve high praise. Both the latter, and the candelabrum, which is modelled after a classic design found at Pompeii, have been manufactured expressly for the Irish Exhibition.

It may not be improper to add, in conclusion, that the Dargan testimonial—in the promotion of which the sympathies of all classes have been enlisted—has taken the very appropriate form of an Industrial College.

ALDERMAN SIR JOHN POTTER.

FOUNDER OF THE MANCHESTER FREE LIBRARY.

NOTHING more strikingly illustrates the living vigour of the English commonwealth than the distinguished excellence which incessantly displays itself in every part of the social frame. Travel from Penzance to the Hebrides to study the people of England, and what a long line of worthies will you become acquainted with. We are not thinking of ordinary worth; that is great, sterling English worth of character—honesty, industry, truthfulness, family attachments, earnest religion; these quiet, genuine realities are found in every town, village, hamlet, and almost every house in the land.

SIR JOHN POTTER.

But at present we refer to what is eminent, to what has at least local distinction; and we say that mental, moral, and social superiority is found in every nook and corner of this dear old England of ours. In some sort the writer has made the experiment. Professional duties have taken him into the bye-ways as well as the high-ways of the land, and making it his practice to keep his eyes open wherever he goes, he has seen and recognised superior men everywhere, so as to make him proud of being an Englishman. Here he has found a village "doctor" so profound in the science of ethnology as to be wise enough therein to teach the wisest; there a village Solon, who in the study of history and the study of mankind, had learnt the science of legislation so well that magistrates and members of Parliament were glad to listen to his unpretending but instructive discourse. This man with the leathern apron is an adept in mathematics; that man with shirt-sleeves tucked up is a proficient in Hebrew; and that shabby-genteel man who deserts his shop for the hills, the vales, the Roman roads and Saxon ruins, is familar with every spot, every genealogy, every great name, every place of worship, every school, every almshouse, every battle, and almost every feud and law-suit of the whole country.

Were we in any district to go in search of the notabilities, we should scarcely, we confess, look for them among local authorities and municipal magnates. Councillors, aldermen, and mayors are generally great chiefly in their own esteem. They know too little to know themselves. Possessed of qualities which crave publicity, they push themselves into prominence, and aiming to seem great in their small way take no care to be great in reality. Unreal and affected to

begin with, they soon learn to worship show and parade, and for the most part end in becoming decorated shams.

Even in so uncongenial a soil the sterling worth of our English blood ever and anon produces excellence. Alderman Sir John Potter is an example. An alderman and knight he is, but he is also something far better, and something that very many aldermen and knights are not. Look on that fine, generous, good-natured countenance, reader, and you at once see the man. You say it is aldermanic? True, Sir John is hospitable; but his hospitality is the hospitality of the heart; it is the natural expression of a liberal soul; and while on the one side his hospitality approaches to jollity, on the other it is qualified and refined by the intellect of a scholar and the manners of a gentleman. Those who associate grossness and vulgarity with their idea of Manchester merchants and manufacturers, would be surprised to find in Sir John Potter qualities of the highest order, fit not only to sustain but to adorn any office in the land. Predominant in Sir John Potter's character, however, is generousness. His heart overflows with liberality. There is in the man a princely munificence of nature which ever prompts him to say and do munificent things. His nature seems to repel what is ordinary and common-place. The stamp of superiority is on every thing connected with him. To be first in all things seems to be not so much his aim as his destiny. On whatever he undertakes he leaves an image of himself, and that image stands up in bold relief. The fact is exemplified in his mayoralty. His predecessors in that office were men of mark. Sir John's own father—one of his predecessors—was a man of extraordinary force of character and surpassing social usefulness; yet it is no disparagement to the father to say that he was excelled by his son. It may indeed be said that Sir Thomas was more sturdy and pertinacious in the assertion and maintenance of his opinions, but it must also be granted that Sir John possesses a more varied culture, more comprehensive principles and wider influence. Of social esteem no mayor of Manchester ever enjoyed so large a portion as Sir John Potter. This was the natural reward of the just principles on which his mayoralty was grounded. Other mayors had been whigs, reformers, radicals; Sir John Potter was an Englishman. Not but he had his political convictions and preferences. As the chief magistrate of Manchester, however, he disowned all distinctions of sect and party. Appointed to represent the community, he felt himself bound to acknowledge merit wherever he found it, and to show favour to all men in proportion to their public eminence and usefulness. Accordingly he gathered around his hospitable board the chief men of all services, all parties, and all denominations. So, too, in his exertions for the public good he was actuated by a regard not to popularity, still less by a regard to party interests, but chiefly by a regard to general utility.

Sir John Potter, a magistrate and alderman of the borough of Manchester, a deputy-lieutenant of the county of Lancaster, mayor of Manchester for three successive years (1848, 1849, 1850-1), an opulent merchant of the firm of Potter and Norris, Piccadilly, Manchester, son of the late Sir Thomas Potter by his wife Esther, daughter of Thomas Bayley, Esq., of Booth Hall, near Manchester, was born the 10th of April, 1815, at Polefield, near Prestwich, a small village on the high road from Manchester to Bury. Having received his school education under the care, successively, of the Rev. William Johns, of Manchester; the Rev. Lamb Carpenter, LL.D., of Bristol; and the Rev. James Martineau, of Liverpool, John Potter repaired to the University of Edinburgh, where he studied during the period from 1831 to 1833. In March, 1845, he succeeded his father as alderman of the municipal borough of Manchester, of which city he was elected the chief magistrate on the 9th of November, 1848. When, on the 10th of October, 1851, her Majesty the Queen honoured Manchester with her august presence, Mr. Potter received at her gracious hands the honour of knighthood.

It is universally admitted, that in no part of her dominions has Queen Victoria been welcomed with more marked or more hearty demonstrations of loyal gladness and respect than in the city and neighbourhood of Manchester. The feeling, honourable alike to her Majesty and her subjects, mainly springing, as it did, as a spontaneous expression of dutiful love toward the sovereign, was, if not in part called forth, yet directed and concentrated by the untiring zeal and administrative skill of Sir John Potter. A bright day in Sir John's existence was that, not so much because he therein received a distinguished token of his sovereign's approbation, as because he was the public representative of the affectionate and respectful regard of a happy and prosperous population toward their Queen. The 10th of October, 1851, was a joyous day for Sir John; we still see his open and manly countenance radiant with smiles, diffusing good humour and gladness over the congregated myriads.

A still happier day was that when Sir John Potter presided at the completion of his own task, and, surrounded by distinguished strangers, as well as the most cultivated, benevolent, and wealthy inhabitants of the vicinity, opened by a formal inauguration "The Free Library" of Manchester. A nobler gift was never bestowed on a neighbourhood. The gift is the higher because it is a national example and will have a national influence. The advantages which "The Free Library" offers are highly valued and largely made use of by the working population. The eminent success which has crowned the effort has already suggested the propriety of another attempt of the kind, and we have grounds for hoping that ere long Manchester will possess a second "Free Library."

The Great Exhibition of 1851 was an object well fitted to call forth the enthusiasm and engage the energies of Sir John Potter. In the capacity of acting chairman of the local committee, he rendered services of the most valuable and effective nature. His position as mayor and his natural courtesy led and enabled him to pay suitable attention to foreigners of note whom the Exhibition attracted to England. Of special service was he to a party of Sardinian workmen, who, together with some of their more socially eminent fellow-countrymen, visited Manchester in order to survey and inspect its manufacturing and commercial wonders. Sir John Potter's attentions on the occasion were acknowledged in the following address, presented to him on behalf of his compatriots by Captain Bertinatti:—

The Worshipful the Mayor of Manchester.

Allow me to present you my fellow countrymen, the Sardinian workmen actually in Manchester, under the direction of the distinguished gentlemen you already know. On this occasion I beg leave to say a few words, in bad English, but with truth and sincerity of heart. At the first coming of our workmen into this glorious land to visit that magic palace where are shown the marvels of the world, and to witness the triumphs of the British industry, I announced then I had received from the Chief Magistrate of Manchester the assurance that he would do all in his power to procure access for us to the great industrial establishments of this noble town; and now such an access having been fully procured for us, we come to offer to the Worshipful the Mayor, and to the principal manufacturers, and the workmen, and the whole population of Manchester, the expression of our deepest feelings of gratitude for your cordial reception, and for having admitted us, as your brothers, to witness this magnificent display of human ingenuity, of which Manchester is the most liberal seat, and which, from Manchester, spreads all over the world the comforts and benefits of an industrial civilized life. We shall never forget the generous hospitality and the kindness we met in every part of England; and we shall never forget that in every part of England, and in this populous town of Manchester, we have been constantly brought to admire, in every class of society, their unshaken loyalty to their most beloved Sovereign, under whose high protection such stupendous deeds are accomplished, and that religious respect for the law which is the best foundation of true liberty. And here I cannot refrain from uttering a wish, that, in a short time to come from this glorious epoch, every nation may bear in their bosom such sentences to be pronounced, as the sentence spoken near four months ago by a noble-hearted Englishman at a meeting principally attended by English artizans and mechanics. "*Let us Englishmen,*" said he, "*bless the day when reposing in the strength of our institutions, we find no jealousy of foreigners*; but, on the contrary, feeling proud in the unshaken firmness of our constitution, we

offer them the free opportunity of witnessing its practical working and its freedom, promoting the good fellowship of the nations of the earth." This example we have fully witnessed in Manchester, and such a noble example shall not be lost upon us; our good workmen returning to their country will talk a great deal of it to their brothers, and they will inspire them with their feelings, and the name of the Worshipful the Mayor and of the town of Manchester will be always pronounced throughout the Sardinian kingdom with the same deep feelings of gratitude which we have the honour to offer you this day.

Of still greater value to Sir John Potter were the following testimonials spontaneously and cordially awarded to him by his associates in the Manchester corporation—testimonials which derive no small portion of their worth and acceptance from the fact, that they are an official echo of the respect, esteem, and gratitude felt and cherished toward the worthy knight by the entire vicinity, and especially by those who enjoy the honour of his personal acquaintance.

Borough of Manchester.

At a Meeting of the Council of this Borough, holden on Monday, the 10th day of November, 1851,

Resolved unanimously—

That the thanks of this Council be and are hereby given to the Worshipful Sir John Potter, Knight, who, during the unprecedented period of three years, has filled the important and highly responsible office of Chief Magistrate of this Borough, for the great ability, constant assiduity, and untiring zeal with which he has performed the numerous duties devolving upon him as Mayor, and especially for having, at a period rendered interesting by circumstances likely to arise in connexion with the Industrial Exhibition in London, consented, at great personal sacrifice, to continue in office during a third year.

For the vigilance, promptitude, ability, and impartiality which he has displayed when presiding over the meetings of the Council, and for the good order he has preserved during its proceedings.

For the urbanity he has invariably shown to the members of the Council, the information and assistance he has at all times proved himself so willing to afford, and for the readiness with which he has called them together for consultation in cases of delicacy, difficulty, or importance.

For the promptitude with which he has consented to convene public meetings for the promotion of measures likely to be beneficial to the community, and for the willingness he has always shown to preside at such meetings, when requested by the promoters.

For his great hospitality; for the liberal and cordial manner in which he has met gentlemen of all classes and opinions; and for the good-will and efficiency with which he has co-operated with his fellow citizens, without distinction of sect or party, for the accomplishment of objects likely to conduce to the public welfare.

For the numerous acts of charity and munificence which have distinguished the whole period of his mayoralty, and for the ready assistance afforded to others engaged in promoting measures of benevolence and charity.

For the great and eminently-successful exertions he has made, at large personal sacrifices, to establish and place in a splendid and commodious building a Free Public Library, suitable for the wants of the numerous and increasing inhabitants of this borough.

For the time given, and the valuable assistance afforded, to the local committee appointed to aid in carrying out the objects of the Great Exhibition of the Industry of all Nations.

For the devotion shown, and the eminent talent displayed, in the performance of the important duties that devolved upon him as the head of the corporation, on the occasion of the visit of Her Most Gracious Majesty to this borough, thereby reflecting credit on the corporation, and securing from his Sovereign distinguished marks of approbation and favour.

And for the way in which he has at all times respected and maintained the rights and privileges of the burgesses, and sustained the dignity of the mayoralty.

At a Meeting of the Council of this Borough, holden on Wednesday, the 1st day of September, 1852,

Resolved—

That this Council feel called upon to place upon record their high appreciation of the long-continued and disinterested exertions and sacrifices which have been made by Alderman Sir John Potter, to carry out, to its successful accomplishment, the proposition which he had the honour to originate, for the establishment of a Public Free Library; and as the representatives of the burgesses—who, when appealed to for their votes, so unmistakably testified their opinion—tender to Alderman Sir John Potter, and the other subscribers, their thanks for the liberality shown and the exertions made to secure the establishment of the Public Free Library about to be presented to the Corporation. That this Council sincerely trust that the most sanguine anticipations of the founder and supporters of so noble an institution may be fully realised; and that it may, as intended, become a great and lasting blessing to the inhabitants of this borough.

ANCIENT ABBEYS IN IRELAND.

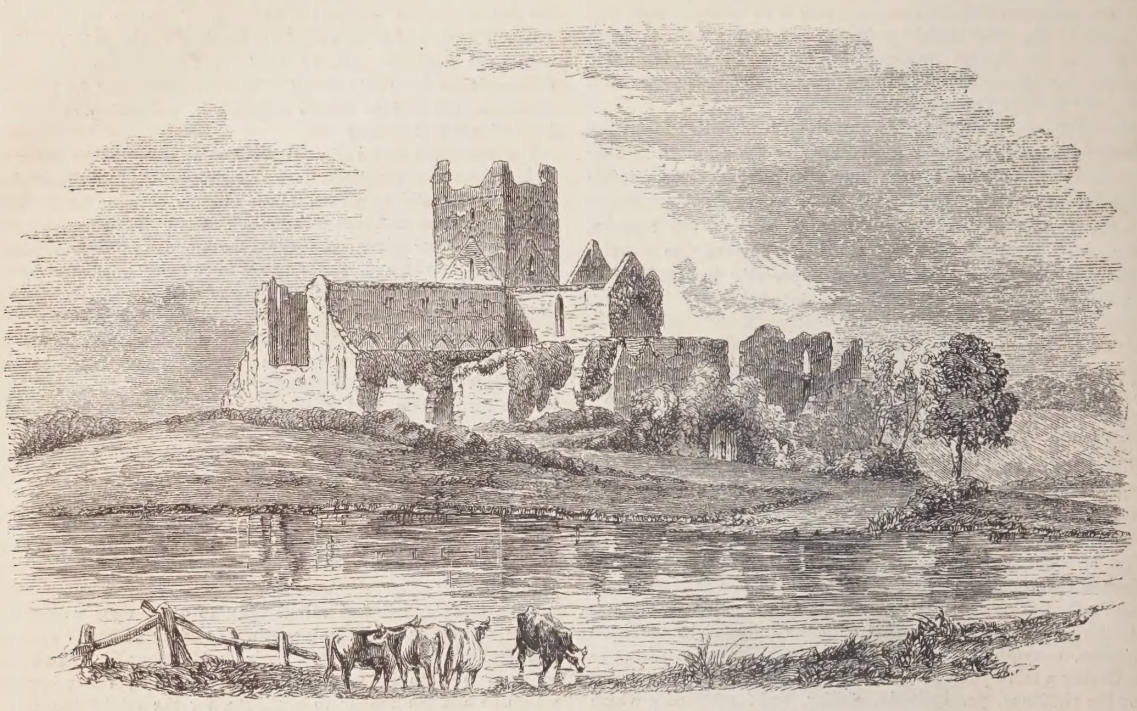
From Coleraine to Glengariff the soil of Ireland is strewn with the remains of former greatness: here the tottering walls of some storied castle; there the ivy-covered and grass-environed site of some ancient abbey, or other place of primitive worship; everywhere the signs of decay amid evidences of returning prosperity. "Belonging to the Christian era in Ireland," says Mr. J. Windele, "there is a great variety of small churches, whose dates extend from the fifth to the twelfth centuries; stone crosses, inscriptions in the Romano-Irish characters, reliquaries, shrines, bells, croziers, &c., and a whole mass of manuscript literature. The earlier churches are generally plain and unornamented, but of a special interest to the antiquary, from the Pelasgic or polygonal character of their masonry and details, manifesting an immediate derivation, or rather continuity, of a preceding style of primeval antiquity in the island; several of these were roofed with stone.

"The churches of the eighth and subsequent centuries exhibit more of decoration and greater extent. Their details present more elaboration, &c., of the sculptor's art. In all these, too, there are peculiar features distinguishing their style from the coeval architecture of the neighbouring country. In them, a chancel is generally superadded to the nave, and both compartments are connected by a semicircular, decorated, sculptured arch. The ruins at Inis Cailtre, Clonmacnois, Monaincha, and Cashel, present interesting specimens of the architecture of this period.

The earlier missionaries made it a practice to appropriate the sacred sites and monuments of the converted pagans, and dedicate them to Christian uses. Near the round towers they built their churches; wells, and fountains, sacred to the inferior deities, they consecrated to the worship of angels and saints; and on the heathen pillar-stone they inscribed the symbol of their faith—the cross. Numerous instances of this practice still remain. In many of those crosses considerable inventive taste is displayed; they are found incised on the tall rude obelisk, and on the horizontal slab. In these the cross is usually placed within a circle. Out of this practice grew the beautiful and elaborate class of crosses covered with sculptured devices, emblems, and the most intricate scroll and fret-work. They are generally perforated at the intersection of the arms, and their sites are almost invariably the most ancient cemeteries, although a more recent species, the 'Wayside Cross' is often found near our high roads, as its name implies. On some of the earlier crosses inscriptions in the Romanesque Irish character occur. The style and general execution of these monuments afford a high evidence of the skill and artistic attainments of their period."

On the estates of many of the Irish nobility and gentry are still to be found the ruins of the ancient religious edifices. Muckross Abbey, one of the sights of Killarney, for instance, is now surrounded by the lawns and pleasure-grounds of Mr. Herbert, one of the best-known landlords in the west of Ireland.

"No one should visit Killarney," says Inglis, "without seeing Muckross Abbey. It is a very beautiful and very perfect remain, and contains within it the most gigantic yew-tree



JERPOINT ABBEY, THOMASTOWN, COUNTY WATERFORD.

I have ever seen; its arms actually support the crumbling wall, and form a canopy above the open cloisters. The

DUNBRODY ABBEY, NEAR WATERFORD.

trunk of this majestic yew-tree measures thirteen feet in circumference."

The great Council Abbey, near Naas, on the Dublin and Cork Railway, is a magnificent ruin of a monastic institution, founded in 1202. It was suppressed by Queen Elizabeth, who presented the estate to Sir Edmund Buller, as a reward for some special service he had performed for her majesty. This Sir Edward was the progenitor of the famous house of Ormond. At Templemore, Tipperary, the seat of Sir John Craven Carden, there are to be seen the ruins of what was once doubtless a fine religious structure, and now known as

the Priory; and near at hand, on the green banks of the Suir, is the noble monastic ruin of Holy Cross Abbey, of which we present an engraving.

This Abbey was founded in the year 1182, by Donald O'Brien, king of North Munster, and the charter of its foundation was witnessed by Gregory, abbot of Holy Cross, Maurice, archbishop of Cashel, and Britius, bishop of Limerick. It is said that Mustagh, a former monarch, received from Pope Pascal, in 1110, a piece of the true cross. This relic, set in gold and adorned with precious stones, was long an object of veneration throughout Ireland. Numerous pilgrims, among whom were the Desmonds and the great O'Neil, flocked to pay their devotions before it. Here it remained until the period of the Reformation, when it was saved from destruction by the Ormond family, and was eventually restored to the Roman Catholic hierarchy, to which it

VIEW OF THE ABBEY OF HOLY CROSS, MUNSTER.

formerly belonged. From this relic the abbey takes its name. The abbot, who sat as baron in parliament, was styled earl of Holy Cross, and was also vicar-general of the Cistercian order in Ireland.

The architecture of the nave is inferior to that of the transepts, choir, and tower, which is supported on either side by a beautiful gothic arch; the roof is groined and pierced with five holes to admit of the passage of the bell-ropes. The two transepts are also groined, and each is divided into two chapels, one of which contains the baptismal fonts, and an altar-tomb, now in a state of decay, probably the tomb of the founder. This chapel was lighted by a window of very curious design.

In the choir are two rich monumental relics, of a very original and gloomy style of architecture. One, which separates two little sanctuaries, consists of a double row of pointed arches springing from pillars, whose shafts are enriched with spiral flutings, and whose bases are ornamented with trefoils. At one side is a font for the reception of holy water. Judging from the dimensions, one would suppose that this curious piece of architecture was intended to contain the remains of the deceased, during the performance of the funeral mass; or perhaps this was the shrine where the holy relic was exposed. The second monument is no less remarkable, and its use equally uncertain. Three trefoil arches, springing from slender columns of black marble, support a projecting stone canopy which is enriched with precious stones. Beneath the canopy there are five escutcheons, three of which bear arms; the first shield on the dexter side bears a cross; the second, the arms of England and France, quarterly; the third, the arms of the Butlers; and the fourth seems to bear the arms of the Fitzgeralds. This leads us to suppose that this elegant mausoleum was raised to the memory of the daughter of the earl of Kildare, the wife of James, fourth earl of Ormond called the White Earl, who died about the year 1450.

When one of Ireland's oppressed sons, wearied with his day's labour, stops at eventide to contemplate the ruins of the old abbey, other personages occupy his thoughts. On these stones, which the sinking sun is gradually leaving in darkness, he reads a whole history of foreign oppression, of civil wars, of defeat and misery. An O'Brien founded this church; probably one of the descendants of that old king of Munster, Brian Boru, celebrated in song as Brian the Brave, who, abandoned by the other kings, accompanied by his five sons, his grandson, his fifteen nephews, and all his faithful followers, met the Danes on the plains of Clontarf, and drove them back to their vessels, after a bloody engagement, in which the valiant old king, then ninety years of age, together with his

bravest sons and the flower of his clan, was slain. Perhaps it was an abbot of Holy Cross, who, hearing an English prelate find fault with the Irish calendar for not reckoning the martyrs, cried, "Alas! my countrymen were too pious to meddle with the blood of saints; but now that the Normans are in the midst of us, martyrs are not wanting."

There are few more melancholy spectacles in Ireland than Derrynane Abbey, the seat of the famous O'Connell family, at Cahirciveen, in the county of Kerry. The situation of this house is extremely fine. "Seen from above," says Miss Martineau, "in its green cove, embosomed in woods, guarded by mountains, whose grey rocks are gaudy with gorse and heather, and facing a sea sprinkled with violets, it looks like a paradisical retreat. The first glimpse of it from the Cahirciveen road—by which Daniel O'Connell passed from one mass of his large property to another—shows his yacht riding in a sound in front of the grounds, the sea view suggests the remembrance of the old day, when the O'Connells of both families—Dan's uncles and father—were understood to do as others did who lived in situations so favourable for those commercial enterprises which are conducted by night." But the smuggling, which many a great family encouraged in the wild times of the last century, is all over now, as well as the agitation which rendered the "Liberator" so admirable a friend, and so bitter an enemy. The head of the house has gone down to his grave, having died poor, very poor, in a foreign land; his eldest son has followed him but lately, and the name and memory of O'Connell are already spoken lightly of in the land of his birth. The old abbey is now inhabited by strangers. "Melancholy to all eyes, it is most so to the minds of those who go a quarter of a century back, and hear again the shouts which hailed the advent of the Liberator, and see again the reverent enthusiasm which watched him from afar, when he rested from his toils at Derrynane." Melancholy, indeed, is the sight of the old house, damp-stained and weed-environed, out-of-joint, unrepaired, unrenewed, and with O'Connell's empty yacht in the forlorn, sand-filled sound, and his chair in the chapel covered with black cloth, "all else that he enjoyed there, in his vast wealth of money, fame, and popular love seems to be drooping away to destruction."

Kell's Abbey, in Kilkenny, and Dunbrody Abbey, in the same county, are now but ruins—crumbling walls and moss-grown stones. The latter structure is considered one of the most picturesque and interesting ruins in the county. The architectural beauty of this abbey is still discoverable, and it requires no great stretch of imagination to again people the wastes around with the Cistercian monks, who in the old time distributed the charities of religion among the peasantry. Dunbrody Abbey was built by Henry de Montmorency, marshal to Henry II., in 1182, and was dismantled in the troublous times of the Reformation.

Within a few minutes' walk of the Jerpoint station of the Waterford and Kilkenny railroad, stand also the ruins of another famous ecclesiastical structure, called Jerpoint Abbey. It was founded by Donagh, king of Ossory, but it has so long been in a state of dilapidation, that we fear the determination of the Kilkenny Archæological Society to restore it will be of no avail, unless the work be at once proceeded with. Stones from its tottering walls are continually being taken to repair the peasants' huts, and even the tombs of the Butlers, and other famous personages of the old time are hardly secured from the sacrilegious hands of the ignorant inhabitants of the neighbourhood.

Other ruins of religious edifices might be mentioned—Kilconnel Abbey, once a monastery of Franciscan friars, built in 1460, but now a mere shell; Athenry Abbey, near Galway, a fine ruin of a building which once belonged to the order of Dominicans; Newton Abbey, near Trim; the ruins of Bective Abbey in the same neighbourhood; Roscommon Abbey; Boyle Abbey in county Roscommon; and St. Mary's Abbey, built in 1415, by Sir John Talbot, the "Scourge of France,"—but that our space forbids. The chiefs who once made merry in the old castles of Ireland, and the ecclesiastics who raised those beautiful religious edifices of which we see only the ruins now, are most of them unknown to fame. And it is as well that it is so, for no good comes of looking back. Irishmen have been too prone to do so hitherto, but their watchword in this nineteenth century should be—FORWARD!

SIGNS OF OLD LONDON.

TRADESMEN'S SIGNS.

THE different events of history which have furnished subjects for signs are particularly interesting and far from uncommon: as the "White and Red Roses" of York and Lancaster; the "White Hart" of Richard II.; the "White Swan" of Henry V.; the "Red Dragon and Greyhound" of the Tudors; the "Boar's Head" of Richard III.; the "Royal Oak" of Charles; the "White Horse" of the Brunswicks; and many others may be mentioned as examples. Heads also formed a very numerous class, especially those of royalty; but which were especially subject to transmutation by the accession of new sovereigns, who, in their turn, occupied the place of the late one. In like manner, the "Duke's Head," in the time of Blenheim, implied Marlborough, was changed to his Royal Highness of York, or his Grace of Wellington.

> "Vernon, the butcher Cumberland, Wolfe, Hawke,
> Prince Ferdinand, Granby, Burgoyne, Keppel, Howe,
> Evil and good, have had their tithe of talk,
> And filled their sign-posts then, like Wellesley now."

The heads of "Milton" and "Shakspere" were occasionally met with. The latter was used by Jacob Tonson, over against Catherine-street, Strand, now 141, and afterwards by Miller, a Scotchman, who published the early editions of the works of Fielding, Thompson, Gibbon, and others, and who altered his sign to the head of "Buchanan." The heads of Homer, Horace, and Cicero, were also taken as signs, especially by booksellers; and it was no uncommon practice for publicans and others, not renowned for modesty, to decorate their house fronts by hanging out their own portraits, as in the case of "Paul Pindar," in Bishopsgate-street, and which the society of antiquaries, some years ago, considered sufficiently authentic to publish, nor should we here omit to notice the house of Taylor, the "water poet," in Phœnix-alley, near Long Acre, and in the evidence of his own words,—

> "There's many a head stands for a sign,
> Then, gentle reader, why not mine?"

an omission must not be made of the "Cuckold's Head," as characteristic of the time of Henry VIII.

> "Here is maryone marchauntes at all gate,
> Her husbōde dwelleth at ye sygne of ye "Cokeldes pate,"
> Nexte house to Robyn renawaye."

The heathen deities and their attributes were somewhat more rare, nevertheless we find the "Caduceus of Mercury," probably indicating expedition. The head of "Esculapius," his "serpent and staff," or his "cock," were appropriate signs for professors of the healing art, and which are still found decorating our modern druggists, as well as the head of "Galen," or the "Phœnix" rising from the flames. Dragons, mermaids, and other nondescripts, contributed largely their share to the departed genius of decoration of our old city. John Rastell lived in Cheapside, "at the sign of the 'Mearmayd,' next to Polly's gate," where he published the "Pastyme of the People," and in the same locality at the "Green Dragon," was published the first edition of the Merchant of Venice. The sign of Alderman Boydell was the "Unicorn," at the corner of Queen-street, Cheapside.

In Heywood's "Rape of Lucrece," first edition, 1608, is a characteristic song, but which particularly relates to inn signs:—

> "The gentry to the King's Head,
> The nobles to the Crown,
> The knights unto the Golden Fleece,

And to the Plough the clown.
The churchman to the Mitre,
The shepherd to the Star,
The gardener hies him to the Rose,
To the Drum the man-of-war;
To the Feathers, ladies, you; the Globe
The seaman doth not scorn;
The usurer to the Devil, and
The townsman to the Horn.
The huntsman to the White Hart,
To the Ship the merchants go,
But you that do the Muses love,
The sign called River Po.
The banquerout to the World's End,
The fool to the Fortune hie,
Unto the Mouth the oyster-wife,
The fiddler to the Pie.
The punk unto the Cockatrice,
The drunkard to the Vine,
The beggar to the Bush, then meet,
And with Duke Humphrey dine.

Before closing this part of the subject, it would be as well to refer to the signs of the old theatres, and, for want of better reasons for explaining the motives which prompted the owners in the selection of them, we may conclude that the form of the "Globe" Theatre may have had some reference to it, while the "Fortune" was appropriate as in the present day, from the extremely precarious and blind nature of the speculation. The "Red Bull" doubtless referred to the sort of entertainment to be there met with, when bears and bulls were baited to vary the amusements; and in connexion with early plays, it will not be inappropriate to note, that it was at the sign of the "Red Bull" the first edition of "King Lear" was published. Having taken this rough sketch of the signs, it would be well to remember, that what have been advanced are nothing more than probabilities, as doubtless very many persons carrying on the same trade adopted the same sign for totally different reasons, and very possibly from whim or caprice.

We will now endeavour to collect and point out such remaining signs and ancient decorations, scattered and fragmentary as they are, which are still to be found about our streets, and which may not inappropriately be adopted as detached links of the chain of history connecting the present with the past.

There are few memorials having any claim upon our attention, either from their antiquity or originality, westward of Temple-bar. In Westminster, at the end of King-street, and near the Abbey, there exists, above the modern sign, a good specimen of carving of a "Boar's Head," and which is undoubtedly the original sign.* There was a token of this house on which is, "The bores head in Kings streete, Westminster," on the reverse, in the field, "I. D. W." The whole line of the Strand can scarcely produce an example. At the corner of Catherine-street is a carving in stone of a "Lion" leaning on a shield, and at No. 166 an antique-looking "Lamb," gilt and suspended by his body over the doorway. There are several of these decorations still remaining in the neighbourhood of Shoreditch, as well as other parts of London, as signs for hosiers and woollendrapers. At No. 46, in the upper part of an old house, there is a carved "Lion's Head," and which is worthy of notice on account of its peculiar position, it having the appearance of looking out of an open window of the upper story or garret; but whether it occupies its original place is a matter for conjecture. Over an ironmonger's near St. Clement's Church, there remains the old sign of a "Gridiron and Bell. Near this locality, in Holywell-street, there exist several houses, decidedly good specimens, if not the best remaining in London, of its ancient architecture. Over the doorway of an old book-shop is a noble sign, in gilt metal, of a "Half Moon," with the face of a man in the inner side. Adjoining this house is a fragment of carving on the post of a narrow passage. An old globe lamp still occupies its place near to it, and which, together with an abundance of dirt, forms an exceedingly picturesque group. Respecting this sign it was far from an uncommon one, and doubtless alluded to the legend of the "Man in the Moon," which sign was represented, sometimes, as a man standing in a crescent, as in the case of John Clarke, in Wapping, in 1668, and represented on his token. On arriving at the city gate, we enter into a new field; historical associations crowd upon us in connection with the haunts of the great authors and literati of the last two centuries: but without allowing these to divert us from our purpose, the first house we arrive at contains, in their office, the original sign of the "Marygold." This was probably adopted as appropriate, on account of the business formerly carried on being that of a goldsmith, which trade, it is well-known, was the origin of many of the most eminent bankers in London. This house was formerly carried on by Richard Blanchard and Francis Child, and still retains the name of the latter, as Child's banking-house. A few doors eastward of this house is Gosling and Sharpe's, in the front of which bank is still exhibited the old sign of the "Three Squirrels." These are represented in iron, and attached to the bars on the upper part of the centre window, are spiritedly executed, and curious specimens. At a few doors beyond, in the same direction, we arrive at the banking-house of Messrs. Hoare, over whose doorway they have fixed the original sign of the "Leather Bottle." Nearer Temple-bar, on the opposite side of the way, and over the entrance, there is the sign of the "Cock" tavern. There is reason to believe it is the original one which decorated the house when honest Izaak Walton took his morning draught of ale there. From a notice issued by the master, in 1665, when the plague was raging, that he should shut up his house for several weeks, he there calls it the "Cock and Bottle," the latter of which now forms no part of the sign. A plausible motive for the adoption of this sign may have originated in the sign, almost exclusively used at public-houses, being to denote that the game of throwing at cocks was played there. A token was issued by William Brandon, who kept a house he called "Ye have at it, on Dowgate-hill;" and on this coin is a man about to throw a stick at a cock. The "Mitre" tavern, opposite St. Dunstan's, which was formerly resorted to by the wits of the last century, exhibits a gilt sign over the lamp. At the corner of Fetter-lane there stood, within a year, the shop in which Cobbett sold his "Weekly Register," over which there stood an enormous gilt gridiron, and which was noticed by the old political economist in his work.

The "Bell" tavern, in Fleet Street, has a good specimen of the flat sign which was adopted after the order of common council for the removal of the projecting ones. It is a large and bold painting on a metal plate.* The subject of this sign may have reference to the saint of the parish church, St. Bride's.

In pursuing an eastward course there are no signs worthy of note, excepting, perhaps, the "Bolt and Tun." The original sign of this old house has long since disappeared; the one now existing is a humble sign, over the coach-office, of a small tub with a short arrow or bolt through it.

Ludgate Hill can scarcely boast of a single specimen; but one was moved from over the doorway of Rundell and Bridge, the gold and silversmiths, on their relinquishing business some few years ago, their sign was two large gilt "Perches," which were in metal, and projected over the footway. The sign of Daniel Lambert is still to be seen within a few doors of St. Paul's Churchyard, and is a portrait of the giant man himself.

In St. Paul's Church-yard, the "Goose and Gridiron" may be seen near their door-way, but it can boast of no higher antiquity than the middle of the last century.

* While this is going to press, the property has been sold and the sign removed.

* This is the second example of the old signs which has been removed, between the time of this paper being in MS. and in the press, and a strong plea for a record of these memorials of the past.

THE STUFFED PENGUIN.

THERE is something remarkably life-like in all the sketches of the late Tony Johannot, so picturesque and still so truthful, that they always have found ready admirers in all who have looked upon them. Whatever subject he undertook, he executed with a fidelity and beauty seldom equalled and rarely surpassed. The engraving which we now present is from one of his inimitable drawings, full of the force and vigour which distinguishes the whole of his works. The picture tells its own story. There, with wrinkled brow and long grey locks, is the old naturalist, surrounded by his treasures, regarding them with greater pleasure than ever miser looked upon his gold. He has invited a few young friends to examine his exhibition, and is pointing out the numerous stuffed birds which form his collection, arranged with an air of picturesque, but withal fantastic, beauty. The old man is proud of the show; it has been the object of his life; every leisure hour has been devoted to it; he has collected with discriminating care, prepared with critical accuracy, arranged with the eye of a connoisseur, and now he looks upon it as complete.

Great variety of expression is thrown into every countenance. The boy shrinks back with an instinctive terror as he passes before an eagle, who is leaning forward in a manner terrible to behold; the little girl is contemplating the fine plumage of the peacock, bright with red and gold and purple, and claps her hands together with a cry of admiration; the old man is looking as if he fully enjoyed the opportunity, as he explains all about the species, nature, habits, country, name, and general characteristics of every bird in the collection—his memory is a complete treatise on ornithology, and he talks like a book.

Meanwhile, the old man has resolved upon presenting to his fair visitors some token of regard, something that they may preserve as a momento of their visit. He has pointed out to one of his young friends a screech owl, with tawny wings and of frightful aspect, but she has shrunk back, half afraid to touch the horrible monster, and politely declined its acceptance; she would not—so she says—spoil so valuable a collection. Still the old man is unwilling to let them depart without some present: the lyre bird is there in all its beauty, the swan with its white and delicate plumage, the peacock in rainbow hues, parrots, and ravens, and humming birds; but the visitor still declines, until at length her attention is arrested by a fine specimen of the penguin.

CABINET OF NATURAL HISTORY. FROM A DRAWING BY TONY JOHANNOT.

"That," says the old man, "I cannot offer you; nature has bestowed upon it neither grace nor beauty, which could alone entitle it to a place in your saloon."

But the visitor gazes upon it with a gesture of unaffected surprise. It has awakened memories deep and tender—brought to her recollection the stories which a brother used to tell of chasing the penguin, a brother who is far away in the northern seas,—she has heard from him of the bird, and to her it possesses more value than all the rest of the collection; it has a grotesque, strange figure, but the penguin is her choice.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER IX.

Officer—"Most worthy signior
The duke's in council; and your noble self,
I'm sure, is sent for."
Brabantio—"How! the duke in council
At this time of night!"—*Shakspeare.*

We have been a long time absent from the Camp at Palestrina: let us now return thither, though we must leave fair Venice for a season, and those with whom we have been engaged there. Our readers will remember that the third chapter of this our

ZENO AND ROBERTO DI RECANATI BEFORE THE COUNCIL.

most veracious history closed with the interview which had taken place between the Venetian general, Zeno, and the good English knight, Sir William Cheke, or Checco, as the Italians called him.

Zeno, as we said, passed into an inner apartment. It was evidently one in which he had secured for himself that perfect privacy which was necessary for a man who had such heavy responsibilities imposed upon him, and who had constant need or deliberation with his own mind to sustain him in his stern course against those who opposed and thwarted him. Flinging himself upon the rude couch, which served as his bed, he surrendered his mind to contemplation, protracted and to all appearance perplexing. At length, he half arose, and continuing the course of his thoughts, he unconsciously gave them utterance.

"So let it be then," he murmured, "perhaps it may suit my purpose as well as anything I could have devised. I shall thus, at all events, prevent his keeping his appointment to-night; and I shall commit him, if possible, to adopt some course of action, or it may be to disclose his own. It is true, I shall expose to him the dissentions and weaknesses of those who fain would govern our State; but I am much mistaken if he be not but too well acquainted with these things already, and so no mischief can result from his being present at the council. Yes, I will even take upon myself the responsibility of summoning him."

Zeno now arose, and stepping across the room to the door, opened it and called—

"Who waits without there?"

In a moment the young Greek was at the door: the general beckoned him to enter.

"Thou hast been through the camp since sun-down, Alexis?"

"So please your excellency I have. I am but just now returned."

"Is all tranquil?"

"As the grave, signore; save the sentinels and those who were preparing to relieve the guards there is no one astir."

"'Tis well. Thou knowest the quarters of the Italian lances that are under the command of Recanati?"

"Assuredly, eccellenza."

"What is the time now?"

"It wants about two hours of midnight, signore."

"Good. Fetch me now the means of writing."

The youth speedily brought the requisites, and Zeno wrote a few lines which he folded and delivered to Alexis.

"Thou shalt take this to the condottiere without delay, and bear back to me his reply. And mark, good youth; I know thee to be true and faithful, and as sharp of eye as thou art true of heart."

The boy replied not, save by bowing silently and pressing his hand upon his bosom.

"Aye," continued his master, comprehending all which the gesture of the young Greek was meant to convey—"Aye, I know it well, Alexis. Well then, thou shalt take good note of all thou seest and hearest. Watch the face of this Roberto as he reads what thou givest to him; and heed the manner of his words more than the words themselves, for he is one of those who knows how to conceal a deep and deadly meaning beneath specious language. And now for thy mission, good youth, for time is speeding, and I have much to prepare ere I meet the council an hour hence."

The youth placed the paper within the folds of his vest and left the apartment; while Zeno proceeded to unlock a box strongly bound with iron, whence he took forth various papers, apparently military reports and others of a more secret character. Over some of these he paused and pondered long, and one who could have seen him at his solitary and absorbing employment and marked now the dark shadow crossing his brow, now the scornful smile curling his lip, might easily divine that he was penetrating the mazes of some devious scheme, and detecting the meshes that a wily hand was laying around his path to ensnare him.

In such occupations and thoughts we shall leave him. It would be bootless to follow his speculations; they would, even had we the power and the will to investigate them, only exhibit one of those chapters of toilful and perplexing meditation which is the lot of every great spirit in every age—the penalty which they must ever pay who would seek to govern their fellow-men. Let the humble and the unambitious account themselves happy in that they are not solicited by those overmastering and passionate aspirations for greatness, which urge irresistibly forward those who in every age are doomed to fill the fore-front of the world's panorama,—beings to look upon and wonder at, with their brows glorified by fame, and their proportions magnified beyond ordinary humanity by the light that shines upon them; but, ah! not to be envied or imitated. Oh ye thrice-blessed and happy who walk ever in the valleys of life, lie down content and careless when the long shadows of the coming night fall upon your lowly cots, sleep your unbroken sleep through the dark hours till the dawn of the morning; and as ye arise in peace, bless that providence which casts not your lot amongst those who are ever wearily climbing up the hill sides, who keep the watches of the night in careful vigils, and the hours of the day in toil, that strews wrinkles upon the brow and plants sorrows in the heart.

In the meanwhile the young Greek proceeded on his mission through the camp at Palestrina, and at length arrived at the place assigned to Roberto Recanati and his free companions, a body of one hundred lances and about four hundred foot soldiers, chiefly Italians, picked up in the various States of the north of Italy, and now banded together under their wily leader. While throughout all the other portions of the encampment the utmost tranquillity and repose were perceptible, Alexis, as he approached the condottiere's quarters, at once became aware that some movement was in preparation. The clank of mail and the heavy tread of armed men at intervals sounded upon his ear, and lights passed to and fro in the darkness. Replying to the sentinel's challenge at the out-post, he soon found himself amongst the soldiers of Recanati, and perceived that a portion of them were equipped in their armour and others were making preparations as if for marching.

"How comes it that you are stirring to-night comrade?" inquired Alexis of one of the soldiers.

"Diavolo!" replied the man grumblingly. "I know not how it comes, save that it pleases our valiant capitano to take the watch at the redoubt next Chioggia to-night: we have more night-work, I think, than justly falls to our share; besides, it is out of our turn now; we should have had the watch last evening instead of those English porkers of Checco's."

"Ah, che porchi sono questi Inglesi!" added the Italian contemptuously. "Si fanno nienti che mangiare e dormire 'tis ever with them eat and sleep, eat and sleep, except when they drink. Per bacco! they are not bad either at the pottle-pot, these Inglishers."

"Nor at the gisarme or the battle-axe either, comrade," added Alexis. "I've seen them fight as well as drink, amico mio, and I trow if they have hard heads they have stout hearts likewise."

The Italian was about to reply angrily, if one might judge from his raised arm and the imprecation with which he commenced; but Alexis cut the retort short by saying

"Well, I can't stay gossipping with you comrade. I must see your captain, as I bear a message to him from his excellency the general. Where shall I find him?"

The soldier pointed in the direction of Recanati's quarters and made no further reply.

"Buona notte compare," said the youth, as he passed forward to the place indicated.

"Thou mayst spare thyself that wish," grumbled the soldier, the night is never good, to my thinking, when one has to watch through it, without wine-cup or dice-board."

At the front of his tent, beside which a watch-fire was burning with fitful gleaming, stood Roberto di Recanati. He was fully armed in a suit of Milanese plate-mail with the exception of his helmet, which lay near him upon a stool.

As the light played upon his figure and lit up his face, which the *camail de fer* left exposed, one could form a fair estimate of his outward appearance. He was tall and rather slight in figure; and, judging from the portions of his legs and arms which were not covered by the mail, you perceived at once that he was singularly muscular, though the reverse of fat. His face was thin and pallid, in the centre of which rose a straight slight nose. Thin, bloodless lips were compressed closely together, so that they rarely opened sufficiently to show the white teeth within them. His pale forehead was terminated below by the lines of two straight dark bushy eyebrows, beneath which glittered a pair of small but keen black eyes, sunk deeply within their sockets and moving with a constant and restless motion, which never suffered them to dwell steadily and at length upon any one with whom he conversed. Upon the whole it needed but little physiognomical skill to feel that the owner of that face was neither an ordinary character, nor one whom a stranger would be very strongly attracted to. There was about those features, at once an expression of determination and yet of wiliness that impressed you with the conviction, that the man was one who would be as crafty to conceive the mode of compassing as he would be persevering to accomplish any object which his subtle and unscrupulous mind once determined upon.

As the messenger from Zeno approached the person whom we have been just describing, this latter was occupied apparently in examining one of those square-headed darts or quarreaux, as they were called, which at that period were much used by the arbalists or cross-bow men, of whom the Genoese were the most skilful in Europe. What the subject of his meditation was, as he curiously examined the shaft, it would not be easy to speculate upon; but, at all events, one would be disposed to suspect that whatever share the weapon in his hand might have with his thoughts, it could scarcely be worthy of the thorough engrossment of mind which now plainly pre-occupied the condottiere. Indeed, so complete was his abstraction that he did not notice the approach of Alexis till the latter had almost reached his side and accosted him somewhat abruptly.

"From his excellency Zeno," said the lad, holding forth the folded paper.

Recanati started at the sound of Zeno's name; a faint flush passed over his pallid features, and his restless eye gleamed quick and penetratingly at the person who had just addressed him. There was something of a disconcerted manner about him, which a keen observer would have pronounced to be just such as one would display whose secret thoughts had been suddenly revealed to him who was the subject of them. But the expression of any such feeling was only momentary, and ere it could have been well remarked upon, it had passed away; yet not so quickly had it passed as to escape the notice of him who stood before the condottiere—for no keener observer ever scanned features or detected their secret meaning than the young Greek, whose native sagacity had been sharpened by years of captivity and precarious existence. Calmly and coldly the Italian captain received the billet, and perused its short contents to the end. Alexis, as he watched his countenance, fancied—but it might only be fancy, conjured up by the play of the flickering firelight—that the dark, straight, eyebrows almost met upon the pale forehead; and that the thin lips quivered slightly as they became more compressed, but no other indication could be detected of the effect which the note had upon the reader; if, indeed, it had any effect at all. At length Recanati said, in a quiet measured voice,

"His excellency does me an unwonted honour. At what hour does the council meet?"

"An hour before midnight, signore."

"And it is now not far from that. Tell the general that I shall not fail to attend, though it may somewhat interfere with my duty to the republic. For this, however, I make no doubt his excellency will provide."

Recanati methodically and very slowly folded up the paper, and put it into his pouch, and then, turning on his heel, entered the tent. The young Greek made an inclination of the head as taking his departure, but ere he passed beyond the precincts of the tent, he turned his head quickly round and cast a hurried glance towards its interior. At this instant, a log of wood that lay upon the watch-fire, suddenly fell from its place into the smouldering ashes and burst into a momentary flame. The light shot into the recesses of the tent, and disclosed to the practised eye of the Greek, the form of Recanati, as he hastily divided the shaft of the arrow lengthwise and closed it up again as quickly.

A low laugh escaped from the lips of the Greek—so low that one a yard removed would scarcely have heard it, and then he murmured as if to himself

"Ha! I thought as much. That bolt *may* slay indeed, but it slays not him at whom it is discharged."

CHAPTER X.

"And he was cladde in cote and hode of grene,
A shefe of peacock arwes bright and kene
Under his belt he bore ful thriftilie,
Well coude he dresse his takel yewmanlie;
His arwes drouped not with fetheres lowe,
And in his hand he bare a mightie bowe,
Upon his arme he had a gai bracer,
And by his side a sword and a bokeler,
And on the other side a gai daggere,
Harneised wel, and sharp as pointe of spere."—*Chaucer.*

"As for my country I have shed my blood,
Not fearing outward force, so shall my lungs
Coin words, till their decay against those measles,
Which we disdain, shall tetter us."—*Shakspeare.*

It might have been about half-an-hour after the scene which we have described in the preceding chapter, that an armed soldier walked to and fro before the massive doorway of one of the interior buildings at the fort of Palestrina. The night was moonless, but the stars shone out to relieve the darkness which fell upon the earth. From time to time the sentinel, as he reached the limit of his short march and turned round to retrace his steps, stopped a moment to look up into the heavens.

There is something about a starlit sky that irresistibly draws the attention and fixes the gaze of every mortal, no matter how unimaginative his nature or unpoetic his temperament. I have known very worthy and sensible people—people who were by no means insensible to natural beauties—walk a live long day and scarcely ever turn their eyes to the sun, looking all the time steadily before them, aye and pride themselves upon that very excellent habit of "always looking before them," and, perhaps, they were right. Then there's the moon; what can be more lovely to look upon? Nothing. And yet they who look very long at the moon are somehow apt to get into disrepute with wise folks, so that "to have an affair with the moon," is very detrimental to a man's character—the very best that will be said of you is, that you are a mope or a lover—you may, however, get a reputation infinitely less agreeable, one which may endanger your personal liberty, and bring you into acquaintance with the chancellor. Therefore the moon is to be looked at in moderation which indeed is all that any sensible person does. But starlight—who can resist the tender, solemn, silent influence of a sky full of stars, especially at midnight. You look up into heaven, and you see a thousand eyes gazing down upon you with a fascination that enthralls you, and turn away your eyes as you will, some strange inscrutable spell forces you quickly to lift them again and commune with those glittering orbs, as you would commune with the deep, speaking eyes of a woman, when the heart would endure no other language. Yes, the spell of a star-thronged heaven is irresistible. Your attention is not confined to one great planet that wearies with its sameness, but you are solicited by a myriad of bright things that speak to you, oh how solemnly, of worlds without number, of space without limit, of time without an ending, and so you lose yourself in that lustrous company and know not how to withdraw from their presence.

I am very certain that the worthy fellow who kept watch and ward upon the fine spring night, in the year of God 1380, at the fort of Palestrina, pursued no such train of philosophising upon star-gazing as that which I have just now ventured to give to you, dear reader; but certain I am that he gazed and gazed again and again upon the "multitude of the heavenly host" that looked down so holily upon him. And the sight of those stars brought back fresh and tenderly upon his heart the thoughts of his old home and of that land whence he many a time and oft looked upon those same stars, as he lay in the greenwood o' nights and watched the deer trip out of the covert and browse in the star-lighted glade, till they came within reach of his long-bow shaft. A bold fellow was Hodge o' the Hill, I wot, as any that strayed along the shaws upon the Trent side in merry England. His equipment proclaimed him at once to be an English archer. In his hand he carried a pike; at his back was slung his trusty long-bow, beside which was a leathern case filled with some score arrows, light and well-feathered; upon his arm he wore a bracer, to protect his sleeve from being cut by the bowstring, and on his hand was a shooting-glove. Beside these, he had the brigandine, or little coat of plate; a skull, or *hufkyn* as it was called; and a maule or mallet of lead, five feet long. On one side he carried his sword and buckler, on the other a dagger and a hook; while from a baldric of green leather was slung a bugle such as foresters use. Such was the goodly English yeoman, Roger Harrington, or Hodge of the Hill, as he was once known in his own shire, before an irrepressible love for vert and venison led him to violate the privileges of park and chase, and drove him an outlaw to seek his fortune in foreign lands, and serve as a soldier beneath the banner of his adventurous countryman, Cheke. And so Hodge now paced backward and forward, and gazed upon the stars, and ever and anon sang to himself a snatch of some well-remembered old ballad of his own Albion to keep him company. Now his thoughts were of the famous Robin Hode, as he chanted a stave or two of the ancient rhyme—

"Lythe and lysten, gentylmen
That be of free-bore blode;
I shall you tell of a good yeman,
Hys name was Robyn Hode.

Robyn was a proude out-lawe,
Whiles he walked on grounde;
So curteyse an out-lawe as he was one,
Was never none yfounde."

"Ah, well-a-day!" resumed Hodge, after a pause, "these were merry times, when Robin roamed through the forest of Sherwood, and none dare question his right to strike down a fat buck in the chase, or kiss a pretty wench in the greenwood. A plague upon your forest laws, say I; if every honest fellow had fair play, by my hallidom, Hodge of the Hill, thou wouldst now be watching the hinds in the parks of merry England, and not pacing the barren sands of an outlandish island. Who goes there—ho!"

This interrogatory, with which the archer's soliloquy was concluded, was uttered in a loud and peremptory tone, and addressed to one who approached to the entrance of the building where the Englishman was keeping guard.

"A friend," was the reply; "one who attends the council."

"Your name," demanded the archer bluntly. "I have got my orders strictly, and must know who I am to let pass—your name, if it please you."

"Roberto di Recanati."

"All right, signor; pass in."

Recanati passed the sentinel, and disappeared within the interior of the building. The archer looked after him for a moment, and then said, in an under tone, "Aye, I know thy cut well enough—a whey-faced fellow, by Saint George. Look you now, one good yeoman of Nottingham, with a stout quarter-staff, would thresh a score of such foreigners. Ah, by my fay, there's nothing like the nut-brown ale and the ox beef of Old England—heigho!"

"The woodweele sang and wold not cease,
Sitting upon the spraye,
So lowde, he awakened Robyn Hode
In the greenwoode where he laye."

Let us leave stout Hodge o' the Hill singing and soliloquising on his weary night-watch, and sighing after the green holmes of pleasant England—let us leave him there in the starlight, and accompany the captain of the Italian mercenaries into the council-chamber of the rulers of Venice.

Recanati passed through an antechamber and entered a large apartment. It was scantily furnished and but partially lighted by a lamp that burned upon a large table which stood in the centre of the room, thus leaving the more distant parts of the chamber in comparative gloom. Around the table sat several persons, some in the long robes worn by the senators and high officials of the republic, others in armour or military costume. At the upper end of the table sat the venerable old doge, Andrea Contarini, his head covered with the horned bonnet, and his white beard falling down upon his ducal robe. Immediately beside him was a personage whose dark and stern countenance well accorded with the robe in which he was clothed. It was entirely of black camlet, without the relief of ornament or colour; and he too, like the doge, was covered, for on his head was a low round bonnet of black felt. This was one of the council of ten, *I Dieci*, or, as they were called from the hue of their robes, *I Neri*. There was no power more absolute or more dreaded in the Venetian state than that which this body now exercised—for as yet the terrible and secret tribunal of the state inquisition, known as "the council of three," had not been instituted. The council of ten, when originally convoked, about fifty years previous to the period of which we are writing, was limited in duration to ten days; but their period of office was, from time to time, increased, till now the members were elected for life. Nominally a criminal court, they were, in reality, invested with the most plenary power, and being exempt from all responsibility and appeal, they virtually exercised an absolute authority over every person and everything in the state. Even the doge himself was not beyond the reach of this potent tribunal. It hesitated not to countermand his orders, as it did those of the grand council; to depose him, and even to put him to death. Rarely, indeed, was the chief magistrate suffered to take part in any state affairs, or exercise the functions of his office without the presence and interference of one of the council of ten, nominally for the purpose of advising, but in reality with the object of controlling all his power, and acting the spy upon his actions and his conduct, which were duly reported to the rest of the council. At the opposite side of Contarini there were seated two men in red robes, but with their heads uncovered. These were members of the senate, or *signoria*, and were known by the appellation of *I Rossi*, and were, in fact, recently added to the council of ten, for the purpose of assisting them whenever the emergency of state affairs rendered their advice necessary. In addition to these were seated, at either side, three or four ordinary members of the senate who had accompanied the doge to Palestrina. These comprised the civilians who were in attendance at the council; beyond them were two men in military costume. The one we have already endeavoured to make our readers acquainted with, and therefore, needs not be further described—the general of the land forces, Carlo Zeno; the other was a man of a singularly noble presence and bearing, full of dignity, yet was there not in that dignity the slightest tincture of pride or arrogance; on the contrary, his face was indicative of a gentleness and long-suffering, that bordered on humility, and bore many marks of sorrow and trial which made him look old beyond his years, while the gray hairs that fell down his neck and mingled in his beard, made these years appear even more numerous still. This was Vittorio Pisani who now, since the arrival of Zeno, had devoted himself to the duties of admiral of the fleet. Perhaps history affords fewer instances of the ingratitude of popular governments, and the instability of popular favour than is

presented to us in the life of this great and good man. More than once the saviour of his country, each service rendered by him to the state was sure to be speedily followed by insult, degradation, or even imprisonment, and yet each act of ingratitude or injury was but the precursor of new supplications for his aid, and found him, marvellous to relate, as ready as ever to forget all that he had suffered—to remember nothing but that his country needed his services and to render those services with the prompt and uncalculating instinct of filial love.

THE AZTEC CHILDREN.

EVERY now and then some rare phenomenon is brought us from America, ushered before our notice with a remarkable tale. By some strange fate or fortune, moreover, the discoveries are made personally, or by the agents of one lucky individual. At one time it is a mermaid, who has come to light; at another, an unclassed animal—a connecting link between man and monkey, entrapped in the wilds of California. Science has enough to do in these days to unravel the tangled threads of mysteries which surround her. Facts and fallacies jostle so unceremoniously together, and encroach with such insidious steps upon each other's domains, that to distinguish between them and refer each to its own proper empire is not an easy task. Nevertheless, science was competent to solve the mysteries of the Yankee mermaid and the Califor-

nian monster. Nature was absolved from the charge of having created two such *lusus*. Both were referred to the cunning agency of man—were shown to be manufactured articles: the mermaid was nothing more than the head and arms of a monkey, dexterously stitched to the tail of a codfish; the Californian monster was a man of stunted dwarfish form, enveloped in the shaggy coat of a bear.

May we be pardoned then for receiving, *cum grano salis*, as the Roman poet hath it, the tale with which the Aztec children have been introduced to the London public? That they are extraordinary little curiosities in their way, all must admit who have seen them,—well worthy of all the patronage and curiosity which have been bestowed upon them,—but we must be permitted still to doubt their identity as little Aztecs, and to regard in a still more apocryphal light the tale of their abstraction from a city called *Iximaya*. Leaving for a short period these little strangers to amuse themselves according to their own pleasure, let us now pass in review a sketch of the history of the Aztecs, the dominant race of Mexico, at the time of the Spanish conquest in the beginning of the sixteenth century.

If the study of ethnology, or the characteristics and migrations of various human races, be one of the most interesting which a philosopher can pursue, it is also occasionally one of the most difficult and perplexing. It is not even necessary to pass beyond the limits of Europe for an illustration of this. The Hungarian or Magyar stock furnishes the example of a race of men individualised not only by physical characteristics from all around them, but by their language as well, which possesses no affinity with any European tongue, and is connected by few and uncertain alliances with some dialects of Asia. The Hungarians, or Magyars themselves will have it that they are descended from the Huns. They still look up to Attila, the devastator, as their great progenitor, and hang up his picture with reverence in their houses. If this theory of descent be adopted, then the Magyars or Hungarians in Europe and the Aztecs in America are brothers—offsets from the same stock, if we accept a theory of Humboldt, as will presently be more apparent.

When the Spaniards invaded Mexico, in the early part of the sixteenth century, that rich and extraordinary country was peopled, as is well known, by a race or races, to which, despite their atrocious barbarities and sanguinary religious code, the term civilized may in a certain sense be applied. The country was subjected to the government of one monarch, Montezuma, the ninth of his dynasty. The inhabitants were collected together in cities, sometimes of considerable population and extent: the ancient city of Mexico, for example, must have had, according to the most trustworthy accounts, a population of 60,000 or 70,000. The people followed different handicraft trades, the results of which were in some cases products of considerable excellence. The cotton fabrics, for example, of which specimens still exist, are good. The art of dyeing them was known, and practised with success. Ornaments of considerable pretensions were made of gold and silver. Some of the public buildings were grand and massive, somewhat resembling the stupendous erections of Egypt, Babylon, and Assyria. Like them, too, they were ornamented with hieroglyphical writing. Cities were supplied with water by means of aqueducts. Roads of good construction—such as would not disgrace a Roman military engineer—extended throughout the empire. The law of territorial possession was recognised; and territorial succession was regulated by statute. In astronomy great progress had been made: the year was divided into 365 days, like our own, but no odd six hours were recognised; to compensate for which, at the expiration of every fifty-two years five days were added.

All these facts tend to prove that the native inhabitants—whom we will for the present simply term *Mexicans*—had entered upon that phase of social development which must be termed civilisation. Other proofs to this effect might be easily adduced, as for instance the existence of relays of couriers at different stages throughout the empire, the establishment of night patrols, and the practice of illuminating the cities at night by bonfires lighted in the streets. But despite these evidences of civilization, the Mexicans, regarded from another point of view, were savages in the worst acceptation of the term. They waged war often for no other purpose than that of making prisoners to offer up in sacrifice to their gods, and they were confirmed cannibals. That such an abyss of demoralisation as these facts presuppose should have been descended into, by a race so cultivated, is without parallel in the history of mankind; and still more extraordinary does it appear in connexion with the reverence in which were held the virtues of chastity and temperance. The punishment for a breach of duty in either of these obligations was death,—with one remarkable exception; people above seventy years old were permitted to get drunk to their hearts' content, without the act being considered a crime.

There is every reason to suppose that the consolidation of native government, on the basis on which the Spaniards found it, had not been of very great antiquity. Not only was this the popular belief, but it is confirmed by such native records as have escaped the ravages of time, and the destructive enthusiasm of the early Spanish missionaries, who destroyed the greater number of these records (all of them hieroglyphic) as so many barbarous relics of idolatry. These records state that the various tribes constituting the native population, and of which tribes the Aztecs were the most powerful and the last to arrive, came from some distant unknown region from the north-west, bringing with them the civilized arts of the region whence they had been expelled; and after wandering many years as nomadic tribes, at length commenced about the thirteenth century to build the Mexican cities. This testimony seems probable enough, but ethnologists are still left in the dark as to the geographical origin of these tribes and their cognate ramifications. Although the first consolidation of the Mexican races into a regular government is represented to have taken place in the thirteenth century, yet the first epoch of their wanderings is referred so far back as the fifth, which corresponds with that Mongolian disturbance in China coeval with the setting in motion of the Huns; and Humboldt assumes that the Mongolian race, first passing into Siberia, one division passed eastward into Europe, where they were subsequently known as the Huns, and another division, travelling east, entered upon the American continent, and eventually settled in Mexico as the Aztecs and their associate tribes.

Returning now to our little strangers, the tale offered us respecting them is this. A few years ago a Spanish priest of central America told a certain tale about a walled city named Iximaya, into which no European had ever entered, or, having entered, never again returned. This city he stated to contain the living remnant of the lost Aztecs, who lived in total seclusion from all the rest of the world, and so greatly feared being discovered, that they kept their cocks in underground pits lest their crowing might be heard. Incited by this account, four travellers, in the year 1848, are said to have penetrated the mysterious city, where three of them died; the fourth, however, being fortunate enough not only to escape, but to bring away the two mysterious children. These latter are said to be members of a sacred race, looked up to as deities by the inhabitants—regarded as objects of adoration, and only allowed to marry amongst themselves—hence their physical degeneration, as evidenced by stunted forms. Plainly speaking, we do not believe in this tale, nor is it credited by the well informed generally. The most usually received impression, we believe, is, that they are the dwarfish offspring of one of those mixed races so common in Mexico. The tale of the Spanish priest was delivered, we have little doubt, as a broad joke. When next he tells it we advise the listener to reply by the witty refrain, or proverb, commonly applied in Spain on such occasions—"A otro perro con ese hueso," which means, being tranlated, "Take that bone to another dog."

Since the above was in type we have learnt that the children have been claimed by an agent of their parents (Indo-Mexicans), and legal steps taken to effect their removal.

LADIES' DEPARTMENT.

STAR PATTERN D'OYLEY.

MATERIALS.—Crochet Cotton, Nos. 10, 20, 22, 24, 26, 28, 30. The Penelope hook, Nos. 3, 3½, 4.

With cotton No. 26, and hook No. 3. For centre star or *a* work 10 chain, make it round, and in the loop you have formed work 24 d.c.; 1 s.c. in 1st d.c.; ·· 5 chain, miss 2, 1 s.c. in 3rd, repeat from ·· 7 times more; in 1st 5 chain, · 2 long, 7 chain, 2 long in same 5 chain, 5 chain repeat from · in each 5 chain all round, fasten off.

Fasten cotton No. 24, and hook No 3½. ·· In 7 chain 4 long, 4 chain turn and on the 4 chain, miss 1, 1 d.c., 2 long; 4 long in same 7 chain; 2 chain, 1 s.c. in centre of 5 chain; 2 chain repeat ·· all round.

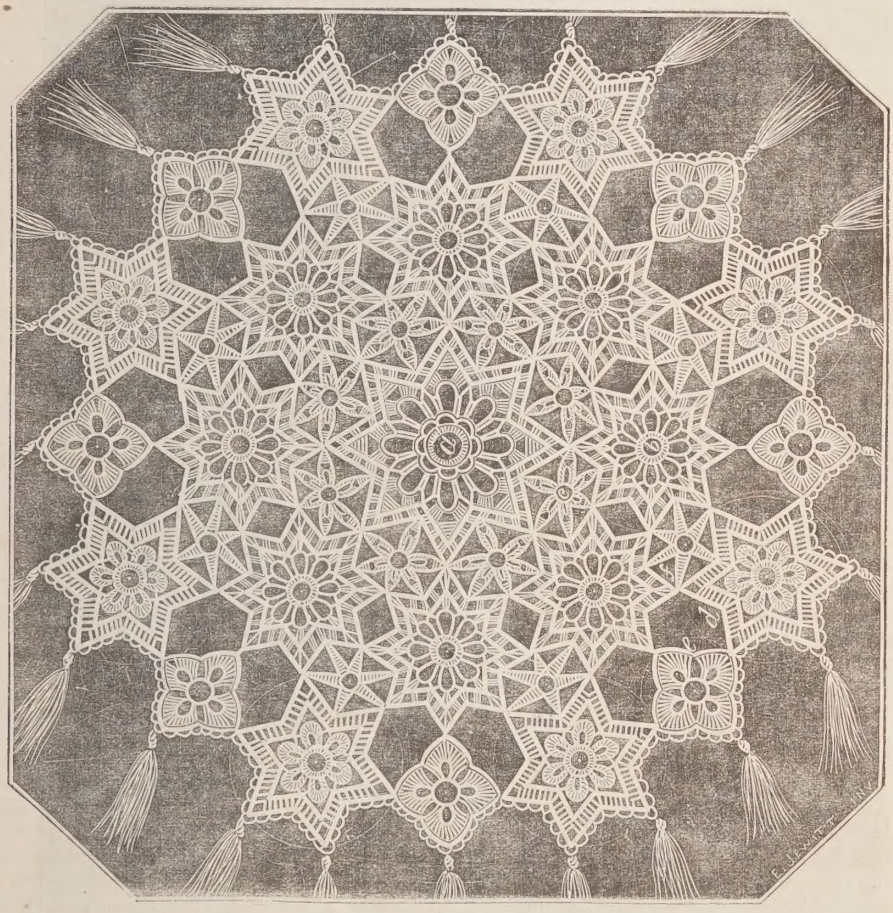
· 2 long, 1 chain, miss 1, 2 long, 1 chain, miss 1, 2 long, 7 chain, 1 long in same as last long, 1 long in next chain, 1 chain, miss 1, 2 long, 1 chain, miss 1, 2 long, miss 4. Repeat all round,· fasten off.

c. With cotton No. 30 and hook 4. 8 chain, 1 s.c. in 1st: then in round loop; · 1 d.c. 5 chain repeat · 5 times more. In 1st 5 chain ·· 1 d.c., 2 long, 3 chain, join to *a*, turn, and on 3 chain 1 d.c. 2 long: in same 5 chain, 2 long, 1 d.c. ·· repeat 5 times more, joining each petal as in the engraving, fasten off.

Make 7 more *c*s, joining between *a* and *b*s in the same manner.

d. With cotton No. 22, and hook 3½. 8 chain, make it round, and in loop work 12 d.c.; · 1 d.c. on 1st d.c., 5 chain, miss 1, repeat 5 times more, · then in each 5 chain; ·· 2 d.c., 4 long, 2 d.c.,·· fasten off.

With cotton No. 20 and hook 3½. ·1 s.c. in 2nd d.c., 6 chain turn, miss 1, 1 d.c.; 4 chain repeat · 5 times more; miss 1, ·· 5 long, 7 chain 1 long in same as last long; 4 long, miss 2, repeat ·· 5 times more, except in the last two points, where in 4th chain stitch of 7 chain join to point of *b*, fasten off. Make 7 more *d*s, joining as in the engraving.



b. With cotton No. 24, and hook 3½, 10 chain join round; work in round loop; 16 d.c.

3rd row: 1 long, 5 chain, 1 long, 3 chain repeat all round.

4th row: 3 long in the centre of 5 chain; 4 chain, 1 s.c. in the centre of 3 chain; 4 chain; repeat all round, fasten off.

With No. 22 cotton and the same hook. · 1 long in 2nd long of 3 long in last row; "3 chain," 1 long in same as last; 2 chain, miss 1, 2 long, 1 d.c. in last long; miss 3, 1 d.c., 2 long, 2 chain, repeat · 7 times more only in last point in "3 chain." Join to *a* in the following manner: 2 chain draw through the 4th stitch of 7 chain of *a*, then repeat the same as before, fasten off.

2nd *b*. Make the same as 1st *b* till the last row, where join in precisely the same way; the 1st point to centre *a* and two more points to 1st *b*; finish the row same as 1st *b* and fasten off.

Make 6 more *b*, joining in the same manner. You will see what points are joined in the engraving.

e. With cotton No. 20 and hook 3½. 10 chain make round; · 2 d.c. in loop; 7 chain repeat · 3 times more. ·· 5 long in 7 chain, 3 chain, 5 long repeat ·· 3 times more, joining, as seen in the engraving, to *b* and *d*, fasten off. Make 7 more *e*s, joining each between two *d*s.

f. With cotton No. 30 and hook 4. Make 7 chain, make into a loop, and in loop · 1 d.c., 4 chain join to *b*, turn, miss 1, 1 d.c., 2 long repeat · 5 times more; join in the same manner, and placed as in the engraving, fasten off. Make 7 more, joining them as you make them.

g. With cotton No. 28 and hook 4, · 1 d.c. on 1st d.c. of *e* 5 chain, miss 2,· repeat all round.

Make the tassels with No. 10 cotton over a card 2 inches wide; wind it round the card 10 times, tie it round about half an inch down, draw the cotton tight and bring the ends to the top again, fasten to the d'oyley, as in the engraving.

Make a sufficient number to go round.

BREAD CLOTH.

MATERIALS.—Brooks' Exhibition Crochet Cotton, Nos. 14, 16, 18, 20. Walker's Penelope Hook, No. 3.

a. With cotton No. 18 make 10 chain, 1 s.c. in 1st chain; then in round loop 3 d.c, ·· 9 chain, miss 3, 1 s.c. in 4th; then in round loop · 1 s.c. 7 chain,· repeat twice more; 1 chain to cross and in 1st 7 chain,·· ·1· 1 d.c., 9 long, 1 d.c., repeat ·1· in the other two 7 chains; 1 s.c. in the 1 chain that crosses the stem ·2· 5 chain; 3 d.c. in the centre round loop.

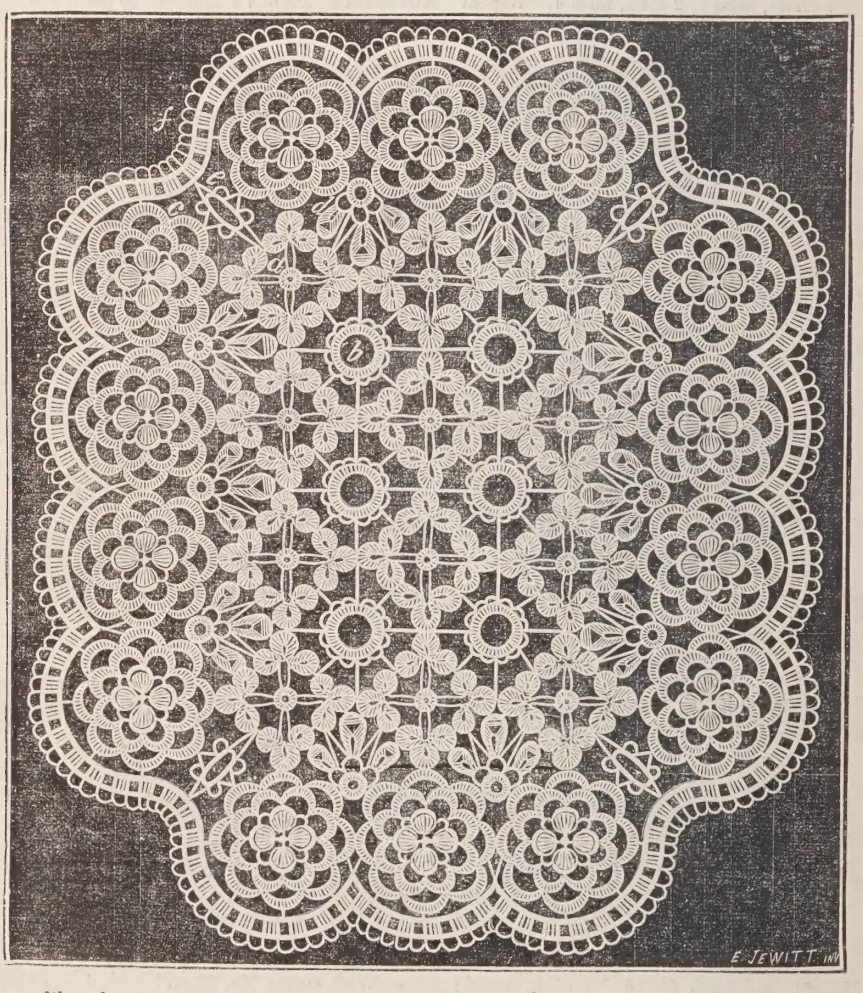
Repeat from ·· to ·· 1 d.c. 5 long, join to 5th long in 3rd section, 4 long, 1 d.c. in same 7 chain; in the next two 7 chains: 1 d.c., 9 long, 1 d.c., 1 s.c. in the chain that crosses the stem ·2· Repeat from ·2· to ·2· 5 chain, 3 d.c. in the centre round loop.

Repeat again from ·· to ·· 1 d.c., 5 long, join, 4 long, 1 d.c., in next 7 chain, 1 d.c., 9 long, 1 d.c., in next 7 chain, 1 d.c., 1 s.c. on the chain that crosses, 5 chain, 1 s.c. on 1st d.c. in centre, fasten off.

Make another *c*, joining to *a* and 1st *c*. Make 12 more; join as in the engraving.

d. With cotton No. 18. 7 chain make it round; 11 d.c. in round loop, join to 5th d.c. of 11 d.c. of *c*, · 7 chain, miss 1, 1 s.c., repeat · twice more; join to the other *c* to 5th d.c. of 11 d.c., fasten off. 1 s.c. in 4th chain of 1st 7 chain. ·· 5 chain 1 s.c. in same as last s.c., then in 5 chain, 1 d.c., 4 long, 2 chain, join to *a*, turn, 1 chain, 2 long on 2 chain, 4 long, 1 d.c. in same 5 chain ·· 1 s.c. in next 7 chain; 7 chain join to next division of *d* 7 chain; 1 s.c. in 4th chain stitch of 7 chain repeat from ·· to ·· 7 chain, join, 7 chain repeat from ·· to ·· again, fasten off. Make 9 more *d*s, joining in the same manner, and as placed in the engraving.

e. With cotton No. 18. 10 chain, make it round and work in loop 17 d.c.; 1 d.c. on 1st d.c., 5 chain, miss 1, 1 s.c. in next 4 chain join to *c*s 3 chain, miss 2, 1 s.c. in 3rd, 5 chain,



Make 11 more *a*s like the 1st, only joining, as in the engraving:—"thus, 1 d.c., 5 long, join, 4 long, 1 d.c."

b. With cotton No. 20. 15 chain, 1 s.c. in 1st stitch and in round loop. ·4 d.c., 10 chain, join where the two *a*s join, turn, 10 s.c. down the 10 chain; 4 d.c., 10 chain, join where the two 9 long of *a* are joined together; 10 s.c. down the 10 chain; repeat from · 3 times more: · 1 s.c., 5 chain, miss 2,· repeat all round; fasten off. Make 5 more, placing them as in the engraving.

c. With cotton No. 16. 10 chain, 1 s.c. in 1st, make it round · 1 d.c., 3 chain, 3 long, 3 chain repeat · 3 times more in round loop. ·· 1 d.c. on d.c., 7 chain, 1 d.c. on 2 long, 7 chain repeat all round ·· 9 d.c. in each 7 chain; fasten off.

1 s.c. in 5th d.c., 9 chain repeat all round. In 1st 9 chain 6 d.c., join to 5th long of *a* 5 d.c. in same 9 chain: · in next 9 chain 11 d.c., repeat · all round; fasten off.

miss 1, 1 s.c. in next, 6 chain join to *a* 5 chain, miss 1, 1 s.c in next, 5 chain, miss 1, 1 s.c., 4 chain, join to *c* 3 chain, miss 2, 1 s c., 5 chain, miss 1, 1 s.c., 7 chain 1 s.c. fasten off. Make 3 more, placing them as in the engraving.

f. With cotton No. 14—1 long between two *c*s; 1 *c* before the corner. Commence: 6 chain, · 1 d.c. in 6th d c. of 11 d.c. of *c* 9 chain repeat · 3 times more; 10 chain, 1 s.c. in 4th chain of 7 chain of *e* 10 chain, ·· 1 d.c. in the centre of 11 d.c., 9 chain repeat ·· 3 times more. Repeat all round the d'oyley, making the corners alike.

2nd row: · 3 long, 2 chain, miss 2,· this is the pattern all round, except at the corners. You miss 2 and make no chain, this is to be done by *e*, and by the 1 long between the two *c*s. You work as follows: make no chain, and miss 4, 2 each side of one long.

3rd row: 5 chain, miss 2, 1 s.c. repeat all round.

THE CHIROPOTAMUS.

THE CHIROPOTAMUS.

No place in the metropolis has more charms than the Gardens of the Zoological Society. Rosherville, Vauxhall, Cremorne, beside them hide their diminished heads. At any rate, in the one you are seldom disgusted as you are in the others. You are not bewildered by the fantastic costume of London gents; you are not surrounded by painted women and drunken men. Between you and nature comes no offensive cloud, but you can walk and examine and philosophise at your own sweet will. You add something to your stock of knowledge, and if you be a wise man, you carry away that which is better than knowledge itself, for

"Sweet is the lore which nature brings;
Our meddling intellect
Misshapes the beauteous forms of things,
We murder to dissect."

The gardens are now peculiarly rich in curious pachydermatous animals. The young elephant and her portly mamma are alone worth a visit to them, although the former, under the fattening influence of cakes and bonbons, has now grown to such a size that the attributes of babyhood are fast giving place to those of the mature elephant. The elephant calf, or little elephant—now only by courtesy—is already a proficient in the ways of the elephant world, an adept in the arts of begging and cajoling, mistress of all the winning blandishments wherewith the elephant tribe are wont to solicit eleemosynary donations from their Christian friends.

Wandering along in quest of the other pachyderms, we next meet with the armour-encased rhinoceros—a beast which naturalists describe as unamiable, stupid, and sulky. We think naturalists are wrong in their description—at least the character does not apply to our friend the rhinoceros in the Zoological Gardens. The humanising influence of delicate food and polite society has evidently not been lost upon him. Instead of avoiding the visitor, he stalks towards him, pushes his large nose between the bars of his enclosure as far as he can, and solicits, in his own peculiar fashion, the donation of a morsel. He is not so adroit a beggar as our friends the elephants, but he does his best. At first he tries what the significant hint of throwing his mouth wide open will do, and this failing, he protrudes a sort of an apology for the elephant's snout. The latter, however, is but a sorry substitute; it may answer well enough for rooting up trees, but it is not able to accomplish those delicate *manipulations*—if the expression may be permitted—which are performed by the trunk of the elephant. We next pass on to the illustrious stranger who divided the attention of the *beau monde* some little time since with the Nepaulese ambassador. We mean the hippopotamus, of course. Since we had the honour of seeing him last, he, too, has grown amazingly—his body rather than his intellectual powers, we fear. He is very little humanised as yet, does not even understand the art of begging, which backwardness is a proof of the possession of very obtuse mental capacities, we take it; and judging from external appearances, it would seem that he considers his mission is to sleep. As the hippopotamus displays no winning ways for our amusement, we leave this pet of fashion and pass on to the enclosure wherein resides the chiropotamus, as he is termed, the pachyderm which we have especially come to see.

Meantime a few preliminary remarks may not be out of place on pachydermatous animals in general, and the chiropotamus in particular. The term pachyderm, or pachydermatous animal, then, means a thick-skinned animal—from παχυς thick, and δερμα, a skin, and includes the elephant, horse, rhinoceros, hippopotamus, the swine, and many others possessing a general similarity to these. It is true the thickness of skin in the so-called pachyderms is, in the greater number of genera, an important characteristic. Not an invariable characteristic, however, seeing that a horse's skin is not thick; but as regards the elephant, rhinoceros, hippopotamus, and pig, the propriety of the term will not be questioned. The pachydermatous class admits of division into animals with *proboscides*, or prehensile snouts, and animals without. The former contains the elephant amongst living genera, and the mastodon amongst dead ones. As regards the pachyderms without prehensile snouts, they are subdivided into families, according to the number, or rather the apparent number, of their toes.

Now, although it be quite true that the elephant alone, of all living pachyderms, has a prehensile trunk, properly so called, yet a sort of attempt at this conformation exists in many others:—thus, for example, our friend the rhinoceros has a sort of prolongation of the upper lip, moveable like a thumb, and very useful for the general purposes of tearing up roots, moving earth in search of food, and other similar purposes. The pig, too, has a snout of great strength and mobility, as the farmer often knows to his cost. A few hungry porkers turned loose in a meadow soon plough the turf through and through, in their search for roots and worms.

We now arrive at the residence of the chiropotamus, or river pig, which name he acquires from χοῖρος, a swine, and ποταμός, a river, and a very appropriate name it is, seeing that he is so exactly pig-like in form and face. What the animal is in appearnce, the engraving alone will show. What he is, so far as is known, we will endeavour to tell. The interesting animal has been in this country about six months, and is a great curiosity, for none of his brethren have ever had the felicity of treading on British ground before. It is said the slave becomes free immediately he touches our shores. Alas! the river hog, or chiropotamus, found our boast a mockery, a delusion, and a snare. In slavery he has been ever since he was torn from Africa and the Cameron river, on the banks of which he was born, and where it may be supposed he reasonably anticipated to spend in quiet the little span of time we call life. Alas! fate had another destiny in store for him. He was to be caught—borne far away over oceans to a strange land, to be gazed at by strange eyes, to be spoken of by strange tongues. A hog of any ambition might find in this some consolation—I question whether our friend does. It matters little to him that artists engrave him; that newspaper paragraphs trumpet his praise; that the British public runs after him as it did after Father Gavazzi or Mrs. Stowe.

The chiropotamus is a denizen of the Guinea Coast of Western Africa, where he spends his time in the rivers and on the river banks of that sultry, swampy region. The specimen now in the Zoological Gardens is about the size of an ordinary pig. The most distinctive character of the animal, to the eye of a general observer, is its colour, a bright maroon, verging on yellow. It may be here well to remark, that the term chiropotamus has only recently been applied to an existing animal; it was long employed to designate certain fossil remains of a pachyderm of the swine tribe, the bones of which are frequently met with in the neighbourhood of Paris, and the Isle of Wight.

It is strange the public has not heard of the chiropotamus before, when we consider the industry and enterprise with which the world has been searched. It is, we are informed, also found in some of the other rivers of Western Africa, and although it has hitherto escaped the grasp of scientific naturalists, has long been known to the merchant explorers of those mysterious streams. Its nearest analogy is the Bosch Vaik of the Cape, an animal so scarce that we missed it from Gordon Cummings's African museum. So remarkable a character is it, that it is almost incredible that it should for so long a time have escaped the numerous correspondents of the Zoological Society, whose labours have been so unwearied and have generally been crowned with such success. Now it has come, the least the public can do is to welcome it. It will never attain to the popularity of the hippopotamus, for it cannot vie with that deservedly public favourite in size; but it is equally rare, equally strange to untravelled eyes; and as novelty is an attraction, for some time to come we imagine that the river hog will be attractive indeed.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER VI.—PART IV.

Spring came on, and with it the time for the completion of the picture. John, in his solitude, as he touched the termination of his labour, was seized with a sudden faintness—the world seemed to reel before him. Leonard one morning found him lying upon the floor, in what he at first supposed a fit. It was but a swoon, the forerunner, however, of a fierce and all but fatal fever. With that womanly tenderness—such a peculiar attribute of Leonard's—he raised his friend and bore him to his bed, bathing his fevered brow; and when a melancholy consciousness dawned in John's vague eyes, Leonard quitted him for a few moments, and bringing a hackney coach conveyed him immediately to that benevolent institution, the Sanatorium. Leonard, prompt in action for another, though strangely careless of himself, had planned with rapid thought all that might be done for his friend. With his last guinea he paid the entrance fee, and only left him when laid to moan in miserable, delirious sleep, within a shaded and calm chamber of the Sanatorium. He hastened with his sad news to Lucretia, knowing her to be a ministering angel in all times of pain and sadness as well as in times of joy. Leonard's and Lucretia's tending of the sick man, their self-sacrificing exertions for his continuance in this peaceful house of the sick, were one of those poems not unfrequently inscribed by the recording angel,—thanks be to the divine germ implanted in humanity, some blessed day to bloom forth into a celestial blossom of unsurpassable beauty.

But ere long Lucretia's active exertions on poor John's behalf must cease, for little Cuthbert, their idol, was stricken with a great evil. In some mad frolic with the boys in the playground, the little fellow met with a fall, which, unregarded at first by him, through a generous desire to shield his companions from blame, showed at length stealthy signs of a fatal disease. The first terrible discovery of this great sorrow was one of those moments in life which the heart shrinks from describing. Lucretia's sympathies, however, were only the more keenly called forth for John, though little of her time could be given to him. Leonard was daily at the Sanatorium, and listening to the ravings of John's delirium, more profoundly entered into the sanctuary of his friend's soul—the flame of love casting fitful illumination upon the ark and cherubim within. Again were Leonard's nights spent in designs for the publisher as of old,—for the desire to maintain his friend in his haven of peace lent a long forgotten spur to his sluggishness; and each day he painted upon the beautiful picture of his friend, whilst his own commission for Lord de Callis lay neglected in a corner of his room.

"His work is noble," said Leonard to himself, "it is wrought in his bloody sweat; such work must accomplish its mission in the world. Honoria must see it as Wetherley's emblem among the crowd of insipidities which will furnish the walls of our exhibition." It was a relief to Leonard to escape from his own thoughts, and for a time to absorb himself in the life of his friend.

Upon such an hour of labour Honoria herself intruded, as we have seen in a former chapter. Her emotion was profound, and its flood of intense feeling carried along with it a certain indignation, which for months had smouldered in her breast against Leonard,—she having equally with Agnes divined Leonard's secret, and having despised him for what she imagined deceit and baseness; besides which his sloth and weakness irritated and bitterly disappointed her, and her anxiety for Agnes had augmented in proportion. A certain coldness even had arisen between her and Agnes upon this subject, Agnes warmly defending her beloved at Honoria's first word. But Honoria's heart was touched by Leonard's devotion to his friend,—an account of which the benevolent physician of the Sanatorium had given her, when through him she first learnt of John's danger,—and now the artist's beautiful act of love had the effect of still further increasing her kindly feeling towards him.

"Mr. Hale, I honour, I respect your devotion to your—to *our* friend; God bless you for it. I have been angry with you these months past, Mr. Hale; you know this, and the reason I have been pained on Agnes' account,—but *she* knows you better than I do,—she must be right. I see how impossible it would be for such a noble soul to love one that was less noble than her own,—pardon me!" stretching forth her hand; "permit me to aid you in your acts of love. But let our friend never know that my hand is in the work, at least, not yet—not yet. This sad wonderful picture is mine. I will send you a draft upon my banker,—he must want for nothing. Oh, Mr. Hale, should, should he even now die, it will be better to die *thus*," looking, with streaming eyes and an exultant joy in her face, towards the picture—a joy strangely akin to that in the martyr's face, "than to have vegetated in a turnip field—than to have remained a clod of the earth, though his portion had been content and peace. But he will *not* die; life shows itself strong through this very struggle; it is the new birth within him. The higher life is arising—is arisen within his soul—he has passed into a higher class of the great School of Life." And with beaming eyes Honoria gazed upon the picture, and gathering her veil about her face, passed out.

The draft upon the banker was for a munificent sum, and a few words accompanying it to Leonard, desired him to induce his friend upon his recovery to go abroad to Italy and to Spain. "This *must* be done," ran the note; "this money will suffice,—all that devoted friendship will accomplish must be accomplished by us."

Honoria's were words of prophecy when she said he will not die. Gradually having passed through the crisis of the fever, and through its attendant state of exhaustion, John returned to a consciousness of life and the world.

He was, therefore, leaning back upon the pillow, and was gazing around him with listless eyes, listening to the chirp of sparrows upon his window-sill, and counting the folds of the white drapery of his bed, when Dr. S—— entered. Having talked cheerfully to his patient and listened with a quiet smile to his inquiry of who it was who had sent him a lovely bouquet of wild flowers, midsummer flowers from some rich hay-field, and which stood now upon the window-sill,—Dr. S—— remarked—

"Probably, my dear sir, some admirer of your picture in the Academy; you've created quite an excitement in certain circles—you, there now lying so feeble in your bed."

"My picture in the Academy!" gasped out poor John with a strange excitement. "Oh no, no, it cannot be—surely not; it was so far from finished;—you laugh at me, sir?" And the sick man trembled and grasped with nervous excitement at the quilt. "It ought not to be—"

"My dear Mr. Wetherley, be calm. I regret I have mentioned this, if it agitates you so much; but will you believe the voice of the *Athenæum*—of the *Literary Gazette*—of all the papers in fact? Here, for example, is one notice of Mr. Wetherley's picture in the *Athenæum:* 'this picture, full of an earnestness rare in art of the present day,' 'an inspiration,' 'a marvellous finish and delicacy of touch;' will you believe now, sceptic that you are? and your picture has been purchased at a marvellous price."

"Oh, sir, you bewilder me! you bewilder me!" said John in a low voice, and closed his eyes and sank his head back upon the pillow.

"He speaks only the truth, and scarcely all the truth, about the success of your picture, Wetherley," said another voice; it was Leonard's, who had quietly entered. "Your picture was noble and grand in intention. It required but a little mechanical finish, which I felt it an honour to be able to give to it; it can do no man discredit; let us congratulate you upon its success, and upon your restoration to art and to us."

The sick man stretched forth his arms, and in the weakness

of a great illness, and of a great joy mingling with a great grief, pressed his throbbing temples upon Leonard's breast and shed quiet tears. Time had been when a keen jealousy would have gnawed and envenomed his heart at the bare thought of owing aught to Leonard's skill; but John had been in the presence of death, and life and the aims of life lay before his soul, shone upon by a power more celestial by it. The reader will imagine how John recovered, surrounded as he was by such an atmosphere of love, and how, though at a distance, Honoria vivified him with her warm rays, the sun of his system. He set forth upon his travels, and Leonard became once more the attendant of the sick. Little Cuthbert lay now extended upon the couch of the Gaywood's sitting-room, a confirmed invalid; his body daily wasted away, whilst his intellect developed with marked rapidity. His was the mind of a philosopher and poet, bursting the husk of a child's frame. Leonard and the child clung with an indescribable tenderness to each other; and thus, accompanying the child in his excursions into the beautiful country about Highgate, where he was drawn in a little invalid's carriage, and planning beautiful surprises for the child, in reading and conversing with him, in sketching for him, in playing soft and lovely music upon the piano, to soothe the gnawing pain which at times assailed the little tortured frame,—Leonard passed the days and weeks and months of Agnes' absence. Where were his thoughts of love for her? the work to be accomplished during her absence? They did not exist. Strange are those problems of character where all duties, except the sternest and most immediate ones, are fulfilled with ineffable grace, where the life would be a one perfect hymn of beauty and praise were but *primary* instead of *secondary* duty served and sacrificed to. Leonard unconsciously followed in the footsteps of his father,—the curse was handed down through his devoted being. At the great Judgment Day will the pleading voice of imperfect organisation, mental as well as physical, raise its lament, and turn aside the sword of the Angel of Judgment? Our Father in Heaven judgeth not as man judgeth; and let us take courage in the thought of His mighty compassion when this cry shall reach His throne.

And thus time rolling on brought near the return of Agnes.

However cold in the eyes of Leonard the letters of Agnes might appear, the love within her soul only burnt the brighter the longer he remained away,—the longer she restrained the expression of her love. It impelled her in the eager search after materials for her literary work, which should win her renown, not alone for her own sake and her work's sake, but as an assurance to Leonard, that she was an object worthy of love, and lived out that which she commanded him to live out also. Stern with him she was, yet sterner with herself. Her every thought and action were purified through the knowledge that she had to *live* as well as to write in an exalted manner; she *would* arouse him, her beloved, out of his lethargy; she would be proud of him before her own soul and before the whole world. Never had she failed in an object, and in him she would not fail; love her he must, and with a mighty love, and their lives should be worthy of the doctrines they would teach. And her woman's tenderness shot forth with rapid growth. She planned ways in which to surprise Leonard with tokens of her love, and a scheme, which gradually ripened within her, was to bring back with her to England the reconciliation of his Uncle Stamboyse,—the acknowledgment from the stern old man that Leonard had done right in the independent choice of a career. All that Agnes had heard of the old merchant had seized upon her imagination, and she felt herself in many points akin to him. "I understand his character better than Leonard does," she said to herself; "he was right, right to a certain degree; truth is many-sided; his vision is narrow,—he saw but *one* side of the truth—but it *was* truth and not falsehood that he recognised in the life of Leonard's father. He must acknowledge through Leonard—through *us*—that principle and ideality may be united." Agnes pondered and pondered upon her scheme of reconciliation with the old merchant, and without mentioning her intention to Leonard, determined to remain a day or two at Hamburg on her return from Sweden, and have an interview with him.

The commencement of May found Agnes arrived at Hamburg with her precious MSS., the result of her eager labour—her most precious treasures packed within her trunk. A miser could not have watched with more anxiety the conveyance of his money-bags than did Agnes watch the conveyance from steamer to hotel of these beloved papers. These papers once safely locked within her chamber of the —— Hotel on the Alter Jungfernsteig, Agnes breathed freely, and began to consider how she should commence her quest.

The name of Stamboyse was one of much note even in that city of great merchants. The English landlord of the hotel was loud in sounding the praises of his wealth; but when Agnes expressed a desire to see him, inquiring where she should probably find him, a very peculiar expression crossed the landlord's face, and a dry smile. "Oh, the young lady would be sure to find Mr. Stamboyse at his offices; he lived there, transacted business there, slept there, never went out from there to public gardens, theatre or church. Yes, yes, there was no doubt he would be *found* there, but whether he would see *her*, that was another question! There were strange rumours abroad about him. It was supposed he had had some great family affliction; but, sure enough, he was an eccentric man—some people called him a bear, others, a misanthrope—but such a thing as a lady, and a *young lady* to call upon merchant Stamboyse! That was a novelty!" And the stout landlord laughed, and rubbed his dimpled hands, and pushed towards Agnes the *carte* of the table d'hôte, and requested, still smiling, to know at what hour she would dine, and whether she would dine in her own room or at the public table.

Agnes, undaunted by this description, set forth in the direction of the old merchant's abode. The tall warehouses, the cranes busily at work hauling up bales of goods, the busy traffic, the self-absorbed and prosaic character of countenance of the crowds in the narrow streets, all filled Agnes with an uneasy feeling; she, the woman, the scorner of all but moral and intellectual wealth, felt out of harmony with the world around her. She recognized how impossible it would be for Leonard and his uncle ever to be aught but antagonistic, and how she herself has, by subtle degrees, felt her kinship of soul with Leonard to increase, with Stamboyse to decrease. "Yet, truth is truth in all circumstances; principle, principle; Stamboyse, Leonard, you *both* are right, yet, both are wrong. I am clairvoyante of both spheres. I must be the mediator. True, thou art weak if thou dost not now drive forth these childish fears."

To various clerks, going in and out of the dusky offices, did Agnes address herself, both in English and German, but they either were too busy to listen to her inquiry after the merchant, or shook their heads dubiously. "He never saw any one during business hours, except upon business. The lady could not possibly see Mr. Stamboyse till evening: it was impossible," testily replied a little man with a large flabby face, a pen stuck behind his ear, and a huge ledger underneath his arm. "It *was* upon business she desired to speak with Mr. Stamboyse," urged Agnes; "but would he give the few lines written upon her card to Mr. Stamboyse, she would call again to learn his answer, and at what hour she might have an interview. Of course," she pursued in a mollifying tone, "she would on no account trespass upon Mr. Stamboyse's time unnecessarily." "I know he will see no lady—never does," returned the man, rubbing his nose with the card; "and so you had better not give yourself the trouble of calling again."

"I will thank you to give the card to Mr. Stamboyse," very calmly observed Agnes turning away, "and I *shall* call again." And so Agnes did in the course of a couple of hours, when she found the clerks yet more uncourteous, and the flabby-faced man so highly indignant, that she felt firmly persuaded the card had never been delivered. Agnes' determination only rose, however, with the opposition she encountered. Leaving the office she walked slowly along a narrow street, or rather lane, the one side of which for many yards was made by the

blank walls of the great Stamboyse warehouses; on she sauntered, pondering upon some stratagem by means of which to beard the lion Stamboyse in his den, and raising her eyes they fell upon a name, painted in white letters, upon the entrance to a passage—"Stamboyse, *Zweiter Stock Linke Hand.*" There is the nocturnal den!" ejaculated she; "now will I of a certainty achieve my object. At what hour does the *Herr Kaufman* Stamboyse sup?" asked Agnes carelessly of a woman who was just entering the passage with one of the quaintly-shaped Hamburg marketing baskets upon her arm. "Sup? *Fraülein, Kaufman* Stamboyse?" returned the woman, suddenly stopping and eyeing Agnes from head to foot, "seven o'clock certainly. *Köchin*—Seven o'clock your master sups, does he not?—There's a lady inquiring. I suppose your master is going to have visitors."

"Visitors—my master—a lady—a lady indeed—sup do you say? That's no business of yours, or of hers," screamed and scolded a remarkably harsh voice from a higher landing, and there was a sound as if a broom were most unceremoniously flung down the stairs, and a loud sound of scouring intermingled with angry ejaculations followed.

Agnes, however, had obtained the information she required, and sauntered on: she wandered through the town, now noticing the busy traffic and the many vessels lying at anchor, and the barges bearing along the many canals the merchandise from these vessels to the warehouses of the great Hamburg merchants; now amusing herself with the gay costumes of the women of the humbler class; now pondering and pondering upon her scheme, and Leonard's, and her own intermingling fates.

Half-past six found Agnes with her hand upon the bell-handle hanging beside the door of Merchant Stamboyse. The sound of the bell resounded through the ghastly passages and up the ghastly public staircase, but no one answered to its summons. Again and yet again she rang. Growing impatient, she rang a fourth time, giving a peal fit to have awakened the seven sleepers. Slowly a little sliding shutter in the door slid back, and a sour-faced old servant-woman, wrinkled like one of Denner's portraits, showed herself.

"And who is then there?" growled an old voice, in German, as ill-humoured as the face. "Oh, I see, the *Frauenzimmer*—the lady, I take it, who wanted to know when the Merchant Stamboyse ate his evening's bread. I'll have none of your impertinent inquiries!" And before Agnes could reply, the shutter was pushed violently back. Agnes, smiling at this extraordinary reception, and wondering whatever sort of a monster must be the master of this house, guarded by such a Cerberus, heard heavy footsteps ascending the stairs with slow and solemn tread. "Stamboyse!" said her heart, and involuntarily her lips felt parched and a great weakness came over her frame. A tall and powerful old man, whose grizzled locks hung in thick masses upon the collar of his coat—that blue coat of the peculiar cut so familiar to her in Leonard's descriptions of his uncle—stood before her. Out of his waistcoat pocket he took a key, and whilst he placed it in the lock Agnes read his strong countenance with a rapid glance. He had not observed her, as she stood somewhat back from the door; he might have thought her merely passing towards some other dwelling in the house.

"Mr. Stamboyse," suddenly spoke Agnes, stepping forward, and her words coming forth without reflection, for a great nervousness was upon her soul. He turned suddenly round—the light in his cold, grey eyes flashed upon her a stern lightning.

"Madam?—I have the honour——?"

"Mr. Stamboyse, I am very anxious to have an interview with you; it is upon business. I have found it next to impossible to gain admittance to you—I am here in Hamburg on purpose; when may I have a few moments'—half an hour's conversation with you?" And Agnes felt that the blood, spite of herself, rushed up to the very roots of her hair.

"Business?" slowly repeated Stamboyse, and his keen eyes perused her face—"business?—you, a *young lady*, with business to the Merchant Stamboyse?" Agnes imagined a shadow of satire upon his face and in his words: it stung her.

"Yes, business, sir. A woman, as *I* take it, may have business, sir, as well as a man; *important* business!" proudly, and with a certain anger in her manner, replied Agnes.

"You are, perhaps, too much of an English *young lady*," pursued the old merchant, "to call here at so early an hour as seven to-morrow morning. If not too early for a young lady, before I go to *my* very important business I can then attend to *your very* important business. Madam, good evening."

The old merchant had entered his door, leaving Agnes standing alone upon the landing. Was she indignant, amused, wounded? She did not know; but this she knew, that all shadow of sympathy seemed impossible between her and Leonard's uncle. "Yes, yes, how could Leonard have endured the slavery of such a master? Her very mission seemed to lose its object; what had she come for? for what did she now desire an interview? She felt as though the whole attempt were an absurd piece of stupidity. She seemed to have lost her anchorage. Who has not known such a miserable, perplexing, mortifying mood of mind? A quiet night's rest, however, had wonderfully calmed her, and at half-past five o'clock the next morning, her interview with Leonard's uncle assumed a more hopeful aspect.

When ready-dressed by six, she flung open her chamber-window, and with a joyous hope within her heart, leant out and watched the bright rays of the newly risen sun gilding the Lombard's Brüke, the masts of the various craft lying in the basin, and the groups of early holiday people passing along the broad public walks of the Alter and Neuer Jungfernsteig, for this was Ascension Day. The bells of the churches were already pleasantly sounding in the clear air, and an unusual peacefulness seemed with the early morning to arch over the busy sea-port town.

Agnes was ushered into the presence of the merchant by the cross old woman, cowed, however, it seemed to Agnes, at some command issued by her stern master, relative to this visit. She entered his presence precisely as the neighbouring church-tower tolled seven. Stamboyse was reading the "Algemeine Zeitung," as he sipped his coffee, wrapt in his morning-gown. The face had become harder than when she last saw him, and more than ten years seemed to have laid their stamp upon him.

"You are come, madam," said he, laying down the paper, rising, offering her a chair at the breakfast table, and perusing her countenance with a peculiar mixture of dry humour and contempt. "Bring in another cup of coffee, Martha," he pursued, addressing the old woman who lingered in the doorway, scowling and sticking out her under lip till she looked more like some corbel in a church than living, to Agnes. "I did not expect so early a lady visitor—you see—Madam, your important business—*if you will favour me!*"

Agnes sate for a few moments with a strange feeling of petrifaction creeping over her; those cold searching eyes of the old man, all the time of her silence, reading her perplexed and distressed countenance. "Now I am here," she continued suddenly, and raised her eyes, fixing them boldly upon his, "my business becomes difficult."

"Humph," remarked Stamboyse.

"Difficult, because I feel how completely you and I are guided, or rather influenced by such opposite views in life."

"What does all this lead to, madam?" growled the merchant, impatiently, taking up his paper.

"It leads, Mr. Stamboyse, to the very *heart* of my business."

"*Heart!*" growled the merchant, "of course, a young lady *can* only have *business of the heart.*" And he continued to glance over his paper.

"Mr. Stamboyse," cried Agnes, starting with impatience from her chair, and stamping her foot with irrestrainable irritation upon the floor, "for once listen to a woman as though she were a human being. Drop, for heaven's sake, the word *young lady*. I am a human being, who demand a fair and candid hearing from another human being."

SIR ISAAC NEWTON.

This distinguished philosopher was born at Woolsthorpe, in Lincolnshire, on Christmas-day (old style), 1642, precisely a year after the death of Galileo. When he was three years old, his mother married the Rev. Barnabas Smith, rector of North Witham, about a mile from Woolsthorpe, and the child was placed under the care of his maternal grandmother. After receiving some slight education at two day-schools in Skillington and Stoke, in his twelfth year he was sent to the Free School at Grantham, boarding in the house of Mr. Clark, a respectable apothecary in the town. At this time he certainly had not the reputation of a clever boy. His position in the school did not even place him in the rank of mediocrity. He was not stimulated by the advancement of others, until an occurrence, rendered singular from its effects, aroused him from his inactivity. One day a boy, who was above him, having given him a kick upon his stomach, from which he suffered excruciating pain, Newton, in revenge, applied himself so sedulously to study, that he not only passed his assailant, but became head boy of the school. The habit of application, which he had now acquired, withdrew him from ordinary boyish pleasures; instead, therefore, of spending his hours in play, he was employed in fabricating either something he had seen, or something of his own invention. Some of his productions were a windmill, a water-clock, and a carriage moved by the person who occupied it. The water-clock was manufactured out of a box given to Newton by Mrs. Clark's brother. It stood about four feet high, and had the appearance of a common house-clock. The index of the dial-plate was turned by a piece of wood which rose or fell by the action of dropping water. The Clark family used the clock long after the inventor had left Grantham. The active mind of Newton pursued other studies even at this time. The walls of his room were covered with charcoal drawings of birds, beasts, men, ships, and mathematical figures, all of which were well designed. Some of the portraits were taken from life, as those of Dr. Dorme, Mr. Stokes, the master of Grantham School, and King Charles I. He also appears to have indulged in poetry.

SIR ISAAC NEWTON.

While drawing and poetising, the principal subject of his mind was not neglected. To the movements of the heavenly bodies he was not negligent; for aware of the imperfections of the water-clock, the hole of which being

small was likely to be stopped by impurities in the water, he thought he could make a more accurate measure of time by noticing the motion of the sun. Accordingly he traced the varying movements of this luminary on the walls and roofs of the buildings with the aid of pins, and succeeded in obtaining accurate sub-divisions of the hours and half-hours. One dial went by the name of "Isaac's dial," and was consulted by the inhabitants of the place as a public clock. When he had reached his fifteenth year, his mother imagined he might be useful in managing the farm and country business at Woolsthorpe, and from a motive of economy withdrew him from school; but she soon discovered his utter incapacity for such an occupation. She therefore decided on sending him back to Grantham school, in order to prepare for his collegiate studies at Cambridge, his uncle having discovered him in a hay-loft, or, as M. Biot says, under a hedge, working a mathematical problem. On the 5th of June, 1660, in the eighteenth year of his age, Newton was admitted into Trinity College, Cambridge, which may be considered the true birth-place of his genius. He was urged to the study of mathematics by an overpowering desire to search into the truth of judicial astrology, and he proved its folly by mathematical means. Without any preliminary study he mastered Descartes' geometry, but having omitted to go through a course of previous study, so essential as a ground-work, he expressed regret to Dr. Pemberton, that "he applied himself to the works of Descartes and other algebraic writers, before he had considered the elements of Euclid with that attention so excellent a writer deserved." Whatever opinion may be formed of his attainment at this moment, it cannot be denied that his knowledge of Dr. Wallis's "Arithmetic of Infinites," Saunderson's "Logic," and the "Optics" of Kepler, was deep and extensive; and having adopted the plan of making comments during their perusal, a proceeding of unspeakable importance to the real student of any subject, we are not surprised to learn that he outstripped the tutor who directed his studies. Very little is known of the first three years he spent at Cambridge, but in 1664, as appears from a statement of his expenses, he purchased a prism to test Descartes' theory of colours, which he found exceedingly defective. The true theory of colours at this time was but imperfectly understood, even by those who stood high in the scientific world. It may be fairly presumed that Newton had not distinguished himself by any very great discovery, or at least communicated it, as early as 1664 or 1665; inasmuch as we find him contesting the law fellowship with Mr. Robert Noedale; and their attainments being equal, Dr. Barrow conferred the fellowship on Newton's rival, in consequence of seniority. In 1665, he took the degree of Bachelor of Arts.

His first grand discovery took place about this period, and was made public in 1666. It related to the different refrangibility of the rays of light. The prism before alluded to does not appear to have fully answered its purpose, or at all events it did not satisfy his ever eager mind. But, in 1666, he procured a triangular glass prism, to study therewith the celebated phenomena of colours. Whatever preparation for experiment had been made by others, and whatever revelations had been made by improved artificial appliances, it is certain that ideas of no ordinary importance were maturing in the mind of Newton. He began his experiments with the triangular glass prism, by darkening his chamber, and perforating one of his window-shutters, so that a convenient quantity of the sun's light, which passed through the prism, was so refracted as to exhibit all the different colours on the wall, forming an image five times as long as it was broad. The prism made the colours stand forth thus:—Violet, indigo, blue, green, yellow, orange, red. Upon this he was much excited to ascertain whence it proceeded, and made many experiments for the purpose, from which he at length drew the grand conclusion, that light was not homogeneous, but consisted of rays, some of which were more refrangible than others. When this discovery was applied to the lens of a refracting telescope, it produced a distinctness of one colour, while all the others were indistinct, which caused Newton to abandon all hope of improvement in that direction and he took into consideration the principle of reflexion. When he had arrived thus far, the plague forced him to leave Cambridge and return to Woolsthorpe; but in 1668 he resumed the inquiry, having thought that highly polished metal might assist in the experiment. He constructed an instrument with the eye-glass at the side of the tube, reflecting the rays upon it by an oval plane speculum. This telescope was six inches in length, and was, as Newton himself observed, an epitome of what might be done. He had seen through it Jupiter, distinctly, with his four satellites, and also the horns of Venus, and it bears a peculiar interest as being the first reflecting one directed to the heavens. Newton contrived another, exceeding in the former utility, which was shown to the king, and is now preserved in the library of the Royal Society of London, with this inscription:—

INVENTED BY SIR ISAAC NEWTON, AND MADE WITH HIS OWN HANDS, 1671.

In 1669, on the resignation of Dr. Barrow, he was appointed Lucasian Professor of Mathematics, and delivered lectures on optics in the University of Cambridge in the years 1669, 1670, and 1671, containing his principal discoveries relative to light. On the 11th of January, 1671, he was elected Fellow of the Royal Society, to which body he was unknown except from his telescope. He submitted himself to be "considered and examined," in a letter to Oldenburg of the 6th February, and the "solemn thanks" of the society were accorded, and the communication itself published in the transactions. That he might place himself beyond the possibility of doubt as to the refrangibility of the colours of light, he recomposed white light out of the seven colours already mentioned. The astronomical discoveries of Newton even surpassed those contained in his "Opticks, or a Treatise on the Reflexions, Refractions, Inflexions, and Colours of Light," since they are, for the most part, the acknowledged foundation of all that is valuable in that most interesting and important science.

In 1678 the Royal Society requested his opinion on a system of physical astronomy. In answer to this, he wrote to Dr. Hooke, the successor of Oldenburg, proposing an experiment for verifying the motion of the earth, by observing whether or not bodies that fall from a considerable height descend in a vertical direction, assuming that if the earth were at rest the body would describe a vertical line, but if it revolved round its axis the body must in its fall incline towards the east. Dr. Hooke, at the instance of the society, tried an experiment in order to prove its accuracy, which, failing to establish Newton's theory, evolved another, viz., that the body would fall in a south-east direction from the point when the body began to move. The truth of this Newton admitted, and the result was a demonstration that a planet, acted upon by an attractive force varying inversely as the squares of the distances, will describe an elliptical orbit in one of whose foci the attractive force resides. This disclosed the true cause of all celestial motion; but, as yet, Newton had not completely comprehended it in its vast extent. An accident revealed this most important doctrine to a mind prepared to act upon any feasible suggestion. In June, 1682, when attending a meeting of the Royal Society, the subject for discussion was the measurement of a degree of the meridian, by M. Picard, in 1679. With fresh light upon the question which had formerly occupied his attention, he returned once more to the investigation of so pleasing an inquiry. Having been able to find the diameter of the earth with the new data thus furnished, as he proceeded, he foresaw what would ensue; and the nervous irritability so produced prevented his completing the calculation himself. It was, however, wrought out through the medium of a friend,—the discovery being, that the force of gravity which regulated the fall of bodies at the earth's surface, when diminished as the square of the moon's distance from the earth, was found to be almost exactly equal to the centrifugal force of the moon as deduced from her observed distance and velocity.

The Royal Society were very desirous that this work should be entered on the register, and solicited Newton to agree to it, on which he expressed his willingness "to enter on the register his notions about motion, and his intentions to fit them suddenly for the press." He gave the MSS. to the society, and they published the "Mathematical Principles of Natural Philosophy," edited by Dr. Halley. When the work was presented—Sir John Hoskins, vice-president, in the chair—a member remarked that Mr. Newton had carried the thing so far that there was nothing more to be added; to which the vice-president replied, that the method was so much more to be prized, as it was both invented and perfected at the same time.

The Principia consists of three books; the first and second "On the Motion of Bodies," and the third "On the System of the World." The great discovery of the work is, that every particle of matter is attracted by, or gravitates to, every other particle of matter with a force inversely proportional to the squares of their distance. From this he was able to calculate not only the weight of the same body at the surface of the sun and the planets, but even to calculate the quantity of matter in the sun and in all the planets that had satellites, and to determine the density, or specific gravity, of the matter of which they were composed. And, on the principles of gravitation, he explained the theory of the tides. Proceeding onwards in abstruse mathematical inquiry, he established the Binomial Theorem—a well-known and most useful algebraical formula. He had invented his system of fluxions prior to 1666, and in 1669 communicated it to Dr. Barrow, who wrote to Mr. Collins stating the fact. The work was eventually sent to Collins, and returned to Dr. Barrow when he had taken a copy, which was published after a careful collation with the original, with Newton's consent, fifty years after it was written. He is also the author of "Universal Arithmetic," and many treatises on the highest branches of mathematics.

On the first of January 1697, Bernouilli addressed a letter to the most distinguished mathematicians in Europe, challenging them to solve the two subjoined problems:—

1—To determine the curve line connecting two given points which are at different distances from the horizon, and not in the same vertical line, along which a body passing by its own gravity, and beginning to move at the upper point, shall descend to the lower point in the shortest time possible.

2—To find a curve line of this property, that the two segments of a right line from a given point through the curve, being raised to any given power, and taken together, may make everywhere the same sum.

Bernouilli allowed six months to elapse for the solution of these problems to be sent in, and at the special request of Leibnitz agreed to extend the time to twelve months. But the day after their reception by Newton, he informed Mr. Charles Montague, president of the Royal Society, that he had solved both. Three solutions were received by Bernouilli, who, notwithstanding, detected Newton's, though anonymous, "as the lion is known by his claw." The last effort in mathematics in which Newton was engaged, was the solution of the somewhat celebrated problem of Leibnitz, which the latter intended as a defiance to England. Its object was to determine the curve which should cut at right angles an infinity of curves of a given nature, but expressible by the same equation. Newton returned fatigued from the Mint and received the problem about four o'clock in the afternoon; but so far from considering it involved the difficulty supposed to be attached to it, he treated it as pastime, and solved it before going to bed.

From the time of Newton's appointment to the professorship of mathematics, to the year 1695, he resided almost constantly at Cambridge, having received a dispensation from Charles II. to continue his Fellowship at Trinity College without taking orders. When James II. issued a mandamus to the University of Cambridge to confer the degree of Master of Arts on Father Francis, a Benedictine monk, without taking the usual oaths, the University resisted such an attack upon their rights; and the Vice-Chancellor being summoned before the ecclesiastical commission for contempt, from the decided tone adopted by Newton, he was elected one of the nine delegates appointed to defend the independence of the University. Their representation to the king had the designed effect, and he withdrew his obnoxious demand. In consequence of the successful termination of this disagreeable encounter, Newton was elected member of the Convention Parliament for the University, and sat till its dissolution. The narrowness of his income, however, was probably the cause of his limiting his residence to Cambridge.

On one occasion, while attending Divine service at chapel, a little dog, left in his study, overturned a lighted taper upon his papers and burnt them. It is reported that when he discovered the magnitude of his loss, he exclaimed, "Oh, Diamond, Diamond, little do you know the mischief you have done me." This fact exhibits the great control Newton possessed over his outward feelings, but it is known that his mental distress, to a certain extent, disturbed his reason. He himself observes that he did not recover his equanimity for a twelvemonth; but notwithstanding this, he was able to compose his four celebrated letters to Dr. Bentley, on the existence of a Deity, at the time the latter was to deliver the Boyle Lecture, for the vindication of the fundamental principles of natural and revealed religion. In the meantime, however, a correspondence ensued with Mr. Locke, in which Newton condemned his opinions as to innate ideas, conceiving that they struck at the root of all morality; yet, on re-considering the subject, he became convinced of their truth, and addressed an apologetic letter to Locke, dated "at the Bull, in Shoreditch, London, Sept. 16th, 1693." In 1694, we find him again occupied in making observations on the lunar theory.

When Newton was in his fifty-third year, and all Europe offering incense to his name, other members of the University, of the same standing as himself, had received lucrative appointments in church or state. It was now his turn to float with the tide of fortune, and exchange the solitude of a study for more active life. Mr. Charles Montague (afterwards Earl of Halifax) was Chancellor of the Exchequer. The coin of the nation was adulterated and debased, so that a new coinage was resolved upon. Mr. Overton, the Warden of the Mint, being appointed Commissioner of Customs, Montague, in a very handsome manner, procured the post for Newton. Its value was from five to six hundred pounds per annum. His great chemical and mathematical knowledge was eminently useful in his new situation, for the re-coinage was completed in two years. In 1699, Newton was promoted to the Mastership of the Mint, worth twelve or fifteen hundred pounds per annum, which he held during the remainder of his life. He drew up an official report upon the coinage, and a table of assays of foreign coins. During his Wardenship he performed his duties as professor at Cambridge, but when elected Master, Mr. Whiston was appointed deputy. Other honours followed the elevation of Newton. The Royal Academy of Sciences admitted the distinguished philosopher an associate; and Queen Anne, who was residing at Newmarket, on visiting the University of Cambridge, conferred on him the order of knighthood. He also sat as member for the University in parliament, and was for five-and-twenty years annually elected president of the Royal Society of London.

On the accession of George I. in 1714, Sir Isaac Newton was received at Court, and his conversation particularly delighted the Princess of Wales. But Leibnitz, who regarded his rival with no friendly eye, represented Newton as a materialist, endeavouring to maintain his charge by portions of his published works. This reaching the ears of the king, he requested him to reply, which he did, and with effect. The Princess of Wales was a lady of great learning, and of a highly cultivated taste. Conversing one day on some points of ancient history, Sir Isaac explained to her a new system of chronology, which he had composed at Cambridge by way "of refreshing himself with history and chronology, when he was weary with other studies."

Not only was Sir Isaac Newton a mathematician and an astronomer, but he was what is of far greater importance, a devout Christian.

ST. ROBERT'S CHAPEL.

We English have an immeasurable advantage over the inhabitants of newly-peopled lands. We are rich in local associations—not a rock or stream, not a sunny plain or shady glen is there, but has its tale of pathos or fun, of tears or laughter, as the case may be. The grandest landscape soon wearies if there be no past connected with it. Our brethren on the other side of the water are less favoured in this respect, though America is not badly off after all.

In this country one knows not where to turn without being followed by the past. Every spot is hallowed by history or legend. For instance, near the once important, but now declining town of Knaresborough, there is a chapel cut out of the solid rock, which forms an illustration of what we have advanced. Not far from the Dropping Well, which is a wonderful curiosity in its way,—not far from where that celebrated personage, Mother Shipton, was born—stands the chapel which bears the name of St. Robert, and drawings of which accompany these remarks. The story is, that the hermit, who had

EXTERIOR OF ST. ROBERT'S CHAPEL.

previously spent some years in the monasteries of Fountains and Whitby, and was afterwards abbot of New Minster, and a contemporary of King John, who gave him forty acres of land in Swinescot, was so delighted with the spot, that he set to work like a mole, and grubbed out a cell for himself. The chapel has a neatly arched roof, a gothic window and door; the ribs rest on neat pilasters. On the right-hand side are four terrific faces; in front an altar. On the floor is a hole, in which was probably placed a cross, and on the sides are two niches, long since dispossessed of their images. The length of the cell is ten feet and a half, the breadth nine, and the height seven and a half. Near the door is cut a gigantic figure, in the act of drawing his sword. This, it has been suggested, may have been designed for the genius of the saint, which, it should seem, powerfully defended the pious hermit. St. Robert was a native of York, and in the hermitage is a figure of the hermit surrounded by his books. About a mile down the river, near Grimbald-bridge, is St. Robert's Cave, the usual residence of the saint, and the scene of one of the strangest murders that ever occurred—the murder of Daniel Clark by Eugene Aram. This murder took place in 1745. It seems that in this cave Clark and Aram had secreted goods and plate, of which they had conspired to defraud their neighbours. In this cave their associates met to divide their stolen property, and here Clark was murdered and buried by Aram. Some short time afterwards Aram left that part of the country, and went to live at Lynn, in Norfolk, where he was usher in a school for upwards of thirteen years. The discovery of the murder was made quite by accident. A labourer found a skeleton in a neighbouring quarry. The people of Knaresborough having long wondered what had become of Clark, supposed the skeleton might be his. A coroner being sent for, the wife of Aram, who resided in the town, and had long been deserted by her husband, was examined. Her evidence threw some suspicion on an accomplice named Houseman, and he, on his examination, having betrayed great confusion and marks of guilt, a closer investigation was made, which terminated in a confession of his crime. Aram, having been implicated by Houseman, was apprehended and brought to York Castle, where he was tried and convicted. It is true that the legal evidence against him was extremely deficient—furnished almost entirely by an accomplice, and so scanty and suspicious that a man tried upon it at the present day would unquestionably escape conviction. But Aram confessed his guilt, though not till after his trial. He delivered a defence so admirable for its ingenuity, and so replete with erudition and antiquarian knowledge, that it astonished the whole court. He attempted to prevent his execution by suicide, in which he succeeded so far as to be brought to the scaffold almost in a state of insensibility. Sir Lytton Bulwer throws a doubt upon the guilt of Aram; we, however, cannot question it. His confession sets that matter at rest; and if Aram's tale be true, it was his wife that urged him to the commission of so foul a deed. He is described as very charitable and humane in general.

Aram was a self-taught man: his devotion to learning was

the one absorbing passion of his life. According to his own account, drawn up at the request of the clergyman who attended him after his condemnation, he was born at Ramsgill, a little village in Netherdale, 1704. At the age of sixteen he went to Newby. "It was here," he says, "my propensity for literature first appeared, for being always of a solitary disposition and fond of books, I enjoyed here all the repose and opportunity I could wish. My study at that time was engaged in the mathematics; I know not what my acquisitions were, but I am certain my application was at once unwearied and intense. I found in my father's library there, which contained a great number of books in most branches—"Kersey's Algebra," "Leyburn's Cursus Mathematicus," "Ward's Young Mathematician's Guide," and a great many more; but these being the books with which I was ever most conversant, I remember them the better. I was even then equal to the management of quadratic equations and their geometrical constructions." At one time it was intended that Aram should be sent to London; however, he remained in the country, where he began to teach, and got married. This last step Aram ever regretted. He says, "the misconduct of the wife which that place afforded me has procured me this place, this prosecution, this infamy, and this sentence." Though married, Aram's assiduity in the acquisition of knowledge seems to have been as great as ever. He turned his attention to the classics: he read all the Latin classics; he then went to the Greek Testament, and afterwards mastered Hesiod, Homer, Theocritus, Herodotus, Thucydides, and all the Greek tragedians. Aram was also equally attached to the study of botany. One of his schemes was the formation of a comparative lexicon. He had made preparations for that purpose. He had investigated the Celtic as far as possible in all its dialects, and had made comparisons between that and the English, the Latin, the Greek, and even the Hebrew. He had made notes and compared above 3,000 of these words together. But this was not to be—the dream was to remain a dream. Punishment was tracking, though tardily, the steps of the criminal, and at last brought him to the prison and gallows, instead of a niche in the temple of fame.

It is no wonder that the author of "Caleb Williams" should have stated that he always had thought the tale of Eugene Aram peculiarly adapted for fiction, and that he more than once entertained the notion of making it the foundation of a tale; or that, in our own time, it should have formed as drama and as novel the subject of Sir Bulwer Lytton's artistic pen.

INTERIOR OF ST. ROBERT'S CHAPEL.

In his preface Sir Bulwer Lytton gives us additional particulars respecting Eugene Aram. He says: "It so happened that during Aram's residence at Lynn, his reputation for learning had attracted the notice of my grandfather—a country gentleman living in the same county, and of more intelligence and accomplishments than at that day usually characterised his class. Aram frequently visited at Heydon (my grandfather's house), and gave lessons, probably in no very elevated branches of erudition, to the younger members of the family. This I chanced to hear when I was on a visit in Norfolk, some two years before this novel was published, and it tended to increase the interest with which I had previously speculated on the phenomena of a trial which, taken altogether, is

perhaps the most remarkable in the register of British crime. I endeavoured to collect such anecdotes of Aram's life and manners as tradition and hearsay still kept afloat; these anecdotes were so far uniform that they all concurred in representing him as a person who, till the detection of the crime for which he was sentenced, appeared of the mildest character and most unexceptionable morals. An invariable gentleness and patience in his mode of tuition—qualities then very uncommon at schools—had made him so beloved by his pupils at Lynn, that in after-life there was scarcely one of them who did not persist in the belief of his innocence. His personal and moral qualities, as described in these pages, are such as were related to me by persons who had heard him described by his contemporaries—the calm, benign countenance—the delicate health—the thoughtful stoop—the noiseless step—the custom, not uncommon with scholars and absent men, of muttering to himself—a singular eloquence in conversation, when once roused from silence—an active tenderness and charity to the poor, with whom he was ready to share his own scanty means—an apparent disregard for money, except when employed in the purchase of books—an utter indifference to the ambition usually accompanying self-taught talent, whether to better the condition or to increase the repute; these, and other features portrayed in the novel, are, as far as I can rely on my information, faithful to the features of the original."

St. Robert may be forgotten, but Eugene Aram must live, for genius has immortalised his name. The reader of Hood will remember the picture of the usher,

> "Who sat remote from all,
> A melancholy man.
>
> His hat was off—his vest apart,
> To catch heaven's blessed breeze;
> For a burning thought was in his look,
> And his bosom ill at ease:
> So he leaned upon his hand and read
> The Book between his knees;
>
> Leaf after leaf he turn'd it o'er,
> Nor ever glanced aside,
> For the peace of his soul he read that book,
> In the golden eventide.
> Much study had made him very lean,
> And pale, and leaden-eyed;
>
> At last he shut the ponderous tome;
> With a fast and fervent grasp,
> He strained the dusky covers close,
> And fix'd the brazen hasp.
> 'O God, could I so close my mind,
> And clasp it with a hasp!'"

All this at times Aram must have felt—at times more than this must have fired his brain; for our crimes walk with us as shadows, blotting out the aim of life, rendering all dark and drear.

THE DEAD BRIDAL.

When Roberto Recanati entered the chamber, the council had but just commenced their deliberations. Charts and military plans were spread out upon the table, to one of which Zeno was pointing, tracing along it some of the military operations which he advocated, and urgently enforcing his views. As the condottiere leader advanced up the room, all eyes were turned towards him, and a general feeling of surprise was manifested by the council. Zeno at once rose, and addressing the council said,—

"So please your highness, and you, excellent signori, I have in this sudden emergency taken upon myself the responsibility of inviting this valiant captain, Sir Roberto di Recanati to attend upon you here to-night—the shortness of the time precluded my consulting the council. Knowing, as I do, his great knowledge and skill in war, and being well certified, moreover, of his intimate acquaintance with the condition and resources of the enemy, I doubt not that he can render you much useful information. I am bound, too, to believe that the fidelity and allegiance which he owes to our seignory, while receiving her pay, will induce him to place his information at your service, and that the honour of a soldier and a knight will forbid his using to your disadvantage aught that he shall see or hear whilst amongst us."

As Zeno pronounced these words—which he did with an emphasis, slight indeed, yet perceived by him for whom it was intended—he fixed his eyes upon the face of the condottiere. Whatever might have been the impression which his observations made upon the latter, his pale face gave no external manifestation, and he noticed them no farther than by a mute inclination of the head, which might equally imply an assent to the statement, or an acknowledgment of the compliment which he was justified in considering they were meant to convey.

When Zeno had concluded he looked to the doge, expecting from him, as the president, some expression of the feeling of the council in relation to what he had done. Contarini, however, cast an uneasy and inquiring glance at his neighbour in black; the latter understood him perfectly and said,

"Your highness would know the opinion of those whose duty it is to give you their respectful advice on all occasions."

"Assuredly," said the doge, "I was about to ask it.—Proceed, signore."

"The noble Zeno has certainly acted with the boldness and promptitude of a soldier, but—"

The wily member of the *Neri* in his turn now paused, while with a rapid glance he collected the feelings of the rest of the council. The noble and ingenuous features of Pisani expressed his cordial approval of what his brother in arms had done, and the countenances of the other senators were too well schooled to express their thoughts, at all events the most acute eye could not collect from them any sentiment of dissent, so the speaker continued—

"But that he has acted with his usual prudence, may, perhaps, be questioned—still knowing his wisdom, and taking the emergency into account, I would humbly advise your highness's superior judgment, that you should now sanction what the general has done."

"Your advice entirely accords with our own view of the matter. We invite Roberto di Recanati as a true and faithful captain, now in the service of our most serene republic, to assist at these our deliberations. How say ye, seignors?"

A general assent was implied by the mute motions of the members, and, at a signal from the doge, Recanati, who had awaited the result with the same pale face and imperturbable deportment which ever distinguished him, quietly took the seat at the council board that was indicated to him. Zeno now continued the observations which the entrance of Recanati had interrupted.

"I was endeavouring to explain to your highness and the council the reasons which I consider justify the course I have urged upon the seignory. To precipitate an engagement with the enemy at this moment would, I hold, be as unwise as it is unnecessary. What says the admiral?"

"In my judgment," said Pisani, "our safest policy is to block up every entrance to Chioggia from the Adriatic; by that means we shall as effectually keep the Genoese fleet within, as we shall prevent any succour being rendered to them from without."

"Yet in the meantime," interposed the member of the Council of Ten, "we should not forget the dangers of lengthening the campaign. The hazards and fluctuations of a blockade are numerous, and such as no foresight can provide against. A thousand of those accidents, which we see happening every day in warfare, may relieve the town, and suffer the enemy to recover from their panic and gain courage to act on the offensive. I much doubt the wisdom of deferring more active measures on the part of the republic."

"Besides," said one of the senators, "the ardour of our

troops is likely to abate by continued inaction. We should take warning by the fate of the Genoese admiral: he, too, pursued the course which our noble Zeno now recommends, happily, perhaps, for Venice, though disastrous for himself."

The spirit of the Venetian general was roused by this insinuation, and he replied warmly—

"Messires, I square not my own conduct by that of Doria, whom, nevertheless, I honour as a brave man; nor will I have the issue of our manœuvres judged by that of the Genoese. I know the troops whom I command and the country which we occupy, and I stake my reputation—my life, if need be—on the safety of my views."

"Nevertheless," said another of the senate, "assuming that our noble general is right, delay will still be productive of grave dangers. Our state is at present much exhausted; our treasury can ill support the increased expenses that this protracted state of inaction will occasion."

"My own revenues, as well as those of every good citizen, are ready to replenish it to the last crown we are worth," said Zeno.

"The troops are already becoming dissatisfied."

"What troops?" demanded Zeno; "not the land forces of the republic? Noble Pisani, do you so report of the mariners under your command?"

"They have shown no dissatisfaction," said Pisani.

"Sir Captain, what sayest thou as to the foreign troops in the service of the state? Thou canst best inform us."

Recanati for a moment looked up at Zeno, as if his quick, restless glance would read his very soul; he then cast down his eyes and replied—

"As the general has appealed to me, I am bound in candour to state, that I have heard some murmurs of discontent."

"And wherefore, I pray you, Sir Captain? Did not the mercenaries receive their full pay?—nay, did they not receive an increase?"

"It is even so," said Recanati.

"Have they been exposed to an undue share of the toils of the campaign?"

"The troops that follow me to the field," said Recanati, haughtily, "never shrink from the foremost place, or murmur at the hardest labour. They love action best, and count war their occupation."

"'Tis well," replied Zeno. "Say, then, dost thou counsel a blockade or a battle?"

The wily and sagacious condottiere at once felt the difficulty of the position in which the interrogatory of Zeno placed him, and he paused to consider his answer. On the one hand, an immediate attack upon the Genoese would, he felt, at once put an end to the schemes for self-aggrandizement which he had formed, and interrupt his secret negociations with the enemy, to reduce whom to the greatest straits was his securest policy: on the other hand, it was almost as important for him to thwart the measures of the general, and to bring him into disrepute; and his own experience and judgment told him that the views of Zeno were sound and would ultimately lead to a successful issue. These calculations passed rapidly through his mind, and he decided that to protract the campaign was, upon the whole, most advantageous for his interest. Turning from Zeno, he addressed his answer to the doge—

"So please your highness, as his excellency the general has thought fit to seek the opinion of one so humble as myself, I am disposed to say that it is safest to follow the guidance of the person to whom the State has committed the command of its armies, and whom she will doubtless hold responsible for the results of the war."

"It is well said," observed the doge, "still are we content in some sort to share the responsibility of our noble general, by guiding him with our counsels; and in this matter now in debate, we doubt the soundness of his judgment, and are disposed to control him by our own."

The doge looked around him, and met the approving looks of many of the senators. In truth, the luxurious grandees of Venice were heartily sick of the fatigues and tedium of the lengthened campaign, totally unused to the confinement which for many months they had now endured, either in the close apartments at the fort or the narrow limits of ship-board, they sighed in secret for the luxuries of their palaces, and were contented to terminate the war at any hazard. Zeno quickly perceived that the majority of the council were disposed to frustrate his plans, and he, at once, decided on boldly resisting the council with the whole weight of his personal authority.

"Messires," said he, "I have received with respect and thankfulness the advice which you have afforded me. The most serene republic, in appointing me generalissimo, has indeed cast upon me the responsibility of acting in this war; I shall neither shrink from that responsibility nor yield up the right of independent action until the State shall see fit to resume the command with which she has invested me.

This bold speech of the General's was not very palatable to those to whom it was addressed; the civilians looked at each other, and at length the member of the Council of Ten said—

"Your excellency will, however, remember that it has seemed good to the State of Venice, that her highest magistrate and members of this Council of Ten should be personally present at the operations. Methinks that their sentiments, upon the present emergency, may be well deemed 'the reason of the State' itself."

"As members of the State sage and exalted, their opinions are entitled to profound attention; nevertheless, I am bound by a higher duty, as the servant of the State, to do that which I believe to be most conducive to her interests. As I find my own judgment confirmed by the voices of those present who are most conversant with military affairs, I shall act upon it with confidence and determination. Suffer me now to retire as I have duties to attend to ere I rest to-night."

Zeno rose to depart, and no one ventured to interfere with his determination. There is something in the attitude of a man who is at once honest and self-reliant that is not easily over-borne. Indeed, the suddenness with which he acted and the peremptoriness with which he announced his decision took all present by surprise. In addition, those who would have willingly opposed him felt that they were in no position to do so; and that if they could even insist on precipitating an engagement with the enemy, and that the result should be disastrous, they would be unable to justify their conduct, and thus risk their own lives. Recanati, too, rose and prepared to leave the apartment. As they passed out into the open air, Zeno laid his hand on the shoulder of the condottiere, and said to him impressingly—

"Signor capitano, I rely on your best exertions to suppress all discontent among the mercenaries under your command. As you well said, he who has the command of soldiery is responsible, I would have a word or two with you at my quarters ere we separate for the night, touching this matter."

"I may not attend you just now," replied Recanati; "my duty calls me elsewhere. I keep the western redoubt to-night. To-morrow I shall attend you as early as you will."

"To-night, signore, if it please you," repeated Zeno. "As to your watch at the redoubt to night, content yourself on that score. I shall take care that the place is guarded vigilantly, so that the republic shall suffer no detriment by your absence. Let us on, signor capitano."

Despite of all his self-control, the thin lips of the condottiere quivered, and his eye glittered angrily as he heard the words of Zeno and marked the cold and almost sneering tone in which he had spoken. Still there was nothing in his language to assure Recanati that he entertained any suspicion of him, much less that he had any actual proofs of his secret commerce with the enemy. He, therefore, felt that his only course was to comply with a request that was in truth a command, and bowing silently he accompanied the commander to his apartment. What was the subject of their conference it is not necessary for us to inquire. It will be sufficient to state that it was some hours past midnight ere Roberto di Recanati left the quarters of Zeno to return to his own.

MOSSES AND THEIR ALLIES.

CLUB-MOSSES AND LIVERWORTS.

CHAPTER III.

THE manner in which a connected chain appears to be kept up between the different families of created beings, animate, and inanimate, which inhabit this earth, is a circumstance so remarkable, that few thinking minds can have failed to observe it. There are, indeed, distinctive marks which separate race from race, but there are also distinctive resemblances which unite them, linking one to another in a regular gradation from the highest to the lowest. Thus we find it among plants; we descend step by step from the mighty cedar which stretches out its arms in Lebanon, to the mildew which overspreads a mouldy crust; and although, on comparing these two objects, we find little of similarity between them, yet in each step of our descent we invariably perceive a something which connects the one with the other, and discover no break in the chain, no step which does not lead to the next, until we find ourselves at the outer limits of vegetable organisation.

One order being thus allied to another, one class to the next, both above and below it in the scale of creation, it is not easy, when we speak of *allied* tribes, to know exactly where to draw a line, which to take, and which to leave. We have spoken of mosses and lichens as in close affinity to each other, and we must now name two other tribes which claim relationship with them both, one of them standing higher, the other lower in the scale.

The first of these, the Club-Mosses, or *Lycopodiaceæ*, "precede" the mosses, and form the link between them and the ferns. The second, the "Scale-mosses" and "Liverworts," or *Hepaticeæ*, *follow* the mosses, and unite them in brotherhood with both the Lichens and the Algæ; there being species in this tribe which partake largely of the nature and structure of both those orders.

Fig. 1. Lycopodium elevatum—Wolf's-claw, or Stag's-horn moss.

The organisation of the *Lycopodiaceæ*, or club-mosses, will be found well worthy the attention of those who delight in looking into the minutiæ of creation, and desire to find subjects

for praise and adoration of the Great Creator in the works which he has made. The order contains but two families, the club-mosses and the *Isoeteæ*, or Quill-Worts.

The Club-Mosses have a tough, persistent stem, beset with hard short leaves. There are no veins in their leaves, which are, however, furnished with large stomata, or apertures in the cuticle, for the admission of air to the cellular tissue of the plant, and are for the most part narrow and taper-pointed. The stems are frequently twelve or thirteen feet in length, and in some species raise themselves into an erect position and become woody; thus approximating to the character of some Coniferæ. In the coal strata are found some curious fossilised remains of gigantic Lycopodiaceæ, which are called *Lepidodendra*, or scaly trees, from the mode of the arrangement of their leaves. These seem to establish the connection between the

Fig. 2. Lycopodium Annotinum—Interrupted Club-moss.

two groups—the Club-Mosses and the Coniferæ. The fructification of this group consists of a short spike, formed by a prolongation of the branch, round which are clustered a number of two-valved capsules. These are sometimes of two kinds; one containing a mass of fine powdery granules, the other, including only three or four roundish, fleshy bodies, of very much larger size than the granules. Both these kinds of capsule lie among the hair-pointed leaves of the head, one in the bosom of each leaf, and inclosed in pale yellow cases. Whether both these kinds, the powder and the spores, have alike the power of reproducing their species seems as yet not to be determined, and botanists differ as to which of them is to be considered as the seed. Lindley tells us, that the larger bodies are the reproducing organs; Decandolle thinks that the one fertilises the other; but nothing seems clearly ascertained on the subject. It is certain, however, that the powder is endued with a curious inflammable property, and is used in making the Chaldee fire, and has also been employed in making artificial lightning at the theatres.

Lycopodium clavatum (fig. 1), the "Wolf's-claw" or "Stag's-horn Moss," is the only species that can be said to be common in England, but that may be found on most elevated moors and heaths. It is found on Hampstead and Hounslow Heaths, and in other London localites. In Wales, Scotland, and the lake countries, and in other mountainous districts, it is abundant, but in Ireland less frequent. The roots of this species are not deeply infixed into the earth, but they run matting themselves together just under the surface, serving thus to bind the soil, and prevent it from crumbling away. The stem is prostrate, frequently branched; the branches slightly raised at first, and then becoming procumbent; these branches thus run sometimes for ten or twelve yards from a centre. The branches are covered with narrow, flat, smooth

Fig. 3. Spiral Filaments, or Elaters of Hepaticeæ.

leaves, the edges of which are slightly toothed and hair-tipped. These leaves do not fall off, but are evergreen and persistent. When about to form fruit there are thrown out from various parts of the branches spikes clothed with leaves, longer, narrower, and of a paler green than those which beset the original stem; these branches are crowned with pale sulphur-coloured heads, something like catkins, usually two on each stem in pairs, but in some cases three will start from the same point. On these spikes are the two kinds of fruit which we have described. The capsules which contain them are in this species kidney-shaped, perfectly sessile, and situated at the base of the bracts. Each is two-valved, and full of either spores or powder.

Lycopodium annotinum, the "Interrupted Club-Moss" (fig. 2), is another very interesting species of this genus, of rare occurrence in the British Isles, but common in Norway, Sweden, and in North America. The roots of this species are tough,

Fig. 4. Gemmæ.

wiry, and tortuous, the stem creeping, very strong, and with a deeply-indented and striped surface. It sends out at intervals branches from one to three or four inches apart, in an erect position; these increase annually, the growth of each year being marked by the altered length and direction of the leaves. These upright branches sometimes divide again, and when fertile, which is not always the case, the spike is usually on the sixth or seventh joint of the branch. When mature, the branches become prone, throw out roots, and send up erect branches as before. The branches are clothed throughout with linear, leaves very acutely pointed, and with minute serratures at the edges. The front spike is oblong, and seated on the point of the branch in this species, being entirely devoid of the peduncle or foot-stalk on which the spike of *L. clavatum* is elevated. The leaves, or *bracts*, in the spikes are nearly round, yet pointed at the apex, and in the axil of

each is placed a large conspicuous veniform capsule, which, when ripe, opens transversely, and sheds numerous minute sulphur-coloured seeds.

Lycopodium Alpinum, the "Savin-leaved Club-Moss," is more common than the last-named species; it is a pretty plant, its foliage of a brighter green than any other of its congenors, and in summer the young shoots have a blue tint. After the escape of the seeds, the spikes bend into a semicircular form, and the bracts become reflexed. Sir W. Hooker tells us that it is much used in Iceland as a dye for woollen cloths. He says, "a vast heap of *Lycopodium Alpinum*, lying before the priest's house, drew my attention, and on inquiring, I found that it was used for the purpose of giving their wadmal a yellow dye, which is done by merely boiling the cloth in water with a quantity of the *Lycopodium*, and some leaves of *Vaccinium uliginosum* (the Bog Whortleberry). The colour imparted by this process, to judge from some cloth shown me, was a pale and pleasant, though not a brilliant, yellow." Wadmal is the woollen cloth usually worn by the Icelanders. Sir W. Hooker tells us that this species of Club-Moss is the badge of the Clan Macræ.

The "Marsh Club-Moss" (*L. inundatum*) is a rather insignificant species which springs up on heaths and commons, especially where the turf has been pared; and neither that nor the "Prickly Club-Moss" (*L. selaginoides*) must receive much of our attention, though of the latter we must just notice that this species produces the double sort of fructification which we have named in our account of *L. clavatum*. The upper capsules contain the minute pollen-like granules, the lower larger grains almost equal in size to the seeds of some flowering plants.

The "Fir Club-Moss" (*L. selago*) is the last species on our list. This ascends the summits of our highest mountains, and is also found on the level of the sea. It has been considered as possessing many extraordinary medical properties, but seems an unsafe remedy to meddle with, as, if too much is used, it induces convulsions. There is a curious species of Lycopodium mentioned by Dr. Carpenter as inhabiting Peru, which he says is liable to be entirely dried up when deprived of water for some time. "It then folds in its leaves and contracts its roots, so as to form a ball, which, apparently quite devoid of animation, is driven about hither and thither by the wind. As soon, however, as it reaches a moist situation, it sends down its roots into the soil, and unfolds to the atmosphere its leaves, which, from a dingy brown, speedily change to the bright green of active vegetation."

The "Quill-Wort" (*Isoetes lacustris*) is the only other genus comprised under the order Lycopodiaceæ. This is a little plant confined to mountain lakes, and there is but one species in the genus. It has a tuberous root about the size of a hazel-nut, from which depend tubular white fibres; the leaves are also tubular and rise from the point of the root without any footstalk. They are of a bright green, and very brittle. The fruit is very curious, consisting of capsules about the size of swan-shot, imbedded in the very substance of the base of each leaf. Newman says, the Quill-Wort "clothes the bottoms of deep and still waters with a perennial verdure." It is found in the little lakes which abound among the Snowdon range. It is said that Dillenius waded into the waters of Llanberis to get it, and Newman glories in the fun of his exploit. "The imagination of a botanist," says he, "delights to picture the Sherardian professor in this interesting situation: his shoes with their enormous silver buckles, and his grey-ribbed hose, are seen reposing on the strand; his important bag-wig, and his formidable military hat sharply looped on three several sides, adorn his learned head; the ample skirts of his coat are gathered on one arm, whilst the other grasps his gold-headed cane wherewith to uproot the brittle *Calamaria*." Surely the nymphs and naïads of the lake must have been a little surprised at such an intrusion on their watery pastures!

Such is the structure and character of the tribe which appears to connect the mosses with the ferns.

The Liverworts, of which we have next to give some account, come lower in the scale of organisation; they are much varied in size, appearance, and structure, and some of them are of exceeding beauty. They muster under their banner some genera which closely resemble true mosses; others which are nearer the structure of lichens, and again others which link them with the Algæ, Jungermanniæ, Marchantiæ, Trgioniæ, and a few other less noticeable genera, are all of this tribe; but they differ so widely from each other that we shall scarcely from their appearance be led to place them in the same order. The similarity of their organs of fructification shows, however, that they must all be considered as belonging to the order *Hepaticeæ*, and we proceed to give a brief notice of a few of the most interesting genera.

The *Jungermanniæ*, or Scale-Mosses, so named from Louis Jungermann, a German botanist, are of a very peculiar and exquisitely delicate structure. The whole substance of the plant is loosely cellular, so much so that, although most of the species are exceedingly minute, the beautiful reticulation of the leaves may often be detected by the naked eye. The herbage consists of a variously dilated frond, frequently naked, but more often covered with small leaf-like appendages. These are often divided, but never truly nerved, and might more properly be considered as dilitations of the frond.

The Scale-Mosses may be considered as divided into two classes: the foliaceous, or those which have the appearance of separate leaves; and the frondose, or those which consist of lobed fronds or thalli.

The former of these divisions is composed of minute plants, which by an unaccustomed eye might be taken for true mosses, amongst which, in many instances, they are found growing. These are widely spread over the ground on banks and trunks of trees, or other positions in shady woods; some are found on moist Alpine moors, frequenting the beds of torrents, or growing in boggy places, along the edges of springs, or rivulets, whilst we find some species spread out on clay and exposed heaths, exhibiting their pretty purple or bronze foliage where nothing else will grow.

The second, or frondose, division of this tribe is chiefly confined to semi-aquatic positions: they are larger, their leafy parts, or fronds, are thicker, broader, and of a different texture from the foliaceous kinds, and some of them are slimy to the touch; but there are one or two of this division, namely, the "Forked," and the "Downy Scale-Mosses," which grow on stones, trunks of trees, and on shady limestone rocks.

The fruit of this genus is a theca or capsule which rises from a tubular leaf or cluster of leaves called the Perichætium, and is usually borne on a seta or fruit stalk. The theca lies involved in this protecting sheath until it is mature enough to make its appearance in the world; the perichætium then opens at the top, and the little theca, unlike the modest little mosses which never lift their young heads to the light without the covering of their calyptra or veil, suddenly starts up, leaving that organ attached to the point at which it originally grew, and displays itself unveiled to the eye which may be sharp enough to detect its diminutive beauties. This theca is four-valved, in shape much like those of mosses, but it has no lid, and no central column round which the spores assemble; instead of this it is furnished with some very curious spiral filaments with which the spores are associated (fig. 3). It is in the possession of these spring-like organs alone that the different families which class under the general name of Hepaticeæ resemble each other, but these are common to the Jungermanniæ, the Marchantiæ, and all the rest of the genera which the order comprises. These organs consist of double spiral threads, somewhat like the trachæ or spiral air-vessels in plants, only more elastic. They are contained in the same case with the spores and curled up among them, and when the capsule is mature, spring up with a sudden jerk like a jack-in-a-box, and scatter the spores which are around them in all directions. So sensitive are these *elaters* that even breathing on them will set them in motion after the spores have escaped. The Scale-Mosses chiefly differ from true mosses in the permanent attachment of the calyptra of which we spoke above, and in having no lid or *operculum*, and no columella. The tubular form of the sheath and the presence of the spiral

filaments, just described, constitute the other distinguishing features of the genus. Besides the normal fructification the Jungermanniæ possess a second kind of reproductive organ by means of which the species are often propagated; these are called *gemmæ*, and consist of minute roundish, or oblong bodies, variously situated, sometimes in the axil of the leaf, at others on its margin, and clustered together in the form of little bells. (Fig. 4.)

FLITTING.

The above is a term with which we believe our English readers are not generally familiar. In fact, we have little doubt that to some of them it will prove quite incomprehensible. As nothing, however, tends so much (as logicians say, and they ought to know) to hinder in the search after truth, as the want of a clear understanding of the meaning of terms and phrases, and as nothing so well promotes the profit and pleasure of all discussions as a few accurate definitions at the beginning, we shall in the present instance premise by saying that "flitting," in Scotland and the north of England, means removing. To be still more explicit, we may add, that by removing we do not mean that simple process by which a British subject, whether at the bidding of a public functionary, or of his own free will, transfers his presence from one locality to another. The term is of far wider signification. It implies the migration of a household with its lares and penates, its stuffs, goods, furniture, and appurtenances, and all the members of it, from one residence to another, with all the noise, and confusion, and discomfort, and bad temper, and complaints, and regrets consequent thereupon,—the breaking up of a thousand old associations, the forced severance of many ties of long standing, the destruction of cherished habits, the separation from old, dear, and familiar friends and scenes, and all the annoyance consequent upon the process of accustoming yourself to the altered circumstances of your new situation.

We are not so simple as to suppose that the favourites of fortune know anything about these things. There is nothing belonging to noble lords and ladies which is not a possession of long continuance. They know nothing about any changes except changes of ministry, and their birdlike flight from town to country and country to town as the changeful seasons roll. And in this nothing accompanies them but their maids, valets, and carriages. There is no bustle, no hurry, no confusion. The country house is there just as it was in the days of their ancestors, or it may be as it was in the days of the unhappy Charles the First. There are there no changes except such as time has worked. That house and that furniture have stood as they are for centuries, and they will continue to stand, the present proprietor is proud to think, till a hundred generations shall have passed away. And the town house, too, is, very likely, his own, or he has a lease of it; while grass grows and water runs, he never moves; the owner of his title always lived there, and will always continue to live there.

It is the middle and lower classes who are best acquainted with the miseries of flitting. They are the rolling boulders that are swept hither and thither by the great waves of the sea of life, battered, smoothened, and rounded; while the great rocks stand fast for ever, and look down on the tumult at their base in calm and indifference. It is for their benefit that we are so often informed of the fact, that "This House," or "This Desirable Residence," is to be let; that so many columns of the *Times* are every morning filled with allusions to "detached," or "semi-detached villas," with so many bed-rooms and so many sitting-rooms, and an unlimited supply of gas and water, in "an undeniable situation," where omnibuses pass every five minutes to the Bank and all parts of London. It is for them that green-grocers fasten up notices on their door-posts that they are possessors of spring vans, and that they have come to the determination of removing goods or furniture to any part of town or country with care and expedition. It is for them that house agents live and move, and keep long lists of dwelling-places suitable to families of respectability.

All these things are doubtless useful, in fact, indispensable in their way. They are necessary to our comfort and well-being, and yet how many of them owe their existence to our infirmities and misfortunes solely. Of the many thousand flittings which take place in this metropolis every year, a very large percentage—we will not say *how* large, lest our veracity should be called in question—are the consequences of our whims, caprices, and calamities, and, must we say, our wickednesses. You know a stockbroker, who seeks refuge from bulls and bears, and prices current, the rise and fall of funds, and war's alarms, in a snug little retreat at Highgate, from which he issues with a blue bag and a smiling face, precisely at eight o'clock every morning. He invites you out to dine with him, and you find everything *comme il faut*; the lady hostess a pleasant and agreeable person, a charming partner of the worthy broker's joys and sorrows; the table appointments excellent, the cookery unexceptionable, the wine *recherché*, the furniture costly and tasteful, the look-out faultless, the garden neat, and you are informed the rent is moderate. You feel assured that the broker is a happy man, and on your way home come to the conclusion that stock-broking is not a bad business, and almost wish you had gone into it yourself. There he is, blessed with a moderate competency, and living inside his means. You feel assured that he is to be envied.

In another year you inquire after him, and where is he? Alas, you find him in the west-end in a very stylish abode, which you know right well he can't afford to pay for; the furniture that looked so well before now looks shabby, and the lady who did the honours so gracefully at Highgate, is like a fish out of water in the mansion at Belgravia. Upon inquiry, you find, that the canker of ambition had seized upon her, as it did upon Julius Cæsar, and upon Wallenstein, and that all the charms of her first residence faded in her eyes, and she insisted upon flitting. Yet a little while and your broker has flitted again—but it is this time to Camden, where he lives in a small house, and lets his first floor, and gets two pounds a-week, and a good deal of abuse as a clerk in the city. *Sic transit gloria mundi!*

Perhaps you are yourself a shopkeeper, at, say Kensington, or Brompton, or Chelsea,—if you are not, don't be offended. We merely suppose that you are, for the sake of argument. There are great numbers of houses in your neighbourhood to be let: you wish there were not so many, for your own sake. Suddenly one of them is taken. You see loads of upholstery stopping at the door. You feel assured it is being furnished regardless of expense. Then a day or two afterwards the family take possession, and the daughters of the house, accompanied by mamma, are seen taking their drives in a showy equipage. They stop at all the shops in the neighbourhood, and shower their orders, like the rain from heaven, upon the just and the unjust. Very likely you are one of the favoured many. You are in the haberdashery line, and you do your own shopwalking in a white neckcloth, which of itself is sufficient to guarantee your respectability—so stiff, so irreproachable, is its tie. You are all smiles and courtesy to those who enter; ready, if desired, to prostrate yourself on your face, and suffer your neck to be trodden on by the fairy feet of your fair customers when entering; and not by any means as fierce as a tiger or insolent as a hyena when they go out without buying anything. Oh no, not you! For a lady to come alone, or without a gentleman, is a sure passport to your chivalry and generosity. You are standing at your door, thinking of nothing in particular, when you see the carriage of these newcomers drive up, and actually stop opposite. You rub your

hands with joy; you have been long looking out for them; your thoughts with regard to them were precisely those of Sisera's mother, touching the delay of her son. Your thoughts regarding them now are those of Napoleon regarding the English army on the morning of Waterloo. At last you have them in your grasp. You hurry to the carriage door, and in your eagerness impede the footman in the discharge of his duty. With low bows and bright smiles you usher the ladies into your shop; your most precious wares are spread before them—rich brocade, gorgeous tabinet, silks of every hue, lace wrought by cunning hands. They select, with lavish hand, some hundred pounds' worth at least, and order them to be sent home, with the account. You promise that it shall be done, but waive all mention of the money, and declare that it is a mere nothing.

A week or two afterwards information reaches you that

something very curious is going on at No. 10, Bellevue-terrace. You hurry thither one fine morning in terrible trepidation, but find the butcher, and baker, and grocer, and tailor, and perfumer, and cheesemonger, and upholsterer, and the landlord to boot, all there before you, and all with their "little bills" in their hands—bills, alas! destined never to be settled—for the house is empty; and of all this dash and show and magnificence nought remains but a little packing straw in the hall, a broken dish, and two pieces of twine. They have flitted in the middle of the night *au clair de lune*.

There is another and very different class of flitting, that we have never witnessed or heard of without a pang, because they are but the emblems, the outward and visible signs of griefs often too great for utterance, the forced abandonment of the dwelling-place which for long years has been the scene of all the genuine happiness you have ever known, in which you have sported in childhood, loved in youth, and in manhood have erected the shadowy castles of ambition—in which you have first seen so many valued friends, and taken your last leave of so many more. Every corner is perhaps associated with some touching reminiscence or some ennobling memory. The pictures on the wall, the old clock on the stairs, the quiet nook on the landing where you have flirted with your partner between dances, the room where your mother has died, the window-seat in which she gave you your first taste of knowledge—the only place in all the wide wide world that you could ever truly call your home.

There is still another flitting, which we have chosen for illustration, because it is, in our estimation, the saddest of any. It is an incident, however, of daily occurrence in the "short and simple annals of the poor." It is very well for a political economist to dwell upon the beauties of competition, and inform us that it, and all the evils attendant upon it, are as inseparable from society as at present constituted as police courts or inns. This may be true, and we do not doubt but that it is true; but it must for ever be a matter of regret to any one whose regrets are worth having, that the great mass of the population, not in England only, but throughout the civilised world, should be bound to no particular spot of ground, but by the slenderest possible tie; in short, that so few of them should be in possession of what politicians of a certain class call "a stake in the country." Their flitting is but a very slight affair, and seeing that it takes place so often, it is well that it is so—a chair or two, a table or two, a bed or two, a pot or two, a pan or two, *et viola tout*. They are placed on a hand cart, the father pulls, the son pushes, and the flitting is over in a few minutes. It is not an affair of much moment in itself.

THE FIGHT FOR THE STANDARD.

Englishmen were never engaged in a struggle of which they might so justly be proud, as the civil war of the roundheads and cavaliers. In none did the sterling virtues of their character, their love of liberty and of country, their hatred of tyranny, their readiness to submit to all losses and all griefs for the sake of the right, their indomitable energy in battling for it, the strong, steady, dazzling glare of their native inborn courage, stand out in bolder relief. In none did the points of contrast between them and foreigners appear so strongly. A contest which produced such men as Hampden and Falkland, Colonel Hutchinson, Fairfax, and Cromwell, is sanctified if only for having given birth to so many worthies. In the cropped and shaven ranks, of which Cromwell's army was composed, under those sour and demure visages, there lay an energy that could conquer the world. That army was the most terrible instrument of destruction that has ever existed. Could a modern general muster ten regiments, composed of the same elements, the same enthusiasm, fanaticism, interest in the quarrel, stern morality, fiery imagination, the balance of power were at an end, for he might set his feet on the necks of kings. This union of spiritual fervour and exultation with sound practical sense, of boiling enthusiasm with steady energy, was such as could never be seen on any soil but the soil of England. When the French rose against their oppressors, they became blasphemous, bloodthirsty, libidinous, mad, outrageous scoffers at all that men held sacred, either in morals or religion. When the English did so, they fasted and prayed, and cut their hair short, and read the Bible, and punished the flesh. They had no Marat, and no Theroigne Méricourt. Were they on this account less prompt in action? Follow them from the prayer-meeting to the battle-field, and, we promise you, you shall see Private Poundtext, who just now was bewailing his sins in the depths of humiliation, laying about him in a fashion that proves that whatever his own opinion of his shortcomings may be in other respects, the thrashing of cavaliers is not a portion of his duty which he is in the habit of neglecting.

THE FIGHT FOR THE STANDARD.—DRAWN BY NICHOLSON,

And the cavaliers—the merry, laughing, cursing, swearing, drinking, obscene, loyal, brave, true-hearted, and generous cavaliers—fighting gaily for the king and church—the church in which their fathers were buried, and in which they had been wedded to their brides, and in which their brothers were clergymen, and the maintenance of which they looked upon as indissolubly connected with the very existence of the English nation,—they did their duty manfully and well; only ceased to fight when fighting was useless, but neither betrayed nor repented. They did not, like the French nobility, fly from their native soil at the first sound of danger, but struggled gallantly to the last, through fire and sword, without any other aid than their own right arms. England may well be proud of both: however we may deplore the struggle, we must admire the virtues it brought to light. Even in a civil war—the worst calamity, save a foreign invasion—we find some of our most ennobling memories and greatest names. Our illustration gives a vivid picture of a most stirring incident in one of the conflicts of that stormy period. At the battle of Edge Hill—the first great engagement between the royalist and parliamentarian forces—fought on the 23rd and 24th of October, Sir Edward Verney being slain, the standard fell into the hands of the enemy. Upon this captain John Smith rushed to rescue, and after a furious encounter—which our artist has pourtrayed with great boldness and effect—succeeded in bringing it back in triumph.

A PEEP AT COUNTRY COUSINS, AND HOW IT ENDED.—LETTER V.

Whitehaven, January 1st, 1821.

My dear Father,—May the bright sunshine of this splendid morning be an auspicious omen that a happy and prosperous new year awaits you; though it saddens me to think, that before its close I shall no longer be an inmate of my dear old home. I do not really know myself how it has come to pass, that my future lot seems likely to be cast amongst these Cumberland hills, nor how it first dawned upon me that my own happiness could only be fulfilled by agreeing to minister to that of my high-principled and very superior-minded cousin Robert. Well! I shall leave the subject veiled in mystery, and give you a few particulars about Christmas. On the eve of the 25th, a party of mummers, dressed in most fantastic costume, came to the Friars, and were admitted into the hall, where we saw them enact St. George and the Dragon with great spirit; though one of the Armstrongs, whose family peculiarity I have mentioned before, and who played the part of the King of Egypt, could not restrain his laughing propensities, and in the midst of a solemn charge to the doctor on doing his duty, burst into a loud guffaw, that proved highly infectious to most present, while it scandalised old Sally to the last degree. She even carried her resentment so far, as to present the luckless wight, when the play was ended, with a bowl of buttermilk, instead of the hot ale that had been prepared for the players; but my uncle took care that every mummer should receive an ample dole of meat, bread, and wassail piping hot, and half-a-crown to boot, so all withdrew well pleased. They were succeeded by a droll set of very young boys and girls, who, in shrill childish treble, shouted rather than sang some old rhymes, commencing, "Ule, ule, ule, three puddings in a pule." They, too, were allowed to come into the hall, and were then persuaded to sing one or two carols more gently, and consequently more pleasingly. Sally brought them some milk, but on my uncle's insisting that the half-starved urchins should partake of the ale, a large old-fashioned silver tankard was produced, furnished with pegs stuck in at regular intervals; so each child was made to drink what filled the space between two of the pegs, and I was made to comprehend the literal meaning of one's spirits being a peg too low. A plate heaped up with narrow but substantial mince-pies, baked in the form of a horse's manger, in commemoration of Advent, was next handed round, and the happy little band went forth again into the freezing atmosphere. At breakfast, on Christmas-day, we were each complimented by the gift of a dough image, meant to represent the Virgin's holy infant, which had been sent by the chief baker in Whitehaven. The day was brilliantly cold, and the evergreens glittering in the most exquisite frost-work embroidery, seemed to invite one to go out and enjoy the clear, bracing air, and wander forth amidst the white sparkling fairyland around us. We accordingly set off for church half an hour before the usual time, and thus came in for the droll spectacle of a country wedding, Christmas-day being a favourite anniversary for the purpose. On arriving at the church, we found it occupied by the village school-boys, who have from time immemorial been privileged to levy a monied tax upon all bridal assemblages, which goes to the fund for supplying coals for the school-room fire. We were looking at the beautiful decorations of the interior of the church, formed by wreaths of evergreens and magnificent branches of yew, holly, box, and ivy, which custom Robert told me had been employed even in apostolic times, as a token that our Saviour was born at the Jewish Feast of Tabernacles, thus marking the season of the year in which the advent took place, when a cry from the village lads of "They're coming," sent us to the entrance door. Picture to yourself a motley assemblage of men and women all mounted on horses of every description, racing in the utmost confusion at the fastest speed towards the church. An elderly spinster reached it first, and very proud she seemed. I could scarcely believe this was really the expected wedding party, nor that they had ridden thus, starting from the bride's house, at least six miles. My aunt said they were indebted to the frost, which had rendered riding at all anything but safe, for their unusual exemption from the mud, which generally bespatters alike both men and women on such occasions. On leaving the church, the bridegroom gave sixpence to the delegated scholars, who held a plate at the door, and every one who wore boots and spurs was obliged to follow his example, but those who could only boast of boots, minus spurs, were let off with the payment of threepence. The bridal party then re-mounted their steeds, and rode off again, pausing, however, a few minutes on the brow of an adjoining eminence, to listen to a congratulatory poem, recited in a loud yet snuffling voice by the head boy of the school, which was rewarded by a donation, that went towards the book fund. Of the fun we had that same evening, I have already written to you, and, indeed, the amusements of snap-dragon, dancing, yule-log, and banqueting are too well-known, even in London, to need detailing; and the only novel features in the evening scene, were the pleasant admixture of rich and poor, gathered together under my uncle's hospitable roof, and the importance which appeared to be universally attached to the foretelling of one's fortune in divers mystical ways. To-day I received many kind gifts from my uncle, aunt, and cousins, accompanied by the warmest assurances of welcome into their family. But though these winged messengers of love flew freely about the household within doors, I soon became apprised that it is considered unlucky to give anything out of the house on New Year's day. Not even a lighted candle is permitted, nor may the refuse ashes be cast out from the hearth, nor a bit of broken meat be bestowed upon a hungry beggar. This last requisition placed my aunt in a great dilemma about an hour ago, when a thinly-clad little girl came over the hills to ask for some broth for her sick mother. The child was shown in and told to warm herself by the kitchen fire, while my aunt sat lost in thought, and my uncle, with a satirical, though good-humoured smile, silently watched the progress of her meditations, being indifferent himself to the superstition, but certain that his excellent wife would cut the Gordian difficulty without infringing the decrees of fate. Presently, she said to the child, "Is your mother very bad to-day?" "Oh, yes," was the tearful reply; and then my aunt said, "Did she tell you to inquire how the family of Mr. Lonsdale were this morning?" "She bid me ask," responded the little girl, "how the good lady was?" "That will do," said my aunt with a highly satisfied air, and leaving the kitchen for a few minutes, she returned laden

with food and clothing, which she bade the child carry home, but to mind and be sure she told her mother that the things were no presents, but had been sent in return for sending such kind inquiries so long a distance on New Year's day. I doubt greatly if the strange message would be correctly delivered, but my aunt appeared quite content; and I must not omit to tell you that before I had risen this morning, Sally roused me from the most luxurious nap by entering the room, candle in hand, and with an earnest request that I would not go a step down stairs until I had either gone *up* the garret flight, or had mounted on a chair in three upstairs apartments, in order that I might be sure to rise and not go lower in the world during the next twelve-months. Of course I complied. I was yesterday interrupted in my letter by a call from the young couple whose wedding we witnessed on Christmas day; they came to beg a little corn, and were making a round of calls on their friends and neighbours, who had each given them a small quantity, and these donations would set them up in seed for their first crop. This custom is called "corn laiting." I shall hardly, I suppose, undergo this ceremonial, but the writing about it has brought the future before me so strongly that I feel little inclination to continue my descriptions; besides, next week I shall be once more at home, when we can talk over fully all I have heard and seen since I came here. Yet, six months hence, if you will condescend to visit the Cumberland mountains, very proud, indeed, will you make your truly affectionate daughter,

DORA HARCOURT.

THE TWO DESTINIES.

"TRAIN up a child in the way he should go, and when he is old he will not depart from it." This is the declaration of infallible wisdom, and the reverse is not less true. There may be apparent exceptions, but they are extremely rare, and, perhaps, if minutely examined, they would not be found to be exceptions at all. It is scarcely possible to conceive of an object more lovely, more interesting, than an infant asleep in its cradle, or nestled in its mother's arms. But who is bold enough to determine that infant's destiny? Hope and desire may be in lively exercise; but expectations the most sanguine, and desires the most ardent, have again and again been crushed and disappointed, because the training has not been such as to bring those hopes and desires to a pleasing fruition. Much is laid to the account of natural disposition, much also to circumstances; but it is the office of the trainer so to cultivate those dispositions and to control those circumstances, that the child may become an intelligent, a happy, a useful member of the community. Without proper training—a training which shall promote the development of the physical, the intellectual, and the moral powers,—natural dispositions will produce only wild and poisonous fruit, which circumstances will bring to fatal maturity.

We are led into these reflections by the two pictures our artist has placed before us. He has selected his illustrations from the working classes. *They* form a large and most important portion of the community, and on the manner in which their children are trained depends, very materially, the order and comfort of the whole population. We cannot conceal the fact that thousands of these receive no training at all, or are trained only for evil. We pass through our narrow streets and lanes, courts and alleys, and we find them crowded with dirty, ill-fed, miserably clad, squalid, wretched-looking children, idling away their time, or busy only for mischief; and we ascertain that they are, in almost every case, the offspring of thoughtless and neglectful, profligate and dissolute parents. Filth and miasma are their nursing mothers, profanity and irreligion their everyday companions. The father leaves them early in the morning to engage in his daily toil; his intervals of leisure he spends, for the most part, in the gin-shop; he rarely returns to his uncomfortable home till his children have gone to rest; and what training can they have from him who cares so little for them, or what profit can they derive from his example, so profligate and wicked? In consequence of the scanty pittance doled out by the selfish husband, the mother has, in many instances, to toil hard, either at home or abroad, to make out a living, and the instruction, the cleanliness, the comfort of her children, become only a secondary consideration, if it enters at all into her thoughts. Meanwhile the children grow up, increasingly ignorant and increasingly vicious, perpetuating the evils of their class, and inflicting serious injury on the whole community.

But we rejoice to know that this is very far from being a just description of the whole of our working population. Thanks to Providence, we have thousands of sober, honest, industrious mechanics, artisans and labourers, whose children are duly cared for, cleanly, decently clad, educated, taught useful employments, and placed in the way of becoming clever workmen, thriving tradesmen, respectable citizens. These, as far as the circumstances of the parents allow, are trained in the way they should go; their parents receive a rich reward, and the community is greatly benefited.

To return, however, to our pictures. The artist has placed two children, two courses, two destinies before us. Like our own Hogarth, the Frenchman has noted the peculiarities of his countrymen, and with a graphic pencil has endeavoured to show how the working man's way in the world is governed by his own determination and perseverance, founded, no doubt, upon the training he received in early life. The incidents in the life of such a man, whether he be a native of England, of France, or of America, do not differ materially. In every place there are temptations to evil and encouragements to virtue; and in every place prudence and resolution are required to avoid that which is evil and to follow that which is good.

"Look on this picture, and on that."—In the one we behold the strong, hearty, cheerful-looking workman parting from his young wife, and proceeding to his daily toil; and she, a few minutes afterwards, is busied in those domestic employments which render home a comfort and a joy. In the other, the husband, whether intent on work or on pleasure we can scarcely tell, makes his first call to the dram shop, while, in the next compartment, the wife is seen in the pawn shop about to leave her wedding ring as a pledge, whether to purchase bread or for other purposes is somewhat equivocal, as is also the conduct of the young female her companion. On the right hand of the reader there are exhibited the comforts of domestic life: in the centre the grandmother with her daughter and grandchildren around her, and the husband hastening with eager steps to join the happy party; on the sides, the preparation for the mid-day meal, and the tired labourer enjoying his supper in the open air. But what a frightful contrast does the engraving on the left present! The sottish husband seated in a low public house, unshorn, drunk, and incapable; returning home at midnight; furious at finding his own door closed against him; his wretched wife and children cowering in terror; their only bed some straw scattered on the earthen floor; and as the result of all this selfish and brutal conduct, the poor distracted mother seeking for her infant the protection afforded by the Hospital for Foundlings. Mad with drink, this husband and father has committed some furious outrage, some brutal assault, and is about to be conveyed to a lonesome dungeon. The artist has left us to suppose that the man is sent to prison or to the galleys, and that, as the result, his wife and children are driven to seek a precarious livelihood either by begging, or by the sale of some trifling articles.

What a pleasing *dénouement* is presented on the right hand! The ingenious and skilful mechanic is industriously employed, as is also his eldest boy; his workshop presenting an appearance of neatness and order in every part; and, as the result of skill and industry, we find him at length a respectable

employer, with his plans before him, giving instructions to persons in his employ, who, evidently, regard him with deep respect.

But through the medium of these pictures the artist becomes also a moralist. In every compartment is instruction, warning, or encouragement. In whatever country the lot of the working man is cast, idleness and profligacy will lead to disgrace, and want, and ruin; industry, forethought, and prudence will lead

THE COURSE OF THE VICIOUS.

to comfort, to competence, to respectability. Philanthropists! strive to raise our working classes above the injurious influences by which they are surrounded. Parents! train up your children in the paths of sobriety, industry, and virtue, that they may be happy in themselves, a comfort to you, and a blessing to the land in which they dwell.

THE CAREER OF THE VIRTUOUS.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER X.

The morning that succeeded the events that we have last recorded, found the Venetian general again in his apartment at Palestrina, as vigilant and as self-composed as if he had, during the hurried repose of the few preceding hours, slept away all recollection of the exciting scene of the past midnight. But, in truth, it was not so. The deep responsibility which he had taken upon himself in contradicting the wishes of so many of those whose power in the state was too formidable to be thought lightly of, weighed heavily upon his mind—but the effect of that weight upon a mind such as Zeno's was not to crush but to concentrate its energies. It is, indeed, the nature of bold, brave spirits to be resalient under pressure; and so his mind rose up to the emergency—calm, self-reliant, and circumspect. That he had other dangers to cope with besides those of the Venetian council, recent events admonished him. That a traitorous intercommunication was carried on between the Genoese and Recanati he had ascertained, and though he had proofs of the enemy having more than once obtained early intelligence of his own movements, he had not by the utmost vigilance been as yet able to discover the means by which that intelligence had been transmitted. At length the circumstance of the Italian condottiere having more than once volunteered to keep the night-watch out of his turn, aroused the suspicion of Zeno, and knowing that upon the night just past he had made the same arrangement, the general took the measures we have already seen in withdrawing Recanati from the redoubt and sending Checco in his place.

And now Zeno sat in his apartment, tranquilly awaiting the arrival of the English knight, whom he had ordered to attend in person and report to him what had taken place during the night-watch. Punctual to the appointed time, the sound of the knight's steps was heard outside, and in another moment the Englishman stood before the general.

"Ben venuto, capitano," said Zeno, in return for the knight's salute, "how passed your watch last night? Hast aught to report?"

"So please your excellency, not much—at least, not much that I set any count on."

"Didst see nothing?"

"Nothing, in good faith, for, as your excellency knows, there was no moon, and the stars gave only light enough to show themselves by."

"Well, what didst hear? for I know well thou didst not close thine ears, good sir knight."

"That did I not, and yet, I might as well have done so, for aught they served me; save the whirr of a bird's wing that swept by in the dark, there was not a sound to waken a young fawn. And so, when the morning broke, our watch ended, and we were relieved. As I marched away my men, I found at my feet this quarrel. How it came there, or when, I know not. It might have been there before our watch began, as it was then too dark to notice any object. Be that as it may, I have brought it to your excellency. If I have any skill in the fashion of bolts, this one was shot from a Genoese cross-bow."

Zeno took the bolt from the Englishman and examined it carefully from its square iron head down to the end of the shaft, and then said,

"It is as thou sayest, Sir William. A Genoese quarrel, truly, aye, and of no common kind. He had a cunning hand who wrought it. Yet am I much deceived in *thee*, sir knight, if thou understandest for what sort of warfare it was formed."

The English captain looked somewhat astonished, but made no reply. Zeno continued,

"Come, I said I would not trust thee by halves. What ho! Alexis!"

At the call of Zeno the Greek lad entered.

"Look at this quarrel, good youth, and say hast thou seen such an one lately, and where?"

The lad took the bolt, looked at it for a moment keenly, and then turned an inquiring glance from his master to the knight.

"Nay, fear not to speak thy thoughts freely," said Zeno, understanding the youth's hesitation; "here is none that is not true."

"Such another as this saw I last night in the hands of Sir Roberto di Recanati; I know it by the thickness of the shaft. Have I your leave, noble signore, to see how it is put together?"

"'Twas for that I called thee; proceed."

Alexis examined the weapon carefully throughout, and at length discovered that the shaft was divided longitudinally into two equal portions; but so skilfully and close did the edges fit together, that the line of junction seemed exactly like other lines drawn down the shaft. For a time the Greek was unsuccessful in his endeavours to divide the parts; at length, in examining where the wood was inserted into the iron head, he smiled, and then turning the head round with a firm grasp, he screwed it off the shaft and separated the parts of the latter, which revolved round a hidden pivot at the bottom. The secret was now apparent—the shaft had been hollowed out, and within it lay rolled up a scroll. This Alexis took out and handed to his master. The latter opened it, and perceived that it was covered with writing.

"So," said he, after a moment's pause, "so then we have at last discovered Recanati's courier. Look you, Sir Checco, this is the bird whose wing whirred by you last night."

"By the faith of a true knight, I begin to think it is so, noble signore. Fool that I was, to take it for an owl."

"Aye, 'twas a great mistake; thou seest now it is a messenger dove. Well, let us see what tidings it bears."

The general now applied himself to decyphering the writing.

"Ha!" said he, "this requires to be well considered upon." And he sat down, and in a moment was absorbed in the perusal of the missive.

"With your permission, excellenza," said the Englishman, "I think it would be well that I should retire for the present."

"Thou art right, my good Checco; it may be as well that I have a moment in solitude to look to this matter."

The knight moved towards the door, but Zeno arrested him for a moment.

"This document," said he, "gives me the plainest proof of Recanati's treason: and to a true knight like thee, a traitor is odious."

"As hell," said Checco, with unwonted energy.

"Then may I count on thy help to foil the traitor and the treason?"

"That may you, general, I swear to you, by the faith of a knight and an English gentleman."

"Farewell, then, for the present; I may want thee again ere long."

And so Sir William Cheke withdrew, and left the general of the Venetians to his meditation.

It was later than was his wont, when Zeno appeared amongst the troops; for he passed much of the morning in consideration of what the secret billet disclosed to him. The cause of the disorders in the Venetian camp was now clearly understood; the proffers of the Genoese to Recanati, the exorbitant demands of the condottiere, which the besieged at Chioggia were not yet prepared to comply with, nor in a condition wholly to reject;—all this he learned, and, knowing it, he was now prepared to baffle and to counterplot. But he learned still more: he learned that the Genoese were daily becoming more and more straitened in their provisions, and

dispirited as to the issue of the siege; that the Genoese admiral sought by every means to induce Zeno to hazard an assault, and for that purpose entreated Recanati to excite throughout the troops a feeling of discontent and impatience at their present life of inaction. All this satisfied Zeno that the course which he had adopted was the most judicious, and he was now more than ever determined to persevere in it.

Time passed on, week succeeded week, and still the forces of Venice blocked up the Genoese at Chioggia by land and sea. In vain did the latter endeavour, by sallying beyond the walls, to draw the besiegers from their position. In vain did the sentinels from the walls, and the mariners from the galleys, endeavour, by taunting shouts and accusations of sloth and cowardice, to goad or shame the Venetians to offensive operations. Chafe they did indeed and burn at the ribald challenges, and fain would they have accepted them; but the strong will and unyielding determination of Zeno controlled them as with a chain of iron, and none dared infringe the rigid rules of discipline which he had established. And so time passed on, and began to work its terrible effects upon the Genoese. Their privations increased, for no supplies of food could reach them, so skilfully had Zeno and Pisani taken their measures. In vain did Francesco Carrara attempt to succour the besieged by conveying provisions to them down the Brenta; for the passages of the river had been blocked up by the Venetians, and the fleet of the Genoese admiral Muraffo could not break through the barriers at Brondolo. Terms of capitulation were offered by the besieged, by which they sought for nothing more than that their troops and flotilla should be suffered to pass unmolested from Chioggia. But the terms were haughtily rejected by Venice, who now felt that the question was no longer whether Chioggia should be retaken from the enemy, but whether that enemy should fall utterly and unconditionally into the hands of their ancient foes. And thus were the Genoese reduced well nigh to the extremity of despair. No alternative remained save to perish of hunger within the walls, or to make a final effort to escape even through the midst of their enemies. The latter course was determined upon; for it had, at least, one advantage over the former, that it presented the possibility of escape.

It was now somewhere about the middle of the month of July. The shadows of night were just beginning to melt away before the gray light of the early dawn, and the outstretched waters of the Adriatic were just becoming visible to the eyes of those who then looked with strained vision to the seaward from the ramparts of the fortifications at Palestrina. These were three persons, who were seated upon the summit of a solitary and distant tower, which flanked the south-western angle of the fort; and whilst they were themselves hidden from observation, they could command a view both outwards along the sea and westward towards the besieged city. One alone there was, within whose ken those lonely watchers must have come, and yet, if he detected their presence, he did not appear to take any notice of them; for he marched to and fro on his watch along the rampart—that stalwart bowman—and though he never looked towards the tower, his sharp eye scanned keenly every other object through the gloaming, and as he came to the end of his short march he invariably stopped, and assumed for a moment the attitude of one attent and listening, and then he would turn back on his way, and in a very low, pleasant chant, sing some ditty of his far-away home.

"Art thou well assured, Alexis," said one of the three persons on the tower, "that thou didst replace the quarrel unseen by any?"

"I will certify that no eye could see me from beyond the redoubt, for I stole along under its cover."

"And I, noble general," said the third person, "will vouch that none could have passed from the fort; I will answer for the vigilance and the fidelity of yon stout bowman Hodge, with my life."

"'Tis well," said Zeno. "Listen, then, my right trusty Checco, and thou shalt learn what work our open enemies and our treacherous allies are carving out for us to-day. Thou must know, then, that we have discovered from the last missive from the enemy—which Alexis intercepted and has just replaced where Recanati will find it ere sunrise—we have discovered, I say, that the Genoese have for some days past been preparing a number of rafts, for which purpose they have demolished many of the houses in the town—with this fleet they propose to leave the city, and, if possible, to effect a junction with the fleet of Muraffo that lies, as you see, yonder," and he pointed out eastward where the hulls of the Genoese galleys were now dimly visible.

"It seems to me, so please you," said Checco, "but a wild scheme and a hopeless."

"I know not that," replied Zeno.

"They can scarcely leave the city before they will be perceived," rejoined Checco, "and once discovered their fate is inevitable."

"And yet they have taken their measures well, and might very possibly have succeeded, were I not informed of their design. In the first place, the rafts will scarcely rise above the water, and so might for a time be unnoticed; but besides that, they have taken good care that we shall have abundance of other matters to divert our attention from Chioggia. The Admiral Muraffo's fleet is to bear down upon Palestrina; that will engage the Venetian armament and Pisani; and then, lest I should look about me too pryingly from sheer idleness, my worthy ally Recanati has undertaken to excite a tumult amongst the mercenaries, so as to give me something to do—What think you of that, good Sir William? Is it not a knightly and a right skilful plot withal?"

"By the holy rood," said the Englishman, in a low and solemn tone, "he is no true knight, but a foul disgrace to the order; the fellow should have his spurs hacked off his heels by the provost-marshal. Thank heaven, he comes not from merry England!"

Zeno smiled, and after a moment resumed—"Well, then, I would now show thee wherein thou shalt aid me to-day. I mean, as usual, to take my rounds of the camp, but I wish not to excite any suspicion by having an unwonted number of attendants. Nevertheless, as I have reason to fear some sudden outbreak, it behoves me to have assistance nigh at hand. I would, therefore, that some score or two of thy trusty bowmen should hold themselves in readiness. Thou shalt thyself remain with them apart while I take with me some one of thy fellows whom thou canst trust, who at a secret signal from me can summon you to my aid. Hast such a one amongst your archers?"

"That have I i'faith, and more than one—but here is Hodge o' the Hill, as his comrades call him, as true as steel and as tough as yew tree. Your excellency may put your life in his hands."

"Good: let him be with me when I leave the fort. And now to your quarters, good sir knight, as secretly as you may. Alexis, thou must to the flotilla without delay. See the admiral privately; inform him of the designs of the besieged; and bid him watch for the signal between them and Muraffo, and hold himself in readiness for action."

The three men then separated, and each went his own way. The gray twilight grew red as the sun drew nearer to the horizon, and Hodge o' the Hill, ere his watch terminated, stood still for a minute and took a sharp leisurely survey all around him. All was still as through the night, save that, as his eye turned westward, he perceived the figure of a man strolling carelessly towards the western redoubt. Had Hodge been blessed with an extraordinary power of vision, or known as much as his worthy captain, he would have had no difficulty in pronouncing who the man was that, as he reached the redoubt, stooped down and took up something from the ground; but Hodge's eyes were just those of a good archer, that can hit the white in the target nine times out of ten, and so he did not recognise Recanati: but he resumed his march and his carol till he was relieved from his watch.

It was not many hours after the scene that we have just detailed, that the Venetian general, as was his wont, passed from his quarters in the fort, with his personal staff around him, and proceeded through the fortifications and the camp upon his round of inspection. As we have already stated, the troops of the republic consisted, in addition to their own soldiery, of a very motley collection of men of all nations; and as each band of free companions was commanded by his own chief, who rendered generally but as little obedience as he could to the generalissimo, one can readily understand how difficult was the task of preserving a paramount authority and enforcing unanimity of action and subordination of all to the one head.

Zeno had already proceeded through the domestic troops; next he visited the quarters of the English archers; beyond these were a body of adventurers, chiefly German; while the extremity of the camp was occupied by the band of Italian mercenaries under Roberto di Recanati. As the general approached the quarters of the Italians, his attention was attracted by loud angry words, as of men in high dispute, and passing on to the spot whence the noise proceeded, he discovered the big German man-at-arms, to whom we formerly introduced our readers, standing like a huge boar at bay, foaming with rage and defiance, while two or three of Recanati's lancers, with hands upon their half-drawn swords, were preparing to assail him. In a moment the combatants were arrested, and Zeno sternly demanded the cause of this unseemly broil.

"This German devil," said one of the Italians, "would defraud us of what we have won from him. And when we sought to get our own, he began to show his teeth, and bristle up like a wild boar, as he is. And then we were going to seize him, and pull out his tusks."

"Der teufel," roared the German; "ye did not play me fair; ye have stript me of every zecchin, and what more would ye have? Besides, noble general, they have cheated me, and played with false dice."

The Italians were instantly seized and searched, when, even as the German had stated, two sets of dice were found upon the person of one of them; one of these sets was evidently loaded.

"Take these sharpers," said Zeno, turning to his attendants, "bind them, and disarm them. We shall hand them to the provost-marshal as we return."

"We demand to be brought before our own capitano," said one of the men.

"On," said Zeno, motioning with his hand; and he proceeded to enter the quarters of the Italian mercenaries.

The sight of three of their comrades bound and guarded, was calculated to excite the passions of Recanati's troops, already but too well prepared for a mutinous outbreak by the wily schemes of their chief. Quick as the flame when the wind blows upon it, the intelligence ran from one end of the troops to the other, and Recanati himself was not the last to hear it. He saw at once how an occurrence of this nature would conspire with his present plans, and he hastened to watch and mould it to his purposes. Pale and self-composed, with his thin lips compressed, as was his wont, the subtle condottiere stood before the Venetian generalissimo.

"If it please your excellency," said Recanati, in a calm voice, "I would desire to know how it is that three of my soldiers are under arrest without my knowledge? I should humbly hope that my authority is sufficient to maintain the discipline of my own troops. I claim these men at your hands. If they have in aught transgressed, I shall see to it. Who charges them?"

Zeno's eye kindled up with a sudden fire, and he was about to reply angrily, but in a moment he seemed to have mastered his emotion, and he said, "You say well, sir capitano, and I am willing to have your aid in looking into this matter. Yonder German charges that these men have cheated him at play, and here are false dice found upon them. What say you?"

"We say, capitano," said one of the men, addressing Recanati, "that if they be false dice we knew not of it."

"And though we did," said another, speaking loud and looking boldly towards the whole band, who were now collected to witness the scene—"and if we did, what then? One can't be blamed for trying to eke out his fortunes and save himself from starving, when he has got half rations and short pay."

"Ha!" cried Zeno, "this is not a matter of breach of discipline for you to deal with, Sir Recanati, but a mutiny which concerns the state, and we shall reserve it. Lead on."

But the spirit of revolt was now fully awakened. At first, one or two hardier than the rest cried out, "They say true—they say true—we must have more rations—we must have better pay."

Then the tumult increased and spread from the Italian mercenaries to the German and other condottieri, till at length the whole camp poured forth its soldiery in a wild, disorderly state, with such arms as they could snatch up in their haste, and all thronged to the quarters of the Italians, and joined in the cry—"double rations! double pay!"

It was a moment that might well try the fortitude of the coolest man—the courage of the bravest. But Zeno was cool and brave as ever man was, and he was besides forewarned of his position and prepared to meet it. When Recanati had first approached Zeno, the latter placed his hand on his sword-hilt, and Hodge of the Hill quietly disappeared from the scene. And now as the cries and the tumult became louder and more frequent, and the soldiers pressed closer upon the general and his little band, with their insolent demands which each moment assumed more and more the appearance of threats, a shout was heard from behind:

"Ha! St. George—St. George for merry England!"

For a moment the clamour of the mutineers was hushed, and all eyes were turned towards the direction where Sir William Cheke led briskly on two companies of the merry bowmen fully accoutred. Then from the other side came a sound as of feet and the cheer of soldiers, and now the cry was "Viva San Marco! Viva la Signoria!" and a strong body of the troops of the republic were seen hurrying forward so as to take the other flank of the insurgents.

It was quite manifest now to Recanati that by some means which he could not devise, Zeno was prepared for any sudden mutiny. The wily condottiere therefore held aloof and took care apparently to be engaged in suppressing the outbreak of the soldiery. And, in truth, these latter became speedily sensible that they were taken at a disadvantage, and the more timid began to fall back and leave the more violent spirits to keep up the cry for pay and rations. And now Zeno seized the first pause when the cries ceased for a moment. With the fearless resolution, for which he was celebrated, he pushed boldly amongst the discontented throng, who felt their boldness rebuked by his noble spirit, and fell back to make way for him. The Venetian general well understood the temper of the troops about him, and took advantage of the moment of indecision to bring them again under authority. To some he appealed as those with whom he had shared many dangers and many victories; others he exhorted as men who should not sully their reputation as faithful allies and true soldiers. Here he reprimanded sharp and sternly—there he promised that any real cause of grievance should redressed, and he reminded all how he had lavished his own private means to the last florin that he might support the troops and meet the engagements of the republic. These efforts soon began to produce the desired effect, and some were even heard to cry, "Viva Zeno—Viva el generalissimo!" At this moment Zeno pointed with his outstretched hand towards Chioggia. All turned to gaze in the direction, when, to their surprise, they beheld one of the most singular spectacles that could be well imagined. Upon the lagunes appeared a number of rafts composed of the timbers of houses and other such materials, the strangest and rudest flotilla which despair ever induced men to hazard a naval engagement in, slowly bearing downwards.

THOMAS BAZLEY.

THERE are few problems the solution of which is more important for the welfare of this kingdom, than that which respects the moral and intellectual position which shall be held by the great employers of the manufacturing districts. The power of a millowner over his "hands" is very great. For good or for ill, the consequences of that power are incalculable. We are all influenced chiefly by those who are immediately above us. Unconsciously, and therefore effectually, we imitate our superiors; and, practically, our superiors are those who stand in the next grade higher than our own. Men of low culture and gross habits invariably abuse their power for evil purposes. Their example deteriorates all who come within its reach. Specially baneful is its influence on their immediate dependents. The heart that breeds vice is open to tyranny. And so masters of uncultivated minds and debased affections are generally despotical. But despotism in a master generates the evils of slavery in the servant. If the one is self-willed the other becomes insubordinate. Caprice on the one side calls forth turbulence on the other. Nothing is more dangerous than a feeling of being unjustly dealt by in

THOMAS BAZLEY.

A vicious employer makes vicious servants. An employer of a cultivated and honourable mind diffuses through his servants a love of what is pure and elevated. Employers have their representatives, who live in close contact with their operatives. Those representatives become so many channels for transmitting the moral and intellectual qualities of the head of the establishment, and, conformably to their own characters, produce good or ill on a large scale and to permanent results. Bad masters and bad superintendents produce bad servants. the minds of the working classes, and that feeling inevitably arises whenever the employer neglects his moral obligations.

The interests which are involved in this issue are of a vast magnitude. England is rapidly becoming one great manufactory. Already its commerce is huge. That commerce gravitates more and more towards the manufacturing districts, and in its powerful tendencies carries thitherward other great interests. England is rapidly becoming the commercial centre of the civilised world. All history teaches that, where com-

merce has its home, there are centered the great interests, and there are determined the great issues of civilisation. Impossible, therefore, is it to look to Lancashire without deep concern. In its hives of industry the fate of Great Britain is being wrought out. On the influences which are predominant there, depends, to a great degree, the weal or the woe of this nation.

As yet those influences are by no means wholly satisfactory. Material good has been there produced on a very large scale. In the products of skill and industry, in the vast accumulations of wealth, in strong intellects and untiring enterprise, in patient labour and a teeming population, means and resources of happiness abound there. But does the higher culture exist in similar proportions? The material prosperity of the manufacturing districts has outrun their moral appliances and their moral power. A disproportion between the two is in constant and fearful operation—a great if not an increasing disproportion. If the chasm continues to widen, it may engulph both moral and physical good. The social frame cannot long endure the spasmodic action which must ensue from a loss of equilibrium in its great motive powers.

Hence, the moral condition of the great employers is seen to be no trivial question. Would that we could report of it as favourably as we could wish. An improvement we do recognise. The millowner of the present day is greatly superior to the millowner of forty years ago. He has received a better school education; he is free from the low and degrading habits of his predecessors; he is in a measure sensible of his moral responsibilities; to some extent, he has the appearance and manners of a gentleman; he is more just and more considerate towards his "hands;" the best of his class encourage the moral and intellectual cultivation of their workpeople.

But we cannot affirm that "the masters" adequately appreciate the higher culture. Even for their own children they do not desire its advantages in a sufficient degree or an effectual manner. A fear prevails among them that a high education unfits a youth for business. With a predominant love of money-making, they look chiefly, some look almost exclusively, to the immediate pecuniary result of intellectual culture. The return per cent. of every outlay is too rigidly regarded. The direct bearing of knowledge on material productiveness is the great question. If the discipline of a university would teach boys to spin more yarn or better yarn out of a given pound of cotton, to the university would boys be sent in crowds. A professor who taught "the art and mystery" of "buying in the cheapest market and selling in the dearest," would soon make a fortune in Manchester. The love of a high intellectual training, for itself and for its own results, exists there only within a very contracted sphere. Hence, opportunities for collegiate training, which have long offered themselves in its highways, have been almost totally disregarded; and the course of study afforded by the munificence of one of its own citizens, in the Owens' College, is as yet not very superior to that of the better sort of our upper-class schools, and gives at present small promise of attracting to its advantages large classes of earnest and eager disciples.

More intense and widely spread would be the love of the higher culture in Manchester and the important district of which that city is the centre, were the spirit and the practice of Thomas Bazley widely prevalent.

The events of this excellent and amiable man's life are neither numerous nor remarkable. We should more correctly set forth the fact, were we to say, that his has been an even tenor of self-improvement and social usefulness. Possessing from his birth the inestimable privilege of virtuous and morally cultivated parents, and being endowed by nature with a happy temperament, the subject of this sketch was in boyhood and in youth free from many perils incident to that important period of life, and was gradually led to acquire habits of self-culture and self-control. By his father, who was fond of mathematical studies, and who held it to be a parent's duty to discipline and form his children's mind, he was early trained to that mental industry and exactitude of thinking, which now characterise and distinguish the man, and to which he owes no small portion of his mercantile success and his social eminence. The happy result was facilitated by a superior school-education. No few of our successful manufacturers received no other instruction than such as may be had in the Sunday-school. It was Thomas Bazley's good fortune to undergo a somewhat higher training. Born on the 27th of May, 1797, at Gilnow, near Bolton-le-Moors (now known as simply Bolton), in Lancashire, he was sent to the Grammar School of that town. At the age of fifteen, he entered as an apprentice a manufacturing establishment in Bolton. On reaching his majority, he began business on his own account. In the year 1826, he removed from Bolton to Manchester, where a larger field and freer scope promised to reward his enterprise. At Dean Mills, near Bolton, and at the New Bridge Mills, Manchester, Mr. Bazley, in conjunction with his partners, established a fine yarn and lace-thread spinning concern, the most extensive of its class. In 1828, he married the daughter of Sebastian Nash, Esq., of Clayton Mills, near Manchester, and has an only son, who, having completed his education at Trinity College, Cambridge, which he left with honours, in January last but one, is now engaged with his father in a fine cotton-spinning business. For twenty years Mr. Bazley has been a director of the Manchester Chamber of Commerce and Manufactures, of which he is now the president. While a resident, from 1835 to 1840, in the neighbouring borough of Salford, Mr. Bazley held municipal offices in that town, and promoted the establishment there of the Borough or Magistrates' Court; he also lent efficient aid in introducing the Municipal Act, and whilst occupying the position of boroughreeve, gave the weight of his character and dignity to the promulgation of the doctrines of free trade; to the recognition of which by the legislature of England the present prosperity of the kingdom is mainly to be ascribed. Within this period, Mr. Bazley was an active and influential fellow-worker, in the cause of free trade, with Richard Cobden, John Bright, and the late John Brooks. Of the consequent labours, special mention may be made of an embassy to Liverpool, undertaken by those gentlemen, together with Mr. Bazley, which, the first of the kind, was most important in its results, by securing the co-operation of that great commercial entrepôt. Possessed of a liberal, as well as cultivated mind, Mr. Bazley is a firm advocate of unsectarian education, and has rendered valuable services to the National Public School Association, in the list of whose vice-presidents his name is found. Wholly exempt from the fear with which some still regard the extension of educational means among the people, he has declared his conviction that such extension would prove beneficial even in a commercial point of view.

"If the labouring classes were well educated, their superior attainments would be alike more profitable to their employers, by increased skill and a nearer approximation to perfection; and to themselves not only in augmented rewards, but in the knowledge that would promote their general comfort and each other's welfare; for could every worker be well clothed, dwell in abodes furnished with manufactured products, and all requisites for rendering the home fireside attractive, there would arise a universal demand for the results of labour beyond all precedent. If there be, then, no higher motive for removing the lamentable ignorance which pervades many of the labouring classes amongst us, why does not even the censurable cupidity of the age remove the stigma?"

Repeatedly have Mr. Bazley's high qualifications called forth from his fellow-citizens the expression of an earnest desire that he would become their representative in the Commons' House of Parliament; but hitherto his extensive commercial avocations have prevented him from acceding to their overtures. In the year 1850, he had the distinguished honour of being appointed a member of the Royal Commission for the Exhibition in 1851 of the Industry of all Nations. In that capacity he rendered most valuable services, not less by the suavity of his manners than his intimate and comprehensive acquaintance with industrial products. As a man and

a citizen, Mr. Bazley is held in very high estimation by his neighbours; and by his diligence in business and his well-directed zeal in objects of high and lasting usefulness, he has, without intending it, yet most deservedly, acquired a national repute.

Mr. Bazley is a man of business, not a man of letters. But the "Lecture upon Cotton," which he recently delivered at the rooms of the Society of Arts, London, in connexion with the Exhibition of 1851,—his Royal Highness Prince Albert, president, in the chair,—bears evidences of a refined and well-furnished mind. We have already given one quotation from this lecture; we conclude with another:—

"Persecution under the Duke of Alva became to England a manufacturing monitor. Artizans and weavers were expelled from their abodes in Flanders, and were welcomed here by the wise, energetic, and reigning sovereign, Elizabeth; whose peaceful triumphs have been more enduring and profitable to the nation than were her achievements in war. Here, then, were the expatriated sons of industry—their country's true wealth—received, hospitably cherished, and located. May the industrious and oppressed ever find a refuge here! Aided by the Flemings, the manufactures of England rapidly extended."

THE TURKS AND THEIR INSTITUTIONS.

CHAPTER I.

We first hear of the Turks in the sixth century, as the most despised portion of the slaves of the great khan, a chief of the Geougen, one of the Tartar hordes, which for ages have inhabited, or rather possessed, the great plains of central Asia.* Their haunts lay mostly in the neighbourhood of the chain of mountains known as the Altai range, which were very fertile in minerals, particularly iron, and the Turks were mostly employed in extracting the ore and forging it. How long the latter remained in this degraded state, we know not, but at last a bold and energetic leader arose amongst them, named Bertezend, and persuaded them to assert their freedom and independence. The revolt proved successful; his daring was rewarded by a crown, and under his command the Turks distinguished themselves by several victories over the neighbouring tribes. The new khan now had the hardihood to seek the hand of his old master's daughter in marriage, but his alliance was contemptuously rejected. He met with better success amongst the Chinese, who bestowed on him one of their princesses, and the insult he had received from the Geougen was avenged in a great battle, in which nearly the whole of that nation was extirpated and their dominion put an end to, and that of the Turks took its place. Their heads, however, were not turned by prosperity, and they preserved the memory of their origin by an annual ceremony, at which a piece of iron was heated in the fire and hammered upon an anvil by the prince and his chief officers in succession; and even when their dominions covered a great tract of territory, they never encamped far from Mount Altai, their former abode. Their emperor's throne was always turned towards the east, and his tent was distinguished by a spear surmounted by a golden wolf, thrust in the ground at the door. They seem to have sacrificed to a supreme being, and to have sung hymns in honour of fire and air, earth and water, as deities of an inferior order. They had unwritten laws, in which offences against morality, or breaches of military discipline, were punished with terrible severity. One of their armies consisted of four hundred thousand men, and in less than fifty years they were connected in loans or alliances with the Romans, the Chinese, and the Persians, and all this while they were still a nomade horde of shepherds. They were terrible enemies to the Chinese, whose empire they invaded as often as internal dissensions gave them a prospect of success, and such was their superiority in arms to their civilized opponents, that their retreat was invariably purchased by subsidies. Their empire at last, however, became large and unwieldy; viceroys who were appointed became turbulent and revolted; continued successes introduced luxury and carelessness; the conquerors became enervated, and the tribes which they had subjugated rose in revolt, so that their dominion was overthrown after it had lasted for two hundred years.

The next time their name comes prominently before us in history, it is as guards of the Mussulman Caliph of the Saracens, Motassem, who reigned in splendour at Bagdad between the years 841 and 870. He had recruited his mercenary forces by robust Turkish youths, either taken in war or purchased in trade, who were trained to bear arms, and instructed in the doctrines of the Mahometan faith. Fifty thousand of them at one time occupied the capital, while their chiefs filled the principal offices in the royal household, and acted as viceroys of the provinces. They behaved as hired soldiers may always be expected to act amongst a luxurious and enervated people, for the Arabs had by this time lost much of the warlike fervour which had distinguished them when they issued from their deserts to propagate the new faith. They rose in insurrection almost at regular intervals, upon receiving the least cause of discontent, murdered and maltreated the reigning prince, and disposed of the crown as they pleased, just as the prætorian guards had done at Rome centuries before.

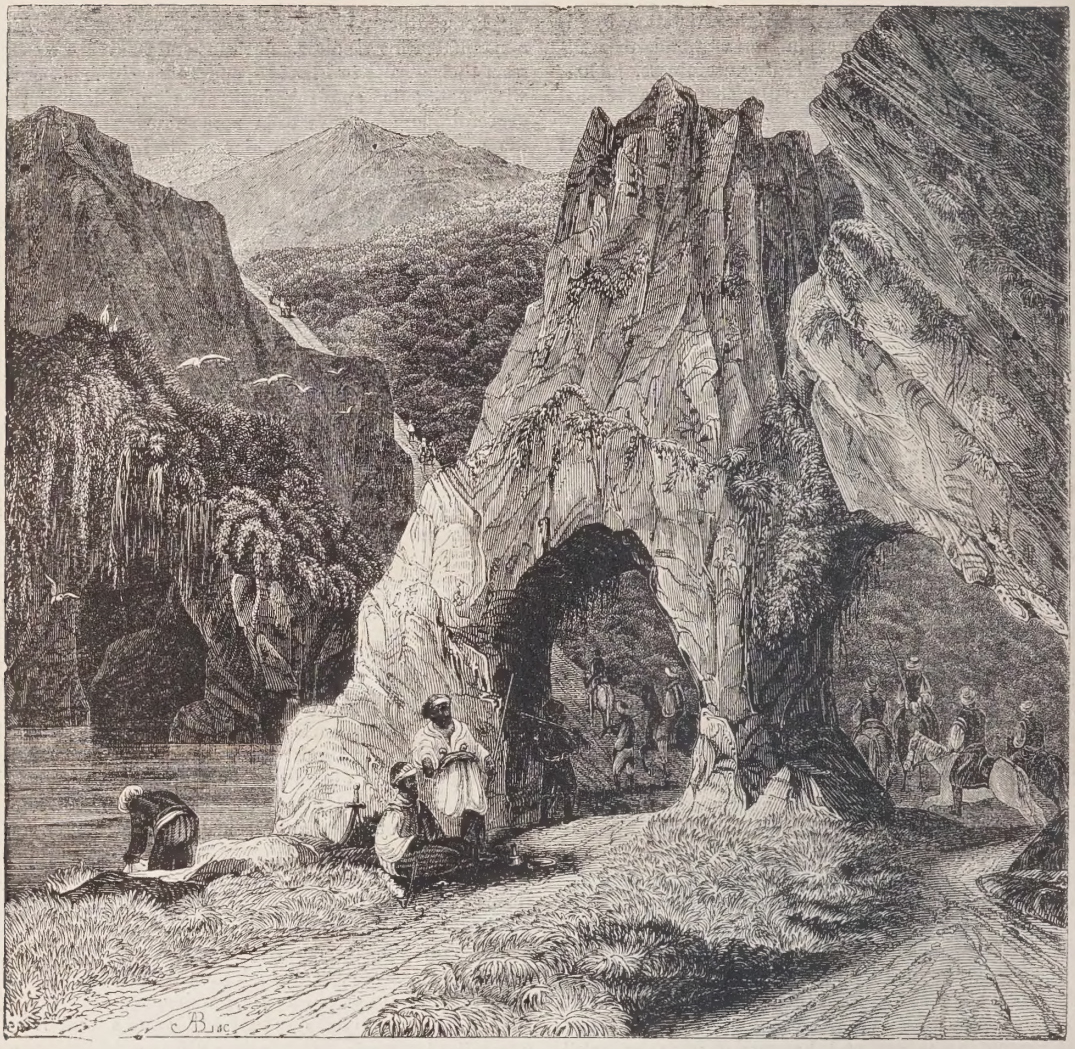
It was in the ninth century, however, that the Turks made themselves known to Europe in all their might and ferocity, under the name of *Ungars* or *Hungarians*. They crossed the frontiers of the Roman empire in the year 889, in huge squadrons of cavalry, and took possession of the province of Pannonia; swept over Bavaria, Swabia, and Franconia, with such speed, that in one day they laid waste a tract of country fifty miles in circuit. In the year 900 they had penetrated as far as the Pyrenees, and in 924 they crossed the Alps, and desolated Italy; and it was not till the year 935 that they were defeated and repelled by the skill and valour of Henry the Fowler and Otho the Great, two Saxon princes, and settled down peaceably in modern Hungary.

The tribe were now scattered loosely over the desert from China to the Oxus and the Danube; one branch of it had founded a republic in Europe, and men of Turkish extraction were the guards and ministers of most of the Asiatic thrones. It was in the year 997 in which Mahmud the Gaznezide, the son of a Turkish emir, seized the throne of the Persian caliphs and assumed the title of *sultan*. He was famed as a warrior, and made twelve expeditions into Hindostan; but he was still unable to contend against the barbarous hordes of his own countrymen, who hovered on the confines of his empire. During his lifetime, however, he managed to keep them in subjection and in peace; but during the reign of his son and successor, Massoud, in the year 1038, they burst upon Persia like an avalanche, and at the great battle of Zendeccan the sultan was defeated, and lost both his kingdom and his life.

The Turks now proceeded to the election of a king; and the choice fell upon Togrul Bey, the grandson of Seljuk, from whom the dynasty received the appellation of Seljukian. Under him, Persia reached the highest pitch of power and importance; he delivered the caliph of Bagdad from the assaults of a rival, and finally succeeded to his throne; and, for the first time, made the arms of the Turks feared at Constantinople.

Under his successor, the famous and terrible Alp Arslan, the prestige of Turkish valour and ferocity was fully upheld. He conquered Georgia and Armenia, and passing across the

* There was a tradition amongst them that the founder of their tribe was, like Romulus, suckled by a she-wolf, and they preserved the figure of that animal on their banners.



PASS IN THE BALKAN FRONTIER, BETWEEN TURKEY AND RUSSIA.

THE SEA OF MARMORA.

CONSTANTINOPLE.

THE CASTLE OF SYLIVRIA, ON THE SEA OF MARMORA.

frontier of the Greek empire, laid waste Phrygia. Diogenes Romanus, the emperor, marched against him with a strong force, and at first met with some slight successes; but at last, owing to the treachery of a subordinate prince, his army was thrown into confusion in the presence of the enemy, and the Turkish cavalry overwhelmed him in a vast cloud. The slaughter was immense, the booty rich, and Romanus himself was taken prisoner, and only liberated upon payment of a large ransom.

Under the successors of Alp Arslan, the Turkish dominions were still further extended, and those of the Greeks still further circumscribed. Palestine was conquered, and a new Mussulman kingdom, that of Roum, was founded, of which Jerusalem was the capital; and nothing interposed between the arms of the conqueror and the capital of the Cæsars but the narrow straits of the Bosphorus. The persecutions suffered by the Christian pilgrims who thronged from all parts of Europe, to pay their devotions at the sepulchre of Christ, became every day greater; and it was a terrible humiliation for the Roman emperor to know, that the barbarian Latins alone had the power as well as the will to aid them. We shall not enter into the details of the various conflicts which took place in the first and subsequent crusades between the Saracens and the Latins, but shall hurry on to the year 1240, when the Ottomans or Othmans, the ancestors of the present possessors of Constantinople, first appear upon the scene.

Gellaleddin, one of the bravest of the sultans of Persia, after a long and brave defence of his dominions against the Moguls, another Tartar horde, was at last defeated, and perished ignobly in the mountains of Kurdistan. His army was broken up by his death; and, while the bolder and more powerful of the Turkman hordes of which it was composed invaded Syria and violated the Holy Sepulchre at Jerusalem, the more humble entered the service of Aladin, the sultan of Iconium. Amongst the latter were the ancestors of the Ottomans. When they joined Aladin, their shah Orthogrul reigned over four hundred families, who dwelt in a camp on the banks of the Sangar, and whom he governed, in peace and war, for fifty-two years. He had a son named Thaman, or Athman, or Othman, a softened form, which it afterwards assumed, who, finding himself gradually emancipated from all control by the downfall of the Seljukian dynasty, and the distance of the Mogul khans, began to assume the bearing and authority of a sovereign prince. In sober reality, he was nothing better than what we, at the present day, should call the chief of a band of marauders; but at that time, and in that region, there was no idea of ignominy or baseness attached to the occupation he followed. He found himself close to the frontier of the Greek empire, and he was thus enabled to gratify his passion for plunder, under the pretext of religious duty; for the Koran not only sanctioned, but encouraged the carrying on of war against the infidels. The passes of Mount Olympus were no longer ably defended as of yore; he easily descended into the plain of Bithynia, and instead of retreating, according to the custom of his tribe, after a successful foray, he retained and fortified all the towns and castles that he captured, and began insensibly to adopt the customs, and indulge in the luxuries of civilization. In the reign of his son Orchan, a body of trained infantry was, for the first time, introduced into the Turkish army, as well as a train of battering engines, and by their aid Nice and Nicomedia were captured. In the year 1300, the whole of the Asiatic provinces of the Greek empire were lost, and the seven churches of the apostle John soon made way for the mosques of Mahomet.

In 1341, the Greek emperor Cantecuzene was foolish or unfortunate enough to call in the aid of the Ottomans against his rivals and adversaries. They crossed the strait, rendered him the assistance he sought; and their friendship was cemented by the marriage of the Greek princess Theodora with the son of Orchan. This time the Ottomans evacuated Europe, but in 1353, they were again invited by Cantecuzene to aid him against his enemies in Romania; and Solyman, his son-in-law, crossed the Hellespont with ten thousand horse, who never went back. The Chersonesus was insensibly filled by a Turkish colony; an earthquake dismantled the walls of many of the towns and fortresses in the provinces—the Turks entered in and took possession, and never gave them up. When Amurath, the brother of Solyman, ascended the throne in 1360, he reigned over the whole province of Romania, from the Hellespont to Mount Hæmus, and the verge of the Greek capital; and he chose Adrianople as the seat of his government. He marched against the Bulgarians, Servians, Bosnians, and Albanians, and repeatedly defeated them, while the Greek emperor, John Palæologus, and his four sons, humbly followed the march of the conqueror, and awaited his pleasure. The fate of Constantinople, the last relic of so much greatness, of so much strength, of so much glory and civilization, was at length to be decided. Her hour was come, and now, for the first time in a thousand years, she found herself in the midst of her enemies with none to help or deliver her.

Amurath turned his victories over the Sclavonian nations to excellent account. A fifth of the hardiest and most robust of the youth of the Danubian provinces were selected for the sultan's use. They were educated in the religion and arms of the Turkish empire; they were then blessed by Hagi Boktesh, a celebrated dervish, who, placing the sleeve of his gown on the head of one of them, exclaimed, "Let them be called janizaries (*yengi cheri*—new or young soldiers); let their countenance ever be bright, their hands victorious, their swords keen; let their spears always hang over the heads of their enemies, and wherever they go, may they return with a white face!" *

The plan was found to succeed so admirably, that afterwards every fifth child, or the children of every fifth year, were selected from amongst the Christian population of the empire in the same manner, and instructed from the age of fourteen in seminaries appointed for the purpose, where they were taught to shoot with the bow, to wrestle, and speak Turkish. Some of them were employed as the household attendants of the sultan, or in the dockyards and arsenals; but the greater number were draughted into the army, and formed the first body of infantry which had appeared in Europe after the fall of the Roman empire. Here was the great secret of their success. All the western powers at that day believed that their main strength lay in their cavalry; no gentlemen would deign to fight on foot; and when foot soldiers were employed they were recruited from amongst the peasantry, and acted not as a united body, but as a sort of attendants upon the knights. As long as the Christians were ignorant of the vast power of a disciplined force of infantry, the Ottomans conquered; but as soon as their attention was turned to the improvement of this arm, and skill in its use became an essential qualification for a general, the balance was once more restored, and the Turks began to decline. Every possible effort was made to promote the *esprit de corps* amongst the janizaries, so as to keep up a feeling of unity amongst them when scattered in the various towns and provinces of the empire. They thus became the strongest bulwark of the Ottoman power in the earlier days of its establishment in Europe, though we shall see hereafter how greatly they contributed to its present decline.

The other exploits of Amurath and his successor Bajazet are numerous and weighty. The latter defeated hosts of Christian crusaders, spread terror through Europe, and threatened to feed his horse with a bushel of oats upon the altar of St. Peter's at Rome; and at last was himself conquered, and captured at the great battle of Angora, the greatest and most sanguinary that has ever occurred in the history of the world, by Timour, the Tartar khan. Amurath the Second besieged Constantinople in 1422, with an army of 200,000 men; but the strength of the walls, and the valour of the mercenaries whom the Greeks employed to defend them—for they were now too feeble or too effeminate to defend themselves—proved sufficient to repel his attacks, and the Greek empire—if that term may be applied to the city itself, for that

* *White* and *black face* are terms of praise and reproach among the Turks.

was all that now remained—received a respite of thirty years longer.

It is melancholy to read, even at this distance of time, of the dismay which reigned at that period at Constantinople. Many are the romances that have been written and the homilies that have been uttered upon fallen greatness, but no better instance of the vanity of earthly power could ever be cited "to point a moral and adorn a tale," than the fate of this unhappy city. The two emperors, John and Emanuel Palæologus, who occupied the throne during this period, were in the last extremity of despair. To save their capital they were prepared to sacrifice everything, even their religion, which a thousand years of strife and contention with the Latins had made it a point of honour with every true Greek to uphold. If the Pope procured him fifteen galleys, 500 men-at-arms, and 1,000 archers, he was ready to heal the schism and become his obedient son, abandon all points in dispute between the two churches, and prevail upon his clergy and people to submit themselves to the spiritual sway of the successor of St. Peter. He went as a miserable suppliant to Rome—the first Greek emperor who had ever done so—and there, such was his terror of the ferocious Turk, that in the presence of four cardinals he acknowledged as a true Catholic the supremacy of the Pope and the double procession of the Holy Ghost. He then kissed the Pope's feet, and hands, and mouth, publicly at St. Peter's, and was in return allowed to lead his Holiness' mule. Alas, poor Greece! Eight centuries previously, bishops were ready to cut their rivals' throats, and shed blood upon the altar itself, sooner than make either of these concessions; but to do the Greek clergy and people justice, whatever the emperor might say, they were as obstinate schismatics as ever, and hated the Latin Christians as cordially as the followers of the false prophet. John's conversion, however, did not avail him. The western powers could not be induced to do anything for him, and after a wearisome delay he returned empty-handed to Constantinople, after being arrested for debt at Venice on his way.

His son and successor, Manuel, made a similar excursion for the same purpose, and with no better success. He was received with all due respect in Rome. He passed on to France, and was there welcomed by Charles VI. and his nobles with magnificent politeness. He was lodged in the Louvre, and a succession of balls and fêtes were got up in the vain attempt to drive away his cares; but his demands for assistance were met with expressions of cold regret that it was impossible to comply with them, or vague promises more painful and more injurious than flat refusals. He crossed over to England, was met by Henry IV. at Blackheath, and during a stay of some days in London, was treated with all the respect and attention due to the representative of the declining dignity of imperial Rome. But the quarrels of the Roses gave the English no time for another crusade. Manuel returned to his capital, after an absence of two years, poorer and more downcast than when he left it.

On the 1st of November, 1448, the last of the Cæsars ascended the imperial throne in the person of Constantine Palæologus. The sultan of the Ottomans, reigning at this time at Adrianople, was Mahomet the Second, a man of great valour, unscrupulous ambition, great learning, but of ferocious temper. He declared his intention of building a fortress upon the European side of the Bosphorus, close to the walls of Constantinople. The emperor feebly remonstrated. Mahomet set him at defiance, and declared that he would order the next envoy who came with such a message to be flayed alive. The castle was accordingly built, and the marble of Christian churches was employed in its construction; the horses of the janizaries, who guarded the workmen, strayed into the neighbouring cornfields—the owners drove them out—frays issued in which many of the Greeks were massacred; the city gates were closed in alarm; Mahomet overjoyed went home to prepare for war. Constantine in despair declared that since the Turks were bent on his destruction, he would put his trust in the Lord of Hosts and die sword in hand at the head of his people.

The winter of 1452-3 was spent in preparations on both sides: Mahomet levying vast armaments and casting guns—for gunpowder had just been invented—of monstrous size; Constantine in strengthening the fortifications, saying his prayers and soliciting aid from abroad. But the west looked coldly on, and on the 6th of April, 1453, the crescent standard was planted before the gate of St. Romanus, and the famous siege of Constantinople commenced.

Some of the populace had previously withdrawn, and many of the degenerate nobility had accompanied them in their flight. Others kept masses of treasure in concealment which, if patriotically devoted to the state, might have employed whole armies of mercenaries in its defence. The Turks numbered 300,000 men; but although Constantinople contained 100,000 inhabitants, most of them were priests, or women, or men so devoid of spirit that they had lost even the first and noblest instinct of our nature, that which prompts a man to fight in self-defence, and in defence of his family and his liberty. A diligent inquiry was made at each house how many of the inmates were able and willing to bear arms in the coming struggle, but the minister to whom the duty was entrusted bore to his master the terrible news that of all this vast multitude there were but 4,970 *Romans* to man the walls. The old Romans, after losing 60,000 men in eighteen months, out of a population of fighting men of 270,000, and suffering three defeats from the armies of Hannibal, in which their best and bravest lost their lives, met not in fear or lamentation in the forum, but in fury, and the remnant marched forth to fight again, unconquered and unconquerable. At Marathon 10,000 Greeks charged a countless host of Persians on an open sandy plain, in a running step, and drove them on board their ships in confusion. How true it is that freedom is its own best defender, and that slavery is the grave of valour, of honour, and of manly sentiment!

Constantine had sought, by conforming to the Roman faith, and suffering service to be celebrated in the church of Sophia, with the Latin ritual, to secure the aid of the Christians of the west; but the unfortunate man by this step only drew on himself the rage of his own subjects, and the degenerate slaves who trembled at the sound of the Turkish cannon were ready to massacre the Roman Catholic priests because they consecrated a wafer of *unleavened* bread, and poured cold water into the sacramental cup. They yelled in the streets, what need had they of Latin aid, and in drunken zeal declared that with the Virgin's aid they could themselves deliver their city from her assailants.

To his five thousand volunteers Constantine was enabled to add two thousand foreigners under the command of John Justiniani, a noble Genoese, and these were all he had to defend a city sixteen miles in circumference, but they animated by the greatest enthusiasm, and he himself was in every way worthy of the name he bore.

The Greeks at first sallied from the gates and engaged in desultory conflicts outside the walls, but they soon found that losses which were nothing to the Turks were disastrous to them in the highest degree, and they henceforth confined themselves to the defence of the ramparts. Their artillery was scanty, but it was well served, though small in calibre. They had a few great guns, but feared to fire them, lest the explosion should overthrow the old walls. Mahomet's great guns, in the meantime, thundered against the fortifications, and at last made some impression. The Turks advanced to fill up the ditch with fascines and rubbish; but all that they threw down in the day the Greeks removed at night. Mahomet mined; they countermined. He erected huge towers on a level with the walls, and by the aid of battering-rams, overturned the turret of St. Romanus; they overturned his towers and built up that of St. Romanus in one night. When he saw it in the morning he swore that had thirty-seven thousand prophets told him, he would not have believed that infidels could perform such a feat in so short a time. He poured liquid fire upon the Greeks; they poured liquid fire on him. He planted scaling-ladders, and the janizaries mounted them in a furious throng; the Greeks hurled them down as fast as they mounted, in one mangled and gory mass,

Towards the end of April fire-ships arrive from Genoa laden with supplies for the weary garrison. They enter the Bosphorus, and are already in sight of the city, when the sultan sends a fleet of three hundred vessels against them. They engage; the unwieldy and badly managed barks of the Turks are overwhelmed by the skill of the Christian sailors. The slaughter is frightful. Mahomet sits on horseback on the beach came on shore he was stretched on his face and received one hundred strokes with a golden rod under the kindling eye of his master, but the city is supplied with provisions and ammunition, and the Greeks are jubilant.

It was now evident that the Turks must abandon the siege if the city could not be attacked from the sea as well as from the land. Their fleet lay far down in the straits, and the

BULGARIANS, INHABITANTS OF TURKEY IN EUROPE.

surrounded by his officers, and swears and yells with fury as he sees his followers giving way. They take heart again, they scramble up the sides of the Genoese vessels, Mahomet spurs his horse into the water in impotent rage and threatens them with vengeance in case of another failure. They are swept down by the artillery and burnt with liquid fire, and twelve thousand Turkish bodies floating in the Bosphorus attest the fury of the combat. When the Moslem commander Genoese vessels, moored in a firm line, lay between them and Constantinople. Mahomet constructed a wooden way ten miles in length, dragged his ships along it in one night, and launched them on the side next the Black Sea. They were chained together, a battery constructed upon them, and several breaches were speedily made in the walls. The garrison was thinned; four towers were levelled with the ground; the Greeks began to despair.

OSTEND.

In the ninth century Ostend, a name which signifies the eastern extremity, was a village of but small importance; yet before the eleventh century had closed, its renown as a port and city was widely extended. In 1445, Philip the Good found it necessary to enlarge its boundaries, and erect a high wall, a magic circle of stony strength, and not long afterwards we find Ostend a regularly fortified city. These fortifications were completed by the Prince of Orange (1583), who had placed himself at the head of the Dutch revolt. The siege which Ostend sustained for three years against the Archduke Albert, from 1601 to 1604, is one of the most remarkable events of modern history. Seventy-two thousand of the besieged perished, and a far more considerable number of the Spaniards were destroyed. At the siege there are said to have been 300,000 pieces of cannon, which were for the most part manufactured in London. At the time of the capitulation Ostend was literally nothing more than a mass of ruins; and in this condition it was surrendered to General Ambrose Spinola on the 14th of September, 1604. The city was entirely rebuilt in 1706, and ceded in 1715 to the Emperor of Germany, Charles VI., who by the establishment of an Indian Company brought about the true era of its prosperity. Unhappily that period did not last long: for in 1734 the Indian Company was suppressed, and ten years afterwards, by a siege of eighteen days, Louis XV. destroyed the new fortifications and captured the city. It was re-taken by the French in 1794.

Situated at the extremity of a plain, Ostend is mainly defended by its modern fortifications, and is entered by four gates. The population is nearly 11,500. The Hotel de Ville, flanked by two towers and surmounted by a cupola, was rebuilt in 1711, it having been destroyed by the siege of 1706.

The only part of Ostend which presents a modern aspect has been built upon a somewhat singular plan; it is called the New City. This is the work of the Emperor Joseph II., who exerted himself to establish and extend the maritime interests of the place.

The ramparts which overlook the sea form an agreeable promenade, at the foot of which a column has been erected which serves at night as a lighthouse for vessels approaching the harbour. During the day the naval signals are conducte from a pavilion which floats to the same height as the column when the water is at its greatest elevation, and sinks as the tide retreats.

VIEW OF OSTEND.

The port has two basins, very large and very carefully constructed, formed with stones and timber; two jetties of timber divide them from each other, and the width of the opening is about five hundred feet. The port affords safe and convenient harbourage to the largest vessels, but the entrance is not always easy, and shipwrecks in its neighbourhood are of no uncommon occurrence.

The port is used by vessels of all countries and of every description, from the small sloop to the citadels of the ocean. More than a thousand are annually entered. The sea bathing is justly celebrated, and attracts a great number of visitors.

HAWKS AND HAWKING.

> But what a point, my lord, your falcon made,
> And what a pitch she flew above the rest!
> To see how God in all his creatures works!
> Yea, man and birds are fain of climbing high.
>
> *Henry VI., part* 2.

Hawking is the art of taking wild animals, chiefly birds, by means of hawks. This sport, though of great antiquity, seems chiefly to have been practised in the two countries of Thrace and Britain. In the former it was pursued merely as the diversion of a particular district; for Aristotle tells us, that "there was a district in Thrace, in which the boys used to assemble at a certain time of the year, for the sake of bird-catching; that this spot was much frequented by hawks, which were wont to appear on hearing themselves called, and would drive the little birds into the bushes, where they were caught by children; and that the hawks would even sometimes take the birds and fling them to these young fowlers, who, after finishing their diversion, bestowed on their assistants part of the prey." But the aborigines of Britain, as well as the Saxons, had a great fondness for hawking, and every chief amongst them maintained a considerable number of birds for that sport.

To the Romans it was scarcely known in the days of Vespasian, but was introduced soon after from Britain; and Martial has the following epigram on the fate of a hawk:—

> "Prædo fuit volucrum, famulus mene ancupis, idem
> Decipit, et captas non sibi, mœrit, aves."

Among this people, the hawk was called *accipiter*, and it was considered a bird of ill omen from being carnivorous; but Pliny says that sometimes, particularly in marriage, it was esteemed of good omen, because it never eats the hearts of other birds; intimating thereby that no differences in the marriage state ought to affect the heart. The accipiter was worshipped as a divinity at Tentyra, an island on the Nile, being considered by the inhabitants as an image of the sun; and hence we find the sun represented under the figure of a hawk in hieroglyphics. It became a favourite exercise of the Roman Britons in the sixth century, and in later times was the principal amusement of the English. Under the Welsh laws of Hoel Dha, "the falconer has a privilege, the day the hawk shall bill a bittern, or a heron, or a curlew. Three services shall the king perform for the falconer on such a day: hold his stirrup while he dismounts; hold the horse while he goes after the birds; and hold his stirrup while he mounts again. Three times shall the king that night compliment him at table." In the beginning of the seventh century, two falcons and a hawk were sent by the Archbishop of Mons, an Englishman by birth, to Ethelbert, king of Kent, the birds then reared in England not being in such high repute; and a king of Mercia requested the same dignitary of the church to send him two falcons which had been trained to attack cranes, as those he had were not sufficiently strong and skilful. At a later period, hawking became so common that laws were made for the purpose of restraining some of the abuses to which it gave rise. Monks were fordidden to keep hawks and falcons; and, in 821, persons carrying hawks were forbidden by the then king of the Mercians from trespassing upon the lands belonging to the monks of Abingdon. Alfred the Great wrote a book on the management of hawks, and, according to Asser, he himself instructed his falconers, hawkers, and hound-trainers. Edward the Confessor's fondness for hawking seems to have been excessive, for in the words of an old manuscript, "Every day after divine service he took to this beloved sport;" while the cause of Harold's unfortunate voyage to Normandy is by some writers attributed to the straying of a favourite falcon, which he was anxious to recover. In the Bayeux tapestry, said to have been worked by Matilda, wife to William the Conqueror, and her ladies, he is represented as embarking with a bird on his hand and a dog under his arm; and in an old picture representing the marriage of Henry VI., a nobleman is represented much in the same manner. After the conquest, the common people seem to have been prohibited from keeping these birds, hunting with them being considered an amusement worthy only of kings and nobles; and thus these birds became as much the token of high birth, as the spurs of knighthood or the blazon of a shield. Nobles carried their favourite falcons with them on journeys, and sometimes even into battle, and would not part with them even to procure their own liberty, if taken prisoners; for to resign his hawk was considered one of the most disgraceful actions of which a nobleman could be guilty, and as a voluntary resignation of his nobility.

Magna Charta, however, gave liberty to every freeman to have in his woods eyries of hawks, sparr-hawks, falcons, eagles, and herons. Large numbers of hawks were generally kept at the monasteries; and Walter, Bishop of Rochester, was so fond of this sport, that when he was eighty years of age, it was (with hunting) the sole employment of his life, to the total neglect of the duties of his office. English ladies also applied themselves so much to the art, that they are said to have excelled the men in their dexterity,—"a proof," says John of Salisbury, "that it is an effeminate amusement."

We find that Jeoffrey Fitzpierre gave two good Norway hawks to king John, to obtain for his friend the liberty of exporting one hundredweight of cheese; and Nicholas the Dane stipulated "to give the king a hawk every time he came into England, that he might have liberty to traffic throughout the king's dominions." Great, indeed, must have been their value, to have been considered as bribes not unworthy of a king. Vast, too, was the expense which sometimes attended this sport. In the reign of James the First, Sir Thomas Monson is said to have given £1,000 for a cast of hawks. We need not wonder, then, at the rigour of the laws tending to preserve an amusement which was carried to such a pitch of extravagance.

In the 34th Edward III., it was made felony to steal a hawk; and to take its eggs, even in the person's own ground, was punishable with imprisonment for a year and a day, besides a fine at the king's pleasure. In queen Elizabeth's reign the imprisonment was reduced to three months, but the offender was to find security for his good behaviour for seven years, or lie in prison till he did so.

Hawks were also made the tenure by which some of the nobility held their estates from the crown. Thus, Sir John Stanley had a grant of the Isle of Man from Henry IV., to be held of the king, his heirs, and successors, by homage and the service of two falcons, payable on the day of his or her coronation; and Philip de Hastang held his manor of Comlertoun, in Cambridgeshire, by the service of keeping the king's falcons. The duke of St. Albans is still hereditary grand falconer of England, an office bestowed on his ancestor, the son of Charles II. and Nell Gwyn.

According to Olearius, who wrote in the seventeenth century, the diversion of hawking was then more followed by the Tartars and Persians than it has ever been in any part of Europe.

Sir John Malcolm, in his sketches of Persia, alludes to the chase of the *ahubura*, or Persian bustard, with hawks. He says that the instant that the *byri*, a kind of hawk, said by Vigne to be the peregrine falcon, is flown, the ahubura runs to meet it with outstretched wings. A fierce contest then ensues on the ground, which generally ends in the ahubura taking wing. A goshawk is then flown, when the ahubura takes again to the ground. The first byri is now no longer of any use, and a second is flown; the contest ends in the ahubura again taking wing, when it is pounced upon by the goshawk, which had all the time remained hovering over the combatants.

Vigne, in his "Travels in Kashmir," &c., gives a nearly similar account.

Near the junction of the rivers Chunab and Dodah, in Kashmir, is a village famous for the capture of hawks. They are taken in nets set open like a school-boy's sparrow-trap containing a live pigeon as a bait. The peregrine, the goshawk, or the sparrow-hawk, which are commonly used in the East, might all be taken in this way. Chumla is the only

place in India where Vigne saw the *chark falcon* in training. He believes this bird to be the true lanner of naturalists.

The following account of falconry in Assyria, from the pen of the great traveller Mr. Layard, is so interesting, that we insert it at length :—

FALCONRY IN ASSYRIA.

"The hawk most valued by eastern sportsmen is the shaheen, a variety of the northern peregrine falcon, and esteemed the most noble of the race. Although the smallest in size, it is celebrated for its courage and daring, and is constantly the theme of Persian verse. There are several kinds of shaheen, each distinguished by its size and plumage; those from the Gebel Shammar, in Nedjid, are the most prized, but being only brought by occasional pilgrims from Mecca, are very rare. The next best are said to come from Tokat, in Asia Minor. The shaheen should be caught and trained when young. It strikes its quarry in the air, and may be taught to attack even the largest eagle, which it will boldly seize, and checking its flight, fall with it to the ground. The sportsman should, however, be at hand to release the falcon immediately, or it will soon fall a victim to its temerity. It is usually flown at the crane, the middle bustard (houbara), geese, and francolins. There is a variety called the bahree, found on the borders of the Persian Gulf, which can be taught to catch geese, ducks, and all manner of water fowl; but it is difficult to keep and train. The next in value is the balaban, which can be trained to strike its quarry either in the air or on the ground. It is found in the neighbourhood of Baghdad, and in other parts of Mesopotamia; is caught and trained when full grown, and is flown at gazelles, hares, cranes, bustards, partridges, and francolins. The baz and shah baz (? astur palumbarius, the gos-hawk, and the falco lanarius) is remarkable for the beauty of its speckled plumage and for its size. It strikes in the air and on the ground, and, if well trained, may take cranes and other large game. The balaban and baz, when used by the Persians for hunting hares, are sometimes dressed in a kind of leather breeches; otherwise, as they seize their prey with one talon, and a shrub or some other object with the other, they might have their limbs torn asunder. The chark (? falco cervialis), the usual falcon of the Bedouins, always strikes its quarry on the ground, except the eagle, which it may be trained to fly at in the air. It is chiefly used for gazelles and bustards, but will also take hares and other game. The bird usually hawked by the Arabs is the middle-sized bustard, or houbara. It is almost always captured on the ground, and defends itself vigorously with wings and beak against its assailant, which is often disabled in the encounter. The falcon is generally trained to this quarry with a fowl. The method pursued is very simple. It is first taught to take its raw meat from a man, or from the ground, the distance being daily increased by the falconer. When the habit is acquired, the flesh is tied to the back of a fowl; the falcon will at once seize its usual food, and receives also the liver of the fowl, which is immediately killed. A bustard is then, if possible, captured alive, and used in the same way. In a few days the training is complete, and the hawk may be flown at any large bird on the ground. The falconry, however, in which Easterns take most delight, is that of the gazelle. For this very noble and exciting sport, the falcon and greyhound must be trained to hunt together by a process unfortunately somewhat cruel. In the first place, the bird is taught to eat its daily ration of raw meat fastened on the stuffed head of a gazelle. The next step is to accustom it to look for its food between the horns of a tame gazelle. The distance between the animal and the falconer is daily increased, until the hawk will seek its meat when about half a mile off. A greyhound is now loosed upon the gazelle, the falcon being flown at the same time. When the animal is seized, which of course soon takes place, its throat is cut, and the hawk is fed with a part of its flesh. After thus sacrificing three gazelles, the education of the falcon and greyhound is declared to be complete. The chief art in the training is to teach the two to signal out the same gazelle, and the dog not to injure the falcon when struggling on the ground with the quarry. The greyhound, however, soon learns to watch the movements of its companion, without whose assistance it could not capture its prey. The falcon, when loosed from its tresses, flies steadily and near the ground towards the retreating gazelles, and marking one, soon separates it from the herd. It then darts at the head of the affrighted animal, throws it to the ground, or only checks it in its rapid course. The greyhound rarely comes up before the blow has been more than once repeated. The falconer then hastens to secure the quarry. Should the dog not succeed in capturing the gazelle after it has been struck for the third or fourth time, the hawk will generally sulk and refuse to hunt any longer. I once saw a very powerful falcon, belonging to Abde Pasha, hold a gazelle until the horsemen succeeded in spearing the animal. The fleetness of the gazelle is so great, that, without the aid of the hawk, very few dogs can overtake it, unless the ground be heavy after rain. The pursuit of the gazelle with the falcon and hound over the boundless plains of Assyria and Babylonia is one of the most exhilarating and graceful of sports, displaying equally the noble qualities of the horse, the dog, and the bird. The time of day best suited for hawking is very early in the morning, before the eagles and kites are soaring in the sky. The falcon should not be fed for several hours before it is taken to the chase. When not hunting, the Arabs give it meat only once a day. Some hawks require to be hooded, such as the chark and the shaheen; others need no covering for the eyes. The hood is generally made of coloured leather, with eyes worked on it in beads, and gold and variegated threads. Tassels and ornaments of various kinds are added, and the great chiefs frequently adorn a favourite bird with pearls and precious stones. To the legs are sometimes fastened small bells. Few hawks will return to the falconer without the lure, which consists of the wing of a bustard or fowl, or of a piece of meat attached to a string and swung round in the air. The Eastern huntsman has a different call for each variety of falcon. A good chark will sometimes take as many as eight or ten bustards, or five or six gazelles in the course of a morning."

Hawks were divided into two kinds—the long-winged and the short-winged. Of the long-winged, the first in value, as in size, came the gyr or jer-falcon (falco islandicus), which, in spite of its alleged want of teeth, is one of the boldest and most powerful of its class, and therefore was used to fly at wild fowl of the largest size, as cranes, storks, herons, and geese. Among falconers, the female only was named the *gyr-falcon*, the male being called the *jerkin*. This fine species seems now confined almost entirely to the most northerly parts of Europe and America. It was often seen by Dr. Richardson during his journeys over the "barren grounds" of North America, where it preys principally on ptarmigan; and the latter birds endeavour to avoid him by diving instantly into the loose snow for a considerable distance. Two of these falcons attacked Dr. Richardson as he was climbing up a lofty precipice in the neighbourhood of their nest.

Next in esteem came the peregrine falcon (*F. peregrinus*), the female of which only was called the falcon, and, on account of her greater size, usually flown at herons and ducks. The male, being smaller, was more frequently flown at partridges, and sometimes at magpies, and was called tiercel, tiercelet, and tassel-gentle. The red falcon and red tiercel were only the young of this species. The true lanner and lanneret (*F. lanarius*) are only found in the south. Louis XIV. had lanners sent him annually from Malta. This bird exceeds the peregrine in size, and was much esteemed for flying at the kite, with which the latter could scarcely contend.

Wonderful stories are told of the swiftness of flight of the falcon; and it is well known that a falcon belonging to Henry II. of France, made its escape from Fontainbleau, and was retaken the next day in the island of Malta, where it was recognised by the rings on its legs. Had it continued on the wing the whole time, it must have flown at the rate of fifty-seven miles an hour; but such birds are said never to fly by night, and the velocity must therefore have been equal to at least seventy-five miles an hour. Another falcon, having

been sent from the Canaries to the Duke of Lermos, then in Andalusia, was found in Teneriffe sixteen hours after it had been seen in Spain.

The hobby (*F. subuteo*), called also the jack, was much esteemed for lark hunting.

The merlin (*F. asalon*) and jack merlin were used to take blackbirds and thrushes. The stone-falcon is only a variety of the merlin. Other species are the bockerel and the bockeret, the saker and sauret; the stelleto of Spain, the blood-red rook from Turkey, and the waskite from Virginia.

LADIES' DEPARTMENT.

NETTED WINDOW CURTAIN.

MATERIALS:—Netting Cotton, No. 24; Embroidering Goat's-head Cotton, No. 30; a middle-sized Netting Needle; Steel Mesh, No. 9; and a long Embroidering Needle.

If worked with the above cotton and mesh four squares will measure one inch, which will be a guide for the number of foundation stitches to make in the beginning for the curtain. The pattern must afterwards be darned in embroidering cotton No. 30, according to the engraving, by passing the needle under and over the threads of the meshes very regularly and even, always keeping the same number of threads in every square, and all must run the same way and be drawn to one degree of tightness, for all the beauty of the work depends upon its evenness and regularity. This pattern may be extended to any size, and would look very well if the flowers were sewn in pale pink ingrain cotton, and the fret-work in white cotton.

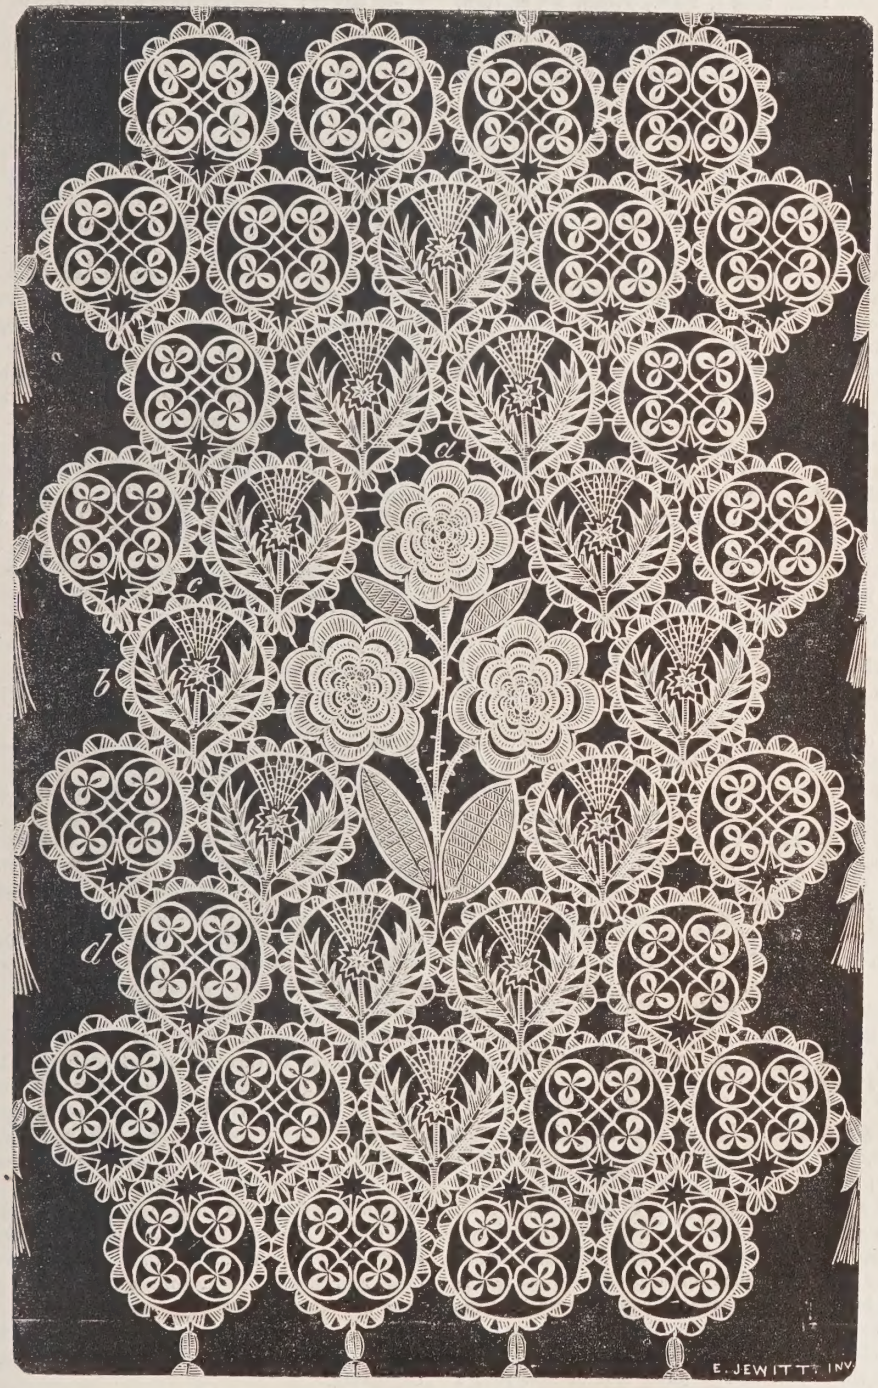
UNION ANTI-MACASSAR.

MATERIALS:—Exhibition Cotton, Nos. 10, 18, 22, 30; and Penelope Hook, Nos. 3, 4.

Commence working this anti-macassar with the centre group of roses and leaves, which is marked *a* for 1st leaf. · 18 chain, turn, and on the chain; miss 1, 1 d.c., 4 long, 4 d. long, 2 long, 1 d.c., 4 s.c. turn and on the other side of the chain, 4 s.c., 1 d.c., 2 long, 4 d. long, 4 long, 1 d.c. · fasten off. This finishes 1st leaf.

2nd leaf. Work another leaf from · to · then 1 s.c. in 1st stitch of stem of 1st leaf: 2 chain, 1 s.c. in next stitch join to stem of 2nd leaf: 8 chain; join to 3rd d. long in same leaf; 34 chain.

1st rose. ··· turn, miss 7 and 1 s.c. in 8th stitch, then in the same loop work 14 d.c.; · 1 d.c. on 1st d.c. 3 chain, miss 1, repeat · 6 times more. · 1 d.c. on d.c., 5 chain, repeat · 6 times more. · 1 d.c. on d.c., 7 chain, repeat · 6 times more. · 1 d.c. on d.c., 10 chain, repeat · 6 times more. In 1st ·· 10 chain, 1 d.c., 4 long, 8 d. long, 4 long, 1 d.c. repeat ·· in the same way in each 10 chain. In filling up the last 10 chain in 4 d. long:—Join to 1st leaf as in the engraving. Then in 1st ·· 7 chain, 1 d.c., 3 long, 7 d. long, 3 long, 1 d.c., repeat ·· in each 7 chain working in the same way. Then in 1st ·· 5 chain, 1 d.c., 2 long, 4 d. long, 2 long, 1 d.c., repeat ·· in each 5 chain work in the same manner. Then in 1st ·· 3 chain, 1



UNION ANTI-MACASSAR.

d.c., 3 long, 1 d.c., repeat ·· in each 3 chain all round. Along the stem from the rose work 6 d.c., 3 chain, 1 s.c. in last d.c., 3 d.c., 3 chain, 1 s.c. in last d.c.; 6 s.c. ··· 24 chain, work another rose from ··· to ··· joining to 2nd leaf; then work 10 s.c. up the 1st stem of 1st rose, 8 chain, join to the stem of 1st rose; 20 chain, join to the 2nd rose; 34 chain, work a 3rd rose from ··· in 1st rose to ··· After working the flowers, join the stem to the last petal, and down the stem 1 d.c., 5 long, 4 d.c.

1st bud. 4 chain, turn, miss 1, 2 d.c., 3 long, 2 d.c., turn, and on the other side of 14 chain: 2 d.c., 3 long, 2 d.c., fasten off. Then on the stem from the bud 8 s.c. cross, and on the other side work second bud, joining to the flowers as you work them. This finishes the centre group.

b, thistle. Commence working with cotton No. 22 and hook No. 3. Work 8 chain, turn, and down the chain work as follows: miss 1, 1 d.c., 2 long, · 4 chain, turn, and on the 4 chain; miss 1, 1 d.c., and 2 long. Repeat · 4 times more: 2 d.c. down the stem, ·· 4 chain, turn, and on the 4 chain, miss 1, 1 d.c., 2 long; then 1 d.c. in 4 chain, stitch of stem repeat ·· 4 times more. This finishes 1st leaf.

2nd leaf. Work 6 chain, turn, and on the chain miss 1, 1 d.c., 2 long; · 4 chain and on the chain miss 1, 1 d.c., 2 long, repeat · 4 times more. 2 d.c. down the stem, and then work from ·· in 1st leaf to ·· then 2 s.c. on the remaining 2 chain of 6 chain for stem of thistle. Make 12 chain, turn, miss 5, 1 s.c. in 6th which forms a round loop: then down the remaining 6 chain, work 1 s.c., and on the 4 chain between the two leaves work 4 s.c. across the stem; and work 10 s.c. which brings to the top of the round loop again. You then commence the thistle. And in the round loop 1 d.c., 2 chain, join to point of 1st leaf, 1 chain; 2 d.c. in round loop; 3 chain join to point of 2nd leaf; 2 chain; 2 d.c. in round loop; 4 chain join to point of 3rd leaf; 3 chain; 1 d.c. in round loop: 6 chain join to point of 4th leaf; 13 chain, turn, miss 9, 1 s.c. in 10th chain stitch: 12 d.c. down the chain, 1 d.c. in round loop; · 3 chain, miss 2, 1 s.c., in 3rd d.c. of last row; 3 chain, miss 2, 1 s.c. in 6th d.c. of last row: 4 chain, miss 3, 1 s.c. in 10th d.c. of last row; · 11 chain, miss 10 and 1 s.c. in 11th: then d.c. on the remaining chain stitched; 1 d.c. in round loop; repeat from · to · 11 chain, miss 10 and 1 s.c. in 11th; then work d.c. along the chains; and 1 d.c. in round loop. Repeat from · to · 9 chain, miss 8, 1 s.c. in 9th d.c. down the chains, 1 d.c. in round loop. Repeat from · to · 9 chain, miss 8, 1 s.c. in 9th; d.c. half down the chain: join to 4th point of 1st leaf d.c. down the remainder of chain; 1 d.c. in loop, 4 chain, join to point of 3rd leaf; 3 chain, 1 d.c. in loop: 3 chain join to point of 2nd leaf; 2 chain, 1 d.c. in loop, 2 chain join to point of 1st leaf; 1 chain, 1 d.c. in loop: fasten off.

c, or outer edge of thistle. With cotton No. 18 and hook No. 3. 1 s.c. in 1st s.c. of stem; 5 chain, 1 s.c. in point of 1st leaf; 4 chain, 1 d.c. in point of 2nd leaf: 4 chain, 1 d.c. in point of 3rd leaf: 4 chain, 1 d.c. in point of 4th leaf: 4 chain, 1 d.c. in point of 5th leaf: 4 chain, 1 d.c. in point of 6th leaf: 7 chain, 1 d.c. in centre of 7 chain; 2 chain, 1 d.c. in centre of 11 chain; 2 chain, 1 d.c. in centre of 9 chain; 2 chain, 1 d.c. in centre of 7 chain; 7 chain, 1 d.c. in point of 6th leaf; 4 chain, 1 d.c. in point of 5th leaf; 4 chain, 1 d.c. in point of 4th leaf: 4 chain, 1 d.c. in point of 3rd leaf: 4 chain, 1 d.c. in point of 2nd leaf; 4 chain, 1 d.c. in point of 1st leaf: 5 chain, 1 d.c. in 1st chain stitch of stem. Then round the chain work as follows: 3 chain, 1 long in next chain; 3 chain, 1 d.c. in next chain; then · 2 long, 3 chain, 1 long in same chain as last long, 1 long in next chain stitch, 1 d.c. in next repeat · 11 times more: 2 long, 2 chain join to 2nd outer leaf of first rose 1 chain, 1 long in same as last long, 1 long in next chain, 1 d.c. in next chain stitch. In the next two repeat from · to · join in the same manner to 1st leaf. Repeat from · to · 6 times more: 3 chain, 2 long, 3 chain, 1 d.c., and fasten off.

Make 11 more joining to centre *a* as in the engraving and exactly in the same manner.

d, shamrock. With the cotton No. 22, and hook No. 3. Make 10 chain, turn, ·· miss 5, 1 s.c. in 6th chain which forms a round loop, into which work 1 d.c. · 7 chain, 1 d.c. in round loop, repeat · twice more, 1 chain to cross; and in each 7 chain all work 9 d.c.: then down the stem 4 s.c., 7 chain, 1 d.c. in 5th d.c. of 3rd 9 d.c.: 7 chain 1 s.c. at the end of the stem ·· then work 39 d.c. all round the chain, which will bring you to where you started from.

2nd flower: 17 chain repeat from ·· to ·· in 1st flower, then round the chain 39 d.c.: 4 s.c. down the stem.

3rd flower: 13 chain repeat from ·· to ·· in 1st flower. Then round the chain 5 d.c. join to 5th d.c. of 39 d.c.: then 29 d.c. round the chain join to 2nd flower to the 5th d.c.; 5 d.c. and 3 s.c. down the stem.

4th flower: make another exactly like the 3rd flower, then 3 s.c. up the stem of first flower, and fasten off.

e, or outer edge of shamrock. With No. 18 cotton and hook No. 3. Make 11 chain and work 1 d.c. in 16th d.c. from where you joined the two leaves together of the shamrock: 20 chain, 1 d.c. in the 16th d.c. of 3rd flower from where you joined the two shamrocks together: 20 chain, 1 d.c. in 16th d.c. of 4th flower from where you joined the two shamrocks together: 10 chain join to 1st stitch of 11 chain. Then round the chain work 3 chain, 2 long, 3 chain: · 1 d.c., 2 long, 3 chain, 1 long in same as last long, 1 long in next chain repeat · 12 times more. Then 1 d.c., 2 long, 4 chain join to the 2nd stitch of 3 chain of 1st thistle edge the 5th point from where you joined it to the rose, turn, 3 s.c. down the chain, 1 chain, 1 long in same as last long, 1 long, 1 d.c., 2 long, 2 chain; join to next point of edge of thistle, 1 chain, 1 long in same as last long, 1 long, 1 d.c., 2 long, 3 chain, join to next point of edge of thistle, turn, 2 s.c. down the chain, 1 chain, 1 long in same as last long, 1 long. Repeat from · to · 4 times: 3 chain, 2 long, 3 chain, 1 d.c., this brings you to where you started from, draw the cotton between the edge and flowers: 10 chain join between 1st and 2nd flowers and down the chain 4 s.c.: 7 chain join to 8th chain from where you began to work the edge, turn, and on the chain 6 s.c. pass the cotton under the 10 chain and work 7 chain join to 8th chain of edge the other side to what you joined the last 7 chain, turn, and on the 7 chain, 7 s.c.: then work 5 s.c. down the remainder of 10 chain and fasten off.

Work 23 more shamrocks, with the outer edge joining each as you work them, in the same manner.

Tassel. With No. 10 cotton; and a card three inches wide. Wind the cotton over the card 30 times, draw the two ends to the top, then through the tassel, and tie firmly. Then about half an inch down, draw the cotton round the tassel and tie; draw the ends again to the top. Then take the tassel off the card, and cut it evenly, after which work the covering for the tassel.

With cotton No. 30, and hook 4. Make 10 chain, 1 s.c. on 1st chain stitch, and in round loop 16 d.c.: 1 d.c. on 1st d.c.: · 15 chain, turn, miss 3, 4 long, 4 d. long, 4 long, miss 2, 1 d.c. on 3rd, repeat · 5 times more. Joining each piece by 1 d.c. at the bottom. When you have finished the 6 pieces, you will have it round at the bottom; and from your last stitch ·· 15 chain, turn, and on the chain miss 1, 1 d.c., 4 long, 8 d. long, 2 long, join to the round; and on the other side of the chain, 2 long, 8 d. long, 4 long, 1 d.c.; this brings you to the end of the other side of the chain; work 1 s.c. in each stitch till you come to the top, when repeat ·· 3 times more, only remembering you join each as you work them half way up.

Then with the ends draw the cover over the tassel, and fasten to the outer edge of the shamrock, as seen in the engraving.

Make a tassel for each outside shamrock. This pattern may be increased to any size required by adding other medallions of either thistles or shamrocks; it has a very beautiful effect if the rose and all the borders are worked in white cotton, the shamrock in green, and the thistles and the upper part of the tassels in pink in ingrain cotton; the centres of the tassels should be white.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER VI., PART V.

Stamboyse looked up with an expression of less contempt: his interest was aroused. Agnes' words now flowed unimpeded; she had lost all self-consciousness and embarrassment. "I am Agnes Singleton, who have chosen as my future husband your nephew Leonard Mordant, the son of that unhappy and misguided man, Augustus Mordant, and of your most unhappy, most to be compassionated sister. I am acquainted with the whole misery of the marriage; of your hatred of Leonard's father—a just hatred; of your anger with Leonard; of your utter abandonment of him; of the disappointment you have had in him. Restrain your angry words, Mr. Stamboyse, what I have to speak now I *must* speak. Pardon me that I touch upon subjects so painful, so forbidden; but at times words must be merciless as the knife of the surgeon. I desire only truth to exist between you and me, between Leonard and you."

"You wish to make up matters. That sneaking young coward has sent you, as his miserable father of old sent my befooled sister, to whine and wring her hands and play off a woman's fooleries before me!" burst in Stamboyse with a force of anger and contempt which must have silenced any one less resolute than Agnes Singleton. But she, proudly approaching the irate man as he paced with angry steps the room, said with a voice of such convincing truth and noble pride, that it quelled even Stamboyse's anger,

"No; Leonard is utterly unconscious of my being here—he would be the very last person in this world to desire so mean, so base a thing. All blame be upon my head. It is because I have perceived in Leonard's soul a secret yearning after a reconciling word from you, as balm to heal the unhealed wound of that great misery, that bitter curse hanging upon him from the wretched marriage of his parents; it is for this that I am come. His is a gentle, noble, yet proud spirit, incapable of base meanness. It is because I recognise, on your side, Mr. Stamboyse, justice—to a certain point—because I regard moral principle as highly as you can do—because I regret, ay, a thousand times more deeply than you can do, the spectacle of glorious mental gifts being dragged down into the mire and trampled upon by coarse brutal feet, through lack of *honesty*—yes, because I consider moral principle of higher importance than intellect, yet worship intellect with the whole powers of my being—that I am come as a mediator between you and your nephew. Let not the additional curse of your displeasure cling to him and darken his life—"

Whilst Agnes still spoke, the old woman burst in wringing her hands and crying aloud, "A fire! a fire in Deich-strasse! the flames are curling up through the roofs at the back of the houses across the canal. You can see them. The engines are coming—don't you hear them? Lord of heaven, preserve us! The warehouses, *Herr Kaufmann*, the warehouses!" And whilst they listened the tolling of the alarm-bells was heard, the thundering along of fire-engines, the shrieks of people in the streets. Stamboyse and Agnes flew simultaneously to the window and flung open the casement. Thick volumes of smoke were hurried along by a brisk wind, sparks were falling in showers upon the barges moored in the canal beneath the windows, people were seen hurrying along or flinging furniture into the street from the windows. A sudden panic seized upon the city this bright holiday morning. The old woman had fallen upon her knees, praying. "We are safe, Martha," said Stamboyse; "don't be such an old fool! I must see, however, that the people are on duty." And he hurried off without apparently remembering the presence of Agnes, and leaving the old woman still sobbing and praying. Agnes gazed out of the window towards the burning houses; the flames flared and leaped up through the roofs, windows and chimneys, white and livid in the glare of the bright early morning sun. Now was heard the sudden crash of a stack of falling chimneys, now the shouts of the distant crowd—the roar of fire-engines, the galloping of soldiers arriving to drive off the crowds of gathering spectators, the rumbling along of waggons and carts carrying away madly heaped together furniture; barges suddenly were unmoored and glided down the canal loaded with furniture and people; men, women, and children bearing the most heterogeneous articles—bedding, books, clothes—were seen hurrying along the quays; the sick, the dying, were borne in litters or in the arms of their friends; children were lost in the crowd uttering loud shrieks of despair. Whilst Agnes yet gazed out, her eyes swimming with tears of excitement and sympathy, a barge just opposite the windows suddenly burst into flames; the shrieks of the people upon it yelled fearfully above the more distant roar of terror—there were people seen leaping into the water, boats putting out to snatch up the sufferers, masses of burning merchandise and furniture falling hissing into the canal. In a moment Agnes had rushed down upon the quay—she was carrying on shore a terrified child whose mother lay fainting upon the stones.

Agnes suddenly felt an extraordinary strength and energy enter into her. Every interest of her being seemed absorbed by the great misery around her. Helping, suggesting, cheering, she was carried along through a dozen dangers, which at the time appeared no dangers to her.

It was at the foot of a flight of wide steps leading up from a wharf into great warehouses, that she had constructed an asylum for a group of children, terrified women, and sick persons. And here with water in front, and on either hand, seemed to be a place of entire safety; besides which, the wind carried the flames towards another quarter of the city. Still, fire-engines came thundering along the wharf, and were stationed in readiness with their long leathern pipes curling like serpents up the walls and over the roofs, and everywhere men were vigilant—for these were the warehouses of the great house of Stamboyse.

The group of people who under Agnes' guidance had sought shelter upon the steps, felt, in resting over-shadowed by the walls of this great house, an assurance of protection. It was such a rich, such an important house, that ill-luck could not befall it—at least, they knew that all that the power of man could do to avert the flames would be done. But together with the engines came men who ruthlessly sought to drive away the fugitives from the broad steps. Agnes pleaded with an unconscious eloquence for the little band; she caught a glimpse of the tall figure of old Stamboyse himself. The brisk wind which so unluckily for the doomed city was abroad that morning, blowing through his gray locks, and fluttering his long green morning-gown. "Oh, sir!" she cried, stretching forth her hands and seizing upon its folds, as he stood at the top of the steps commanding the men to drive off the fugitives; "I conjure you, have pity upon these miserable women and children—upon these sick—these aged! See, see, the wind carries the flames in the contrary direction—your great warehouses stand surrounded by this canal; oh, may not this be an asylum for this handful of the afflicted! May not heaven for their sakes guard, preserve your merchandise!" And she clung to his skirts, looking up at him with such an eager, pleading, and extraordinary look in her excited young face, that Stamboyse was strangely affected.

"Yes, yes; perhaps you are right—let them be brought in. Within the court there is space sufficient; only let these steps be cleared—let there be room for the engines to work, if need be!" And Agnes had the great joy of seeing Stamboyse himself aid in the conveyance of the weak and fainting within the area of the great court-yard.

"What are you here for?" the old man said hurriedly to her, after they had made a temporary shelter for the sick. "You should not be here—go home. Are you alone here in

Hamburg—quite alone? This is no scene for you. Heaven alone knows what may be the termination of this fire. I will send you under safe escort to your hotel. You must return directly to England!"

"I cannot go yet," returned Agnes in a low, firm tone, grasping Stamboyse's hand. "I must stop with you—I must. God will bless you for your action to these miserable people. I shall be no burden to you. I feel it within me to remain here." The old man returned no answer, except a momentary glance of surprise and inquiry at the delicate white profile which was turned away from him and which was arrested as if intently listening to some distant sound. "Hark! hark!" she exclaimed; "do you not hear that cry! It is from the brigade in the street: they command that water be made to play upon the roofs of the houses; the cry is that the flames are rushing in this direction."

She and Stamboyse now were out upon the quay. A chain of busy hands was formed to pass along buckets of water, in order to saturate the bales of goods lying within the court-yards, whilst the engines played vigorously upon the roofs. Across the canal, in thick volleys, flew flakes of fire; the wooden bridge spanning the canal was wreathed with flame. A turmoil of men surged around the nearer end of the bridge, seeking to stop the fatal progress of the fire. The houses connecting the bridge with the street, in which the Stamboyse warehouses stood, were blown up with gunpowder. The horror, the tumult, increased with every hour; but as yet the warehouses of the wealthy Stamboyse stood untouched.

And hour after hour passed by, and Stamboyse with Agnes at his side stood working in the chain. No words were uttered by either. All consciousness seemed lost, except for the one absorbing anxiety—the putting a check upon the devouring flames. Before the eyes of Agnes rose the vision of the helpless beings within the court-yard—the weeping children—the sick. What vision rose up before the inward eye of the stern old merchant? Let us believe, for the sake of the divine spark implanted within each human breast, that it was some other object than the salvation of his bales of lace and stockings.

Time passed over uncounted by the surging multitude. The hoarse voice of the bell from the near church of St. Nicholas tolled the hours; but its voice was drowned in the hubbub of cries and crashing roofs and walls, and in the roaring of panting flame which a quick light breeze fanned into yet wilder fury; and the sun calmly sank down in the gloomy western sky, and was mirrored together with the flames within the waters of the Alster basins, and of the many canals. And now flames wreathed around the St. Nicholas church, and its tower fell with thundering crash, scattering death and still deeper horror around it. Fire had seized, as evening approached, upon the corner of the outer warehouse of the house of Stamboyse; but the redoubled energy of the workers had kept it under; and now it was extinguished, and the flames, as if wafted away by the wing of some guardian angel, turned to devour elsewhere.

Agnes, in after years, referring to this moment, was heard to say that she suddenly became aware of her own identity when the flames sank and the immediate danger was passed, and that she, feeling a sudden weakness overwhelm her, was caught round the waist and sustained from falling under the feet of the multitude by a strong arm, and that this was the arm of old Stamboyse. "My whole soul," pursued she, "seemed to have poured itself forth in silent, yet frenzied prayer, for aid from heaven for those poor souls. All personal danger was unheeded, all physical exhaustion, during those long hours of strained anxiety." Stamboyse at that moment also came out of his rapt trance, and his eyes became aware of the young girl standing at his side drenched with water; her black hair fallen upon her shoulders, her face white as a corpse, and rigid as a statue. And as he saw her small white hands, upon one finger of which glittered in the fire-light a slender ring, handing on the water-buckets, a sentiment of tenderness, unknown since his early love of his sister, seized upon him, and his heart opened and received her into its depths.

But we must hasten over this portion of our story. The fire had passed in its fury across this portion of the city, leaving wreck, ruin, and death behind it. Few were the buildings which escaped besides the warehouses of the Stamboyse. Smouldering ruins were revealed in this quarter of the city when the sun arose next morning, whilst the flames were still devouring like hungry demons all before them as they hastened forward. The cry went through Hamburg that the judgment day had arrived, and that all would perish. But the miseries of the great fire at Hamburg we will not here dilate upon, further than as they concern our story. Stamboyse and Agnes, as if united by this vast calamity, throughout that night did noble deeds of love and piety to numbers of miserable homeless beings who took refuge within the asylum so marvellously preserved. And thus did Stamboyse break his vow, registered long years ago, "to root out utterly all human love from his disappointed heart."

"But Agnes—that is your name, is it not?—you must now return to England; I insist upon it; I dare not permit you to remain longer in this doomed city. You have already done far more than your strength can sustain. All that can be done more for these miserable people shall be done—trust in me. Such great afflictions truly open the hearts of men; they do more to prove the fact of universal brotherhood, as you remarked, than all the democratic orations in the world.' And Stamboyse insisted upon Agnes reposing herself for a short space in such accommodation as the awful time afforded. The tenderness which the old man lavished upon her remained deeply impressed upon her soul, and will continue to be remembered until the latest hour of her life. He learnt from her her own anxiety regarding the precious manuscripts left at the hotel; had it been possible, he would have hastened himself to ascertain their safety and bring them to her. But the flames were roaring on in their fatal career in the very direction of the hotel—nay, even flying rumours reached them that the *Jungfernsteig* was already one mass of flames. All that Stamboyse could do was to assure her that he would seek after the papers, and if they existed send them after her. He insisted upon her starting by the steamer the next morning; accompanied her thither, pressing upon her a much larger sum of money than she was willing to accept; and, in short, did all that the tender affection of a kind father would dictate.

"And Leonard," said Agnes, at parting, "what message to him? Oh, Mr. Stamboyse, you can forgive!——"

"Any message you choose, Agnes, for the sake of his love of you—of yours for him." And thus Agnes Singleton returned to England by the first steamer which brought to London the disastrous news of the great Hamburg fire.

PUNISHMENT OF TORRIGIANO, THE SCULPTOR.

Peter Torrigiano, the celebrated Florentine sculptor, who executed the fine monument of Henry VII. in Westminster Abbey, was engaged upon a statue of the Infant Jesus for a Spanish grandee. The price was not fixed, but the purchaser, who was very rich, had promised to pay for it according to its merit. Torrigiano made it a *chef-d'œuvre;* the grandee himself enthusiastically admired it: he was at a loss for words to express his approbation of it, and on the following day sent his servants with enormous bags of money. At the sight of them the artist thought himself amply recompensed; but on opening the bags he found—thirty ducats in copper. Justly incensed, he seized his hammer, broke the statue, and drove away the servants with their bags, bidding them tell their master what they had just seen. The grandee was ashamed of his conduct; but it is impossible to make the great blush without arousing their vengeance. He immediately went to the inquisitor, accused the artist of having done violence to the infant Jesus, and pretended to be horrified at so frightful an outrage. In vain did Torrigiano contend, that one who creates has a right to destroy his own productions; justice pleaded in vain for him, with fanaticism for his judge. The ill-fated man was put to the torture, and expired in the midst of the most horrible sufferings.

DRAWN AND ENGRAVED BY W. J. LINTON.

VIRGIN AND CHILD.

RAFFAELLE'S "VIRGIN AND CHILD."

Rome has been a watchword in the world. There, from their mountain throne, the grave of barbarism, the cradle of civilisation, the Cæsars ruled all lands, and shouted forth their proud defiance to all nations and kindreds of the earth. There, philosophy and poetry developed all their acuteness and refinement; and while in solemn tones one gave forth its deep speculations and rules for useful life, the other clothed its thoughts in a vesture of enchanting loveliness and imperishable beauty. There, the arts and graces waited on man's bidding, and reared for him the golden house and temples of snowy marble, and with all their magic power made his life a very vision of delight. Italy was the mistress of the world; Rome was the wonder of Italy. And when these classic days had passed away, when the sun of their glory had sunk in night, and all that remained to tell of the imperial majesty of Rome were ivy-mantled ruins or disjointed fragments of its artistic greatness—great in their fall—beautiful in their decay—the admiration of succeeding ages—the models for all time!—there again revived the love of the beautiful, which was not dead, but sleeping; and from the ignorance of the dark ages, Italy was the first to recognise the value of art.

From the study of the antique—art-trophies won from time—the Roman painters improved in knowledge of design, greatness of style, beauty of form, and justness of expression, and they have left behind them, as monuments of their genius, and as a legacy to the world, much that is valuable in the higher departments of art; so that Rome has become the centre to which European painters have directed their attention.

And foremost stands Raffaelle, a great man towering above his fellows, the prince of painters, at once the admiration and the envy of his contemporaries, the cynosure of all eyes, the painter for all men and for all time. His whole life was devoted to art. He was the only son of Giovanni Sanzio, an ordinary artist of Urbino, and was born on Good Friday, March 28, 1483. His father instructed him in the rudiments of his art, and the boy afterwards became a pupil of Petro Vanucci (Perugino), who at once detected the genius which the lad possessed. Raffaelle was an ardent student; he applied himself with indefatigable industry to the details of his profession, and so closely imitated the style of Perugino, that it was difficult to distinguish their works the one from the other. When Raffaelle was sixteen years old, he had gained all that was to be acquired from his master Perugino, and soon after began to execute some original designs for churches and private galleries. For the convent of Evernitani he painted a picture of the crowning of the Virgin; for the Dominican church at Città di Castelle, a crucifixion; and the marriage of the Virgin for the church of St. Francis, at the same place; all of which laid the foundation of his future fame, although in these early productions the style of Perugino is strikingly observable.

Not long after the completion of the last-mentioned picture, Raffaelle, in conjunction with his fellow-pupil, Pinturicchio, was employed by cardinal Piccolomini to decorate the Siena library. Ten large pictures, illustrative of the history of pope Pius II., were to be executed, and the cartoons for the whole were drawn by Raffaelle. At Florence, he carefully studied the works of Musaccio and Leonardi di Vinci, acquired the true principles of colouring, and the art of chiaro-oscuro; so that from that period his painting became more and more interesting and attractive. While he resided at Florence, he composed that admirable production, the "Entombing of Christ," which drew forth the high applause of Vasar, as a "most divine picture." In 1508, Raffaelle was employed by the pontiff, Julius II., in ornamenting an elegant suite of rooms, called La Segnatura, which he completed so much to the satisfaction of the pope, that the works of former masters were excluded from the papal palace, and the walls occupied by the productions of Raffaelle. Julius II. loved art, but not so ardently as Louis X. This zealous friend of painting steadily patronised Raffaelle, and for a long time he superintended the erection of St. Peter's. The arcades of the Vatican were decorated under his direction; and their thirteen ceilings, each containing four subjects taken from sacred history, were designed and harmonised by himself; and about the same time his genius was exerted on those majestic cartoons from which were embroidered the tapestries of the papal chapel.

Raffaelle remained single all his life—he was wedded to his art; the cardinal di Bibbiena offered him his niece, but he declined the proposal. In his early days he had formed an attachment for a baker's daughter, to her he was strongly attached, and in his will left her a sum sufficient for her maintenance.

The last work in which he employed his pencil was a painting in oil of the transfiguration. With this sublime production his life and labours ended. While engaged upon it he was attacked by a fever, which, for want of proper treatment ended fatally on Good Friday, 1520.

His whole existence was spent before the shrine of art. He was cradled in a studio, the palette and the brushes were his toys, his earliest lessons were in painting, his childhood and youth were consecrated to it, he rose higher and higher in the path of glory, surrounded by aspiring disciples, dwelling in the greatest splendour, until at thirty-seven years of age his life was ended and his body was laid out in his painting-room in state, and his own picture of the Transfiguration placed near him. He was the great incomparable man of his time, distinguished among painters by the appellation of the Divine.

Some people have been disappointed when they have looked upon the pictures of Raffaelle; and a story is related that a person of acknowledged taste and judgment visited the Vatican with an eager desire to study the works of Raffaelle, but passed by with indifference those very compositions which were the objects of his inquiry and curiosity, till he was recalled by his conductor, who told him that he had overlooked what he sought for. This suggests an important inquiry. How is it that the works of Raffaelle strike some minds so little at first sight? It is not, it has been said, that he imitates nature so well, that the spectator is no more surprised than when he sees the object itself, which would excite no degree of surprise at all; but that an uncommon expression, strong colouring, or odd and singular attitudes of an inferior artist, strike us at first sight, because we have not been accustomed to see them elsewhere. Raffaelle may be compared to Virgil—sublime, easy, natural, and majestic. There cannot be a stronger test of excellence of any performance, either in poetry or painting, than to find the surprise we first experience not very powerful; and yet to find, by more frequently testing it, that it not only supports itself, but increases continually in our esteem, and leads us on to admiration.

Every accomplishment and qualification necessary to form an illustrious painter were combined in Raffaelle; sublimity of thought, a fruitful and rich invention, remarkable correctness of drawing and design, and a wonderful disposition and expression. His attitudes are noble, natural, and graceful, and contrasted without the smallest appearance of affectation or constraint, and to the eloquence and grandeur of the antique he added the simplicity of nature.

Our engraving, from one of this master's designs, represents what has been so often and so beautifully represented, "The Virgin and Child." The original picture is in the possession of Rogers, the poet and banker, and the cartoon or rough drawing, upon large paper, which served as the design for the picture, is numbered among the treasures of Mr. Colnaghi. It was discovered by that gentleman in a very dilapidated condition, but with great care and attention has been completely restored. From that cartoon our engraving is exactly copied. The design is simple, but its very simplicity constitutes its greatness, and exhibits the power and skill of Raffaelle. To enumerate his works would require a volume; to point out their whole merits, a genius as mighty as his own.

PEERS AND M.P.'S;
OR,
LORDS AND COMMONS.

Amongst the nations of Europe, England stands foremost for the freedom of its institutions—a freedom the result of its representative government. Some nations we see still dependent for their weal or woe on the pleasure of one man; others have adopted the system of representative government, but they have emasculated it so as to take from it all power for good. Even in England in our own time we have seen a wonderful change introduced. The constitution had lost its virtue—it had become a sham, a means whereby a selfish oligarchy waxed fat and insolent and strong. The very struggle for reform put an end to that. Old Sarum and Gattan ceased to exist. The representatives of Manchester and Birmingham were admitted into the senate of the land, and on the success of the free-trade movement it was shown how right in the main, how superior, as a whole, to all selfish and party considerations, is the representative body as it exists now. True, there are selfish men belonging to it—men sordid, worthless, without principle, without honour, without the sense of shame; but they are not leaders of the house, they form a contemptible minority. Test the house any way you will, and you will find it impossible to get a better. The senior wranglers of Cambridge and the first-class men of Oxford—these are the men you see framing budgets and discussing tariffs, night after night. Go into the courts at Westminster, ask who are its chiefs, look well at their faces—and you will recognise them on the floor of the House of Commons. You say this is all very well; but you are a practical man, and you want practical business men in the house. Well, turn to the manufacturers, and merchants, and bankers most widely known—the men in whom the public most confide—the chairmen and directors of our great railways, of our gigantic navigation companies, and other bodies—where are they? The answer is, in the house. Try it in another way; what class has not its representative there? We answer none.

Can oratory boast a more brilliant son than Macaulay?—he is in the house. There Fox, the Norwich weaver boy, represents democracy, and he is heard with a deference rarely paid to the inheritors of noble names and stately halls. There nonconformity has its champions as well as the church. Mr. Bright represents the peace party, Mr. Heyworth that of temperance. We know not how an assembly of equal worth, and talent, and power, could be got in any other way; and Englishmen think so too. Every man who can, wishes for a vote—every man who can, wishes to add M.P. to his name.

All, then, are interested in the history of Parliament, including in that phrase not merely the Commons but the Lords as well—its history, its privileges, its power, its great men concern us all. They belong to all that is best and brightest in our national life. If it were not for our Parliament, we should now be withered up by the blight of the despot and the priest. We have not to look far to see what would have been our despicable state had it not been for that. We propose, then, to treat this subject, so interesting to all, as popularly as we can—if possible, to be amusing and as rarely dull as the nature of the subject will admit. At times we must be so, for we shall have to wander far back, groping our way in the dark sepulchre of the past. If we do so, we shall have the consolation, however, of feeling that we thus give the reader a sketch more complete than he could get in any other way. Elsewhere he can find the details at greater length; here we give an outline sufficient for those who in this busy age have little time to read. To original research we make no claim: those who seek that must go elsewhere.

THE HOUSES OF PARLIAMENT.

On the banks of the Thames, on the right hand, just above Westminster Bridge, a palace with a hundred turrets may be seen. This is one of the most magnificent buildings ever erected continuously in Europe. Probably it is the largest edifice in the world. It is the royal palace of Westminster; beneath its roof meet the Houses of Parliament. Upon what is said and done there depends in a great degree not merely England's future, but also that of Europe and the world. With the new building there are but few historical associations; yet it must be looked on with admiring eye, on account of the important nature of the business transacted, and on account of the character of the men by whom that business is carried on. The old palace was burnt down on the 16th of October, 1834. The first stone of the new one was laid April 27, 1840. The architect is Sir C. Barry. It covers an extent of nearly eight acres. "In its style and character," says Mr. Cunningham, "it reminds us of those magnificent civic palaces, the town-halls of the Low Countries at Ypres, Ghent, Louvain, and Brussels, and a similarity in its destination renders the adoption of that style more appropriate than any form of classic architecture. The stone employed for the external masonry is a magnesian limestone from Auston, in Yorkshire, selected with great care from the building-stones of England by commissioners appointed in 1839 for that purpose. The River Terrace is of Aberdeen granite; there is very little wood about the building; all the main beams and posts are of iron, and the Houses of Parliament, it is said, can never be burnt down again. The east, or river front, may be considered the principal. This magnificent façade, 900 feet in length, is divided into five principal compartments, panelled with tracery, and decorated with rows of statues and shields of arms of the kings and queens of England from the Conquest to the present time. The west or land front is as yet in an imperfect state, but will, it is believed, surpass in beauty and picturesqueness any of the others, though from the nature of the ground it will not be in an uninterrupted line. A new façade is to replace the law courts, but is not yet commenced." The principal public entrances are through Westminster-hall, from Old Palace-yard, both leading into the central octagon hall, whence the right-hand passage will take you to the Lords and the left to the Commons. We will suppose you are anxious to be present at a sitting of the Upper House. For this purpose you must be furnished with a peer's order. The house meets at five, and seldom sits more than a couple of hours. Compared with the Commons, the Lords take it easy indeed. You will see also that the house is thinly attended, and that the most active in it are the law lords and the bishops, whom you will observe sitting on your left in their robes. The House of Peers, one of the richest chambers in the world, opened for the first time, April 15, 1847, is 97 feet long, 45 wide, and 45 high. When you enter you will see the throne, with the chairs for the Prince of Wales and Prince Albert—the woolsack in the centre of the house, on which the Lord Chancellor sits—the reporters' gallery facing the throne—the strangers' gallery immediately above—the frescoes, the first on a large scale executed in this country, in the six compartments, three at either end, the subjects of which are "the Baptism of Ethelbert," by Mr. Dyce; "Edward III. conferring the Order of the Garter on the Black Prince," and "Henry Prince of Wales committed to prison for assaulting Judge Gascoigne," both by Mr. Cope; "the Spirit of Religion," by Mr. Horsley; and "the Spirit of Chivalry," and "the Spirit of Law," both by Mr. Maclise. There are twelve windows of stained glass by which the house is lighted at night from the outside. Between the windows, and at either end of the house, are eighteen niches for statues of the Magna Charter barons, carved by Mr. Thomas. Immediately beneath the windows runs a light and elegant gallery of brass-work, filled in compartments with coloured mastic, in imitation of enamel. On the soffits of the gallery, or cornice immediately beneath the gallery, are the arms of the sovereigns and chancellors of England, from Edward III. to the present time. During the debate the stranger will have time to see all these things. The chances are he will be more interested with the chamber and its splendid decorations than with the speeches of the peers; but if such be his object he can easily effect that when the house is not sitting. When occupied in hearing appeal cases the house is open to the public; at other times

an entrance is obtained by an order from the Lord Chamberlain, or by a personal introduction by a peer.

If, instead of the Lords, you prefer to visit the Commons, by turning to the left when you enter the central octagon hall, you will find yourself at the lobby of the house. If you wish to catch a member, you had better be there by four, when the speaker is usually at prayers, and the house meets. Any member will give you an order for the strangers' gallery, which is thrown open immediately after the speaker's prayers are over; but if the debate be an important one, you had better get your order a few days previously, and be down at the house by one o'clock at the latest, or you will have no chance of getting in. Before now, the writer of this, on an eventful night, has waited in his turn from half-past one to ten before he has been able to take his seat in the strangers' gallery. The speaker's gallery is the best place for a stranger: you have comfortable cushions to sit on; you are nearer the house; and as it is not thrown open before five, you can save yourself the dull hour which is appropriated to presenting petitions and transacting private business. The debates commence generally a little after five, and continue till midnight, and at the latter end of the session far beyond that. The House of Commons is a much plainer chamber than that of the Peers; is sixty-two feet long by forty-five feet broad, and forty-five feet high. The ceiling, however, is of nearly equal beauty. The windows are filled with stained glass; the walls are lined with oak, richly carved, and supported on carved shafts and brackets is a gallery for members, extending on either side. The house is lighted in a remarkably beautiful manner from above. At the north end, directly opposite you as you enter, is the speaker enthroned in his chair of state; on a table before him is the mace, which is removed when he leaves the chair; and boxes, green and red, appearing to be official, which orators on each side thump in a very impassioned and effective manner. Above the speaker is the reporters' gallery, and above that are gilt lattice wires through which

"We almost think we gaze
Through opening vistas into heaven."

That is to say, gleams of silk and satin indicate that behind those wires are clustered a select few of the British fair whose womanly curiosity has led them to submit to being cooped up in that abominable style while the debates are being carried on.* Just under the strangers' gallery is the bar, at which sits, girt with a sword, no less a personage than the sergeant-at-arms. Members come into the house either by the public approaches or by a private door and staircase from the star-chamber court (one of the twelve courts lighting the interior), so called from occupying the site of that once dreaded tribunal. The Westminster Bridge end contains the apartments of the speaker and the sergeant-at-arms, and the Vauxhall Bridge end the apartments of the usher of the black rod and the lords librarian. Above these a long range of rooms has been appropriated to the committees of either house. Altogether the building is very fine, and so it should be, for it is there the nation collectively acts, and thinks, and speaks; and it will cost an enormous sum, which would be thrown away were it wasted on a building in which there was nothing to see and admire. The entire expense of this vast and splendid building will, probably, not fall short of a million and a half, nor will it be completed, it is thought, before 1856.

You will find the lords are more polite than the commons. Often, in the galleries of the former house, you will see woman in her pride and beauty looking calmly down upon the busy scene. As we have already remarked, she is not visible in the lower house, and perhaps 'tis as well that she is not. What is the oratory of the tongue against that of the eye? What chance has a prosy senator of being heard when the wives and daughters of England are before you in all their charms? Where they are, they certainly can do no harm and receive none. The reporters, however, can tell you something of the dulcet tones that occasionally—even during the most eloquent parliamentary harangues—find their way into their gallery from the gilt wires above; so true is it that though you coop up woman, you cannot silence her—so true is it that woman has a tongue which she will ever proudly use.

If, supposing you have effected an entrance, you mean to stay all night, you had better buy an orange or two of the merry-hearted Irish woman who waits in Westminster Hall, and who will supply you with that necessity at a very fair price. You are not allowed to leave your seat and return to it; once in the house, you must stop there, if you wish to make a parliamentary night of it. This is very trying, indeed. The house, as we have stated, begins at four, the private business lasts till past five. About seven the house goes to dinner; about ten the house gets very full again. Then the great guns speak. Her majesty's ministers, who sit on the treasury-bench, which is the first row of benches on the speaker's right, rise to defend their measures from the great men of the opposition, who sit immediately fronting them. The benches become crowded; loud "hear, hears," run through the house; the bell rings for a division; the members tell off into different lobbies behind the speaker's chair; in a little while the tellers return and announce the number; the victorious party, of course, receives the announcement with tremendous cheers. Some routine business is then disposed of, and the house willingly adjourns to bed.

THE LORDS.

Our readers must forgive us if we give them the results of a few historical inquiries—inquiries, however, made by such men as Mackintosh, and Hallam, and other great ones in historical lore; the subject may be dull, but, as we cannot omit it, we will be as brief as it is possible to be.

The House of Lords consists of two classes, lords spiritual and temporal. The temporal and spiritual peers of England all sit by virtue of their creation or consecration; the temporal peers of Scotland have each a vote in the election of sixteen members of their body to represent the whole during the continuance of each distinct parliament. The temporal peers of Ireland, immediately after the passing of the act of union, elected under its authority in the same manner, but for life, twenty-eight representatives, and the right of election has subsequently been exercised to supply from time to time the deficiency created in the representation by death. The spiritual peers of Ireland are represented, not by election, but rotation, the two archbishops sitting alternate years and three bishops in annual rotation. At this time there are in the House of Lords twenty dukes, twenty-one marquises, one hundred and twelve earls, twenty-four viscounts, twenty-four bishops, and one hundred and ninety-six barons. You will find but a small proportion of these in the house. The absentees are by far the most numerous.

"The following," says Lodge, "is the ceremony in use in admitting a peer into the House of Lords. After the peers have taken their seats, the lord chancellor being on the woolsack, garter-king-at-arms attired in his taliard, and bareheaded, comes into the House of Lords bearing the patent, if there be one, and writ of summons of the peer to be introduced, who then follows between two peers of his own rank, attired in their robes of state, and is led by them to the chancellor, to whom he makes obeisance; garter then presents the patent and writ of summons to the lord chancellor, who directs the same to be read; this being done, the oaths are administered to the new peer, and the chancellor dismisses him to take his seat, to which he is directed by the two noblemen who introduce him, garter leading the way. The writ is then delivered by the lord chancellor to the clerk of the house, to be laid up. The new peer forthwith rises from his seat and returns to the lord chancellor, who congratulates him on his becoming a member of the house of peers, or on his elevation to the dignity of the peerage, as the case may be.

* Ladies have been excluded from the strangers' gallery since 1738. Mr. Grantley Berkeley has gallantly attempted to get the house to sanction their admission, but the house has hitherto stolidly refused.

THE TURKS IN EUROPE.

CHAPTER II.

On the 26th of May, the Turks prepared for a final and general assault. Some attempts were made at negotiations, but they failed, and both sides allowed themselves but one alternative—victory or death! Mahomet found by astrology

RECEPTION OF AN AMBASSADOR AT CONSTANTINOPLE.

that the morning of the 29th was the propitious hour for the assault. On the evening of the 27th, the various bashaws and commanders were summoned to his tent to receive his final instructions. The cowards were warned in oriental

language that if they turned away from the foe, had they the wings of a bird, they could not escape his vengeance. To the first man who mounted the breach, he promised the government of the fairest and wealthiest provinces of his empire, and to load him with riches and honour. Dervishes traversed the camp, and held out to those who fell in the conflict visions of immortal bliss in the flowery gardens of Paradise, wrapt in the embraces of dark-eyed lovers of inconceivable beauty. And those who should survive were promised the plunders of the luxurious city, and their share of the captives. In the interval they were exhorted to abstain from food, and to fortify their courage by prayer and ablutions. The enthusiasm and fanaticism of the whole army was thus wrought up to the highest pitch, and loud shouts of "God is God, there is but one God, and Mahomet is his prophet!" warned the unhappy Greeks that their hour was come.

The scene in Constantinople was widely different. On the evening of the 28th, Constantine summoned the noblest of the Greeks and the bravest of the allies to his palace. What followed was touching and pathetic in the last degree. Constantine rose superior to his fate and situation, and seemed in this last awful hour to bid defiance to fortune. His words were worthy of the line of kings of which he was the last, and of the great empire whose overthrow he was about to witness. The purple, for the first time in eight hundred years, seemed to cover a Roman of the ancient mould. His speech was a farewell worthy of Cato or the Gracchi. He sought to infuse hope into the minds of his friends, when his own looks and the tones of his voice were those of a man in whose breast all hope, save the hope of immortality, was extinguished for ever. His followers saw his struggles, and threw aside the mask of calmness and inflexibility. They armed with the courage of despair, the only courage which needs no exhortation to arouse it. They wept, they embraced, they solemnly devoted their lives to the service of the empire; this was all they had; their families and fortunes were in the hands of God. They parted at midnight—each to his post on the ramparts, where he maintained a feverish and anxious watch till morning. Constantine with a few faithful followers entered the church of St. Sophia, and there with prayers and tears received the sacrament for the last time, and the last sacrament that was ever administered there. The body of the church, dimly lighted by a few lamps, was filled with a crowd of worshippers, women, children, and old men, prostrate in adoration, but it was the adoration of fear. The plaintive wail of the "Kyrie Eleison!" uttered by thousands of voices, was wafted across the straits, and was heard with trembling by the peasants on the further shore of the Bosphorus, and fell with a strange significance on the ear of the Turkish soldiery. The emperor reposed for a few moments in the palace, then took a last farewell of his family and household, who filled the air with their lamentations, and rode through the deserted streets to the walls. From the summit he could hear the noise made by the countless hosts below filling up the ditches and smoothing the way to the breach.

At daybreak the besiegers rushed to the assault; in the van, a dense mass of fanatical peasants and camp followers, without order or discipline, whose slaughter blunted the weapons and tired the arms of the Greeks. Every shot and thrust swept them down by dozens; but still on they came—on, on, on,—in a vast swarm, till the ditch was choked with their dead, and the main body could march over them as over a bridge. After two hours' fighting, the Greeks had still the advantage, when the sultan in person led on the janizaries for one vigorous and simultaneous effort. The drums and trumpets struck up a martial air to drown the cries of fear or pain, the artillery thundered from the land-batteries and the fleet, and the vast force plunging madly forward, was soon lost in the cloud of smoke which hung like a curtain round the scene of carnage. To describe what followed would be impossible. The shouts of the combatants, and the clash of the weapons, and the roar of the guns, rent the air. The Greeks revived their ancient glory, and fought like giants against those awful odds, foot to foot and hand to hand. Constantine cheered them by his voice, and incited them by his example. Thirty janizaries, headed by a huge monster named Hassan, gained the top of the ramparts. Eighteen of his followers were killed upon the spot, and he sank on one knee beneath a shower of stones and darts; a host of Turks followed close at his heels, and the city was lost. A few nobles formed a square round the emperor, and, with their faces to the enemy, died man by man. "Will no Christian cut off my head?" was the mournful exclamation of Constantine in his last anguish, as he was swept along in the melée, the aim of a thousand weapons. He fell by an unknown hand, and his body was afterwards found buried beneath a mountain of the slain.

The whole of the Turks now rushed into the streets, and, in the first heat of the pursuit, two thousand unresisting Greeks were slaughtered; but their attention was soon drawn off by the rich booty which they saw on every side. The Greek and Latin historians who have written of the occurrence tell fearful stories of the massacres which followed, and the Turks speak with equal confidence of their clemency and generosity; and it seems likely that the latter are nearer the truth. In large cities, the number of lives lost after the fighting is over is seldom great. The assailants become scattered, and their fury is abated by a thousand novelties which strike the eye in every street. But of the violence of the Ottomans there does not exist a doubt. Everything was done to outrage the feelings of the Greeks. The images of the saints, upon which they looked with so much reverence, were dragged through the streets with every circumstance of ignominy. The cross was trampled under foot; convents were broken open, and the nuns violated at the altar. Upon the first news of the assault, a crowd had filled the Church of St. Sophia. When the Turks entered the city, the sanctuary, the choir, the nave, the upper and lower galleries, were thronged to excess by ladies, children, husbands, and fathers, and the doors barred, in the foolish belief that, ere the infidels entered the holy place, an angel would descend from heaven and put them to flight as far as the frontiers of Persia. The doors speedily gave way before the axes of the Turks, who rushed in and began to select the captives from the mass before them. They were bound together without distinction of rank or sex, and driven rudely through the streets under the lash of their captors. The fairest of the women were reserved for the harem, the men were sold into slavery, and many a nun, of noble descent, was torn from the horns of the altar to adorn the seraglio of the sultan. The splendid libraries with which the city abounded were scattered or destroyed; the churches and convents were despoiled of their rich ornaments, accumulated by the piety and munificence of centuries. The sultan entered on horseback at two in the day, and rode straight to the Church of St. Sophia, marvelling as he passed along at the splendour and riches which surrounded him. He saw a soldier breaking the marble pavement of the church, and sternly ordered him to desist. "Be content," said he, "with the booty I have given up to you; the town and buildings belong to me." He then ordered the walls to be deprived of the pictures and mosaics with which they were adorned, and restored to their naked simplicity. The muezzin ascended the tower, called the faithful to prayer in the name of God and the prophet; the imaum preached, and Mahomet himself offered thanksgiving on the altar, and the Christian church became a mosque.

Thence he proceeded to the palace of the Cæsars, and as he entered, struck by the air of desolation which marked that august abode, he repeated two lines from a Persian poet—

"The spider hath woven her web in the palace of the emperors,
And the owl hath sung her watch-song in the towers of Efensiyab."

The sultan now fixed his residence in Constantinople. The Greeks, upon being assured of protection for their lives and property, returned to their homes; their patriarch received his crozier from the successor of the prophet, and the establishment of the Turks in Europe became an accomplished fact.

We have already alluded to the amazing extent of the empire they established in Europe, and the strange element thus introduced into European society, as one of the most wonderful events in modern times. But it loses a great deal of the marvellousness which at first sight we might be disposed to attach to it, when we remember the mixture of extreme simplicity and temperance with fervid fanaticism which has at all times characterised them. They emerged from the condition of a simple pastoral tribe into one of comparative civilisation, without losing many of their old virtues or contracting many new vices. The Turk, when roused into action, acts vigorously, promptly, energetically, and allows no scruples to stand in the way of the accomplishment of his purpose. But to see him afterwards, one could hardly believe he was the same being. The deed done, he relapses into listless dreamy indolence, and seems content to let everything take its course. He is perpetually at one extreme or the other. He knows nothing of our calmness and steadiness of purpose, and our moderation. Most of the passions of savage life have accompanied him from the plains of Tartary and cling to him still. If a man offends him, he is seldom content with any reparation short of his life. If he covets a thing, he seizes on it straightway; if he falls in love, he does not pay court, and dangle, and sigh, and write poetry; he buys the woman he adores in hard cash, hurries her into a seraglio, and shuts her up close, as if he was jealous of the wind and the sun, and there sates his passion. Of anything like a union of souls between man and woman he has no idea, nor could it readily be explained to him. The Koran denies that women have souls, and he is the more inclined to believe it from the fact, that those that he sees have received no education, except a few idle accomplishments to delight the voluptuous eyes of their owners; their intellects are so dwarfed that there is apparently little in them, except the gift of speech, to distinguish them from the lower animals.

Nor has the Turk any idea of the whirl and bustle of public life, such as we see it in England or France—the thirst for distinction, the patient industry, the complicated intrigues, the eager watching of public opinion, the united agitation, and all the strife and turmoil by which the great business of life is carried on. He cannot see the use of all this. He loves ease above all things. To secure it he rouses himself occasionally into violent exertion, but then as soon as the occasion has passed away he relapses again. The leading feature in his character is undoubtedly his religious fanaticism, but unfortunately the religion he professes is not of such a nature as to turn this fanatacism to good account,—for Mahometanism does not contain the two great requisites which a religion must possess before it can influence men's lives. It does not inculcate self-restraint as a desirable means of attaining to a higher state of happiness, and as conducive to mental repose; nor does it act upon the fears or hopes of its worshippers by threatening to visit their bad acts with retribution, or reward their good deeds with happiness in the world to come. One or two verses in the Koran certainly represent revenge as an undesirable mode of gratification, but by no means in very strong language; and in other places true believers are commanded to content themselves with mere pecuniary compensation, or at all events to take care that the retaliation does not exceed the offence. But the futility of this injunction must be apparent when we remember that men never take vengeance except when under the influence of fierce passion, and to expect persons in this state to strike a proportion between the injury they have received and the retribution they are about to inflict, is the acme of absurdity. The virtues which Mahomet inculcates are precisely those which a barbarous people would be sure to practise, though he had never said a word about them. They are generous, humane, charitable, kind to the miserable and forlorn, but when their passions are roused, woe to him who stands in their way.

Faith and not works is the sum and substance of Mussulman orthodoxy. It is not necessary that one should do right, but that he should think right, in order to enter paradise. Any Moslem who dies in the belief that there is but one God, and that Mahomet is his prophet, by that alone secures his salvation. A man of loose and dissolute life, who disobeys the precepts of the Koran, is, indeed, understood to undergo a short period of severe discipline by way of expiation in purgatory, *mais cela ne fait rien*. No jolly Mussulman would renounce his pleasures for such a bagatelle, especially when it looms so dimly in the future. As is generally the case, however, the minute observances of the faith are strictly attended to; the five daily prayers with the face turned towards Mecca, the various ablutions of the person and garments, the fasting in Ramazan from sunrise till sunset, are observances which no believer omits to perform. These are, however trivial in themselves, sure evidences of a pharisaical spirit, and consequently are not entitled to the praise which sentimental travellers have expended upon them.

Whatever may be the value of Mahometanism in a moral point of view, however, as a military creed it is unexceptionable. Many, in fact nearly all its formulæ, are better adapted for the regulation of a camp than the government of a civilised nation. Wine is forbidden; cleanliness is strictly inculcated; close and unshrinking fidelity to one another, and unswerving hatred to infidels are essential duties; and, lastly, he who falls in battle for the faith, no matter what his previous life, is forthwith wafted to paradise—an abode of sensual bliss, where the warrior passes the time in the society of immortal women of ravishing beauty, and finds himself constantly surrounded by all the delicacies that can please the palate, and is lulled by the flow of clear streams. The ten first followers of the prophet possess, in this immaculate region, seventy pavilions glittering with gold and silver and precious stones; in each of these seven hundred beds, and around each bed seven hundred houris! Every soldier goes into action with the encouraging prospect of a crown of victory or crown of martyrdom. Death in battle against the infidel, amongst the Ottomans supplies the place of patience, and faith, and hope, and charity, and long-suffering, and virtue, and knowledge, and truth. No mode of propagating a faith was ever more agreeable to its missionaries. All Mussulmans, under the Turkish law, were looked upon as soldiers, and formed a separate and superior class to the nations they conquered; and to this day none but Mussulmans can enter the Turkish army. When they first commenced their career of rapine, a third of the conquered lands was distributed amongst the soldiers; the privates often receiving large tracts of territory, which the original inhabitants cultivated as their serfs, rendering them a tenth part of the produce. The tenure by which they held these gifts, however, obliged them to follow the sultan to the field, whenever he called upon them; but did not oblige them to remain beyond one campaign, so that when the winter began to close in, they generally marched off home, and left him to fight his battles by himself as he best could. This of course rendered foreign wars next to impossible, and a standing army became clearly a necessity. The corps of janizaries was accordingly embodied in the manner we have already described. Part of these, about 25,000, were kept in barracks at Constantinople; other divisions in some of the principal towns of the empire: but a vast number were scattered over different parts of the country, married and pursued various trades and occupations, and though in receipt of regular pay, never performed any part of a soldier's duties. In fact, the janizaries were rather a military caste than an army, for their sons were, *ipso facto*, janizaries also, though they never handled a musket. Those of them who lived in barracks and were under arms, were as insolent, turbulent, and rapacious as prætorian guards usually are. They plundered and maltreated the people, and kept the sultan in terror; and owing to their refusal to submit to any of the modern improvements in drill or discipline, they were almost useless against European armies in the field.

In 1826, the sultan Mahmoud occupied the throne—a ferocious Turk, but a man of great strength of character, and fully alive to the necessity of introducing reforms into the internal administration of his empire. One of his first steps was, the levying of a body of troops, amongst whom he intro-

duced the European drill with the happiest effects. The janizaries were enraged at this, and began to clamour for the heads of the principal officers of the state, a very common mode of showing their displeasure. Mahmoud raised the standard of the prophet, and called upon all true Mussulmans to rally round him; and, attacking the janizaries upon all sides, massacred every one of them, as Mehemet Ali the Marmelukes, or Peter the Great the Strelitz. This step was followed by various other reforms, even of the costume—the flowing drapery and magnificent turbans of the nation being displaced by the angular frock coats and tights of the Franks, and the red and ungraceful fez-caps. The importance of this change in an artistic point of view may be estimated by reference to our engraving, exhibiting the various forms of head-dress used in different parts of the empire. The tendency to adopt European customs has been equally great in every other department; and what effect these changes will have upon the general condition of the empire still remains to be seen; for there can be no doubt that Turkey has not yet passed through the transition state, and it would therefore be premature to pronounce upon the merits of the reform. Our engraving (p. 124) represents the reception of an ambassador at the divan.

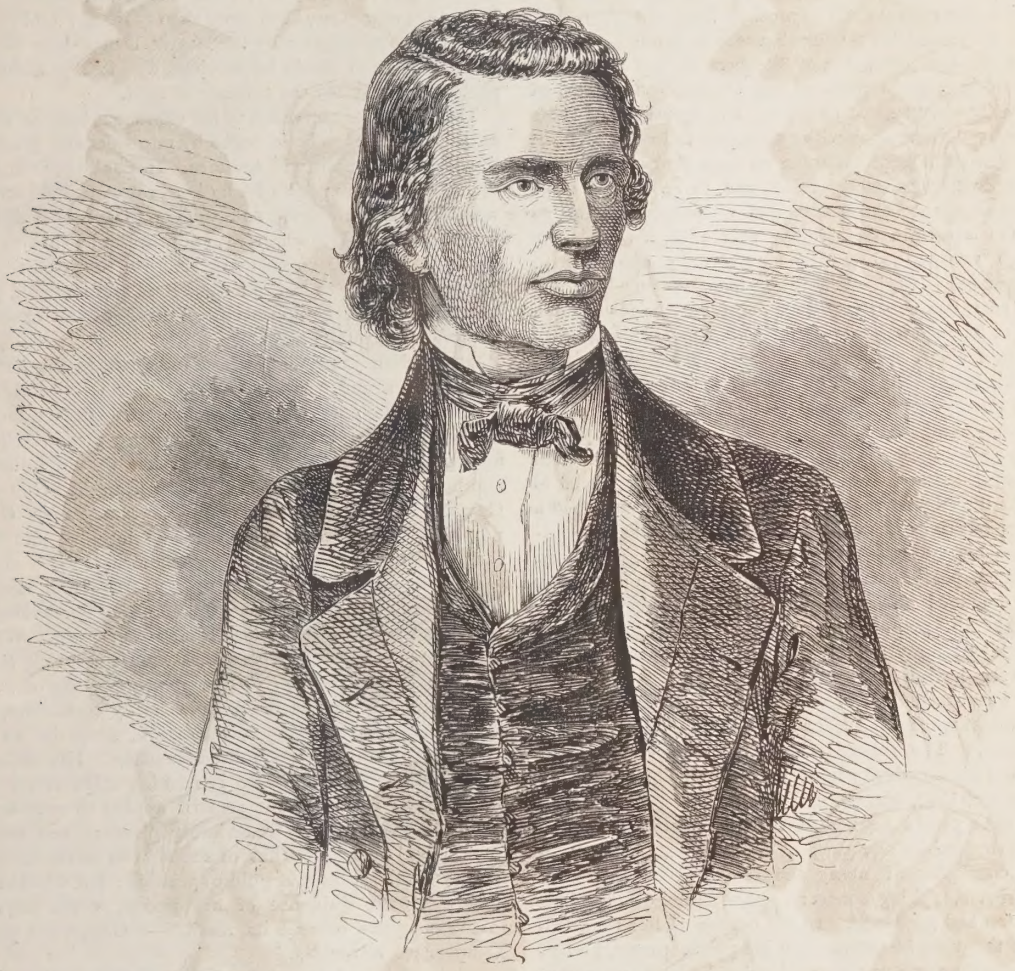
TURKISH HEAD-DRESSES.

1. Constantinople Fez. 2. Egyptian Tarbouch. 3. Fellah's Turban. 4. Turban of the poor in Egypt. 5. Turban and Cap of Bethlehem wool. 6. Egyptian Caffieh, worn as a turban. 7. Arab Caffieh, held by a band. 8. Caffieh, with a cord of camel's hair; Caffieh with a turban. 9. Greek Fez. 10. Round Turban with a twisted pad, common in Africa. 11. Loose Syrian Turban of a Scheikh of Lebanon. 12. Drapery for protection against cold or rain. 13. Head-dress of peasants in Lebanon. 14. Turban of a patriarch, or bishop of the Copts. 15. Coptic priest. 16. Asiatic Turban, common at Smyrna, very heavy behind.

MR. JOHN B. GOUGH.

This eloquent and successful advocate of Temperance was born on the 22nd of August, 1817, at Sandgate, in the county of Kent. His father had served in one of the regiments of British soldiers engaged in the Peninsular war, and had retired on a pension, having been wounded in the neck. His mother occupied the position of a village schoolmistress. From her John received his first lessons, but was sent at a very early age to a school at Folkstone, where, though so young, he soon became a teacher. When only about eight years of age, he manifested a keen taste for the beauties of nature, and an ardent love of history and poetry, especially of the romantic kind. He was a good reader; and on one occasion attracted the notice of the celebrated Wilberforce, who patted John on the head, and presented him with a book, having first written his name on the fly-leaf. There was a library in the village, and John was often sent for to read to the visitors of that watering-place. He was fond of speaking also, and having a talent for mimicry, he would dress up a number of dolls, and personating some clergyman, he would pour forth his mimic oratory much to his own amusement, if not to the edification of his dumb auditors.

When about twelve years of age, John's father made an agreement with a family in the village, who were about emigrating to America, to take him with them, and gave them a small sum on condition that they should teach the boy a trade, and provide for him till he was twenty-one. In June, 1829, he left his native village; and after visiting some of the principal attractions of the metropolis, he sailed from the Thames on the 10th of that month. On the 3rd of August he arrived at New York. He spent two years at a farm in Oneida county, during which period he received no advantage either from going to school or from learning a trade. In 1831 he returned to New York city, where he was engaged as an errand boy and to learn the book-binding trade. Here he saved a little money, and sent to England for his father, mother, and sister to join him; his mother and sister did so, but his father preferred remaining in England. They were shortly after plunged into circumstances of deep poverty, and in the summer of 1834 his mother died suddenly—a circumstance which deeply affected both his health and spirits.



PORTRAIT OF JOHN B. GOUGH.

About this time the foundation was laid of many future sorrows. Having a good voice, being able to sing pretty well, having the faculty of imitation strongly developed, and being well stocked with amusing stories, he got introduced to the society of thoughtless and dissipated young men, to whom his talents made him welcome. Here he acquired a fatal appetite for strong drink, which he indulged to excess. He began to attend the theatres frequently, and soon felt ambitious to "strut *his* hour on the stage." He obtained a situation as actor and comic singer. A career of recklessness and dissipation succeeded; his habit of drinking excessively became confirmed, and in 1837 he was, to use his own language, "thrown like a football on the world's great highway, at the mercy of every passing foot." For a short period poverty brought him to his senses, and induced him to abstain from the intoxicating cup; but he soon formed an acquaintance with

companions who destroyed his resolutions of amendment, and before long he was again on the broad road of dissipation, neglecting his business, impoverishing his resources, destroying his reputation, and injuring his health.

In 1838, Mr. Gough married, and commenced housekeeping, and engaged in business with a good prospect of success. But in a short time every bud of promised comfort and respectability was nipped, and his circumstances began to be truly desperate. Want of health, and remorse of conscience, made him miserable beyond description. He sought relief in deeper and yet deeper potations, till *delirium tremens* in all its terrors attacked him. The narrative of this portion of his life—including amongst other harrowing details the death of his wife and child—may be passed hastily over; his career became one of almost unmitigated woe. He sank as low in mental and moral degradation as it was well possible for a human being to sink,—into a state apparently beyond all hope of redemption. Yet at this very point his redemption was at hand.

Societies for the promotion of Temperance had for several years existed in various parts of the United States, and had operated with considerable success. The members of these societies exerted themselves with exemplary industry, and left no means untried to place the sober on their guard against the insidious influences of strong drink, and to rescue from the grasp of intemperance those who had unhappily become its victims. On a certain day—in the year 1842, if we mistake not—Gough was tapped on the shoulder by one of these zealous advocates. With a benevolent look, and in a kind and courteous tone, the stranger asked John how he should like to become, as he once was, respectable and respected, well clad, esteemed by friends, useful, and happy? John sighed, and expressed his belief that such a change was impossible. The course the stranger proposed was that of immediately abandoning the use of all intoxicating drinks, and signing a pledge expressive of his determination to do so. This was urged with so much earnestness and affection that Gough determined to comply with the friend's request. Accordingly, he attended a Temperance meeting the next evening, and after briefly relating his once happy and now miserable condition, he signed the temperance pledge, with a palsied hand and in characters singularly crooked! He was long before he recovered his strength and spirits; but he persevered. Friends rallied round him. His talent for public speaking being known, and his former career having been notorious, curiosity as to his addresses was excited. He soon became popular, and his time was almost wholly occupied in lecturing on the Temperance question. The sphere of his operations was soon extended, and his popularity increased with great rapidity.

In November, 1843, Mr. Gough married his present wife; and from that period he has devoted his time and talents entirely to the public advocacy of Temperance; addressing audiences consisting of many thousands, and everywhere obtaining friends, making converts, and receiving testimonials of approbation and good will. In the course of less than two years from the time he commenced his public career, he had travelled more than twelve thousand miles, by land and water; delivered six hundred and five public addresses, in churches, halls, public buildings, and in the open air; and obtained 31,760 signatures to the total abstinence pledge.

The fame of Mr. Gough's eloquent and successful advocacy of Temperance having reached England, desires had frequently been expressed for a visit from him. Invitations had more than once been sent to him, but they were respectfully declined. At length, however, a Metropolitan Society—"The London Temperance League"—sent an invitation to him in terms so urgent that he found it impossible to refuse compliance. After consulting valued friends, he determined on a visit to his native country, and on the first of August, 1853, he and his wife arrived safely in the metropolis. He has delivered several addresses at Exeter Hall, and other places in London, as also in various parts of England and Scotland. The expectations raised by the reports which had reached England have, in every case, been more than realised; and so great is the anxiety manifested by the largest Temperance Societies in Great Britain to obtain his services, that it is probable he will prolong his stay till the summer of 1854.

The highest testimonials to his character, both as a man and as an orator, have been borne by ministers and gentlemen of the first respectability in America. In England, as in America, he has "swayed multitudes by his oratory; made strong men weep like little children, and women to sob as if their hearts would burst." His whole soul appears to be thrown into his discourses, and he succeeds in riveting the attention of his hearers from first to last, eliciting loud and repeated plaudits, and calling forth manifestations of feeling to an extent rarely observed in a public assembly.

An English journalist, whose judgment in these matters is considered sound,* says:—"Mr. Gough is a well adjusted mixture of the poet, orator, and dramatist—in fact, an English Gavazzi."—"If Gavazzi possesses more power, Gough has more pathos. This is the main difference, the chief distinction; and here the difference is in favour of Gough. Gough excels Gavazzi in pathos, far more than Gavazzi excels Gough in power."—"His air makes promise of nothing; and hence all that is given is so much above the contract. It is impossible to conceive of anything more entirely free from empiricism. From first to last, it is nature acting in one of her favourite sons. Oratorically considered, he is never at fault. While the vocable pronunciation, with scarcely an exception, is perfect, the elocutionary element is every way worthy of it. He is wholly free, on the one hand, from heavy monotony, and, on the other, from ranting declamation, properly so called. There is no mouthing—no stilted shouting. His whole speaking is eminently true; there is nothing false either in tone or inflexion; and the same remark applies to emphasis. All is truth; the result is undeviating pleasure, and irresistible impression. His air is that of a man who never thought five minutes on the subject of public speaking; but who surrenders himself to the guidance of his genius, while he ofttimes snatches a grace beyond its reach."—"Gough is a pattern to Temperance advocates."

* Rev. John Campbell, D.D.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER VI., PART VI.

On the morning after Agnes' arrival, upon Leonard's mantelpiece lay a note directed in the hand of Agnes; no longer a far-travelled letter, but a note left by a messenger. Leonard hesitated to break the seal, and he looked long and with a moody gaze upon that bold and rapidly-indited address. He paced up and down his room; he felt as though his doom were about to burst thundering over him. Where was the winged impulse of Love which should have transformed him into a very Hermes of speed? Instead of words of joyous, passionate welcome, his disturbed fancy hissed around him words of bitter reproach and reproof, and cold, stern eyes glittered hatefully in his imagination, like the fiery swords of the angels of Rebuke and Judgment. The secret voice of self-contempt also raised its bitter cry—his very life seemed frozen within him. Having so long yielded to morbid weakness, having so long permitted weeds to spring up unchecked from the rich soil of his nature, they now had choked the fair lilies and the gorgeous roses, and all the tender herbs and blossoms were dragged down into a tangle of confusion and misery. "Had only the gardener Love but tended the fair herbs, then would they have flourished and waxed into mighty forest trees," said the voice of self-excuse. "The gardener Duty was ever ready at his post, even were Love absent," whispered the voice of conscience; "but thou

turnedst away and wouldst not heed his advice. Behold the desolation of thy garden! were Love even to return, the garden would know him not."

"Dearest Leonard," ran the note, written in pencil and with a great haste visible in each word, "I am come back to surprise you—I have much, very much, of vital importance to communicate. I cannot write more—but come! you *must* not delay.—Yours, A. S."

Did Leonard speed to his betrothed on the wings of love? No. The words of the note jarred his every nerve. He paced up and down with a vacant misery. He pulled forth a sketch which he had begun—some way suggested to him by the sharpened features and form of little Cuthbert, as he saw him lying day after day upon his couch. The sketch represented an aged woman, a pilgrim as it were to some far off shrine, lying dead at the foot of an ancient cross. She had come up through the land of graves and of gloom. A sea stretched out beyond the barren place of sepulchre, and the uprising sun cast beams of light upon the waters and upon the sharpened rigid face of the dead. "The End of the Pilgrimage" was written beneath the sketch. As Leonard drew the recollection of little Cuthbert's sad white face, in which the simplicity of the child mingled so awfully with the expression of a life's pain and anxiety,—that face, stamped with the mystic and unmistakeable print of death upon the hollow eyes and skeleton-like profile, rose up before his soul, and blinded his eyes with tears, whilst a mighty longing seized him to soothe even for one hour that little pilgrim touching upon the threshold of the awful unknown. "Oh! why in the sight of the All-seeing One do I dare with base untruth to simulate a love which I do *not* feel?" cried out the nobler nature of Leonard. "It is love which binds my soul to this poor child; there is no deception in that, and now it speaks in these burning tears, in the mighty pity, in the unappeasable longing to soothe him, to clasp that tiny transparent hand, in the thought which makes his departure such unutterable pain. In the presence of the purified soul of this little pilgrim sunk at the foot of his cross, for whom the morning of immortality is about to break, let me gird up the loins of my resolution; let me shake off the fetters of a mean slavery; let me not do a base injustice to the woman whom I have once thought I loved. *She* does not love; thus her suffering, if she should suffer, will be but the sufferings of a wounded pride; and justice and nobility of soul Agnes possesses, if not *love*. The very words too of her note may have reference to some communication of her own relative to this very subject. Let me save her the pain; let me take the burden upon myself."

A transient gleam of energy shot forth through Leonard, and hastily laying aside his sketch, he seized his hat and went forth towards the Gaywoods, intending to sit a little while beside Cuthbert's sofa, and then proceed to Agnes.

The formation of a resolve even, be it a painful one, has something in itself so healthful that body as well as spirit are braced by it as by a fresh breeze from the ocean. Leonard walked along with a step almost buoyant; even the suburban trees and shrubs, and the blue May heaven arching over the roofs of houses, sent a waft of hope to his spirit.

The carriage of Dr. S. was standing before the Gaywoods' little gate, and that benevolent man himself was descending the steps as Leonard reached them. A peculiarly grave expression upon his countenance fell upon Leonard's heart with a sad foreboding—a cloud suddenly overcast the transient gleam.

"Poor little Cuthbert," said Dr. S., "I fear will not remain many days, if hours, with us. Miss Gaywood you will find much distressed. It seems also that her sister has always believed that the child must ultimately recover. I grieve that at this trying moment, when Miss Gaywood herself has so much to endure, there should be the necessity for her to inflict this fresh pain upon her sister. But I am sure they will wish to see you, Mr. Hale," pursued Dr. S., as Leonard, with a mingling of delicacy and cowardly shrinking from the sight of their hopeless misery, was about to turn from the door. "Little Cuthbert was asking for you whilst I was there; he seems extraordinarily attached to you. What a dreadful shock will this be to the poor child's father."

In the passage Lucretia encountered Leonard, her face was bathed with tears. "Dear, dear Leonard!" she ejaculated, "you will guess the sad news. How thankful am I to see you! Go in to the beloved child; he has had a wretched night, and in the delirious dreams which tortured him, was unceasingly conversing with you as though he were a grown man. A man?—what do I say?—as though he were a seraph! Oh, he loves you so much, so much, you can comfort and cheer him as we cannot, for he always has loved you more than he has loved us. Oh, I thank God that he sent you to us. I cannot yet come in, Leonard; the dear child cannot bear to see me weeping, and cuts me to the soul by his words of comfort. I must tell poor Mary the dreadful truth; she never has listened, for one moment, to a hint of the possibility of Cuthbert's dying. How can I prepare her and strengthen her to endure the blow? But go in, dear friend: stay with Cuthbert till I return."

Leonard found the child lying, as usual, upon his sofa, with his books, his little drawings, his flowers about him; but he was thinner, more spectral—the terrible fever of the night had been doing its fatal work rapidly.

"Dear, dear friend," cried the child, opening his heavy eyelids as Leonard softly unclosed the door, and stretching forth his arms eagerly towards him, "I felt you were coming. I've seen you all night, and we have been so happy, for we both were in heaven, and you were much happier than now; and we were gathering flowers such as do not even grow in dear India. I know they are all unhappy because I am going to die. I know Dr. S. told dear aunty Lucretia so, and I do wish I could comfort them—make them feel as happy as I do. I'm not unhappy now as I was when I came away from papa and dear India; or as I have been at school when I have quarreled with the boys and felt angry and bad. Do comfort them—you always have comforted me—you talk so beautifully, and are so gentle and kind. Oh, I do love you, dear," and the child raised his thin arms and encircled Leonard's neck as upon that first night when they met; and his little parched lips kissed again and again Leonard's bowed face. "Don't you also be sad, dear," said the child anxiously, as Leonard averted his face seeking to repress his emotion. "I'm sure we never shall be parted. Dear, dear man, don't be sad; I've a deal to say to you; sit down beside me, dear; take hold of my hand—there: that does me good. I've not much pain now. I've not had pain now for a long time, that is so nice, only I am so faint, and am not certain of all that I say; but I do not now trouble you, dear aunties, by being so fretful. Oh, it's you, dear. I feel—ah—I want to ask you something. I have known a long time—oh, long before aunt Lucretia, that I was going away, and have thought a great deal of dear Christ's words about dying, though I did not like to talk with people of what I knew, for it made them cry; but as I have lain upon the cushion, dear, beneath the trees and the sky, and you have talked or read so beautifully to me—all those words came clear to me—and oh, many, many things which I *can't* tell you even! And often, when you have thought me asleep, I've been thinking upon these things; how happy, how lovely those days were. Oh, how I do love you, dear! But one thing I have often, often thought of, and it makes me very unhappy. I do pray God will forgive me! I saw one day, when I first went to the school, a poor old man who was quite lame, and he hopped along in a very funny fashion; and I laughed quite loud, and began to hop as he did, and all the boys clapped their hands and laughed, and hopped also—the poor old man was very much hurt; was it not wrong; was it not wicked? I have so often thought of this since I was lame. I would give a great, great deal to ask that poor lame man to forgive me. I know now what a sad thing it is to be lame. I've always looked about for him when I was well enough to go out in my little carriage. But I feel better since I've told you, dear friend—but don't *you* ever be cruel—be unkind; it is a deal worse than death. I'm glad you are here, keep fast hold of my hand. I'm tired

now, I'll sleep—only don't move from me—I do so love you." Leonard leaned his head upon one hand, whilst the other grasped the boy's little fingers.

What strange visions may now have flitted ghost-like before the spirit of the child as it journeyed along the dim Valley of the Shadow of Death? Sunlight fell upon the rigid features—and birds and butterflies flitted about without on joyous pinions, and the cries of merry, robust children at play came into the still room through the open window! But the senses of little Cuthbert seemed already closed to all sound and sights of earth.

thought of death is a reality. To her, until now, that great school-master in the School of Life—Death—had read no lesson. And she, hearing his stern, relentless accents, finds the lesson one too hard to be believed. A fresh and unimagined consciousness of evil—sweet, joyous Mary—has entered into thy life, as pacing and weeping restlessly up and down that straight gravel walk, thou seekest to understand these mournful accents. Henceforth, at times of greatest joy and security, their echo will resound through thy heart, and a horror will have entered into thy soul, which will lurk behind each beautiful beloved form and feature.

THE END OF THE PILGRIMAGE.

And what strange and doleful visions arose now before the spirit of poor Leonard? Let us not seek to enter the torture chamber of that poor soul, where once more the rack, and the flame, and the pincers, and the saw were at their fearful labour. The child's placid but sharpened countenance lay statue-like upon the pillow, the face seeming to mature in its expression as hour after hour passed over. Lucretia and Mary, recalling the face in after years, always remembered it as the face of a youth and not of a child. At length, Lucretia having performed her painful task of preparing Mary for the sad climax approaching in the dear child, looked into the room, and there still sate Leonard, with bowed head, grasping the little hand. She silently breathed a prayer, and gazing with swimming eyes, glided forth again to seek poor Mary, who in an agony of grief was pacing up and down the straight walk of the little garden.

Mary's joyous and hopeful nature, in which life was so strong and beautiful, must endure a great struggle before the

CHAPTER VII.

Again the voice spake unto me,
Thou art so steeped in misery,
Surely 'twere better not to be.

Alfred Tennyson.

Guess now who holds thee? Death, he said. But there
The silver answer rang, "Not Death but Love."

Elizabeth Barrett Browning.

It is the morning of Agnes' arrival, and whilst Leonard sits holding the hand of the dying child, steeped in bitterest despair, self-contempt, and distrust of Agnes' love, poor Agnes waits with longing, listening, breathless impatience for Leonard. What joy to convince him by the greeting of love, brought from his uncle, that *his* interest, *his* happiness, have been a quickening thought in her soul during a long absence. What matters the loss of her long-worked-for papers! The awful sights and sounds of that terrible day and night, the glow of human sympathy which had electrified her being, cast

all personal loss into nothingness. "Oh, if he would but come—quick! quick!" cried the excited girl; "why did I

THE DEATH OF LITTLE CUTHBERT.

not more urgently word my note? but words upon lifeless paper sound so flat—so powerless; he must have been from

home—let me seek to calm myself; but every nerve still vibrates,—my ears still resound with the crash and the cries of that dreadful scene. My eyes, if they close, mirror back that whirling chaos of flame and vapour and swaying multitudes.

Oh, Leonard! Leonard! why do you not come? I long to hold your hand, and to assure myself that I am sane—that I possess a peaceful, a calm haven of rest. If there be communion of soul, you must—you must listen to my cry!" And Agnes, with excited hands, pushed back the hair from her throbbing temples, and with clasped hands, standing by the window, gazed with fixed searching eyes and listening ear. But hour after hour went by, and no Leonard arrived.

"Do you say that Mr. Hale left home at eleven *after* he received my note?" asked Agnes, with a forced calmness, from a servant whom she questioned in the course of the afternoon; no Leonard having arrived, and poor Agnes, after tortures of anxiety, impatience, and indignation, having once more despatched her messenger to Leonard's lodging.

"Yes, miss, Mrs. Buddle said she put the note upon Mr. Hale's chimney-piece, and she saw Mr. Hale reading it a long time as she was a fetching the breakfast-tray out, and then Mr. Hale had painted a bit, and took his hat and went out. She says she did wonder how he could stop painting just as usual, so quiet-like, after he got a letter from you, miss, and you just come back; but gentlemen says she is so—"

"That will do," coldly and sternly interrupted Agnes, and the gossipping woman withdrew to gossip to her heart's content below stairs.

Every word had been torture to Agnes. The door closed. Agnes clenching her hands together, for a moment stood white and rigid as a statue, then sunk her clenched hands upon the table, and falling to the floor upon her knees, buried her face in her hands—a heart-piercing low moan bursting from her lips; and so for a space she knelt. No tears flowed from beneath the burning eyelids. The moment had arrived when spontaneously, irrevocably, her soul severed itself from Leonard. "Henceforth he shall be as one dead to me," spoke the inward voice within Agnes' heart: "what miserable weakness to permit a phantom, a mere love of an ideal Leonard, to devour my life, my happiness, my career! God be praised, life is rich in a thousand ways! Yet—yet to have possessed in Leonard the unutterably dear friend whom I have dreamed—to have been all in all to him—to have been doubly strong in each other, I in him and he in me! Oh, what joy, what deep, deep, blessed joy! But, alas, alas! that cruel voice which has ever whispered of his coldness—his carelessness; that, *that* was the truth. No, *he* never burned with the ardour of *my* love. No fire of devoted passion burned within his heart! But *that* fire smoulders within my heart ready to leap forth into a mighty conflagration: but it shall not kill—destroy,—it shall, O Father in heaven, through Thy aid, flame forth only to kindle noble love and devotion in other hearts. My work in the world shall be wrought out alone through this mighty love—*it* shall be my husband, my beloved. Father, I thank Thee that I am snatched away from the brink of a great misery—from this treachery: for the sake of this strongest impulse of the soul and being, I can crush all tender thoughts of a cruel phantom. Leonard does not and *never* loved me; this I see clear as the sun. Thus am I severed from him, and he from me. I pray heaven I forget him—I shall, I do. I am happier, O God, than I have been for long." Agnes arose from her knees—a strange light burnt in her eyes, her usually pale cheeks glowed crimson, her lips were streaks of vermilion, her frame trembled with a strange ague-fit; and yet her countenance was that of a victor, and not of the vanquished. Up and down the little chamber she paced—the air oppressed her—the sounds of the awful fire at Hamburg roared in her ears, mingling in delirious confusion with the thousand fancies of her overwrought brain. "I stand upon the eve of a fresh chapter in my life: I shall never see Leonard more—I *will* not—if his love did not dictate an instant meeting with me, it is a miserable love, unworthy of the name. He shall be freed from his bondage. I will never more see the face of one who has been so unutterably dear. I will write to him, telling him of his uncle's words—that shall be my revenge. Let me to the last offer him only deeds of love and words of kindness. As the words of a guardian angel shall be the words of my letter;—but—no never, never, never more will I see him. And my dear papers—my lost manuscripts—the labour of three long months! But what is that loss, the loss of Leonard, to the losses, the agonies, the burning frenzies of those poor sufferers in this mighty conflagration! Would that I knew what tidings were received!" Agnes bathed her burning cheeks in water; she flung open her window to gain a breath of air; but her lips were parched, her very brain seemed scorched and seared. As evening began to gather, and the golden rays of sunset glowed upon the windows of the houses opposite Agnes hurriedly walked along the dry, warm pavement of the narrow, quiet street in which she lived; she was seized with an impetuous longing after physical action; repose she could not, weary and exhausted to the last degree as was her frame. Calling a cab, and ordering the driver to drive as rapidly as he could to the outskirts of the great city—she cared not whither, only that it must be where were green fields and fresh air—she was soon driving along one of the great crowded thoroughfares leading from the heart of the heat and fever of the metropolis into suburban verdure.

SIGNS OF OLD LONDON.

Within two doors of Cheapside, there is a head with a large feather or other projection shading the upper part. Of these singular-looking relics, there are many scattered over the city. At the back of this house, in Paternoster-row, there is another specimen peering out from the centre of plain brick surfaces, ill according with the present style of architecture. These relics may have been inserted as mementos of the old building which was destroyed at the great fire. There are four others to be seen in adjoining houses in Queen-street, and which are well worthy attention. Two of them have the evidence of high antiquity. The mode of decorating of the hair in one case corresponds with that of the costume in the time of Henry III., whilst another may very possibly be a relic of a far earlier date. In many instances they can be accounted for as marking the property of the Mercers' Company, as in the examples to be found in Gracechurch-street, where they are evidently their crest, and have the distinguishing mark of the crown on the head. While these have, in most cases, no reference to signs of tradesmen, nevertheless we find them sometimes called the "Maiden Head," which was by no means an uncommon sign. In like manner the "Dolphin" and "Mermaid" were appropriated from the arms of the Fishmonger's Company.

In Upper Thames-street, next to the church of Allhallows Great and Less, is a singular sign of an enormous size, and which in that respect is unequalled by any in London. It belongs to a public-house, and the subject is an "Hour Glass." Nearly opposite to this in the same street, and placed flat against the walls of an old warehouse, is a painting on a metal plate of a "Leather Jerkin." This unique specimen is worthy attention in connexion with costume. The inscription is too much effaced to decipher more than a few detached letters. The similarity in the form of the dress has given rise to very absurd traditions of the watermen in the neighbourhood, who connect it with the "coat and badge" given by Doggett, to be rowed for annually, but to which it has no evidence of shewing any reference.

In Lower Thames-street there is another specimen of a "Sun," very similar to the one in the Poultry, with the exception of the date, which is the same, appearing below the figure.

In Fenchurch-street, at a grocer's, are seen "Three Sugar Loaves" projecting, and gilt and surmounted by a "Crown;" and near to it, at another of the same trade, is a similar sign with a "Star" above, in which is the date 1725.

In Little Distaff-lane, in stone, against a house, is a shield with a book with seven seals and three crowns, which are the arms of the University of Oxford.

Over the door of a grocer's shop in Gracechurch-street, near Fish-street-hill, is a very good specimen of the sign of a

"Grasshopper:" it is of metal, gilt; and the fact of the spot being very near to the house of Sir Thomas Gresham, favours the tradition of its being his identical sign. His shop was near the end of Lombard-street. Near the other end of the same street, within a few doors of Leadenhall-street, is a fair specimen of a "Black Boy:" this is carved in wood.

In Leadenhall-street, at No. 36, is the sign of an ornamented "Key," suspended with the handle downwards, in which is inscribed the date 1713. Within a few doors of the East India House, against the house, is a large carved shield, on which are the bearings of three mitres.

In Aldgate is a gilt sign of the "Head of Galen," over a chemist's shop, date of 1765; and another of the same subject in the Minories.

In Clement's-lane, within a few doors of Lombard-street, is a good stone sign inserted of "Three Foxes," with a date of 1668. This sign is worthy of remark from the very spirited manner in which the subject is treated. The attitude of the triad is curious, the foxes being seated in a remarkably upright posture. The subject itself is also worthy of notice, and capable of speculation as to its origin and meaning. The immediate locality being directly opposite to Three Kings'-court, suggests a notion of a satirical allusion to the three kings. The fact of the number three so often occurring in different signs, and in connexion with subjects which appear to afford no explanation, is worthy also of passing notice. One, however, may be offered, and that is that three objects are often described in coats of arms in the shield, which first may have been used as an armorial bearing, and afterwards retained as a sign; and another of the mystic number, as in the case of the seven stars before referred to.

In Paternoster-row is the sign of the "Bible and Crown," inserted in a niche over the window of a house long famous for the publication of religious works.

In the Old Jewry, against a house, is a large carving of an eagle or griffin, which perhaps is merely a fragment of the original sign.

The Museum of Guildhall contains, amongst other city relics of antiquity, the stone sign of the "Boar's Head," in East-cheap. This marked the spot where formerly stood the inn mentioned in Shakespeare's "Henry IV.," and is an exemplification of a desire after the great fire of London to identify spots which were dear to the old citizens by early associations.

In King-street, within a few doors of Snow-hill, is a piece of spirited sculpture in stone, inserted, representing the figure of "St. George and the Dragon," in high relief, with the date of 1668. It is the sign of the "Old George" inn.

In Holborn there are few signs worthy of note from their antiquity, with perhaps the exception of the "Bull" inn.

On the Surrey side of the Thames there are many curious relics. A short distance from Blackfriars'-bridge, is the sign of a dog eating out of a three-legged pot. There has been much speculation as to the origin of this singular sign. In Akeman's list of tokens we find No. 1442, "The Dogg's Head in the Potte in Old-street," and No. 1610, "Oliver Wallis in Red Cross-street, O. I. W., 1667," each of which has on it the device of a dog eating out of a pot.

In several towns in the west of England the same sign occurs, and its antiquity is undoubted from the fact of its being mentioned in the old poem of "Cock Lorrels Bote."

> "Here is saunder sadeler of froge strete corner,
> With Jelyan Joly at sygne of the bokeler,
> And mores moule taker;
> Also annys angry with the croked buttocke,
> That dwelled at ye sign of ye dogges hede in ye pot,
> By her crafte a breche maker."

The old stone sign of the "Dog and Duck" may be seen inserted in the wall of Bethlehem Hospital, on the garden side. This relic formerly decorated the well-known place of entertainment. It represents a dog with a duck in his mouth, with the date of 1617 engraved in the stone.

These notices and remarks of the old London signs will, doubtless, be very unsatisfactory to the antiquarian rambler who may be in search for historical relics. The sketch could easily have been extended to a considerable length, as many of the subjects introduced are capable of a separate essay in the hands of a zealous antiquary. That, however, has not been the object of the author of these remarks; but merely to introduce the subject and leave it for others more able than himself to do greater justice to it. There are, no doubt, very many relics of old signs still in existence, and which are worthy of record, in obscure situations, or which are preserved in other parts of the houses than meet the eye in a pilgrimage through the street. The subject has hitherto met with little attention, except in desultory and incidental notices. This has, probably, arisen from its not appearing of sufficient importance; but when we consider that the quaint sign has played its part and formed a prominent characteristic in the customs of old London, has been used to decorate the residences of its most eminent citizens, and is stamped on the title-pages of the choicest treasures of our libraries, it is presumed it will require no further apology for offering it to the readers of THE MAGAZINE OF ART.

THE LIGHTHOUSE OF CORDOUAN.

THIS celebrated French lighthouse is built upon an isolated rock at a short distance from the mouth of the Gironde. It was commenced in 1584 under Henry III., and finished in 1610; but considerable alterations have been made since that time. It was originally designed by Louis de Foix, the architect of the Escurial, who is said to have died there, and to have been buried within it. The same rock was formerly occupied by a lighthouse founded by the Black Prince, when the English held possession of that part of France.

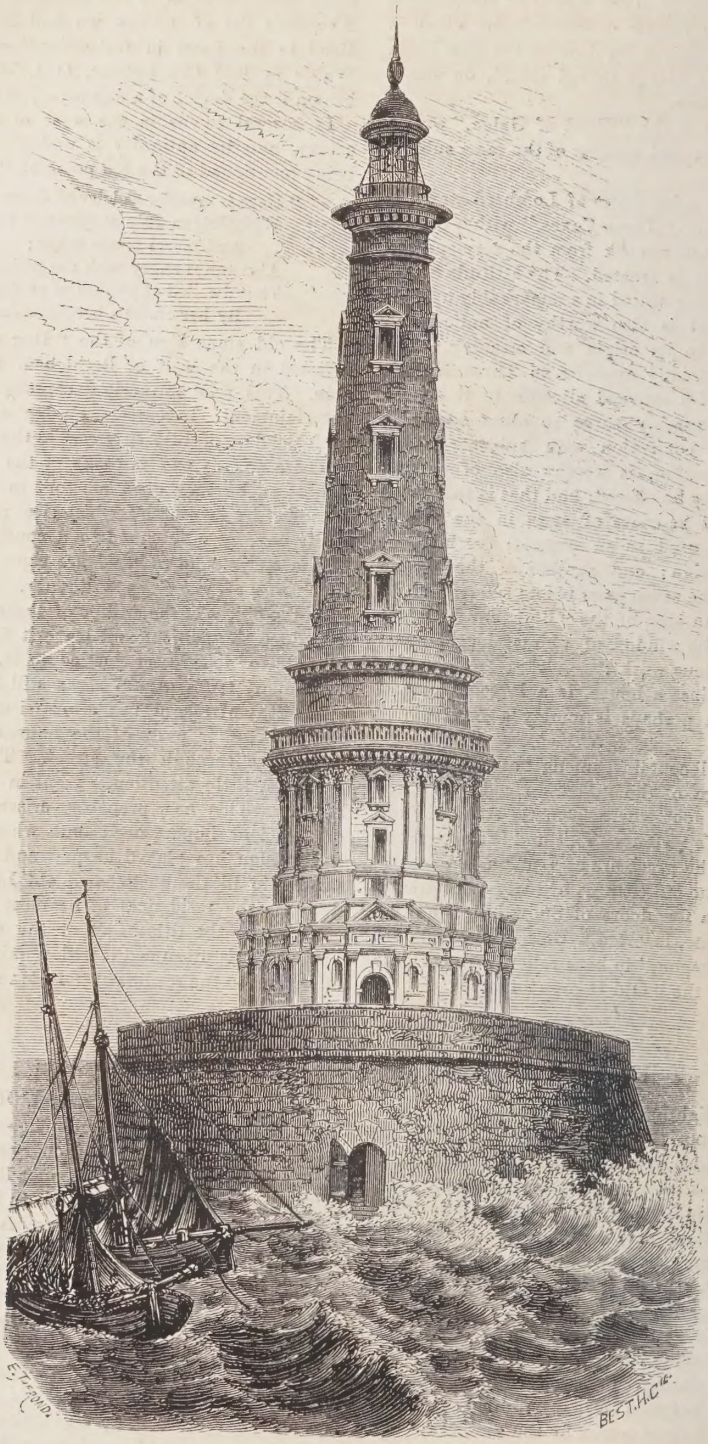
The neighbourhood of the Gironde is peculiarly interesting. It is one of the most flourishing vine districts in France. The aspect is that of an undulating country, affording here and there peeps of the river between the gentle hills and valleys which intersect it. The vintage occurs in the month of September, and then the banks of the Gironde present a scene of activity and bustle. Every road is crowded with ox-carts and cheerful groups of pickers; the air resounds with songs and laughter. But beautiful as the locality appears, it abounds in marshes and stagnant pools which render it unhealthy; and gay and cheerful as are the groups of vine-dressers, fearful scenes have been enacted on that very ground. There raged the horrors of the civil war, when the revolutionary party overcame their antagonists the Girondins, and swamped even the very name of the department. One cannot regard the old lighthouse—la Tour de Cordouan—without remembering the deep tragedy of the revolutionary struggle, when the lily of St. Louis gave place to the Bonnet Rouge.

The present building is elegant in form and rich in architectural ornament. The structure is circular, the vestibule extensive and carefully fitted up, while the lofty turret is surmounted by the lantern, the light of which affords a safe guide to mariners entering the estuary of the Gironde. The first story of the tower is known as the king's apartment, richly and profusely ornamented, the exterior decorated by a colonnade of Doric pillars which support the first gallery. The second story has been consecrated as a chapel, and is of a circular form, enriched by Corinthian pillars and sculptures of great beauty; it is lighted by a double range of windows, while over the entrance to the chapel is a bust of the architect, Louis de Foix, admirably executed, together with an appropriate inscription. The tower which rises from the summit of the chapel is occupied by a winding staircase, lighted by large and elegant windows; a gallery surrounds the pharos, from which a commanding view may be had of the neighbouring coast line.

The lighthouse of Cordouan is more richly ornamented, and

possesses greater attraction in an architectural point of view, than any other on the coast of France. In structures of this sort attention is usually absorbed in the utility of the building rather than in any graceful appearance which it may present to the eye. But both beauty and utility have been united in this edifice not only beautiful, not only valuable in the navigation of the coast, but also a noble model of what such structures might be made.

The number of lighthouses on the French coast was, in 1839, fifty-nine; since that period the number has been aug-



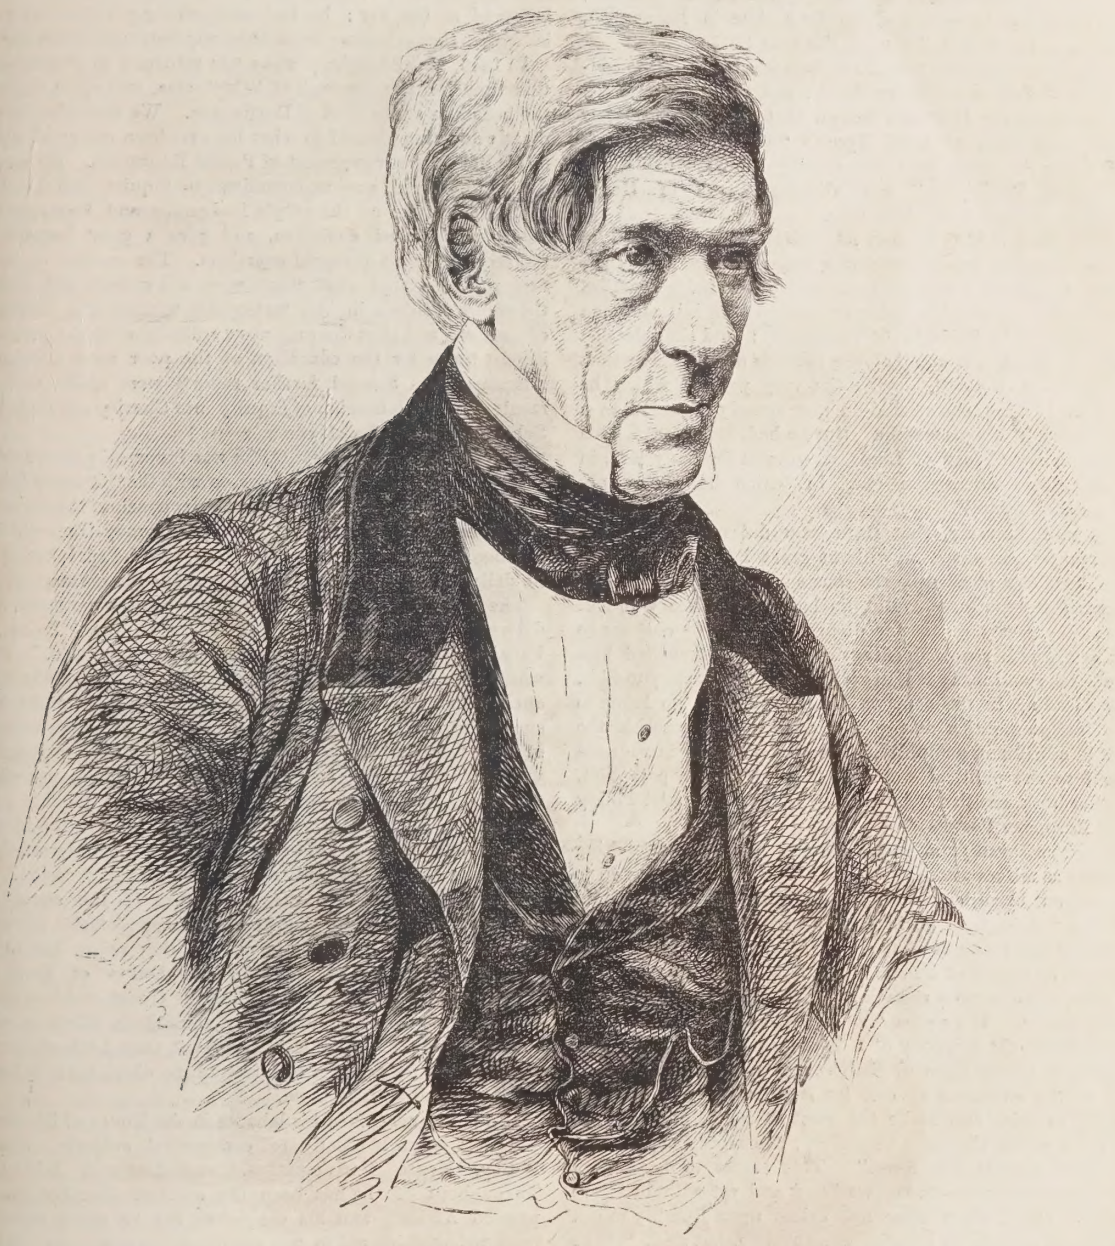
LIGHTHOUSE OF CORDOUAN.

ancient specimen; the harmony of its proportions, and the perfection of its decorations, are worthy of the strength of the tower and the firmness of its foundation. In these days utility is the great object of an architect, and for this taste is sometimes sacrificed and harmony disregarded; but Louis de Foix, in this sublime monument of his genius, has left an

mented to 169, comprising thirty-seven of the first order. The beacon tower of Cordouan is one of very great importance, as the mouth of the Gironde is beset with sand-banks, rendering the passage difficult and dangerous to mariners quitting or entering the river. For antiquity, beauty, and utility, this lighthouse is peculiarly interesting.

LORD BROUGHAM.

Henry Brougham was born in the house, No. 19, St. Andrew's-square, Edinburgh, in the year 1778. His father was a Westmoreland gentleman, of old Saxon family, who, while travelling in Scotland, became acquainted with Miss Eleanor Lyme, niece of Professor Robertson, the celebrated historian; he married that lady, and took up his abode in Edinburgh, in the house above named, where the subject of our memoir first saw the light. He was educated at the High-



HENRY LORD BROUGHAM AND VAUX.—FROM A DAGUERREOTYPE BY BEARD.

chool of Edinburgh, and at fifteen entered the University of the ame city. Leonard Horner, who was an infant playfellow of Brougham, on the pavement in St. Andrew's-square, was also is college contemporary, and augured great things of him. They were admitted members of the Speculation Society at he same time—a society in which Lord Lansdowne, Lord ohn Russell, Jeffrey, and many other distinguished men, first xercised their oratorical powers. Writing to a friend, Horner thus alludes to Brougham—then a youth of nineteen or twenty:—"Had you any conversation with Brougham? He is an uncommon genius of a *composite order*, if you will allow me to use the expression. He unites the greatest ardour for general information in every branch of knowledge—and, what is more remarkable, activity in the business, and interest in the pleasures of the world—with all the powers of a mathematical intellect. Did you notice his physiognomy?"

Even at that early age Brougham's physiognomy must have been something remarkable. His is one of those remarkable faces which distinguish men from the common order; and a face like Brougham's does not change much. There is nothing soft nor beautiful about it; it is louring, stern, hard, and almost repulsive, and yet with a wonderful softness about it when lit up by a smile. The chin is long and squared; the forehead high; the cheek cold and brassy; the nose, mouth,

and eyes seemingly huddled together in the centre of the face. No—Brougham never could have been good-looking, even as a youth; and therefore we wonder not at the query of Horner to his friend, "Did you notice his physiognomy? I am curious to know your observations on it."

Brougham, as a youth, did not seek the "primrose path of dalliance." From the first, he was a hard and energetic worker. Mathematics were his favourite study; and within a year after his matriculation at college he transmitted to the Royal Society a paper on *Porisms*, which was duly published in the "Transactions." Other papers followed, which led to a correspondence with foreign scientific men, conducted in Latin His college studies over, Brougham travelled abroad, and on his return he settled down for a time in Edinburgh, practising at the Scotch Bar until the year 1807.

It was about this time that Brougham was brought into contact with Jeffrey and Sydney Smith, and the *Edinburgh Review* was founded. It is now known that the slashing review in that publication of Lord Byron's "Hours of Idleness," which stung the noble poet into writing his "English Bards and Scotch Reviewers," was the handiwork of Henry Brougham, written in his 29th year.

By this time, 1807-8, he had left Edinburgh and settled in London, where he was shortly after called to the bar by the Society of Lincoln's Inn, and engaged in extensive practice. His always indefatigable industry pointed him out as a man to be employed in business of emergency; and the selection of him to plead the cause of the English merchants against the Orders in Council, during the very year in which he settled in London, shows that he was already regarded as a man of mark in his profession. But he had, before then, been engaged in the House of Lords, as counsel for Lady Ker, in the Roxburgh Succession case, in which he honourably distinguished himself.

It is said, however, that Brougham did not acquire his wonderful powers of speech without great labour. His first efforts, both as a pleader in the courts and as a debater in the Commons, were failures. But he had extraordinary pluck. He was never cast down nor disheartened. He only set to work again with renewed energy. His mind travelled into all subjects; and many languages were made tributary to him. After pleading in the courts all day, he would go home to study foreign politics at night, and forthwith publish the result in a brilliant pamphlet. He first publicly introduced himself to the political world in this way by a pamphlet, or rather book, entitled "An Inquiry into the Colonial Policy of the European Powers."

Brougham, even from youth, seemed to watch his waking moments as misers watch their gold. Not one was allowed to pass without being laid under contribution. Hazlitt has said of him, "Brougham is, in fact, a striking instance of the versatility and strength of the human mind, and also, in one sense, of the length of human life. If we make a good use of our time, there is room enough to crowd almost every art and science into it. If we pass 'no day without a line,' visit no place without the company of a book, we may, with ease, fill libraries, or empty them of their contents. Those who complain of the shortness of life, let it slide by them without wishing to seize and make the most of its golden minutes. The more we do, the more we can do; the more busy we are, the more leisure we have." This seems to have been Brougham's practice—to be ever busy, and yet withal to have leisure! Once, when some one called upon Romilly to ask him to edit a book, he pleaded want of time, but said, "Take it to that fellow Brougham—he has time for everything."

In 1810 he entered Parliament as member for Camelford, a rotten borough belonging to the Earl of Darlington. Being a Whig and Reformer, he attached himself to that party, and, consequently, remained long in Opposition. Although, in an early number of the "Edinburgh Review," he had written an article somewhat hostile to the slavery abolitionists—then believing the struggle to be only one between the East Indian merchants and the West—he took his side by Wilberforce and Granville Sharpe, and spoke more than once on the same side. But his first appearances were unsatisfactory; and it was not until he had been some time in the House, and delivered his speech on the Rights of Admiralty, that he began to excite attention. Horner speaks of this speech as a triumph, and predicts great things from his parliamentary career:—"I would predict," says he (and this was written forty years ago), "that though he may very often cause irritation and uncertainty about him to be felt by those with whom he is politically connected, his course will prove serviceable to the true path of liberty and liberal principles."

At the general election in 1812, Brougham contested Liverpool with Mr. Canning, but was defeated; and for four years he remained out of Parliament. During the interval, he laboured at the bar; he had an immense practice, and probably got through more work than any barrister of his day.

In 1816, Mr. Brougham was again returned to Parliament, this time for the borough of Winchelsea, and again through the influence of the Earl of Darlington. We find him immediately devoting himself to what has ever been one great object of his life—the advancement of Public Education. He moved for, and obtained, a select committee to inquire into the state of the education of the people in London and Westminster. He was appointed chairman, and gave a great impulse to the inquiry by his personal exertions. The committee, in its first report, stated that there were a hundred and twenty thousand children in the metropolis without the means of education; and that the numerous splendid charities provided in past times for the education of the poor were grievously mismanaged. Several further reports were made, and the result was, a commission of inquiry into Charity and Endowed Schools all over the kingdom.

Brougham's popular reputation was immensely increased in 1820 by the part he took in connexion with the "Queen's Trial," as it was called. He was the leading counsel on the occasion, her Majesty having appointed him her Attorney-General. His exertions in this cause were prodigious, and the speeches which he delivered on the occasion were perhaps his greatest efforts.

The orator succeeded. The government announced their determination to proceed no further with the "Pains and Penalties" bill, and the Queen was thus "acquitted." Such was the popular verdict at least. The public joy was without bounds. A spontaneous illumination in London for three successive nights, followed the announcement of the triumph of the Queen's cause. The witnesses for the prosecution were burnt in effigy, again and again; the newspaper offices which had taken part against the Queen were mobbed; and Brougham, Denman, and their coadjutors became the idols of the nation. There could be no doubt of the disinterestedness and courage of Brougham and Denman on this occasion. By exposing themselves to the displeasure of the court and government, they shut themselves out from official advancement in their profession—not only in that reign, but in the reign that was to succeed—for the Dukes of York and Clarence were both arrayed against the Queen and her cause. Brougham and Denman, however, could both afford to wait; they suffered for a time, it is true, but they both ultimately earned the lofty position and reward, to which their splendid merits so well entitled them.

Brougham continued his labours in the House of Commons, devoting himself chiefly to commercial subjects, Foreign Policy, Negro Emancipation, and National Education. Throughout life he has been the untiring friend of the oppressed African, and his eloquence has on many occasions rendered valuable aid to the anti-slavery cause. In 1820 he introduced a bill to provide gratuitous education for the poor of England and Wales, but it met with such determined hostility from the clergy, that he abandoned it in despair. In 1823 Mr. Canning took office, and it was rumoured, that he who had heretofore been friendly to the Catholic claims, now intended to make sacrifice of the cause. Some words which he had let fall in debate had been construed in this light, and the friends of the Catholic claims unitedly fell upon him as a renegade.

On the night of the 17th of April, a debate occurred upon

petition presented in favour of Catholic Emancipation, in which Burdett, Tierney, and Brougham all spoke vehemently against the minister. Brougham's speech was the most severe. At the outset he was hesitating, disjointed, and somewhat rambling, as is his wont in opening up a subject. He cited instances of the humiliation of genius at the throne of power, and of dereliction of principle for the sake of office; he went on accumulating a cluster of such illustrations, and then, growing in vehemence, and increasing in rapidity of utterance, he glared his eye and pointed with his finger, to make the aim and direction sure. Canning sat in constrained silence, obviously ill at ease, writhing his body to this side and that, as if to find some shelter from the storm. The most perfect stillness hushed the House; every member held his breath; and it is said that, in one of the pauses of Brougham's speech, a clerk let fall a pen on the floor, the sound of which was audible in the far gallery. But on went Brougham; his stiffness and awkwardness clean gone, every feature working with excitement; and down came his terrible accusation of Canning, "that his acceptance of power had been the most monstrous truckling for office that the whole history of political tergiversation could present."

At length Canning could endure no longer. His prudence left him, and starting to his feet, his cheeks flushing, his nostrils quivering, and his eyes almost glaring, he exclaimed—"I rise to say that that is false!" There was dead silence for a few moments, and even the Speaker seems to have been taken by surprise. At length he broke the silence by expressing a hope that the Right Honourable Secretary would withdraw the expression. He refused to retract "the sentiment," and Mr. Brougham to withdraw the imputation. But at length, after "explanations," and with the aid of friends, the quarrel was composed, and Brougham and Canning afterwards shook hands in the House.

In the year 1823 we find Brougham co-operating with Dr. Birkbeck in the foundation of the London Mechanics' Institute; and in 1825 he was exerting himself to establish a University in London, in which he ultimately succeeded. Indeed, the University of London, of which he seems to be the permanent Lord Rector (though not called by that name), was mainly founded through his untiring exertions. About the same time (in 1825) we find him engaged in another movement for the Popular Education of the masses—namely, the establishment of the Society for the Diffusion of Useful Knowledge, the object of which was to prepare, and circulate among, the working classes cheap books and treatises of a much higher character than had formerly been accessible to them. The *Penny Magazine*, among the first of the higher-class cheap periodicals, sprang out of this movement; and unquestionably this and the other admirable publications of the Society gave an impetus to the cause of popular education, of which we are still reaping the benefits.

King George died, and was succeeded by his brother William; on which a general election took place in 1830. Political feeling ran high at the time; the Reform movement was acquiring power; and it had been considerably increased by the revolutionary events which had occurred in France. Brougham was looked upon as one of the greatest men among the Liberal party; and, in proof of the estimation in which he was held, he was invited to stand for the largest constituency in England—that of Yorkshire. His electioneering canvass of that county is spoken of as something quite extraordinary and unprecedented. The district to be canvassed was of great extent, and no candidate had before ventured upon a personal canvass as Brougham did. He devoted about a fortnight exclusively to the work, during which he travelled by night and day: he had relays of horses at intervals, stopping at all the chief towns and large manufacturing villages, where he appointed meetings of the electors—in schools, chapels, and public rooms; and these he addressed, some at cock-crow in the morning, others in the forenoon, at mid-day, in the evening, and, in some places, the people assembled at midnight to receive and hear him. He travelled many hundreds of miles in the course of this canvass, sleeping little and talking enormously. The canvass was a triumph; and Brougham was returned the representative of the largest constituency in England: he himself said that he had thereby arrived at the pinnacle of his fame.

But he went higher yet. A Reform ministry came in, and it is said the Mastership of the Rolls was offered to Brougham, but declined; and his name shortly appeared in the list of the new ministers as Lord Chancellor. We are not about to describe his acts or conduct in that high office. Perhaps more are disposed to blame than to vindicate him while in power. O'Connell used to say that he considered himself "the best-abused man in Europe;" but Brougham shared with him in this honour, if such it be. His appearance in their Lordship's House was dreaded as a spectre of revolution; and certainly he disturbed the equanimity of the debates in the Upper House by occasional extraordinary displays of his peculiar oratorical powers. He was Henry Brougham still, though now a Lord. The nature of the man was unchanged, and he continued the same restless, indefatigable, hard-working, versatile genius that he had ever been. Take an instance. He was sworn in Lord Chancellor at twelve o'clock, and at six o'clock of the same day he had laid on the table a bill to reform the abuses of the Court of Chancery. In the capacity of Lord Chancellor, he got through an enormous amount of work, and cleared off in a wonderfully short time the long arrears of business which had accumulated under Lord Eldon. Lawyers said he was hasty and impetuous in his procedure; and not always sound in his judgments—one of which was reversed by the King in Council. Indeed, the satirical remark was made of him by an eminent lawyer, that "if his Lordship knew a little law he would then know a little of everything." But he was doubtless of great use, and we are now profiting by his labours in Law Reform—especially in the Law of Debtor and Creditor, and in the Law of Bankruptcy. He also originated the excellent County Court system, his object being "to bring justice home to every man's door."

But Lord Brougham was felt to be a man who did not work well in harness. He was constantly leaping over the traces. So, when a change of ministry took place, and a new Liberal ministry was appointed, Lord Brougham was not included. Since then, his career has been pronounced to be somewhat erratic; but he has held by his early principles, though he may not have chosen to take the particular course prescribed by the party of the time. His mind is of too original and eccentric a cast to allow him to follow quietly in the track of a party: and, consequently, no party relies upon him. On that fruitful topic, however, we shall not venture to dilate.

It remains for us to say a few words on his lordship's career as an author and a philosopher. His optical discoveries and discourses have won him an honourable name in France. He has contributed several able treatises to the publications of the Society for the Diffusion of Useful Knowledge; that upon the "Pleasures, Objects, and Advantages of Science," is one of his best, and is most popular, simple and clear in expression, and exceedingly interesting. His work on "Political Philosophy," written for the same society, is a very able book, but little known. On his loss of office as Lord Chancellor, he devoted some portion of his leisure to the illustration of "Paley's Natural Theology," and he afterwards published a valuable Treatise, originating in conversations with Lord Althorp, on the same subject. Since then, he has published two series of "Lives of Men of Letters and Science, in the time of George III.," which have had an extensive circulation, and been deservedly admired. But his greatest work, unquestionably, is the Edition of his Speeches which he has himself corrected and published. That work will be his best monument; forming, as it does, a collection of the finest master-pieces in modern oratory. It is in this work that posterity—while it will, happily for him, have lost the record of his weaknesses—contemplating the value of his services, will place him amongst the foremost men and greatest benefactors of his age and country.

BALMORAL.

Balmoral Castle, the Highland residence of Her Majesty, is situated in the county of Aberdeenshire, some five hundred and fifty miles from London. The house and grounds belong to the united parishes of Crathie and Braemar, on the south side of the valley of the Dee. The castle stands on a beautiful level, while

> "The Dee's silver stream rolls his swift waters near,
> Gilt with the golden sunbeams here and there."

The villages of Ballater and Castleton—pretty retreats for a few months in the summer, and rendered of somewhat more importance than hitherto by virtue of their vicinity to royalty—are each about eight miles distant from Balmoral, the one *up* the river and the other *down*; but the quiet of the place is seldom much disturbed by visitors, the nearest post-town, Aberdeen, being fifty miles away, and the roads onwards but indifferent.

The parish church manse, with the school-house and post-office, are distant about half a mile from the castle, on the opposite side of the river, which is here crossed by a suspension bridge. The few cottages thereabouts are hence called Crathie Bridge. All the district, from Balmoral up towards the source of the Dee, was once covered with dense masses of trees called Marr Forest; and, even now, much wood remains on the Braemar side of the castle; so that, with the extensive plantations of fir and larch, which have been formed by order of the Prince, the wood around the castle subserves a double purpose—that of ornament, and shelter for the deer and other game on the estate.

The Castle of Balmoral formerly belonged to the Earl of Fife, who let it on lease to the late Sir Robert Gordon, brother to the Earl of Aberdeen. After the Queen's first visit to Scotland, several years since, she expressed a desire to possess a house of her own among the mountains, and this wish becoming known, it was proposed to Sir Robert Gordon to offer his house to Her Majesty. Sir Robert complied, and Prince Albert became the purchaser of the estate, together with the adjoining property of Abergeldie at Birkall. Having been thus suddenly raised from the condition of a gentleman's shooting box to the rank of a royal palace, Balmoral soon underwent considerable alterations and improvements. During all the spring and summer months, for several years, the sounds of the carpenter's hammer and the mason's saw were heard amid the quiet woods around the house, and many were the alterations and transformations that took place before it was considered in a fit condition for royalty to reside in; but as the end of the parliamentary session came round, the sounds were gradually stilled by all descriptions of labour being quietly put aside for a season, and the Queen and Prince, with the young family, came and took possession of the mansion. As year succeeded year, the castle increased in size and importance—tower being added to tower, and apartment to apartment, and wing to wing, till at last it assumed a very picturesque and handsome appearance. To be sure, there was no particular order of architecture observed; but the mixture of castellated towers, conical turrets, pointed gables, &c. erected at different periods, just as fancy or necessity dictated gave to the whole pile an imposing, old-fashioned, and home like aspect, quite at variance with our notions of royal palace in general, and like none other in particular. The magnificen George IV., "the finest gentleman," &c., built a palace a Brighton, which looks like a toy for the top of a giant's twelftl cake—a palace indeed, which, considering its cost and the poo return which the public have eventually got for their money gave the English people rather a distaste to kingly architects But as neither Osborne (the royal summer residence in th Isle of Wight), nor Balmoral, has cost one penny of publi money, either for the original purchase, or subsequent altera tions; and as the Queen and her husband have show themselves neither extravagant nor careless of the feelings o the people; their movements are regarded with a love an devotion to which the "finest gentleman," &c., was a complet stranger. Thus it is that, year after year, the royal progress t Balmoral is hailed with delight by every man, woman, an

BALMORAL CASTLE.

hild—"from peer to peasant"—along the whole route from Euston Square to Aberdeen.

As the royal circle has increased, it has been found that he old castle at Balmoral, in spite of numerous extensions, is nadequate for its requirements; and orders have been given or the erection of a new and more commodious house a few ards distant. We have no doubt the same sound economy, rudent management, and good taste with which all Her Majesty's household concerns are conducted, will be found o have presided over this necessary addition; and we are uite sure every one of her loyal subjects will unite with is in ardently desiring that it may add greatly to the comfort f the whole royal family.

Standing as it does in the lovely valley of the Dee, surounded by all the beauties of Highland scenery—never so eautiful as in autumn, when the heather bells are in blossom nd the yellow gorse throws a liberally golden hue on the hills nd valleys—Balmoral may be considered one of the finest esidences, in point of situation, ever possessed by royalty. mediately above the fall, and a fog-house has been erected just in front of the fall, commanding one of the most picturesque views imaginable—a very Niagara in miniature. Further up the valley are several other romantic falls, among which may be mentioned those of Cornenuelgie, Quoich, and the Linn of Dee.

At about six miles distance over the hills, in the valley of Glenmunick, stands a cottage surrounded by a few trees, which is known by the name of the Hut. It is nothing more nor less than a gamekeeper's lodge; but her Majesty having taken a fancy to reside in it occasionally, she has had its little rooms furnished and made comfortable, and often remains here for days at a time. It is surrounded by the wildest and most romantic scenery imaginable: the crested summit and rocky sides of "dark Lochnagar" tower in all their majesty behind, while in the foreground lie the dark silent waters of Loch Muick—a sheet of water four miles in length, closed in on either side by steep hills whose shaggy sides descend abruptly into the water.

BALMORAL CASTLE.

n every direction, the view from the house is grand and icturesque. A writer in a local guide-book thus describes :—"From the castle whithersoever the eye is directed, it tches glimpses of enchanting scenery, in which the beautiful lends with the sublime, and the picturesque rises to the mantic. Eastward, the view is bounded by Craig-auarroch (the rock of oaks) and by the precipitous chasm called ie pass of Ballater. Westward, beyond the military road om Braemar, which winds by the hoary Cairn-na-cuimhire, ay be obtained some glorious peeps of the pine-clad heights Invermulet. Southward, the eye reposes on the soft and agrant foliage of the Birks of Craig-au-gowan; and northard, the Dee winds its silvery course amid a hundred eathery hill-tops, with a dark curtain of inaccessible mountin behind."

Nor are the environs of this delightful residence less inviting. bout four or five miles up the valley, in the forest of Balloch ay, is the fall of Garrawalt, formed by a mountain stream ashing with impetuous fury down a narrow glen, dark with ees. A neat wooden bridge crosses the boiling stream im-

It is almost needless to say that the royal family are beloved by the peasantry round about Balmoral. No military cortége attends their footsteps as they wander over hill and dale, or through dark wood and glen; no guard is necessary to shield the Queen from her hardy Highland subjects, and she walks or rides about the neighbourhood of the castle as any Lady Bountiful might, doing good and visiting the sick and needy; the blessings of the poor attending her whithersoever she goes. A thousand stories might be told of her thoughtful kindnesses and judicious charities among her humble neighbours—at one time erecting a school-house, and providing efficient teachers for the children; at another rebuilding the cottages of the peasantry in good substantial style; and at all times so comporting herself as to win their honour and respect. Her Majesty and Prince Albert regularly attend divine service in the little parish church on Sundays, during their stay at Balmoral. The parishioners take no particular notice of them or the children, but allow them to come and go just as any other respectable proprietors in the neighbourhood. The same conduct is observed at all other times. When the

royal family go out among the villagers, there is no such running after their carriages, or crowding to get a sight of royalty, as disgusted her Majesty on her first, and only, visit to respectable Brighton. On the contrary, at Balmoral the simple people content themselves with a distant respectful recognition—a touch of the hat, or a curtsey, which is invariably and graciously returned; and so our beloved queen and her husband are enabled to enjoy their autumn holiday in their own fashion.

About two miles from Balmoral, on the same side of the river Dee, there is a small castellated mansion belonging to the Prince, which is known thereabouts as Abergeldie castle. This is the Highland residence of the Duchess of Kent and her suite during the period of the Queen's visit. It is a plain substantial-looking house, with nothing but a square tower in the centre to distinguish it from many a private gentleman' mansion; but its situation is delightful. Standing close b the side of the river, and embosomed in thick woods of birch which abound in this neighbourhood, it has a charming out look. The visitor to this spot, if he be at all romantic, ca easily understand the sort of feeling which inspired Burns o this neighbourhood, to write his charming "Berks o Aberfeldy."

The district all around the royal residence is well stocke with game, and affords abundant sport for the Prince and hi friends. Deer-stalking, grouse-shooting, lake and river fish ing, and such other out-door exercises and amusements as ar common to Scotland, are to be found whenever they ar required, and many a good day's sport is, no doubt, chee fully afforded to visitors.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER VII., PART II.

Youths and children passed the dusty careering cab, in which, sunk back in a corner, lay poor Agnes, devoured with strange feverish horrors, and yet planning great plans for the future. These youths and children grasped in their hands bunches of blue hyacinths, and cowslips, and primroses, telling of happy strolls among the distant woods; their faces were full of joy, and they all talked merrily among themselves, but Agnes heeded them not. Neither did she heed a poor sunburnt countryman who, standing at the corner of a squalid street, exhibited, with stolid mien, to a squalid crowd, a marvellous banner of his own construction—a banner fit to have been borne in a procession to the honour of Flora. Primroses, and blue-bells, and cowslips, and tulips, and narcissci, all in thick clusters massed together with bright contrasts, and upborne by a thick hazel-pole wreathed with ivy. The children, with their hot dirty hands and faces, eagerly stared up at the beautiful banner, attracted by its magic, as was also a certain astounded white butterfly which had bewildered itself among the smoky London roofs. Even the policemen's hearts were touched by the vision of spring beauty, and left the stolid countryman unmolested; and he had stood there all that livelong day with the same unmoved features, except when a most unusual gleam had passed across his copper-coloured face, as a tall gentleman, whom he had observed watching his banner for some moments, placed in his hand half-a-crown. Yes, Leonard had heeded the countryman whilst passing along this same great thoroughfare, although Agnes had not. And the tall gentleman, and the vast wealth of the half-crown, remained the one bright memory of London in the heart of the bearer of the floral banner for long dull years to come.

On rattled the cab past crowded stalls of fish and vegetables, where miserable flowers had baked in the sun's rays the hot day through, their parched leaves covered with dust, and fainting amidst the squalid crowd; and on rattled the cab out among suburban pleasantness, where lilacs were bursting forth into their fresh greenery, and where the little garden plots were gay with bright spring flowers; but Agnes heeded them not. Neither did she heed the darkened windows of a little house especially gay with spring beauty; and little did she divine that within its shadow Leonard's spirit had brooded, these last many hours of misery; nay, was still mysteriously linked with its sorrow. Agnes, forgetful of the Gaywoods and of their connexion with Leonard, was utterly unobservant of the road she was pursuing, and remained oblivious to all but her partial delirium.

Within the green duskiness of the Gaywoods' little sitting-room was an awful visitant. The Angel of Death already cast his shadow across the brow of little Cuthbert. Mary and Lucretia, with hushed breath, knelt beside the sofa where the child still lay, sleeping as Leonard had left him a few hours previously, but the features were sharper and the complexio more transparent. Suddenly his large eyes flashed open wit a strange intelligence, a smile beamed over the whole tran figured countenance, and then the head sank with leade weight upon the encircling arm of Lucretia. The supren moment had arrived. The sisters sank their faces upon th little corpse with a sickness of the soul too deep for tear and, marvellous to relate, through the brain of Lucretia passe a strange vision of seraphic awe. The spirit of the chi shone down upon her with eyes of joy and purity unutterab —as if of effulgent glory was his whole being—and stretchin forth his loving hand, suddenly another spirit was at his sid dimmer, sadder, yet scarcely less beautiful, and as if flamin up into brightness as it touched the hand of the child, and the unheard accents of the child-spirit's quivering lips fe upon his ear. It was the spirit of Leonard!

And where was Leonard? Rousing himself at length fro his torturing meditations, with a stern determination to me Agnes, Leonard arose from beside the sofa of the dying chil and without indulging in a natural grief at what his soul to him would be his last glimpse in life of his beloved litt friend, he quietly left the room and house, unseen by any o of the small household. But once more within the vortex the metropolis, and approaching the presence of Agnes, disgu and world-weariness seized yet firmer hold upon him; seemed impelled to fly from his stern judge, as if some irrev cable repulsion dwelt within her sphere. Her countenance, h fancied words, harrowed his morbid and vacillating natu till, mingling with the old pain, a paroxysm, it may be, seiz upon him, not unlike the misery of his poor mother, who face was ever haunting him in strange juxtaposition with th of Agnes. Now Agnes' stern cold features melted into t unrecognising gaze of his mother as last he had seen he now as vacantly he stood staring into a toy-shop—the to unconsciously bearing his memory back into the years of h childhood—the passionate words of his mother's love rang his brain, but the words were words spoken with Agne stern, unrelenting, cold lips. Impelled as if by a demo Leonard posted out of London. On and on he walked f hours, with a strange delirium upon him, which, as in th case of Agnes, showed itself in a restless desire for motion.

When the rejoicing rays of the morrow's sun dart sparkling through the matted boughs of a solitary wood, sor miles from London, they fell upon the pallid face of a m who lay prostrate at the foot of a twisted and gnarled o thorn just bursting into blossom. The sun's rays dance merrily among the leaves; the soft morning breeze aro shivering through the branches, and scattering down the rai

drops which hung upon them from a shower fallen in the night. The little birds suddenly burst forth into their morning anthem, and the whole wood was awake and filled with an active joy. But the man lay unmoved. The glittering rain-drops fell upon him, glancing upon his soft but matted hair, and quietly rolling over his white face like bright tears. The wind waved his hair and the skirt of his coat; and a little bird, fluttering down from the thorn tree, perched upon his uncovered head, and began pecking the long, dank hair which fell upon the mossy ground, and with several hairs in her bill flew up again to weave them into her nest. A lovely green and orange beetle crawled wonderingly out of a hole in the thorn-tree root, and passed slowly across the man's clenched hand, as it lay outstretched upon the moss. Trees, birds, insects, and flowers had all awoke to activity and joy, but the man lay motionless among them. The sun rose higher into the heavens, and his rays fell through an opening among the trees with a searching violence upon that passive face; and then came a sudden shower, drenching the hair and clothes; but the form remained quiescent and as fading as a mass of crushed flowers which lay beside him. And sounds of gay laughter, from pic-nic parties in distant parts of the wood, floated upon the breeze to the old thorn tree; and the cheerful splash of oars from a little river which flowed through the wood; and the quiet bleating of sheep from sunny uplands; and the barking of watch-dogs and the crowing of cocks from one homesteads and the yet more distant village. The sad face grew darker and more ghastly, and birds continued to sing over the poor corpse for three days, and grass, full of its young vernal vigour, and convolvolus, and vetches, had begun to nod over the face and hands and catch at the fearful fingers with their innocent, loving tendrils. But about sunset on the third day, a keeper, passing through the deep wood, discovers by his dog this strange trespasser. His face grows dark almost as the one upon the moss at which his dog barks and whines, and the keeper rushes out of the wood, and up to the distant village. And the passive figure lying at the foot of the thorn tree occasions a mighty convulsion within and around that rose and honeysuckle festooned and whitewashed public-house. And the doctor, and the beadle, and the landlord, and the keeper, and various other notables of the village, are off with a cart to fetch out of the wood this sad, terrible figure; and the coroner is sent for post-haste.

And when the moon slowly rises and shines between the clump of pines which grow upon the terrace of a beautiful Italian villa lying among the hills above the village, where the slender spire of the village church seems to melt away into the tender night heaven, and where the breath of May sweeps across meadows and into the open casements of cottages, cheering the hearts of the sick and wafting sweet dreams to the slumbering children, slowly comes the cart along with its fearful burden; and there is a busy hum of voices around the cart from the men who accompany it, and women and children glance fearfully at the procession as they stand outside their gardens in the dusty road; and some of the children begin to cry; but the women's voices murmur as busily as the men's who attend the procession.

And the clergyman and others are awaiting the arrival in the dimly lighted mouldering church. And when the sad form is displayed by the glare of candles, the changed face is still not so changed but that the landlord gives a great gasp, and exclaims, all hot and excited—"Lord! Lord! if it aint that painter gentleman as used to be down here last summer a painting—a mighty great friend of Miss Pierrpoint's,—Lord! Lord! but my missus will take on a bit I reckon: he took a picture for her of our pretty little Rose as is gone, and was a right nice pleasant gentleman—Lord! Lord!"

And among the people looking in at the church door was the countryman of the floral banner; but the face glared upon by the dismal candles, and stolid in the midst of that excited assembly, was faded as the banner now was, and scarcely less an object of scorn. Though the countryman had only that very hour been showing his marvellous half-crown given by the tall gentleman, even he did not recognise the giver.

CHAPTER VIII.

O friends—O kindred—O dear brotherhood
Of all the world! what are we, that we should
For covenants of long affection sue?
Why press so near each other, when the touch
Is barred by graves?—*Elizabeth Barrett Browning.*

We left Agnes Singleton driving along in a cab towards the first glimpse of country freshness and repose which she should reach, with her being fevered with the memories of the awful Hamburg fire, and her soul sick with its renunciation of her love for Leonard. We will not follow her along her wild walk across the lovely stretch of undulating country, lying between Highgate and Hampstead, which so peacefully reposed that beautiful May evening, with its rich woods, and gleaming ponds, and soft green slopes, beneath the golden sunset sky—on, on she walked, like one in a trance, oblivious to all around her, and it was only a kind of instinct which led her back to London and her solitary home, when night had closed in. Neither will we describe her miserable awakening upon the morrow, nor how with this morrow still no Leonard came! Alas! Agnes little could divine that the earthly husk of Leonard's spirit lay fading and changing into an object of dread beneath the pleasant leaves and blossoms of the beautiful, peaceful woodland. Could she, as she wandered frantically along that soft May evening, but have manifested the richness of her love to him, instead of hardening her soul against him, would it have availed aught? Could she have withdrawn him from his miserable fate by the strength of her warm life—could she have bound him to the earth and to its beautiful realities? Had Agnes' eyes looked into his with all the devotion which filled her heart, would they have laid the phantoms which tortured his brain? Had the voice of Mary Gaywood reached Leonard's ear, clear as a bell and holy as a seraph's hymn pouring itself forth in "I know that my Redeemer liveth," as upon many a twilight—would the demon have been laid, as within Saul's breast by the touch of David's harp? Could aught have rescued Leonard from the last sad act? Alas! Leonard was one of those beings left, in the extreme moments of their existence, to struggle utterly alone; abandoned, as it seems, by man—abandoned even by their better self; and whose cup of misery flows over in completest bitterness through the loss of faith in the one True Friend, the Father without whose knowledge not a sparrow falleth to the ground.

Honoria is standing beside the bed of Agnes with an extraordinary mournfulness and pallor upon her noble countenance. Agnes is lying dressed upon her bed, and appears sunk in a profound sleep. There she has lain for two days and a night. Honoria has learnt from Agnes' servant that she has awakened once and drunk a cup of coffee, and again fallen into her death-like sleep. Agnes was not one of those people who would fall into a brain fever, or pine away and break their hearts, however bitter the pain; her physical being was utterly exhausted, but Nature, that marvellous restorer, sank her into the Lethe of sleep in order to again brace up her being for fresh endurance! Alas! poor Agnes, thou art proud and filled with a bitter indignation, which for the time would have silenced thy cry of love—had Leonard lived! How will thy soul array itself in sackcloth and ashes for each shadow of reproach and anger, when thou shalt hear that Leonard is dead—has died by his own hand!

Whilst Honoria gazed upon that calmly sleeping pale face, the tears rolled quietly over her cheeks, and stooping down to impress a kiss upon her friend's brow, the eyes of Agnes suddenly unclosed and looked at her for a moment in bewilderment.

"Oh, Honoria!" cried she, hurriedly, and started up, "Honoria! Where am I?—Oh!—I begin to recollect—but how kind of you, Honoria! How did you learn of my return? What a great, great joy to see you, beloved friend! I have been so strangely exhausted by all that great fatigue of the fire—that awful fire at Hamburg, Honoria. You can tell me what news has arrived since I left. I have been in a strange dream ever since, but am quite refreshed now." And she

rose from her bed, and drawing back the window-curtains, looked out into the sunny street. "Honoria, I have lost all count of time; I have no conception what hour of the day it is; scarcely what day it is of the week. I feel like one of the sleepers of Ephesus," with a deep sigh and her head sinking upon her breast. "Honoria, I shall have such sad things to describe to you about that fire, when I feel less weary than I do now; and some noble and beautiful things, too; but oh, my God!" and Agnes, dropping her arms upon the toilette-table, buried her face upon them, and deep sobs shook her frame. Honoria watched her friend in the most painful state of suspense. Had she seen Leonard since her return? did she know any circumstances which might throw light upon the termination of his life? what did this demonstration of a great grief denote? and Agnes, too, ordinarily of so undemonstrative a character? Honoria knew not how to enter upon the miserable inquiry, how to break the sad intelligence to her.

Agnes soon restrained herself. "Honoria," said she, with a sad, faint smile, "I am so utterly exhausted by this great excitement, my nerves so thoroughly unstrung, that I must appear in your eyes little better than a weak child; but you must have read of some of the horrors of the fire in the papers. And, Honoria, only think, I have had a great loss myself: all my papers—all my labours of the past winter at Upsala and Stockholm—are probably lost. Is it not a sad thing for me? But you do not seem to appreciate my loss, dear Honoria—the loss of such valuable material?" "That seems to me at this moment but a small loss, Agnes," spoke Honoria, with trembling lips, and her eye rivetted with an unspeakable sadness upon her friend. "Of course, of course, Honoria, in comparison with the loss at Hamburg of life and property; but, just at this moment, to me this loss of mere written paper is very sad; it was so very, very dear to me!" And again tears chased themselves down Agnes' face, and her lips quivered convulsively. "Agnes, my dear, dear Agnes!—But there is Leonard!" and Honoria would have drawn Agnes' bowed face upon her breast; but Agnes started violently up, and exclaimed,—her face flushed crimson, and her eyes sparkling with a wild light—"Honoria, never, never speak that name to me: our love is at an end: with him it never existed! He is to me as one dead. For his sake—for mine—let us never, never speak of Leonard!"

"Have you seen him since you returned, Agnes?" eagerly inquired Honoria.

"No, no, Honoria; he loved so little that he never came, although I summoned him—yes, in the first hour of my arrival. Oh! Honoria, was *that* love?" and the poor girl trembled with a bitter passion.

"My Agnes, Agnes! Leonard is DEAD!" cried Honoria, flinging her arms around her friend, and pressing Agnes convulsively in them.

"Dead!" spoke Agnes, in a low hoarse voice, tearing herself from Honoria; then, as if in whisper, "Dead!" and Agnes had sunk upon the floor in a swoon.

It was a most painful task to communicate to Agnes, upon her awaking, the truth regarding the death of Leonard, and little was the light which the unhappy girl could throw upon the motives leading to such a deed as self-destruction. That he had been seized with a sudden fit of insanity was their sad verdict, as well as that which the coroner had passed the evening before.

News of Leonard's death had been brought with the early dawn to Honoria upon the very day we find her now with Agnes. Accompanied by her father, she had hastened down, post-haste, into the neighbourhood of Dorking, when, having satisfied themselves that the body was indeed that of poor Leonard Hale—having learnt all the very small information that could be given by the villagers, and arranged with the clergyman what was necessary to be done for the interment respectfully and mournfully of the poor corpse within the precincts of the quiet church-yard—they returned as rapidly again to town, there to prosecute fresh inquiry. Honoria, upon their journey, communicated to her father, the, to him, most astounding intelligence, that Leonard Hale and the son of Augustus Mordant were one and the same person. The old gentleman appeared unable to realise such a surprising fact. "And yet, and yet, Honoria, you remember how the likeness to Mordant always struck me in the young man but it *is* surprising, surprising!" he repeated a dozen times as they hurried back to London.

Honoria knew that Agnes was expected from Sweden about this time, and her anxiety regarding her waxed great; but that she had really returned Honoria first learnt at Leonard's lodgings, whither she and her father had immediately hastened. There, upon a table beside Leonard's easel, lay the little hasty note in Agnes' hand, and to which, sobbing violently the good old woman of the house pointed. For, like every one brought within his sphere, Leonard had inspired her through his gentleness, with a strong affection for him.

"Oh, *do* you think, Miss Pierrpoint, mum, that there was anything wrong between Mr. Hale and Miss Singleton. Oh if we had but known that the poor gentleman had had any thing upon his mind—my old man and I—I'm sure and certain we'd have worked the very flesh off our bones to have given him a bit of ease. He was such a sweet-spoken gentleman Yes, indeed, Miss Pierrpoint, mum, and Mr. Pierrpoint, sir he was far more like a lady in his ways than any gentleman—never a cross word; but it was always—'If you please, Mrs Buddle;' and, 'I'll be obliged to you if you will have my breakfast ready at the hour I ring for it;' and, 'You'll oblige me by not disturbing my pictures;' always 'please' and 'thank you' so natural like, and so punctual in his payment. Mum it's true *this* month is owing for; but then, poor young gentleman, he could not have foreseen his death, you know." And she sobbed violently into her checked apron. "And all his traps, mum—Mr. Pierrpoint, sir—what's to be done with them? Mr. Buddle and me, we've had a precious deal of talk about who'd look after them. If Miss Singleton—but I don't think she cared much for the poor departed gentleman—that I don't, indeed, mum; for Mr. Hale, he never seemed revived like by her letters; and the very last morning that I set eyes upon his blessed face, came that trumpery bit of a note there from her, and she just come, her servant said, from across the sea, and to send such a two or three lines as *that!* And he seemed to think so too, for he drawed and drawed a mortal long time before he went out—to see *her* we supposed. Now that does not look much as though she cared for him—do it mum?"

And so Mrs. Buddle sobbed and chattered, and passed judgment upon Agnes Singleton, whilst Honoria gazed round the room filled with its traces of poor Leonard's sad life and beautiful genius, till her heart swelled with a sad pain. Mr. Pierrpoint meantime condescended to communicate all the details of the discovery of Leonard's body and of the inquest to Mr. Buddle, who, with spectacles on nose and newspaper in hand, listened breathlessly to every word. The newspaper contained a paragraph descriptive of the discovery of a dead man within a wood near Box Hill, and that paragraph had greatly excited Mr. and Mrs. Buddle's nerves—already excited by the disappearance of their cherished lodger—and Mr. Buddle, in a nervous trepidation, had just made up his mind to set off that very afternoon to look at the corpse, so soon as Mrs. Buddle should have fortified him for the journey by a hot luncheon, when the sad mystery was partially cleared up by the appearance of Mr. and Miss Pierrpoint. And now Honoria sought out poor Agnes, as we have already seen.

Within a week's time Mrs. Buddle had to retract her hard judgment upon Agnes.

"Oh Mr. Buddle, it is enough to make one's very heart break to see the face of that poor young thing Miss Singleton Not that she takes on like as I should have done, a crying and a sobbing like; but she looked so very white in her black dress when she stepped out of the carriage in which Miss Pierrpoint brought her, that I'd a mighty piece of work of it not to begin a crying myself in her face; and they says not a word, but Miss Pierrpoint and she they just goes into Mr. Hale's paintin'

room as was, and I hears the key turned in the lock, and Miss Pierrpoint comes down directly—'and don't disturb her on no account,' says Miss Pierrpoint, in her noble, commanding way; 'leave her quite alone, Mrs. Buddle, I shall call again for Miss Singleton.' But I assure you, Mr. Buddle, I got quite frightened—she stayed so long up in that there room. Thinks I to myself, if she should now make an end of herself, what a tragedy that would be! If she should fall into a fainting fit, or take on dreadful, whatever could one do for her? I listens, and listens, and listens, and I hears nothing at all, but the old clock ticking in the passage just as usual, and the distant cries in the road. I gets quite fidgety, and at last I remembers that I'd opened the window of Mr. Hale's painting-room this morning, and that if I stepped into the garden, without being

AGNES IN LEONARD'S STUDIO.

inquisitive like, I could just quietly see what the poor thing was a doing of—it is but taking a motherly oversight, I says to myself—and then I steps across the flower-bed. I took care and did not trample upon your sweet-williams and sweet-peas, Mr. Buddle, so don't be so frightened!—and there I gently looks in—and Lord a mercy!—I was ready to give a skreech; for I sees the poor young lady lying upon the ground, and one grows quite narvus with such horrid histories; but she was neither dead nor in a swoond, I see immediately, for her hands were clasped and her head, as it lay upon a chair, shook with her violent crying; but all so quiet, Mr. Buddle; and there was the picture Mr. Hale were a drawing of—the woman dead at the foot of a cross—the very last day he were alive; she'd put it, poor young lady, up upon the easel; and there hung his cloak and garden hat behind the door, and all his colours and brushes and painting things and books lay about just as he'd left 'em—I'd not had the heart to touch them; and the sun shone in so warm through the window, and the birds were a singing so cheery, and some way I never felt sorrier for anything nor anybody in all my life, Mr. Buddle, I do assure you, and I did not know which to pity most, him or her; and I stepped quite back from the window and prayed that the spirit of peace might enter into that poor young thing's heart, and that she might put her trust in what is more than man. And then, whilst I was crying a bit to myself in the garden, and tying up your balsams, Miss Pierrpoint comes again, and comes out to me in the garden, and asks me a deal about Mr. Hale, and she looks very sad; and she says, says she, 'Mrs. Buddle, Miss Singleton thinks she should like to come out into this quiet place and live with you—she would like to live in Mr. Hale's rooms; and you must disturb nothing till she comes—poor thing!—she was to have been Mr. Hale's wife, you know, Mrs. Buddle, and every thing is very dear to her. Now, if she comes to live here, you will be very attentive to her and kind, and will not disturb her in any way, for she is a great writer and very clever, and must be quite quiet, especially now she is so unhappy. Now, remember, she takes your rooms from this time, but she will not return here for some weeks, as she is going away with me into the country. But here is my address, and if you want anything, write to me; and if there are any little bills of Mr. Hale's to be settled let us know.' Very handsome that of Miss Pierrpoint; but I don't think there will be many bills, he was such a very

abstemious gentleman was Mr. Hale. And, then, Mr. Buddle, Miss Pierrpoint went up into the room, and directly after, without ringing for me, they lets themselves out and drives away."

———

Some ten days after Honoria and Agnes had thus abruptly left Mrs. Buddle's, and were located in a quiet village in one of the most beautiful districts of North Wales, whither Honoria had conveyed her friend, the following letter was received by Honoria from Ellis Stamboyse:—

Nottingham, May 25th, 1842.

MADAM,—Learning from my confidential clerk, Andrew Gaywood, of your friendship with Miss Agnes Singleton, I am induced to address you in preference to her, considering the natural state of her feelings in consequence of the rash and fatal act of my relative, Leonard Mordant, more particularly as the circumstances which I have to communicate bears upon her connexion with that unfortunate man.

A succinct narrative will perhaps be the best mode of presenting my communication.

On hearing of the fatal fire of Hamburg I hastened immediately to that city, but arrived only to learn, although the whole of the property and premises of our home remained in substance intact, that still we had sustained an irreparable loss in the death of the valued head of our house, Michael Stamboyse. He appears to have perished with several others, towards the close of the fire, in endeavouring to save a valuable amount of property lying in the city warehouses. My relative, who was a man of the strictest business habits, appears on the day previous to this event to have made a final will, which I found in his bureau properly attested, and which, to my astonishment, was made principally in favour of Miss Agnes Singleton, supposing her to become the wife of his unfortunate nephew, Leonard Mordant.

I have said that I made this discovery with surprise, because at that time this young lady's connexion with my relative was quite unknown. On inquiry, however, I soon learned of the singular circumstances of her arrival in Hamburg, and of the extraordinary manner in which these two strangers, of apparently such opposite characters, were thrown together, and became co-actors amid such appalling events. From Miss Singleton herself you will probably have heard the particulars, and more than I myself know of what passed between her and my deceased uncle, relative to Leonard Mordant.

From what I hear regarding this young lady's character, I deeply deplore the rash, and I must say sinful act, of poor Leonard, which has thus deprived both him and herself of benefits which Providence evidently designed for them.

This is perhaps hardly the time to express my sincere and earnest admiration and esteem of such portions of Miss Singleton's character as have come to my knowledge. At some future time, I trust that I may be enabled to evince to her the sincerity of these sentiments, and my earnest sympathy with her in this deep trial.

I remain, madam,

Yours truly,

Miss Pierrpoint. ELLIS STAMBOYSE.

Of the tempest of affliction which had burst over the little home of the Gaywoods by this accumulation of death and sorrow, we will not speak; the sympathetic reader, who has accompanied us so far, will easily have conceived it.

SQUARING THE CIRCLE.

THE problem of squaring the circle, to which allusion is so often made—without, however, being always clearly understood—consists in constructing a square whose area shall be exactly equal to that of a given circle. Unhappily, the problem is insoluble; we can only arrive at an approximate solution; and in the present day no one who has even an elementary acquaintance with the first principles of geometry will lose his time in the vain attempt to solve it completely. True geometricians have always been aware of the difficulty, or rather impossibility, of the task. In their investigations, they have merely aimed at approximating nearer and nearer to exactness; and not unfrequently they have been, as it were, surprised into discoveries in the various branches of mathematical science. But there has always been a class of men less enlightened and more daring, who, scarcely knowing what they wanted or what they were doing, yet pretended to discover the squaring of the circle, perpetual motion, and other things beyond human power. The problem of squaring the circle is as old as geometry itself. It occupied the thoughts even of philosophers in Greece, the very cradle of mathematical science. Anaxagoras employed himself about it in the prison where he was confined for having proclaimed the doctrine that God is one and alone above all. Aristophanes, the Molière of the Athenians, introduces the celebrated philosopher Meton upon the stage, and cannot devise any better method of bringing ridicule upon him than by making him promise to square the circle. It was Archimedes who first found out the approximate ratio of the circumference of a circle to its diameter. Apollonius, or Philo of Gadara, found ratios still nearer the exact truth; but what they were is now known. The labours also of Adrian, Metius, Vietus, Zudolph, Van Keulen, Machin, and Lagny, in this direction of inquiry, are well known.

Cardinal de Cusa was the first of modern alchemist-geometricians. He fancied he had discovered the true method of squaring the circle, by making a circle or a cylinder roll along a plane surface until it had described its whole circumference; but he was proved by Regiomontanus to be in error. After him, towards the middle of the sixteenth century, a professor royal of mathematics, Orontius Fineus, gained distinction by his remarkable fallacies on this subject. The celebrated Joseph Scaliger also indulged in these caprices. Thinking lightly of geometricians, he wished to show them the great superiority of a learned man like him. Vietus, Clavius, and others, having ventured to refute his mathematical reasoning, he became incensed, loaded them with abuse, and was more than ever convinced that geometricians had no common sense. About seventy years ago, M. Liger thought he had discovered the true solution, which had been for ages concealed from view, by demonstrating that the square root of 2 is equal to that of 25, and that that of 50 equals that of 49. His demonstration did not, he said, rest upon geometrical reasoning, which he detested, but upon the properties of figures.

There have been a number of bets and challenges in connexion with this problem at different times. Among other examples we may mention that of a manufacturer at Lyon named Matherton, who after having announced to geometricians and mechanicians the discovery of the squaring of the circle and perpetual motion, defied them to prove that he was mistaken, and deposited a sum of £120, to be paid to the person who should succeed in doing so. M. Nicole, of the Academy of Sciences, irrefragably demonstrated his error and demanded that the deposit should be awarded to him. The obstinate manufacturer resisted, and pretended it was necessary also to prove the fallacy of his perpetual motion; but the Judicial Court at Lyon could not see what a demonstrated truth had to do with an error yet to be demonstrated. He, accordingly, lost his cause, and Nicole devoted the money to the hospital of the town. Another instance was that of a gentleman at Paris who first challenged all the world to deposit very large sums against the correctness of his method of squaring the circle, and then himself deposited £400. From his method he deduced proofs of the doctrine of the Trinity, of original sin, and certain philosophical principles. As might be expected, there was great competition for such a deposit. Among others, a woman entered the lists. She thought nothing more than common sense was needed to refute the alleged discovery. The matter was tried in a superior court of law, which decided that a man's fortune ought not to suffer for the error of his judgment, provided they are not injurious to society, and the king ordered that the challenge should be considered null and void. The French Institute having been overwhelmed every year with voluminous packets on the squaring of the circle and perpetual motion, at length came to the resolution to receive no more upon these subjects. Yet only a few years ago, on opening a paper which had been kept sealed for many years at the request of the author, as containing a precious discovery, it was found to be another attempt to solve the insoluble problem.

SCHILLER'S "BRAVE MAN," ILLUSTRATED BY RETSCH.

On a former occasion we presented to our readers eight illustrative designs by this celebrated German artist; engravings made doubly interesting by the genius of the designer and the fame of the poet whose composition they illustrated, namely, the "Pegasus in Harness," by Schiller. In those designs the peculiar characteristics of Retsch were distinctly portrayed; that style and expression which can be taught in no school, but owe their birth to the genius of the man, were well depicted. While the general effect is good, while the grouping shows both taste and judgment, the careful minuteness with which every detail is managed shows us that the German master was diligent in every minor particular, in order that his work might bear a more elaborate criticism than that which would suggest itself on a first glance.

Retsch possseses an almost intuitive perception of an author's meaning, and this renders his illustrations striking and peculiar, sometimes exaggerated and fantastic, often ineffably sublime. Here and there he even corporealises the metaphors of the poet, now by a drawing grotesque and vague, now by a literal interpretation. And he is neither a borrowing nor begging man, his work is original; whether he depicts the thoughts of others or his own, he goes about it in a way no other man would, never seems to seek for a precedent, or to design after this or that great man, but fairly sketches what he thinks; he has fashioned the picture in his mind's eye, it has grown up before him into shape and vigour as real as though the men, women, cattle, fields, and cities were actually before him. For while Retsch is original, his is not that sort of originality which represents nothing truthfully; he is true in all that he does. He is thoroughly German, has much of the earnestness and depth of thought peculiar to his countrymen, is the best picture-maker for a German poet, and besides no mean poet himself, the picture-poet of Germany.

The designs which we now give are intended to illustrate Schiller's well-known poem, entitled "The Brave Man."

A river has overflowed its banks, the desolating water with huge masses of ice floating upon it has poured down on the devoted city, these ice fragments are striking together with fearful violence, the cry of alarm has been raised as the dark waters have come onward with irresistible power, deluging the fields and pasture lands, sweeping over the high roads, and in their wild fury bursting on the town, and in a few moments carrying away the arches of the bridge, the houses, and the walls. Towards the banks of the river there is nothing but desolation, and the citizens of the loftier localities look with affright on the raging water—old and young, rich and poor, are gathered; the governor with his slashed doublet and plumed bonnet is riding in their midst, the people flock around him, all suggesting remedies, for a portion of the bridge still remains separated entirely from the shore, the rushing water beating upon it with increased violence, but that one part of the bridge and one house upon it still is there, like a rock in the sea. There is within that dwelling an old man, his daughter, and entire family; they are exposed to almost certain death; they stretch forth their arms, crying for help to their fellow-citizens, crying for help to the heavens! The people regard them with stupor. Who is bold enough to front the danger? Who has courage enough to expose his life to save those unfortunates? Who among that crowd will do it? Again and again the question is put, but in vain; the hours pass on; the peril increases; the ice-blocks smite on the frail arch like battering-rams, and the stones tremble.

The governor offers a large reward; he holds the bag of gold in his hand; how anxiously all eyes are turned towards him; even the crippled beggar strives to get nearer, and his eyes grow bright at the chink of the guelders. The figure nearest to the magistrate is looking upward with a perplexed glance, as though counting the cost of the venture. Every face exhibits the same expression; what will cupidity not do? who can withstand the offered gold? who will now volunteer to aid in the rescue? Duty and humanity have appealed in vain, let Mammon cry in the market!

Do you remark in the crowd that young man of a vigorous frame, and fine, sagacious, honest countenance; his shadowed profile only visible, but his athletic form indicating strength and energy? He presses through the crowd, and volunteers to go, and a great shout is raised for the hero. A boat is procured, he steps lightly in, and, with almost supernatural skill, guides his craft amongst the ice-blocks. This is the second picture.

The brave man is standing in the boat, his tall, well-proportioned frame in full exercise, his head towards the citizens he strives to save; his countenance is noble and expressive, the index of a noble heart. A wild scene of desolation surrounds him. To the right is the city, the steeple of the old church rising above the houses, but elsewhere nothing but the turbid waters, the masses of floating ice, with here and there the fragments of the wreck it has already made;—here the trunk of a tree—there the body of a dead bullock—and in the centre of the stream the remaining portion of the bridge fast giving way, the unhappy family gathered upon it, with arms outstretched for help. Help is at hand. Fearlessly the deliverer urges on the boat nearer and still nearer to the object that he seeks; his risk is imminent, but his brave heart never trembles. True courage knows no danger, and from its vocabulary blots out "impossible."

The third picture shows us that the rescue has been effected. Amid the floating ice-blocks the brave man steers his boat, at the near end of which sits the old man, wan, pale, ghastly; his children are clinging to him with the tenacity of despair; the young hero is exerting himself to the utmost, and his figure is displayed to advantage by the position which he occupies;—the artist has thrown wonderful energy into this composition; the anatomy of the strong, muscular frame is boldly and accurately represented. The boat is nearing the shore, where the group of citizens may be noticed; the governor occupies the principal place, and the evident excitement of the crowd is well exhibited; most of them are pressing forward, while some have climbed the neighbouring walls, and are looking on the brave man's struggle. Already they hail him as a hero, a conqueror—and caps are waved, and shouts are raised, as the boat draws near.

The fourth picture concludes the story. The bark has touched the shore. The emotion of the citizens, their joy at the rescue, is evident enough; the family rescued from their perilous position form an interesting and touching group, as with clasped hands and on bended knees they pour forth their gratitude. The governor and the brave hero form the principal objects in the design; the first is stooping forward and offering the bag of gold to the young man, who is steadily refusing it; with significance he points to the rescued group, as if he said, "This is reward enough, I seek no other recompence, my guerdon is their happiness; what gold can be compared with that?" Skilfully the artist has represented the sunshine, bright and beautiful, falling on the group; elsewhere the clouds are dark and murky, but now the storm is over, and the beams of light fall cheerfully on the brave deliverer.

Maurice Retsch was born at Dresden in 1779. His family came from Hungary, and had been driven from their old home to escape the persecution that raged there against the Protestants. Not till he was twenty years old did Retsch apply himself to the study of painting; but he disliked all restraint and would have preferred following the bent of his genius as a hunter in the woods and as a student of nature in solitude. "He was, however, persuaded to enter the Academy at Dresden in 1798, and after submitting awhile to the irksome drudgery of copying, to acquire the mechanical part of painting, he began to exhibit his talent and genius as an original and poetic artist. The works of his illustrious countrymen Schiller and Goethe acted on his mind like inspiration, and

THE GOVERNOR OFFERING A REWARD FOR THE RESCUE OF THE FAMILY.—SCHILLER'S "BRAVE MAN."

THE BRAVE MAN GUIDING HIS BOAT TO THE RESCUE.—SCHILLER'S "BRAVE MAN."

THE RESCUED FAMILY NEARING THE SHORE.—SCHILLER'S "BRAVE MAN."

THE BRAVE MAN REFUSING THE OFFERED REWARD.—SCHILLER'S "BRAVE MAN."

with a kindred spirit he embodied their wild and wonderful descriptions in form and substance." The principal engraved works of Retsch are "Sketches illustrative of Goethe's Faust," "Illustrations of Schiller's Fight with the Dragon," "Fridolin, or a Walk to the Forge," "The Song of the Bell," "Pegasus in Harness," "Illustrations to Bürger's Ballads," and to Shakspeare's Macbeth, Hamlet, Romeo and Juliet, Lear, Tempest, Othello, and Merry Wives of Windsor. Besides these there is a great number of purely original pieces, and a celebrated design called "The Chess Players."

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER IX.

"Les lagunes offrirent alors le singulier spectacle d'une troupe se hasardant sur des barques construites avec dés debris de maisons, et qu'on était obligé de soulever pour les faire passer par-dessus une enceinte de pieux; les Génois, tantôt dans l'eau, tantôt dans leur bateaux, et l'enfanterie de Zeno s'avançant dans ces marais pour les charger."—*Daru.*

"Come, bring forth the prisoners."—*Richard III.*

It was a spectacle worthy of the hand of a painter to commemorate, or of a historian to describe—that moment when Zeno directed the attention of the Venetian army to the strange flotilla moving slowly downwards from Chioggia. The cheers and shouting which a moment before ran along the camp were now hushed to the profoundest silence. The tumultuous mass of troops, partially armed, in all variety of costumes, and speaking in different dialects and tongues, surging like the waves of the sea when the wind drives them to and fro, were now motionless and mute as that sea in a summer calm. They gazed in speechless astonishment at this evidence of a sudden and desperate courage on the part of the Genoese, and felt that a deadly struggle was near at hand. The general felt that the crisis was at hand, and promptly and skilfully he availed himself of it.

"Look, soldiers," exclaimed Zeno, "while ye are wasting your energies in causeless complaints, the prize of all our toils, that which should crown our patient perseverance, is about to escape from us. See, the Genoese are bearing away all their riches, the spoil which should soon have been yours by the right of war—the pillage which I would have given to you when we should enter Chioggia. But it is not yet too late. The admiral will aid us. See, he is ready." And pointing to where the Venetian fleet lay, he showed them Pisani steadily bearing down so as at the same time to intercept the vessels of the Genoese admiral, Muraffo, from forming a junction with the rafts, and to prevent the latter getting out of the lagunes.

The words of the general, added to the sight which the troops beheld, produced a change in the feelings of the soldiers as sudden as it was complete. They felt that if they now refused to act cordially under the command of the republic, the Genoese would assuredly escape with their property and equipments. The approach, too, of the enemy aroused all their martial feelings, and a simultaneous hearty cheer burst from all sides; and cries of "To arms! to arms! Viva San Marco! viva la Signoria!" ran along the lines and rent the air. Zeno was not slow in seizing upon this favourable conjuncture, for he knew well how evanescent and uncertain is the enthusiasm of the masses; he, therefore, called upon the soldiery to arm themselves with all speed, and to be prepared at once to act under his command. Nor was he without assistance. The sagacious mind of Recanati at once perceived that the tide of popular feeling was completely turned, at least for the present; he, therefore, determined to affect to guide the current which he could not oppose, and patiently await its reflux. And so he now joined in the exhortations of Zeno, and commanded his band to equip themselves in their armour and be prepared for an approaching engagement. It was not long before the whole force of the republic, domestic and foreign, were under arms and drawn up as orderly and quiet as if no mutiny had, within the last hour, threatened to overturn all authority and discipline.

And now the rafts, crowded with Genoese soldiers and sunk to the water's edge, were bearing down through the shallows. At the same moment the Genoese fleet made all sail towards the barricades that had been placed across the mouth of the lagune with the intention of driving with full force against them; and so sweeping them away. But Pisani was not an idle spectator of this movement. Dividing his flotilla into two, he placed one portion at the barricades to meet the fleet of Muraffo, and reserved the other for the rafts that were coming down the lagune The action commenced between the fleets of the two republics, each commanded by its admiral. In vain did the Genoese galleys bear down upon the Venetians—again and again they were repulsed; and as the object of Pisani was to protect the barricades from his enemy, he was contented to act merely upon the defensive, avoiding, as much as possible, a close collision with the hostile fleet, and keeping them from coming side by side by a constant discharge from the archers with which his galleys were manned. Meantime, the other portion of the Venetian fleet awaited the nearer approach of the rafts. These latter had now reached a part of the lagune, where the Venetians had driven down piles of timber attached to which were beams which floated across the water. In order to pass these the Genoese were forced to get off the rafts and stand in the shallows nearly up to their necks, while they endeavoured to lift the rafts over the floating barrier. With infinite toil they had now succeeded in forcing two or three of the lightest of the rafts beyond the beams, and still, to their surprise, their enemies looked on without an effort to check them. Another and another of those frail barks was freed, and the men springing from nearly all the others into the water, prepared for one simultaneous and decisive effort. Now was the moment for which the Venetians had waited. The land forces had moved down to the brink of the lagune, watching in silence and ill-restrained eagerness the progress of the enemy. The moment was now come when that restraint should be removed. Drawing his sword, Zeno waved it over his head and crying out—"On comrades, on—follow me." He plunged into the waters and was soon wading deeply through them. The cheers of a thousand voices promptly responded to his cry—"On, on! follow the general," was heard on all sides, and the troops dashed impetuously into the lagune and struggled onward to meet the foe.

While the land forces were thus occupied in this singular movement, Pisani's galleys bore down upon the ill-fated rafts. The collision was terrible, as the large, heavy galleys came crushing over the frail and ill-constructed floats, smashing through them as the ploughshare tears through the soil and breaks it in pieces. Many of them were sunk with drowning wretches clinging to the spars; those which had not yet passed the boom made all speed back towards Chioggia; but great numbers of the men were already disembarked, and with the courage of despair now fought their way onwards in the water. It was at this crisis that the forces of Zeno reached their enemy. A terrible and a novel sight it was truly, to see land forces thus engaged in a species of sea-fight, standing not upon the decks of galleys, but mid-deep in the water. A silent, deadly struggle ensued; silent save when that silence was broken by the gurgle of some death-groan

bubbling up through the water, or the splash of the wounded man as he fell down dying the double death of slaughter and drowning. At length victory declared in favour of the Venetians. The greater portion of the Genoese who had thus rashly deserted their rafts were slain, the residue of them contrived to struggle back and rejoined their companions, and ultimately regained Chioggia, with a considerable portion of their effects, which, fortunately for them, had been stowed upon the rearmost rafts, and thus remained above the boom. There was little booty, therefore, for the soldiers, save what armour was on the slain, and such jewels and money as they had upon their persons. But the issue of the day was of no small importance to Zeno. He had succeeded in checking the spirit of discontent and insubordination, and animated the troops with new vigour and fresh dependence upon him. Above all, he had counterplotted the crafty condottiere, and even made use of him, without his knowledge, as a vehicle of communicating the schemes which he was plotting against the republic.

And now the day was well nigh finished, when but one further duty remained to be discharged. Zeno sat in the large apartment of the fort which we have already described; around him were several of the military leaders, and amongst them some faces with which we are already acquainted — the Count Polani, Checco, and Roberto di Recanati. In the midst of the apartment stood the German arblasteer and the three Italian soldiers, the latter with their hands bound. It was a court-martial, which, notwithstanding the busy events of the day, Zeno did not neglect to call.

"Signori," said the general, addressing the officers, "I must crave the aid of your judgments for a short space. The affairs of the morning prevented my disposing of this matter sooner."

A moment's pause ensued, when he continued,

"Stand forth, good arblasteer, and state to the court thy grievance."

The big German, whose wrath had cooled down considerably since the morning, seemed but little desirous to prosecute the matter any further. Nevertheless, in his own defence, he was forced to detail the transactions which we have already related. When he had ended his story, he exclaimed with a rude good nature,

"Der teufel, general, I bear no malice, not I. Let yonder lance-man give me back what he won of me, and I am content."

"Dost hear what the German says, fellow?" asked the general of the Italian soldier. "Wilt thou do as he requires?"

The lance-man looked at his companions, and then replied,

"So please your excellency, I will."

"It is well," said Zeno. "Thou doest voluntarily that which, hadst thou refused, thou shouldst have been compelled to do. So much for the matter between thee and this German. Now for that which is of graver import. Messires, I crave your attention."

Zeno then detailed to those whom he had summoned, the tumultuous scene of the morning, the immediate cause of which was the complaints of the three men of Recanati's band, and their demand for increased pay. When he had ended the statement, he asked,

"And now, Messires, is not this a plain violation of the allegiance which the soldier owes to the state that pays him? What say you?"

There was but one whose voice was not heard in affirmation of Zeno's question. To that one Zeno now turned, and said,

"Sir Roberto di Recanati, I would have your judgment in this matter, as the captain of these men. Perhaps I am justified, by your silence, in holding that you concur with all those present?"

The condottiere bowed slightly, as if implying an assent which he dared not withhold; but Zeno still looked at him as if demanding a more unequivocal expression of his opinion. The condottiere was therefore forced to speak out.

"I do not dissent from the opinion of the court: the matter is as you say, signore, too plain to admit of dissent. Methinks, however, it might have been safely left to their own chief to deal with these offenders, as I would assuredly have done after I had aided in suppressing, for the time, the discontents which somehow manifest themselves amongst the troops but too often of late."

The look and tone with which these words were uttered did not escape the observation of Zeno; nevertheless, he seemed not to notice them, but continued,

"Well then, signori, the opinion of the court is unanimous, that these three men, belonging to the lances under the command of Sir Roberto di Recanati, have been guilty of mutinous language, and of having excited the troops to revolt against the republic. And now for the punishment to be awarded. With that I shall charge myself. Is the provost-marshal in attendance?"

The officer referred to stept forward.

"Lead forth these men to the quarters of Sir Roberto di Recanati's band, and in the presence of their companions—for I shall look to you, Sir Roberto, that your troops are turned out—proclaim that they have been found guilty by their own captain and this whole council, of having excited the mutinous tumult of this morning, and then declare the sentence which the state awards—the loss of the right hand. And add that which thou findest written herein." So saying, Zeno wrote a few lines which he folded and delivered to the provost-marshal. The culprits were immediately removed, and the court rose.

"Aye, let it be so," muttered Recanati to himself, as he made his way to his quarters. "Fool that thou art! I will indeed do thy will in this matter. Ha! thou seest not how thou art playing my game. When thy provost-marshal chops off the hands of these three poor caitiffs, he shall have done more to forward my plans and to make the troops disaffected than I could have accomplished in days of plotting."

And the condottiere smiled and compressed his thin lips, and pursued his way homewards.

The troops of Recanati were drawn out in front of the fort, awaiting in silence the scene that was about to be presented to them. Many, too, of the other mercenaries were present, and amongst them a number of the English archers of Sir William Cheke. Whether the appearance of these latter was casual or the result of some precautionary arrangement of Zeno's we shall not say. And now the three prisoners were led in front of the soldiery, bound and guarded by the men of the provost-marshal. This officer proceeded deliberately to state the crime of which the men had been found guilty, and then said in a loud voice—

"Hear the sentence which the state awards—that each of these men shall lose his right hand! But," he continued, reading from a scroll in his hand, during the breathless silence (a silence which Recanati knew was like the lull which precedes the whirlwind on a sultry day in summer), "the most Serene Republic, through her generalissimo, remits the punishment in consideration of the alacrity with which the soldiers returned to their duty and the bravery with which they fought to-day."

The effect of this unexpected pardon was electrical. Shouts rent the sky as the liberated men joined their comrades. "Viva Zeno! Viva il generale! Viva la Signoria!" resounded on every side; and one could scarce credit that they who now uttered these acclamations were the same fierce soldiery who, a few hours before, had assailed the same general with threats and intimidation. The dark eyes of the condottiere glittered with malignant passion at an issue so utterly different from that which he had confidently calculated upon. Clenching his hands with suppressed rage, he said hissingly—

"Sacro Diavolo! che cosa sciagurata! Who could have foreseen such an issue? Well, well, the wind takes many a turn; who knows how soon this breeze may chop about and blow from the opposite quarter. And then—aye, then—let our generalissimo look to himself. In the meantime patienza."

CORK AND ITS ASSOCIATIONS.

"THE sweet city o' Cark," as the "natives" denominate it, has from time immemorial been the head-quarters of Irishry, or rather the principal town in it, for it has for many a day been an English stronghold, and until the sudden growth of Belfast, it was the greatest, if not the only commercial town in Ireland. The name is said to be derived from *Corough* or *Curkey*, an Irish word, meaning morass or swamp, as the site was formerly a cluster of marshy islands, often overflowed by the river Lee. Its identity with that of the well-known bottle-stopping wood, has furnished materials for a great variety of jokes, some of which Croker has recorded amongst graver matter. One is told of Foote, who, on being asked, at a convivial entertainment given by an Irish nobleman, if he had ever been at Cork, replied, "No, my lord, but I have seen a good many drawings of it this evening;" another of Curran, who, apologising to a foppish companion for wearing a shabby coat, on his return in the packet from England to Ireland, said—"I always make it a point to go to sea in a *Cork jacket*."

SHANDON STEEPLE, CORK.

In the year 1600, Cork consisted of but one street, like any Irish village of the present day, and was thus described by Camden. "Enclosed within a circuit of walls in the form of an egg, with the river flowing round about it, and running between, not passable through but by bridges, lying out in length, as it were, in one direct broad street, and the same having a bridge over it!" The river was not made navigable in the south channel till 1670, and about that time, the town, which, till then, was but a receptacle for provisions from the surrounding country, began to improve rapidly. The eastern marshes, on which the best part of Cork now stands, were drained, and a bowling green and pleasure gardens established upon them; but these were destroyed by the Earl of Marlborough (afterwards Duke), in 1690, when besieging the place. The fortifications gradually decayed from this time forward, and were replaced by useful buildings; canals were arched over, the marshy islands united with one another, and the city assumed its present appearance, which fully entitles it to the praises its inhabitants bestow on it. But it was a long while before it became celebrated for its gaiety. Lord Orrery, in writing to Dean Swift in 1736, drew a woful picture of its dulness, a description which would now-a-days, we think, be applicable to no town in Ireland but Derry. "The butchers," says he, "are as greasy, the Quakers as formal, and the Presbyterians as holy and as full of the Lord as ever; all things are *in statu quo;* even the hogs and pigs grunt in the same cadence as of yore, unfurnished with variety, and drooping under the natural dulness o the place; materials for a letter

are as hard to be found as money, sense, honesty, or truth."

To enliven the place a little, a theatre was opened in 1760 by Spronger Barry, and the first night of the performance was signalised by a very uncommon occurrence. There had been an execution that morning for robbery, and the body of the culprit, after hanging for the usual length of time, was cut down and delivered to his friends. One of the actors, named Glover, having a taste for surgery, and fancying the man was not dead, used means to restore animation, and succeeded. Patrick Redmond, for such was the name of the hapless wight, having indulged rather freely in whiskey on the same evening, in honour of his restoration, went to the theatre, and on seeing Glover, rushed on the stage, to the terror of the audience, and thanked him publicly in the most uproarious manner. Even at this period Cork was famed for its handsome women, who made their appearance in the height of the mode, though London was then at a fortnight's distance, and Paris beyond reach of all persons of moderate expectations. There were assemblies held once a fortnight, and smaller ones weekly, called *drums*, for admission to which a trifling charge was made, and the company sang, danced, walked, or played cards, without restraint.

No town in Ireland, Dublin alone excepted, will bear comparison with Cork as regards the number of the historical reminiscences connected with it. Limerick boasts itself the "city of the violated treaty;" Derry, "the maiden city," as having sustained the ever-memorable siege, which Orangemen, in their cups, to this day celebrate with jubilation; but for a real city of broils, and tumults, and wars, and rumours of wars, and changes, and revolutions, give us Cork. It was here that Perkin Warbeck, the personater of the murdered Duke of York, first made his appearance upon the scene; and the first who saluted him king was John Watley, a wealthy Cork citizen, afterwards mayor; and when the impostor had been baffled in England, baffled in Scotland and baffled in France, hither he returned to recruit his failing fortunes, and hence he hurried to his doom in London. This business caused Cork for the first time to feel the effects of royal displeasure. Henry VII. deprived it of its charter, but soon restored it, however. Towards the close of the fifteenth century, Cork was a thriving place, but, strange to say, the citizens all intermarried with one another, for the simple and cogent reason, that the whole of the surrounding country being in possession of the Irish clans, who treated the towns-people as Sassenachs, the latter never dared to show their noses outside the walls, much less go abroad for the purpose of making love. During the great wars of Hugh

THE MATHEW TESTIMONIAL, CORK.

O'Neill, in Elizabeth's reign, the inhabitants of all creeds, Catholic as well as Protestant, continued faithful to England; but when James I. succeeded to the throne, they became insubordinate and dissatisfied, being unwilling to be ruled by a Scotchman. The Catholic party broke out into open rebellion, and signified their abhorrence of the new dynasty by burning all the bibles and prayer-books they could lay their hands upon. Lord Mountjoy, however, put an end to the tumult on his arrival in May, 1603, and hanged the ringleaders. In the revolution of 1641, Cork adhered to the royal cause, even after it had become desperate; but as soon as Cromwell made his appearance before it, it speedily surrendered, terrified by the "crowning mercies" which that personage declared Providence had bestowed on the republican arms in other quarters. On this occasion, Oliver, probably for the first time in his stern, rigid, and sanctimonious life, was pleased to be facetious. But the joke he perpetrated was grim, severe, and sarcastic, as became the witticisms of a general of the Commonwealth. He had ordered the church bells to be all taken down and converted into siege artillery. The clergy remonstrated, as did also the citizens. He simply remarked in reply; "that since gunpowder was invented by a priest, he thought the best use for the bells would be to make *cannons* (canons) of them."

Prince Rupert proclaimed Charles II. at Cork in 1649, but Admiral Blake appearing in the harbour at the head of a large fleet, the inhabitants were over-awed, and would have remained quiet, if they had not been excited to resistance by the instigation of Lord Broghill. In 1655, under the parliamentary *régime*, very severe laws were enacted against the Catholics, none of whom were allowed to reside within the walls. On the 18th of May, 1660, Charles was again proclaimed, eleven days before his restoration in England; and during his reign, Cork made rapid progress in trade and commerce, and the Catholics once more regained the ascendancy in the city. Consequently, when William of Orange landed, it declared for James, and in his interest received a garrison of Irish troops, and his adherents maltreated the Protestants, in which they were countenanced by James himself, when he made his appearance there.

The battle of the Boyne did not discourage the Stuart party, and they still held out, till William sent a large force, under the Duke of Marlborough, to reduce the town. He arrived in the harbour in September, 1690, and the garrison surrendered a week afterwards. The Duke of Grafton, a natural son of Charles II., was killed during the siege, and there were many romantic displays of valour on both sides. One of these is worth recording. The besiegers, having seized the cathedral, posted two files of musketeers in the steeple, for the purpose of galling the garrison of an old fort with their fire. They succeeded so well, that the latter turned two guns against the church, and the steeple soon began to totter. The men in the tower got frightened, and were preparing to go down, in spite of the remonstrances of their officer, Lieutenant Horace Townsend, when he kicked away the ladder by which they had ascended, and thus cut off all means of escape. His gallantry met with its reward, for next day the fort surrendered.

Some slight ebullitions of Jacobite feeling in 1715, and again in 1745, are the only political incidents worthy of notice which have since taken place.

Rich as Cork is in historical reminiscences, in literary and artistic associations it is probably still richer, if we may be allowed to include the county with the city. Who does not know that it was in the latter that the gentle author of the "Faerie Queene" lived, and loved, and laboured, and fled in the night from his burning homestead at Kilcolman, with the yells of Tyrone's kerns ringing in his ears; thus paying the penalty of his Saxon origin, and being in no way respected for his poetical abilities, which the clans were but ill prepared to appreciate? His "View of the State of Ireland," composed in his retreat at Cork, is a faithful description of the country at that period, and abounds in acute observations, and sound criticisms on the men and manners of the time. Three books, at least, of the "Faerie Queene" were written in the same romantic retreat, and here, too, he was visited by Sir Walter Raleigh, the "courtier, scholar, and soldier," and one of the warmest of his friends. Raleigh had been commissioned in 1580, in the army that was sent to repress the rebellious Earl of Desmond, who was aided by Spanish and Italian auxiliaries, and, during the summer of 1581, being left in command of the Queen's forces by the Earl of Ormond, lay in the woods about Lismore, and in the neighbourhood of Cork, carrying on a partisan warfare with the insurgents, and occasionally residing at Cork. It was at the close of these troubles that Spenser came to Ireland, having been presented by Elizabeth with three thousand and twenty-eight acres of the lands of the unfortunate Desmond in the county of Cork, but on condition that he should reside on his property. When Raleigh returned from his American voyage, he, too, took a part in the "Munster Plantation," by taking possession, under royal letters patent, of twelve thousand acres of the conquered territory. The house in which he resided, and the garden in which he first planted the potato in Ireland, are still shown to the visitor at Youghal. On his return from the expedition against Spain and Portugal in 1589, he paid a visit to his estates, and saw Spenser in his shady retreat on the pleasant banks of the Mulla. The poet celebrated his friend's return by the poem entitled "Colin Clout's come Home Againe," the dedication of which he dates from "his house at Kilcolman."

It was in Cork that Penn, the great William Penn, first became a quaker. The new society made their appearance there about 1655, and Penn, having attended one of their meetings, was so struck by the homily preached by Thomas Lowe upon the text—"There is a faith that overcomes the world, and there is a faith that is overcome by the world," that he adopted the broad brims and straight collars on the spot.

He did not escape the persecutions with which all dissenters were visited at that day. He was arrested in 1667 with several others, and carried before the mayor, who, however, knowing his father's influence in England, offered to liberate him, if he gave a bond for his future good behaviour. Penn, however, being of opinion that he could behave himself sufficiently well to satisfy the expectations of all reasonable men without any bond at all, sturdily refused, and was thereupon committed to gaol. A manly letter addressed to Lord Orrery procured his release, but eighteen of his companions in misfortune were left to languish in confinement. During his imprisonment, John Exham, another quaker, an enthusiastic disseminator of the new doctrines, and an old soldier of Cromwell's army, walked through the streets, clothed in sackcloth, and with ashes on his head, preaching repentance and amendment of life. The authorities, considering, we presume, that these things were not so necessary as Exham imagined, shut him up also, for a long period, but could not damp his ardour. He lived till 1720, when he was ninety years of age, and whenever he found himself at liberty, persevered in his old course.

A host of other celebrities have in later times made their appearance in Cork. Barry, Butts, Grogan, and Cavanagh Murphy, in the fine arts, and Boyle, the famous Earl of Cork, in science, would alone be sufficient to render the place illustrious. The writers who, in the columns of the *Nation*, in 1843 and 1844, poured forth so rich a stream of ballad poetry, and shed lustre on the follies of the O'Connellite agitation, received some of their most ardent and gifted recruits from the banks of the Lee. And the city too was well beloved by the witty, the humorous, the polished, and well-read Father Prout, the parish priest of Watergrasshill. It is a little village, in the midst of bogs, and brakes, and dells, on the coach-road from Dublin to Cork, and if we mistake not—for it is now a long time since we travelled it—the last stage before the end of the journey. Stages are now done away with; even Bianconi's cars—those capacious vehicles which in the olden time swept the tourist through the south of Ireland—are steadily receding before the mighty railway engine and

Watergrasshill is relapsing into obscurity. It is surrounded by the chosen home of elves, and fairies, and goblins, and ghosts, the classic ground of myth and legend; and here for many a year the good father tended his flock, and amused the world of London by his quaint disquisitions and squibs in the pages of "Fraser." He belonged to the old school of parish priests, who will never more be seen in Ireland, but who differed from many of their successors in being polished and travelled gentlemen, well read in foreign literature, haters of broils, and lovers of jovial companions and good wine. Peace to their ashes! Father Prout was the last of them, and in him Cork lost a son who, in all his wanderings, looked to her with fondness and regret. The church of Shandon, a very conspicuous object—an engraving of which we herewith present to our readers—came in for a large share of his regard. It stands upon the ruins of Old Shandon Castle; and the belfry, with its beautiful peal of bells—built on one side, strange to say, of grey stone, and on the other of red—is associated in the mind of every genuine Corkonian with his dearest and tenderest recollections of his native place. Long ago, when Irishmen were obliged to seek refuge daily in foreign lands from the misery and ruin which reigned in their own, a ballad was composed by some of the exiles, beginning, "Farewell to thee, Cork, with the sugar-loaf steeple," full of pathos and beauty, in which Shandon tower received its due meed of honour. Father Prout pays it a tribute no less exquisitely beautiful, in the well-known lines, which we regret our space will not permit us to quote entire. A few stanzas, however, will serve our purpose:—

"With deep affection
And recollection
I often think of
Those Shandon bells,
Whose sounds so wild would,
In the days of childhood,
Fling round my cradle
Their magic spells.

"On this I ponder
Where'er I wander,
And thus grow fonder,
Sweet Cork, of thee;
With thy bells of Shandon,
That sound so grand on
The pleasant waters
Of the river Lee.

"I've heard bells chiming
Full many a clime in,
Tolling sublime in
Cathedral shrine,
While at a glibe rate
Brass tongues would vibrate;
But all their music
Spoke nought like thine.

"For memory, dwelling
On each proud swelling
Of thy belfry knelling
Its bold notes free,
Made the bells of Shandon
Sound far more grand on
The pleasant waters
Of the river Lee."

With the mention of one other name we shall conclude this notice; but this is a greater one than any—Father Mathew, of temperance celebrity—who has worked so great a revolution in the social habits of the Irish people. He is a native of Thomastown, and was educated at Maynooth. He took religious vows as a Capuchin friar, and entered upon his labours at Cork. The frightful consequences resulting from excessive whiskey drinking amongst the peasantry struck him at once, and he formed the noble resolution of devoting his whole life and energies to the extirpation of this pernicious habit. He commenced holding meetings twice a week, in which he detailed to his hearers, in simple but forcible language, how much evil their drinking customs brought upon them, and called upon them to take the total abstinence pledge. This was administered in the shape of a simple vow, dictated by the father himself, after which he added, "May God give you strength to keep your resolution;" at the same time presenting the individual with a medal. His efforts were crowned with an almost marvellous degree of success. His brother, a distiller on an extensive scale, was ruined by the movement, and the worthy friar himself was impoverished by his philanthropic labours. As a tribute to his worth, the government settled on him a pension of £300 a year, but this, we believe, is barely sufficient to pay the premium of an insurance policy which he placed as a security in the hands of his creditors. The monument, of which we furnish an engraving, was erected in his honour by his fellow-citizens, but we regret to say, that, owing either to poverty or apathy, it has never yet been completed. It stands upon the Charlotte Quay, near the Capuchin Church.

MOSSES AND THEIR ALLIES.

CLUB-MOSSES AND LIVERWORTS.

CHAPTER III., PART II.

The colour of the scale-mosses varies through all the shades of green into brown, yellowish, dusky purple, and bronze. The theca is usually black, or deep purple, or dark brown, although occasionally it is nearly transparent.

The seta or fruit-stalk is in most cases semi-transparent and as delicately reticulated as the other parts of the plant. Our example, the pear-shaped scale-moss (*J. turbinata*, fig. 4.) shows this very beautifully. This species is one which is frequent in moist shady spots in limestone districts, and we have selected it as illustrative of the highly cellular structure of plants of this tribe. *J. pusilla* (fig. 5), the dwarf scale-moss, is given for the purpose of exhibiting the beautiful form of its folded sheath or perichætium. The plant is of a tender green, the capsule brown, and the edges of the bell-shaped sheath of a delicate pink. This is given, as are all the other scale mosses of which we present drawings, as they appear when magnified to about six times the natural size.

Sowerby says, in speaking of mosses, that which may with equal truth be said of the tribes which at present engage our attention, "It is chiefly in the economy of nature that we must look for the utility of these little plants, that she has fashioned with so much care, and for the reproduction and dissemination of which she has invented so beautiful and complicated an apparatus as that described above, though they are destined for the most part to flourish where no human eye beholds that beauty, no intelligence, save her own, can calculate the necessity and advantage of their existence. Their ministry is pursued in concert with other families lower in the scale of vegetable being; the smaller species assisting in the production of soil upon newly formed lands, clothing with verdure the most barren spots, and gradually fitting them for the support of the higher order of plants; while the larger are occupied in no small degree in the production of land itself, especially the aquatic kinds, which fix themselves upon the surface of lakes and stagnant waters, already interlaced with the slender stems of the *Charæ-Conferoæ*, and

plants of similar habit, gradually converting the liquid plain into a partially solid one, on which eventually grasses, rushes, &c., are capable of growing; thus are formed morasses, which, by a further progress of vegetation, become at length fertile meadows. While thus slowly operating to increase the extent

Fig. 4.—The Pear-shaped Scale Moss.

of the habitable world, their influence directly and indirectly affects in various ways, but more frequently, perhaps, unseen and unsuspected, the welfare and interest of those who are too apt to despise their apparent insignificance, and too proud to stoop to the examination of their surpassing beauty." Of the wells and rivulets. The slippery scale-moss (*J. Pinquis*) is another of this description.

We next come to the family *marchantiæ*, named from Nicholas Marchant, a noted botanist. It is a pretty and singular tribe, its trivial name, liverwort, being derived from a fancied resemblance to the human liver; this resemblance was supposed to indicate some special virtue in the plant, as connected with that organ, and in olden time it was considered a specific for jaundice and other such disorders. The marchantiæ grow on

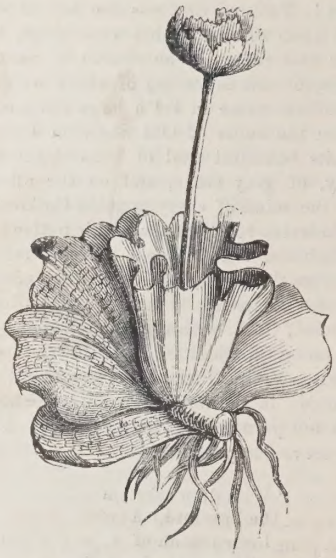


Fig 5.—The Dwarf Scale Moss.

earth or the bark of trees in damp places, spreading over the ground in the form of a green incrustation, from the lower surface of which root-fibres are developed. This crust or thallus is entirely composed of cellular tissue, the cells of the outer layer being closer in texture than the rest, and forming a thick leathery cuticle, in which are large stomata. The fruit consists of a head of spore-cases, radiating from a central disk called the "shield," like the spokes of a wheel. The

Fig. 6.—The Broad-leafed Scale Moss.

species which render their feeble aid in thus converting water into land, are some of the little frondose scale-mosses, and also some of the other tribes of the hepaticeæ. The broad-leaved scale-moss (*J. Epyphilla*, fig. 6), which is depicted of the natural size, is one of these. It is frequent on moist heaths, and in damp woods, and thickets, especially by the sides of head is mounted on a long stalk springing from a bell-shaped sheath, which starts from the surface of the frond or thallus, usually at the margin. The spore-cases or thecæ open by irregular fissures, either four or eight in number. Besides this normal fruit, *gemmæ*, or detached buds, of quite a different structure, are found on these plants. These are small leafy

bodies which spontaneously separate from the parent plant, and when mature are washed out by the rain, and carried abundantly to new localities, where they spring up and grow very rapidly. The form of the thalli or fronds of the marchantiæ is thus quaintly described by the good old herbalis Gerard:—"Liverwort is a kinde of mosse which spreadeth itself abroad upon the ground, having many uneven or crumpled leaves lying over one another, as the scales of fishes do; greene above, browne underneath." These fronds are variously lobed, their colour is a living green, and when broadly spread over a damp bank or the wall of a fountain or reservoir of water, they form a beautiful object. The Germans have the same name for the tribe as ourselves, and call it *leberkraut*. The conical liverwort (fig. 7) is common. It is of a yellowish-green tinged with brown; the peduncle, or fruit-stalk, is white touched with pink, and fleshy. It springs from a concave disk, usually situated in the marginal clefts of the fronds. The sporules are large, of a dark olive hue. The fronds, when bruised, send forth a peculiar fragrance, like bergamot.

The other example given (fig. 8) is of the star-headed liverwort (*M. polymorpha*), a species even more common than the conical.

Fig. 7.—Conical Liverwort.

Of the other genera which the order *hepaticeæ* comprises we shall say but little, as they are few and, in comparison, insignificant.

Targionia hypophylla at first sight resembles a marchantia, but differs in its fructification, which is globose and nearly buried in the margin of the frond; and this, with anthocerus punctatus, sphærocarpus terrestris, and a few species of a little tribe called *riccia*,—on which, as they are for the most part little known and not of much general interest, we shall not enter particularly,—complete the number of the genera contained in this order.

Fig. 8.—Star-headed Liverwort.

PEERS AND M.P.'S;
OR,
LORDS AND COMMONS.

II.

That the proceeding does not always go off so smoothly as in the above extract, the reader of Lord Byron's life is aware. Mr. Dallas, who was present, says: "I accompanied Lord Byron to the house. He was received in one of the anti-chambers by some of the officers in attendance, with whom he settled respecting the fees to pay; one of them went to apprise the Lord Chancellor of his being there, and soon returned for him. There were very few persons in the house; Lord Eldon was going through some ordinary business; then Lord Byron entered. I thought he looked still paler than before, and he certainly wore a countenance in which mortification was mingled with, but subdued by, indignation. He passed the woolsack without looking around, and advanced to the table where the proper officer was attending to administer the oaths. When he had gone through, them the chancellor quitted his seat and went towards him with a smile, putting out his hand warmly to welcome him, and though I did not catch his words, I saw that he paid him some compliment. This was all thrown away upon Lord Byron, who made a stiff bow and put the tips of his fingers into the chancellor's hand. The chancellor did not press a welcome so received, but resumed his seat, while Lord Byron carelessly seated himself on one of the empty benches to the left of the throne, usually occupied by the lords in opposition. . . . We returned to St. James's Street, but he did not recover his spirits." His lordship's mortification arose in part from the fact that his relative, the Earl of Carlisle, had not offered to introduce him. To revenge himself for this disappointment, Byron, in his "English Bards and Scotch Reviewers," took a biting revenge. Till then he had introduced his guardian into the satire in the most complimentary manner possible—

> "On one alone Apollo deigns to smile,
> And crowns a new Roscommon in Carlisle."

In common with members of the House of Commons, peers enjoy all the privileges they possess. They have, however, others. They may vote by proxy; they are not subject to make answer to questions from the lower house of parliament; they can only be tried by peers, and a peer has this advantage on his trial, all his peers are summoned to his trial, and he is acquitted or condemned by the verdict of the majority, which is not given upon oath, but in the form, "Guilty," or "Not guilty, upon my honour," pronounced by each peer in his place in answer to the question severally put by the lord steward who presides in the court, beginning with the youngest baron and proceeding to the first duke or senior prince of the blood royal. A peer, also, answers to bills in chancery upon his honour and not upon his oath; but when he is examined either in civil or criminal cases as a witness, or in the high court of parliament, he must be sworn. A peer cannot be bound to keep the peace in any other than the courts of queen's bench and chancery, and the honour of peers is so highly tended by law that it is much more penal to spread false reports of them than of other men; scandal against them being called "scandalum magnatum," and subjected to punishment by divers ancient statutes. Peers are exempted from attending court-leets or on the "posse comitatus." A peer cannot lose estate but by death or attainder, except, indeed, he wastes his estate so as not to be able to support his dignity; then he can be degraded by act of parliament; but there is but one instance of this supreme jurisdiction, which was in the case of George Neville, Duke of Bedford, in the reign of Edward VI.

The great council of lords spiritual and temporal dates as far back as the time of William the Conqueror. In the reign of Henry III., where we more clearly see daylight, it was entirely composed of such persons, holding lands by barony, as were summoned by particular writ of parliament. Tenure and summons were both essential at this time in order to render any one a lord of parliament. No spiritual peer was summoned without a baronial term. The prior of St. James, at Northampton, having been summoned in the twelfth of Edward II., was discharged upon his petition because he had nothing of the king by barony, but only in franhalmoign. The prior of Bridlington, after frequent summonses, was finally left out with an entry made in the roll that he held nothing of the king. The abbot of Leicester had been called to fifty parliaments, yet, in the twenty-fifth of Edward III. he obtained a charter of perpetual exemption, reciting that he held no lands or tenements of the crown by barony or any such service as bound him to attend parliament or councils; but there were great irregularities in the lists of persons summoned. "It is worthy of observation," remarks Mr. Hallam in a note, "that the spiritual peers summoned to parliament were in general considerably more numerous than the temporal. This appears, among other causes, to have saved the church from that sweeping reformation of its wealth, and perhaps of its doctrines, which the commons were thoroughly inclined to make under Richard II. and Henry IV. Thus the reduction of the spiritual lords by the dissolution of the monasteries was indispensably required to bring the ecclesiastical order into due subjection to the state. From the time of Edward III. the council, consisting of the chief ministers of the crown, and the lords' house in parliament, were often blended together in one assembly. Thus was formed the great council which exercised a considerable civil as well as criminal jurisdiction. In the time of Edward III. or Richard II. the lords, by their ascendancy, threw the judges and rest of the council into shade, and took the decisive jurisdiction entirely to themselves, making use of their former colleagues but as assistants and advisers, as they still continue to be held in all the judicial proceedings of the house. Ages have come and gone, and the grand council of the nation is now not in the upper, but lower house; but, as part of the whole English constitution, it still exists. And though now of decreased importance and power, still it has claims for the intellect it yet boasts, and for the good it yet accomplishes. Intellectually, it must take a high stand, for it is constantly replenished from the most successful lawyers of the other house. Historically, it has been the barrier against the despotism of the crown. To the great whig families that upheld the revolution of 1688—that bravely contended with a lower house of Jacobites—we owe the Hanover succession, and England's subsequently growing favour. On the face of it, it seems absurd that a man should be a legislator born; but, at the same time, practically the custom has not been fraught with the evil which might have been anticipated. It is very clear that many men who have done the state good service, have cared more for acquiring hereditary honours for their children, than for the immediate éclat which promotion to the peerage conferred on them.

Of course the lords do not act as common men. For instance: in divisions they give their votes beginning at the lowest and proceeding *seriatim* to the peers highest in rank. Each one answers for himself, content or non-content. If the numbers should chance to be equal, it is invariably presumed that the house is against the bill. The lords are still true to the maxims of their forefathers. We are unwilling to change the laws of England. Right or wrong, a law is a law, and with them, for that reason alone, is to be reverenced and preserved. The lord has this advantage over an M.P.: the latter may pair off when a division is about to take place, and thus the loss of his vote to his party is compensated for by the absence of the vote of the M.P. with whom he pairs off to his party. A lord may do more than this: he may vote for a measure by proxy. Some men are very large holders of proxies. The number of those held by the late Duke of Wellington was prodigious, and almost dangerous to the state. There were times when the noble duke had nearly half the votes of the peers in his pockets. Debating, in such circumstances, must have been little better than a farce.

THE LORD HIGH CHANCELLOR.

The world in general, and the readers of Bleak House in particular, we take it, have heard of the Lord High Chancellor,

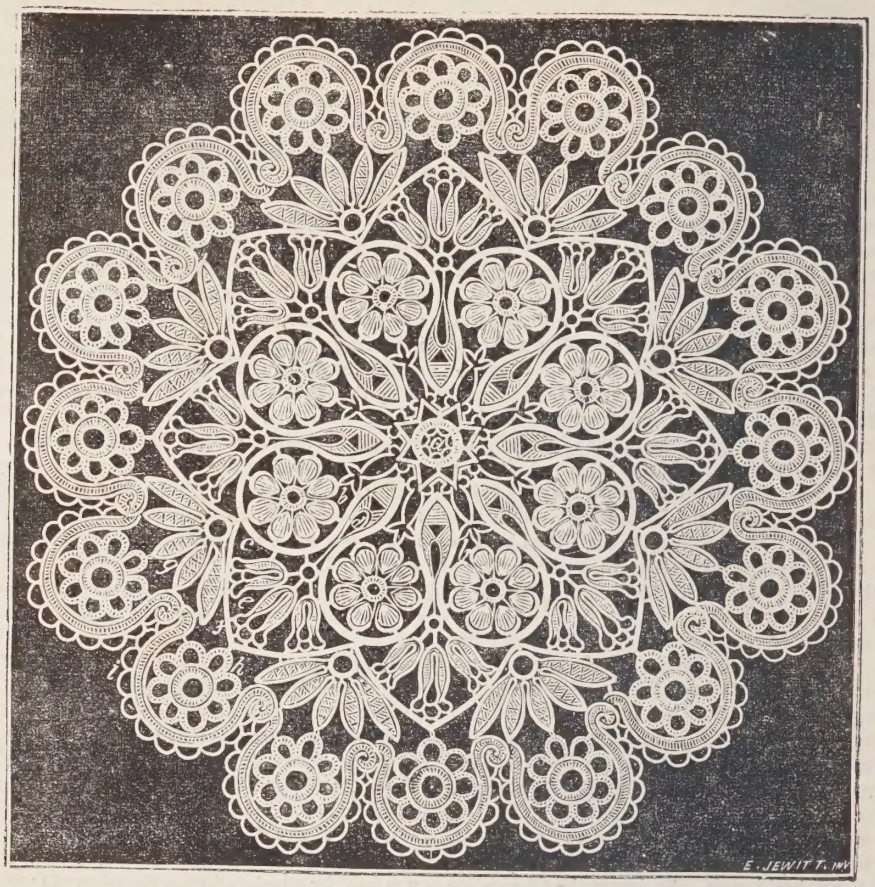
the Keeper of the Great Seal—of her Majesty's Conscience—of church livings and patronage and power held by no other living man. Of his power and influence in general it does not become us here to speak, but it does become us very briefly to state that he is Speaker of the House of Lords, and that, therefore, we have something to do with him here. One of the oldest offices existing is that of Lord Chancellor: the almost fabulous Arthur is said to have had a chancellor; certainly such an officer existed in the time of the Anglo-Saxon monarchs, for the good St. Swithin, we believe, was one. But in our point of view he is merely Speaker of the House of Lords, an office he holds whether he be peer or not. In recent times, for instance, we find on the 22nd of November, 1830, an entry in the list of peers present, "Henricus Brougham, Cancellarius;" but he had no right to debate and vote till the following day, when the entry of his name and office appears in the same place, "Dominus Brougham et Vaux, Cancellarius." This privilege of speaker, according to Lord Campbell, is said to belong to him by prescription, and he has enjoyed it many centuries, although in the reigns of Richard I., John, and Henry III. (within time of legal memory), it was exercised by the Chief Justiciary. The crown may by commission name others to preside in the House of Lords in the absence of the Chancellor; and no speaker appointed by the crown being present, the lords of their own authority may choose one of themselves to act as speaker, which they now often do in hearing appeals; but all these speakers are immediately superseded when the Chancellor enters the house. He is a very great personage, is the Lord Chancellor, for the time being. To stay him in the execution of his office is high treason. Whether he be peer or commoner he has precedence above all temporal peers, except they be kings' sons, nephews, and grandsons. If he be a peer his place is at the top of the dukes' bench on the left of the throne, and if a commoner before the woolsack. Generally, however, peer or not, he sits there as speaker, and when he joins in debate he leaves the woolsack and stands in front of his proper seat at the top of the dukes' bench. Anciently the Chancellor addressed the two houses on the meeting of parliament. This, however, he does not do now; as speaker of the lords, he is not equal in power to the speaker of the commons. He is not addressed in debate. He does not name the peer who is to be heard: he is not appealed to as an authority on points of order; and he may do what would be considered very indecorous in the Speaker of the lower house—he may cheer the sentiments expressed by his colleagues. When he addresses their lordships he is to be uncovered, and he is covered when he addresses others including a deputation of the commons. When he appears in his official capacity in the presence of the sovereign, or receives messengers of the House of Commons at the bar of the House of Lords, he bears in his hand the purse containing, or supposed to contain, the Great Seal; on other occasions it lies before him as the emblem of his authority, or is carried by his purse-bearer. When he goes before a committee of the House of Commons he wears his robes and is attended by his mace-bearer and purse-bearer. Being seated, he puts on his hat, to assert the dignity of the Upper House; and then, having uncovered, gives audience. At the opening or close of a session of parliament he is the bearer of the royal speech, which he delivers, on his knees, into the hands of his sovereign—a mode of procedure handed down from very early times. In respect to dress he has great choice. He may "weare in his apparel velvet, satene, and other silkes of any colours except purpure, and any manner of furres except genettes." In good old times the office was filled by an aspiring clerk with a view to a fat bishopric; now it leads to nothing further. It has become the *ultima Thule* of the aspiring lawyer Once chancellor, he has nothing else to look forward to. On account of his high rank, his important duties, his great labours, and the precariousness of his tenure, he has generally received the largest remuneration of any servant of the crown. In early times, this supply seems to have been raised principally from presents and bribes; then by sinecure places in possession and reversion. Now he has a fixed salary, and a retiring allowance when he has resigned office, to enable him to maintain his station and still to exert himself in the public service as a judge in the House of Lords and in the Privy Council. But for the prospect of a sufficient pension on retiring from office, it would be unreasonable to expect men who are at the head of a most lucrative profession to give up their practice, as is required of all who accept this exalted but precarious dignity. It is well known that Lord Brougham made a considerable sacrifice of income by becoming Lord Chancellor, and there are, even now, barristers whose professional gains amount to, if they do not exceed, the salary attached to the chancellorship. Yet these are the men, and none but these, who are wanted to preside in the highest court of judicature in the realm. The proper tenure of office is during pleasure, and it is determined by the voluntary surrender of the Great Seal into the hands of his sovereign, or by the latter's demanding it in person, or sending a messenger with a warrant for it under the privy seal or sign manual. There have been grants, says Lord Campbell, of the office of chancellor for life and for a time certain, but these Lord Coke pronounces to be illegal; and while its political functions remain, the person holding it must necessarily be removable with the other members of the administration to which he belongs.

Lord Campbell, in his valuable work, commemorates 167 chancellors. Memorials of the Anglo-Saxon chancellors are scanty, but we have a series nearly unbroken from Maurice, who held the Great Seal in the year 1067, to the present occupier of that important post. Of these chancellors, the greater number were ecclesiastics. The first lay chancellor in England was Fitzgilbert, appointed by Queen Matilda soon after her coronation, during the short time she occupied the throne; and there was no other till Sir Robert de Bourchier a soldier appointed by Edward III. Bishop Williams, in the reign of James I., was the only Protestant divine who was ever in possession of the Great Seal; although the Privy Seal was held by a bishop during the reign of Queen Anne. Scrope, in the reign of Richard II., was the first law lord ever created; since then the number has considerably increased. Much of the best blood in the peerage has a legal origin.

There are now sitting in the House of Lords seventeen peers descended from chancellors in the direct line. Earl Fortescue from Sir John Fortescue, Lord Mountfort from Sir Thomas Bromley, the Marquis of Winchester from Sir William Poulet, the Earl of Bradford from Sir Orlando Bridgman, the Earl of Coventry from Lord Coventry, the Earl of Shaftesbury from Lord Shaftesbury, the Earl of Winchelsea and Nottingham from Lord Nottingham, the Earl of Guildford from Lord Guildford, Earl Cowper from Lord Cowper, the Earl of Macclesfield from Lord Macclesfield, Marquis Camden from Lord Camden, the Earl of Lovelace from Lord King, the Earl of Hardwicke from Lord Hardwicke, Earl Talbot from Lord Talbot, Earl Bathurst from Lord Bathurst, the Earl of Eldon from Lord Eldon, and Lord Erskine from the illustrious lord of that name.

It may be satisfactory to our readers to learn that only one chancellor was beheaded while in possession of the Great Seal, and that, during the last three hundred years, only six have been impeached, and only one—the great Somers—acquitted. So much for the Lord Chancellor. Gradually he has become great and strong and terrible, from a very small beginning. As Gibbon says, "This word, so humble in its origin, has, by a singular fortune, risen into the title of the first great office of state in the monarchies of Europe." It is clear that the office has now reached its culminating point; change looms in the future—law reformers are at work. In a short time the political character of the office may cease to exist. In the meanwhile, chronicling things as they are, we could do no less than devote a chapter to an office which makes its possessor the president of the peers of England, and which has been generally bestowed by victorious party chiefs on the lawyers who have most skilfully—most powerfully and successfully—fought the battle of party on the floor of St. Stephen's.

LADIES' DEPARTMENT.



ROSE D'OYLEY.

MATERIALS :—Exhibition Crochet Cotton, Nos. 14, 16, 18, 20, 28. Walker's Penelope Hook, Nos. 3, 3½, 4.

a. With cotton No. 20 and hook 3½, work 13 chains : make it round and in loop 24 d.c., · 1 d.c. on d.c. 7 chain, miss 2, repeat · 7 times more: ·· in 4th chain stitch of 7 chain, 1 s.c., 12 chain, 1 s.c. in 6th chain from hook ; 7 chain, 1 s.c. in same as last s.c. ; 5 chain, 1 s.c., in same as last s.c., 5 chain, 1 s.c. in next chain stitch to 1st of 12 chain ; 5 chain repeat ·· 7 times more, fasten off.

b. With cotton No. 18 and hook 3½, work 10 chain, make it round, and in loop 24 d.c. · In 1st d.c. work 3 chain, 3 long, 3 chain, 1 d.c., miss 1, and repeat · 7 times more. Those only in the last, 2 long, join to 4th chain stitch of 7 chain of *a*, 1 long, 3 chain, 1 d.c., fasten off. Make 7 more *b*, joining to the 7 chains of *a*.

c. With cotton No. 16 and hook 3, ·· 1 s.c. in the centre of the two 5 chains of *a*, nearest the foundation ; 7 chain, 1 s.c. in the centre of 5 chain ; 5 chain, 1 s.c. on 2nd long of 1st division of *b* ; · 3 chain, 1 d.c. on next division repeat · 5 times more, 5 chain ; 1 d.c. in next 5 chain, 7 chain, repeat ·· 7 times more, fasten off.

D.c. all round the chain and fasten off.

d. With cotton No. 28 and hook 4, · 7 chain, 1 s.c. in 1st chain, and in round loop 1 d.c., 4 long ; 3 chain ; join to d.c. stitches where the two 5 chains are found together, turn, and on the 3 chain 1 d.c., 3 long ; then in round loop, 4 long, 1 d.c. ; hen join to the d.c. on the opposite side, and fasten off. Repeat 7 times more.

e. With cotton No. 18 and hook 3. Where you left off in *d*, join on No. 18 cotton ; 9 chain, 1 s.c. in 5th chain ; then in round loop ·· 1 d.c., 5 chain, join to 5th d.c. from where you joined No. 18 cotton on ; 5 chain, turn, and on 10 chain, 1 d.c., 9 long ; 1 d.c. in round loop, 7 chain join to the top d.c., 3 chain, 1 s.c. in the 7th chain ; 3 chain, 1 d.c. in the 7th chain ; · 2 · 5 long, 1 d.c. in same as 1st d.c., 1 d.c. in round loop repeat ·· from ·· without joining the 10 chain twice. The second time only work to · 2 ·, work 3 long, join to 5th d.c. from where you joined No. 18 cotton on ; 2 more long on 7 chain, 1 d.c. ; then 3 s.c. down the stem. Make 7 more joining in the same way : fasten off.

f. With cotton No. 16 and hook 3. In 14th d.c. of *e* from where you joined No. 18 cotton on, · 1 d.c., 4 chain, join to 1st 3 chain of *e* of 1st section, 4 chain, join to 2nd 3 chain of *e* of 1st section ; 8 chain, join to 1st 3 chain of *e* of 2nd section, 3 chain, join to 2nd 3 chain of *e* of 2nd section ; 8 chain, join to 1st 3 chain of *e* of 3rd section ; 3 chain, join to 2nd 3 chain of *e* of 3rd section ; 4 chain, repeat all round ; d.c. all round.

g. With cotton No. 16, and hook 3, 10 chain, make it round and in loop ; 8 d.c. join to the same place, where you began the long chain of *f* 5 d.c. · 5 chain join to 8th d.c. of *f* from where you joined the d.c. : 6 chain, turn, 1 d.c., 7 long, 1 d.c. miss 1, 1 s.c. in next d.c., repeat · 4 times more. Join in the same place only to last petal. In the last petal work down the chain as follows : 1 d.c., 4 long, join to 8th d.c. from were you joined the 1st d.c. ; 3 long, 1 d.c., fasten off. Make 7 more. Joining each as you make them.

h. With cotton No. 16 and hook No. 3, 15 chain, 1 s.c. in 1st stitch ; then in loop ; 24 d.c., · 1 d.c. on d.c., 7 chain, miss 2, repeat · 7 times more, then in each 7 chain, 9 d.c., except the last, which work as follows : 5 d.c. join to 3rd point of *g*, 4 d.c. in same 7 chain.

The next, *h*, join in the same manner to point of *f*, make sufficient to go round, joining alternately to *g*s and *f*s.

i. With cotton No. 14 and hook No. 3, ·· 1 s.c. on 5th d.c. of 1st division of *h*, · 5 chain, 1 s.c. in next division, repeat · 5 times more, 9 chain join to next point of *g* "9 chain," 1 s.c. in next point of *g*, 9 chain repeat ·· from all round. d.c. all round, and when you have come to the end of "9 chain" 4th d.c. join to the 9th d.c. · 7 chain, miss 2, 1 d.c. in next, · repeat 9 times the 10 and 11, join to the other side and fasten off.

INTERIOR OF THE INDUSTRIAL EXHIBITION BUILDING, NEW YORK.

THE NEW YORK EXHIBITION.

The great advantage of a university education lies in the knowledge it gives young men of the exact extent of their own powers, as compared with those of their companions, who are to be their competitors in the great race of life. A home-bred youth, however careful his training, must always labour under serious disadvantages, because, for want of a standard of comparison by which to measure himself, he never knows his weak points, nor in what direction his strength may be most profitably exerted. He may enter upon life in the full persuasion that every word his friends told him was true, and that he is in reality a prodigy of learning, or one of the rising stars in the constellation of science, till he perhaps finds himself miserably deceived, and surpassed by thousands even in his favourite pursuits. On the contrary, frequent trials of strength with others whose occupations and prospects are the same, not only sharpen his faculties and stimulate him to industry, but enable him to form an accurate estimate of his own worth, tell him where his forte lies, reveal his weaknesses, rouse his caution, and teach him what weapons he is most likely to handle with greatest dexterity. The great secret of success in this world lies not merely in doing a thing well, but doing it better than others. If you cannot beat somebody, you are nobody. It is no wonder that life is compared to a battle.

Now, as far as regards all peaceful pursuits, the nations of the world have been hitherto exactly in the position of a youth who has never been at either school or college, and is consequently in complete ignorance as to the position he occupies on the ladder of attainment. In the science of destruction the scale of merit has been many a time adjusted. The killing powers of every people in the universe have been ascertained with marvellous nicety; but strange to say, down to the year 1851, no country had full means of learning what was its real proficiency in the arts which minister to human happiness and comfort. In that year, the Exhibition of the Industry of all Nations in London for the first time made the artizans and manufacturers of each completely aware of the precise nature of their merits, and the extent of their deficiencies as compared with their neighbours. The eyes of some of them were painfully opened. Marvellous transformations took place. Designs and ornamentations which, a month previously, had been looked upon as perfection itself, appeared hideous and absurd; workmanship, warranted to last for ever, found itself side by side with some that plainly promised to last longer. The finest linen met with finer linen still; furniture that had defied competition all over the walls, and in all the newspapers, cried craven, and showed the white feather when it found itself in the lists. In short, prejudices of every kind received a general shock from which they never recovered. Before the Exhibition opened, America, France, and England, the three great rivals in commerce and manufactures, had but a vague and imperfect idea of each other's strength. None of them knew exactly what it had to fear—on which side it was likely to be assailed. When it closed, each was perfectly aware of its own position. Clearly France was by far superior in everything in which taste and artistic skill played the leading part. Nobody could accuse the lively Gauls of overweening vanity in informing the world so often during the period of the Exhibition—that "quant aux articles de goût et de luxe, la France y tenait la première place." In the useful, in everything that could be accomplished by enormous power of machinery, by untiring industry, in the art of production, in short, without reference to anything but practical utility, Great Britain was undoubtedly first in the scale. But America had certainly the pre-eminence in ingenious applications of science to industry, in inventions calculated to facilitate the great transactions of commerce and agriculture,—in everything which acute practicality could devise. This was exactly what was to be expected from a new country, the resources of which are still but imperfectly developed, the raw materials of which are but half known, in which the whole energies of a people of unrivalled activity have as yet been barely sufficient to afford a glimpse of the mighty future that is still in store for them.

But from the very nature of her contributions, bulky, heavy, and valuable, America laboured under great and striking disadvantages at the World's Fair in 1851. The expense of carriage, in some instances from an immense distance inland, and over a vast expanse of ocean,—the risk, the doubt which many felt regarding the success of the enterprise,—all combined to deter American inventors and manufacturers from entering into competition. The consequence was, that the department allotted to the United States in the Crystal Palace was at first scantily filled, and though later arrivals helped to swell the list, its contents were at no time of a nature to attract the attention of the multitude. The glittering products of French and Austrian and Belgian industry which surrounded them, as a general rule, presented far more attractions to the marvelling crowds who daily thronged the fairy avenues of that gorgeous erection. Nor did the English press at first do justice to the efforts of the Americans. The contrast between the sombre hues of their contributions, and the brilliant exterior and exquisite finish of the more elaborate handiwork of their competitors, was sneeringly pointed to. It was not till the first burst of superficial sight-seeing was over—till the thoughtful and serious portion of the visitors began to make the Exhibition a place of study, with a view to discover what blessings or promise of blessing for mankind it contained, that America received her due meed of praise. And when it came, we are bound to acknowledge that it was hearty and cheerful. It was then found that almost every article she sent in contained in itself the germ of a revolution in some department of trade or commerce or manufacture. It was, however, evident that it was only on her own soil that her capabilities could be rightly judged of, where all the products of the vast extent of territory which acknowledges her laws, and which includes every variety of climate, from the frosts of the arctic circle to the blazing heat of the tropics—her railway system, her telegraphs, her steamboats, her fire-arms, her locks, her sailing vessels, her marine engines, all of them different from, and, let us add, all of them in some way superior to those of the old world—could display all their peculiarities, powers, and advantages. In no foreign country was such a consummation possible, and in the New York Exhibition America has done all, and more than all, that was expected of her. In no collection of the works of human industry has the genius of utility made such a triumphant display. All the ingenuity, mechanical skill, and enterprise of a great people have been combined for the single object of facilitating or securing man's dominion over nature. Native cutlery has made a brilliant show, and one that may well cause Sheffield and Birmingham to tremble. Indeed Yankee manufacturers in this department have already attained to such proficiency as to have, in many instances, excluded the Englishman altogether from the market. In locks, the old supremacy has been fully maintained, and in mechanics' tools ingenuity enough has been lavished in devising new shapes, new powers, and new methods of use, to dispense, one would think, with any progress in this direction for a generation to come. Four new patent processes for planing boards; new machines for cutting staves, and for dressing flax; new lathes; new iron planers, and shapers, and presses which manipulate cold iron like so much putty, bruise it, slice it, roll it, bore it; looms, spinning-machines, carding-machines, power-pumps, steam-presses, caloric-engines, steam-engines, screws, sewing-machines, and a host of other contrivances for diminishing or dispensing with manual labour, or for overcoming space and wind and waves, crowd the machinery department. There is one article in it, however, which, although it does not, in consequence of its being so well known by the public, attract so much attention as some others, deserves more than a passing notice, from the mighty influence it has exercised upon the industry both

of Great Britain and America. We need hardly say we allude to Whitney's Cotton Gin, an invention now half a century old, but which has played as prominent a part in the growth and extension of cotton manufacture as the power-loom.

A few facts will convince our readers of its importance. Great Britain, the great seat of cotton manufacture, receives eighty-four per cent. of the raw material from America. In certain parts of Georgia and South Carolina, owing to peculiarities of the soil, the cotton when plucked is almost ready for exportation without any further trouble. But throughout the remainder of the cotton districts of the Union, it is so entangled with the seeds when gathered, that a tedious course of hand picking used, in former times, to be necessary to make it fit for the manufacturer. The consequence was, that in 1793 the United States were able to export only 307 bales, and the manufacture in England was proportionally restricted. In 1794 Eli Whitney invented a machine which with marvellous rapidity clears the staple of every impurity, and turns it out ready for use; and in that year the exports rose to 3,000 bales. In 1849 it reached 1,500,000 bales, and in 1853 it will probably be one-third larger. At the present moment the manufacture of cotton employs one-eighth of the population of the United Kingdom, who turn out products to the value of £30,000,000 yearly, and its taxes supply one-fourth of the whole revenue of the empire. So much for the Cotton Gin.

In the philosophical instrument department, America stands without a rival; in carriages—in which she displayed so much excellence at the Great Exhibition—we observe no novelty, except wooden springs, which we think an invention of doubtful utility. Piano-fortes, too, hold their old ground, but still fail to equal those of other countries in finish.

In a mere summary like the present, we cannot enter into the details of the various departments. We therefore pass from the subject of mechanical inventions, with a mere mention of those in which we think American skill and perseverance have produced marked and striking results, and promise to compete successfully, and that at no distant day, with the best productions of foreign artificers. American artizans have now seen their strength, and are enabled to measure the progress they have made. They began little more than half a century ago from nothing; they now find themselves entering the lists against the time-honoured skill of the old world. There is, however, one section of the Exhibition more interesting, we think, than any, but which has not at all made the display that might have been expected of it; not for the want of materials, certainly, but perhaps for want of time, and space, and means. We allude to that which contains, or should contain, the natural products of the American climate and soil, from the Atlantic to the Pacific, and from the great northern lakes to the gulf of Mexico. A more wonderful and varied collection of articles which minister to human comfort or happiness, or more striking evidence of the vast and almost inexhaustible resources of the territory of the United States, could not be afforded than specimens of each of these, if well arranged, would exhibit. Much has been done; more might have been done. We do not chide; we simply regret. The various kinds of farinaceous and other products, which make an American breakfast-table such a marvel to a foreigner—wheat, rye, oats, Indian corn, pumpkins, peaches, yams, flour, sugar; the materials of industry and manufacture—hemp, cotton, flax, wool, and the iron, copper, and other ores, from the great mineral region of Lake Superior and other districts, all find a place in the Exhibition; but not so prominent a one as we could wish them, nor so arranged as to indicate their importance. In one branch of industry, however, we are glad to find America rising into competition with the old world—and that by no means a trifling one. Vine-growing has become a profitable calling in the States, and promises to render them independent of the European continent in a matter for which a large sum of money is yearly disbursed. It is, of course, still in its infancy, but the results hitherto obtained have been most gratifying. Ohio is its great seat, and the grape mainly cultivated is of home origin. Cincinnati is the centre of the vine district, and though many of the dressers are foreigners from Germany, France, and Switzerland, most of the vinegrowers are Americans. The wines already obtain a preference in America, although, of course, the manufacture has not been brought to anything like perfection. The number of acres cultivated as vineyards in Ohio is about 2,000; and the crop of last year is supposed to be worth 1,000,000 dollars, or about £200,000 sterling. This year four commercial houses in Cincinnati have prepared more than 250,000 bottles of sparkling wine, worth about fifty shillings a dozen, but have not been nearly able to supply the demand.

With regard to the fine arts, the result of the Exhibition has been gratifying and holds out great promise of future excellence. American artists have hitherto had great difficulties to contend with. The intense application to money getting, or purely material pursuits, which always prevails in a new country, has deprived them of the great rewards of genius—fame, and public encouragement. The beautiful has been too much kept in the background, and her sister the useful over-caressed. Properly, the two should work together in harmony, and this is a truth which the American people are now beginning to recognise. Considering, therefore, that all the gems of art lie in Europe, and can never be examined or studied by the mass of the people, and that American artists can only drink in inspiration at these great fountains after a long and painful pilgrimage, the collection of so many *chefs-d'œuvre* at New York is an inestimable benefit, and the works of native genius occupy no unworthy place beside them.

THE BEAUCHAMP TOWER.

Gray makes his bard exclaim—

> "Ye towers of Julius, London's lasting shame,
> With many a foul and midnight murder fed."

It is more than questionable whether the poet had any right to connect the name of the great Roman with London's lasting shame. It is certain, however, that England's saddest tragedies have been acted there—that nowhere has poor human nature appeared in darker colours—that nowhere have been seen in clearer light the faithlessness of friends, the brutality of power, the savage hate of foes. There Anne Boleyn and Catherine Howard, the victims of a monarch's caprice, went to a bloody death. There Lady Jane Grey met her untimely end, so as to shed eternal lustre on her ill-starred life. There is that gate,

> "Misnamed, through which before
> Went Sidney, Russell, Raleigh, Cranmer, More."

Those walls tell a fearful tale. In the absence of history, we could read in the Beauchamp Tower the characters of the men and times. So strikingly true is it, as has been observed, that there could be no doubt, for instance, as to the ambition of Edward I. or the weakness of Edward II., the lust of Henry VIII., the bigotry of Mary, or the vanity of Elizabeth, if we possessed no other record than these walls could furnish. The Beauchamp Tower is history. Ages speak to us by it. It records for us the chronicle of the past; it tells what innocence languished here, trusting in God when vain was the help of man—what high hope was here changed into black despair—what proud ambition had here to relinquish a palace for a prison, dreams of empire for stone walls, the throne and the sceptre for the scaffold and the axe.

The Beauchamp Tower, in all probability, derives its name from Thomas de Beauchamp, Earl of Warwick, who was confined in the state prison there, prior to his banishment to the Isle of Man, in 1397. It consists of two stories, ascended by a circular staircase; the lower story was till lately used as the

officers' mess-room. In this apartment there are several pointed arched recesses, originally admitting light into it from narrow embrasures, but these are now blocked up, and windows opened in another part. It is situated on the west side of the Tower. We have said, part of it is the officers' mess-room; part of it is devoted to better purposes, for it is now a repository for the ancient enrolments of chancery, the most valuable, it is said, of our national documents. Of the Tower as a whole ittle now remains. To what therefore does exist at the present time a considerable value attaches. As we as a nation have not been remarkable for the attention we have paid to such places, it is gratifying to find that we are awaking from our apathy, and that the Beauchamp Tower is being restored under the direction of Mr. Salvin, an eminent architect in this department of building. Till recently it has been inaccessible to the public. It was only so late as 1796 that the inscriptions it contains were discovered. Till then, by some means, they had been plastered over; now, when we enter the state prison, memorials of its former inhabitants meet us on every side. Everywhere we see inscriptions, coats of arms, initials cut to wile away a weary hour, or, possibly, to remind posterity of men who hoped to be remembered by it for something more than an inglorious captivity and a wretched end. These inscriptions are sad in the extreme; no one can expect they could be otherwise. For instance, what can be more touching than the following:—

"William Rame, 22 die Aprilis, anno 1559.

"Better it is to be in the houze of morning than in the houze of banqueting.

"The hearte of the wyse is in the morning houze. It is better to have some chastening than to have over moche libertie.

"There is a tyme for all things; a tyme to be borne and a tyme to dye; and the daye of deathe is better than the daye of birthe.

"There is an ende of all things; and the ende of a thing is better than the begenyng.

"Be wyse and patient in trouble; for wysdom defendith as well as money.

"Use well the tyme of prosperitie, and remember the tyme of mysfortune."

Another inscription, in old Italian, is translated as follows:—

"Since fortune hath chosen that my hope should go to the wind to complain, I wish the time were destroyed, my planet being ever sorrowful and discontented. "Wilim Tyrrel, 1541."

The above inscription has the name Charles Bailly cut upon it. In another part of the prison is the following inscription by the same hand:—

"Be friend to one, be enemy to none. Hoping, have patience, A.D. 1571, 10 Sept. The most unhappy man in the world is he that is not patient in adversitie; for men are not killed with the adversitie they have, but with the impatience which they suffer.

Tout vient a poient quy peult attendie
Gli sosbiri ne son testémoni veri dell'angoscia mia.
"Æt. 29, Charles Bailly."

It appears that Charles Bailly, or Bailif, as Camden spells his name, was a person engaged in the services and practices of Mary, Queen of Scots, who, coming over to England, was, at the very moment of his landing, seized and imprisoned. This prisoner was afterwards liberated.

"Thomas Maigh, 1581.
"Thomas Maigh, which lieth here alone,
That fayne wold from hense begon,
By torture strung my troyth was tried,
Yet of my libertie denied.
"1581—Thomas Maigh"

"1585—Thomas Bawdewin—Juli.
"As virtue maketh life,
So sin causeth death."
(A pair of scales.)

Not the least interesting of these marks is the name IANE, (fig. 6), without any ornament in addition: this is supposed to have been cut by the husband of Lady Jane Grey during his imprisonment. The beautifully designed and well executed sculpture (fig. 3), is the work of John Dudley, Earl of Warwick, eldest son of John Dudley, the ambitious Duke of Northumberland, and brother to Lord Guilford who was executed.

It will be seen, by a reference to the engraving, that the shield containing the lion, bear, and ragged staff is surrounded by a border composed of oak sprigs and acorns, honeysuckles, and another plant which we have not been able to find a name for. The inscription is as follows:—

"Yow that these beast do wh. behold and se,
May deme with ease wherefore here made they be,
With borders eke wherein . . . .
From brothers names who list to search the ground."

The unfinished line may be filled up with the words "there may be found."

Mr. Balley, in his history of the Tower, says, "The names of the four brothers were Ambrose, Robert, Guilford, and Henry; and taking it for granted that the pun, which is evidently couched under the above lines, has an allusion to them, we may conjecture that the roses, separated in one corner, are meant for the name of Ambrose, his next eldest brother; the elucidation of the remaining part of this singular device may be left as an interesting puzzle."

We would suggest that the acorns may possibly have been intended for the first letter of Ambrose's name; the roses for the R in Robert; the honeysuckle for the H in Henry; and perhaps some ingenious reader will enable us to apply the remaining flowers to the G in Guilford.

Another inscription (fig. 7) is the following:—

"Verbum Domini manet,
1568.
John Prine."

The date, as well as the words of this inscription, renders it highly probable that the person who made it was some priest of the Roman Catholic communion.

The words, "Saro Fideli. Inggram Percy," (fig. 7) were written by the third son of Henry V., Earl of Northumberland. There is every reason to believe that he was implicated in the northern rebellion, for which his brother, Sir Thomas Percy, was executed, with several others, in the month of June, 1532. He appears to have been pardoned, and to have died about the latter end of the following year.

The inscription "A. F. Page" (fig. 1), relates to Francis Page, who, after studying the municipal laws in England, went abroad, and being ordained priest, returned as a missionary into his own country. He resided for the most part with Mrs. Anne Line, a widow gentlewoman; and being at last seized, he was condemned to die, and was executed at Tyburn in the year 1601. Mrs. Line was also persecuted and suffered death for entertaining him.

The name of Peveril is met with in several parts of the prison; one in connexion with sculptures of a cross and shield of arms, on which are three wheatsheaves, the armorial bearings of the Peverils of Derbyshire (fig. 2); again at the bottom of a partly defaced Latin inscription, cut round a border of a horse-shoe shape (fig. 8); and also at the bottom of the inscription (fig. 1). The history of this prisoner is not known; but it is no doubt owing to the sight of these inscriptions that we are indebted for the suggestion of the novel of "Peveril of the Peak." The scene in another part of the Tower, described in the "Fortunes of Nigel," has also been evidently studied on the spot.

The inscriptions are so numerous, that it is difficult to select from them; here is, however, one we cannot pass over—

"He whom this place will not mend,
Was bad before and worse will end."

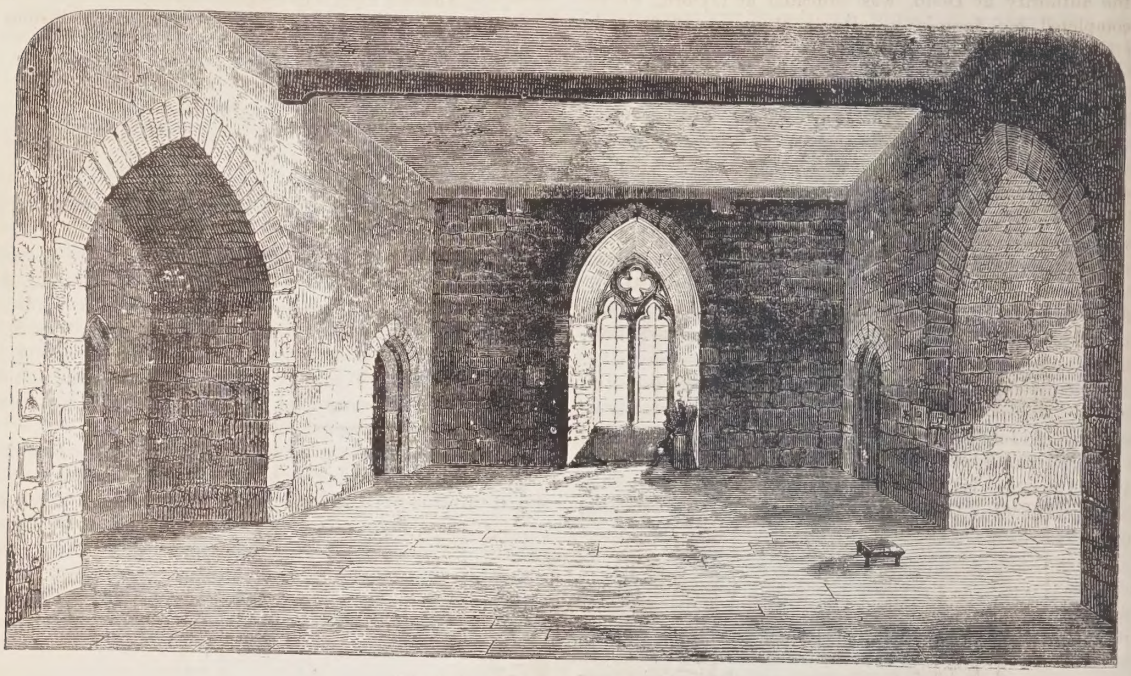
Above the fire-place is an inscription by the Duke of Norfolk, who aspired to the hand of Mary, Queen of Scots. Scattered here and there are the names of several eminent nonconformists (fig. 4), who suffered at Tyburn and elsewhere, amongst them Dr. Cook.

Elsewhere we meet with the record, "1576, Thomas Fooll." Below this is a rude piece of sculpture by Thomas Willyn-

gar, without date, which consists of a bleeding heart with the letters T. W., the initials of his own name, on the one side, and P. A., most likely those of his mistress, on the other. There

" My hart is yours tel dethe."

Passing over several inscriptions of little interest, we come to the following inscription :—



ROOM IN THE BEAUCHAMP TOWER.

is also a figure of Death holding a dart in the left hand, and an hour-glass in the right; and on the opposite side of the

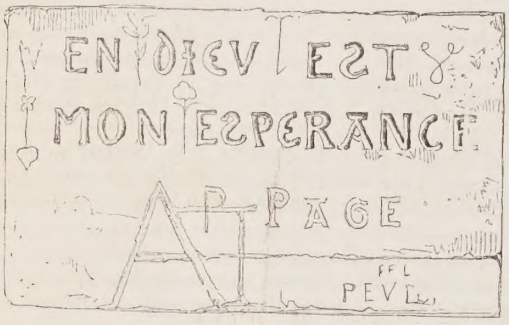


FIG. 1.

This person was, probably, a descendant of the Ropers in Kent, one of whom married Margaret, the accomplished daughter of Sir Thomas More.

Our space obliges us to refrain from noticing other inscriptions of much interest; we cannot, however, pass over, without a few words, that of Thomas Abell (fig. 5), who, on the authority of Dodd, was educated at Oxford, where he completed his degrees in arts in the year 1516, and, mentioned. When the validity of the marriage between Henry and Catherine became a question, the affection which Dr. Abell bore towards his mistress led him into the controversies to which it gave rise, and he opposed the divorce both by words and writings. By giving in to the delusions of

proceeding in divinity, became a doctor of that faculty. He was a man of learning, a great master of instrumental music, and well skilled in modern languages. These qualifications introduced him at court, and he became domestic chaplain to Queen Catherine of Arragon, wife of Henry VIII., and had the honour of serving her majesty in the capacity above-

Elizabeth Barton, called the Holy Maid of Kent, he incurred a misprision, and afterwards was condemned and executed in Smithfield, July 30, 1540, together with Dr. Edward Powell and Dr. Richard Featherstone, for denying the king's supremacy, and affirming his marriage with Queen Catherine to be good.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

CHAPTER IX.—CONCLUSION.

"My bride,
My wife, my life! O we will walk this world
Yoked in all exercise of noble end;
And so through those dark gates across the wild
That no man knows. Indeed I love thee: come,
Yield thyself up: my hopes and thine are one:
Accomplish thou my manhood and thyself.
Lay thy sweet hands in mine and trust to me."

Alfred Tennyson.

Let us, at all events, have a gleam of sunshine in which to bid farewell to these scholars in the School of Life. It is full three years after the mournful deaths of Leonard and of little Cuthbert, that we meet our friends, Lucretia, and Mary Gaywood, and John Wetherley, sauntering along an umbrageous lane leading from Clifton Grove towards the Hellings. Of poor Leonard's fate the three friends had been conversing; and this may account for a certain mournfulness which overshadows their countenances; but as they speak of the noble steadfastness with which Agnes has pursued her path, purified by her deep sorrow, an undying love permeating her every word and deed—her whole life devoted to the service of suffering humanity—their faces beam with an enthusiastic joy.

"Her true union with poor Leonard was more accomplished by his death," remarked Lucretia, "than ever it could have been by his life. Through her he still acts and lives in the world; his spirit of universal love has entered into her, and become active through her moral being. To her imaginative nature, the ideal of Leonard, mingling, as it does, with bitterest regret for her own hardness—though even I, John, am ready to confess now, that I formerly accused Agnes Singleton too severely of an absence of tenderness and love—has been, and ever will be, probably more effective in its influence for good and nobleness upon her life, than the marriage with the living Leonard ever could have been, even had he returned her love with the full force of his being. Love may do his work by separation at times rather than by accomplished union. But you, dear Mary and John, shake your heads; you are

sceptics! And may *your* lives, beloved ones, in their accomplished union, read a yet stronger and yet more beautiful moral. But, dear ones, I am not going to preach you a marriage homily; I am going to consult you about a scheme which Andrew, and Mr. Ellis Stamboyse, and I have in hand. We were very busy in discussion, you may remember, the other evening when you two returned from your long day's ramble, bringing with you that grand sheaf of water-plants, and that beautiful sketch of the old willows upon the island; but as we had not quite settled affairs, we would not then tell you."

"Oh, I'm afraid you did not tell us, dear Lucretia," cried Mary, with her sweet, gay voice, "because John and I were so full of our adventures, and so selfishly absorbed in our happy day; do, do forgive us! But what is the scheme? three such wise people can only have concerted a marvel of wisdom!"

"It is that I shall become book-keeper for the London branch of the great house of Stamboyse—book-keeper with a salary of £200 a-year; what think you of that?"

"You *book-keeper*, Lucretia!" her two listeners exclaimed with one voice of astonishment.

"Yes, the idea is novel I confess, but the more you reflect upon it the better I fancy you will like it," pursued Lucretia, smiling at the surprise written upon the countenances of her auditors. "You know that Ellis Stamboyse has long been an advocate for the employment of women in various occupations usually closed to them—and how in every direction he would open up paths for their enlightenment, and for means of their usefulness, both to themselves and others—and how he and Agnes have worked together in this direction for some two years past you also know—and how since his return from America he has become still more earnest upon the subject. The other day he offered Andrew this situation in London, which has a much higher salary than the one which Andrew fills at Nottingham; but Andrew hesitated, both because he dreaded, on account of his delicate health, the increased responsibility, and the greater confinement; and because, delightful as would have been his near neighbourhood to us, he still regretted leaving his old routine of business and his old haunts—you know Andrew's ways! And then, all at once, Mr. Ellis proposed that I should become their book-keeper with £200 a year! I was not so much surprised as you are; all became clear to me at once, and many things could thus be accomplished about which I was anxious. I had wondered often how I might, after dear Mary was gone, employ my time in such a manner as should, to some degree, banish my longing for her dear presence. Dearest Mary, now that I have found this employment, I can speak of this selfish regret of mine in losing you, who these long years past have been my sister, daughter almost, and most beloved of friends." Mary could only reply by pressing Lucretia's hand fervently to her lips.—"And then, too, I shall be *so* rich; there will be no fear for sickness or old age in years to come; and, besides, I have secretly determined never to rest until Andrew gives up his situation and comes and lives with me in London—and we will take a cottage within a short walk of you at Brompton—so there will be plenty of money provided for our own wants. I already have fixed upon the cottage even. And it will be most edifying, I assure you, dear ones, to see me setting off to my *office* each morning punctual as clock-work by the omnibus; and still more edifying to see me sitting within my glass case, like some rare stuffed animal, with my big ledgers about me. I mean to become the very model of a book-keeper; it will never do for a *woman* to do such a thing imperfectly, you know. And thus you see it is all arranged, and Andrew comes over to-morrow evening to give me my first lesson in posting the ledger. Yes, dear Mary, you and John may laugh, but the thing is no joke!" And thus, gaily talking, the trio passed along towards the old-fashioned village of Wilford, where John had determined that he and Mary should be married, and where the three were now waiting until the marriage-day arrived.

The reader will perceive that various changes must have taken place in the heart of our friend John Wetherly since we parted with him, seeing that we find him now a third time in love. John himself laughed with Mary about what he called "his very susceptible heart," and had confided to her the history of his youthful passion for L'Allegro; at which both Mary and John smiled, recalling L'Allegro, as they now knew her, the very elegant, but insipid, fine lady, whose interests in life were bounded by the desire to see "her dear husband and babes" enjoying every possible creature-comfort, the "babes," be it observed, adorned always in the most exquisite and costly of attire, fashioned by no meaner hand than that of the fair L'Allegro herself. They smiled not at L'Allegro's love—so far as it extended—but at its extending within such narrow bounds, and sighed also when they believed that they had divined what was the peculiar and secret trial of Ellis Stamboyse's life, disappointment in the compass of his pretty wife's soul, which he so willingly would have cultivated and enriched with precious seed, till it should have brought forth roses more beautiful than those which glowed upon her pretty cheeks, and she became truly a *help-mete* for him in this world of stern labour. John also had confided to Mary his more serious passion for Honoria, and with words of a deep earnestness declared that if ever Mary found in him the devoted, faithful friend and life-long companion which he so earnestly desired to be to her, she must ascribe much—if not all—of their happiness to Honoria, and to the upright principles which she so sternly had inculcated, to the aspiration after, first moral, then intellectual perfection, which she had thought necessary to inspire him with. "No, never, never, beloved Mary," had John once exclaimed, "could I ever have recognised the beauty of your and Lucretia's lives, had it not been for Miss Pierrpoint's influence. Never, never could your beautiful love have been bestowed upon me, except for her teaching of *wisdom;* for even had she by her wealth and influence raised the poor boy from the turnip-field into the painter and well-to-do man, that would not have crowned me with the rarest of blessings, the love of a pure and noble-minded woman such as you! Yes, sweet little Mary, let our gratitude towards, and love of, this dear and noble friend show itself to her through the accomplishment of our beautiful dreams of an ideally lovely marriage. Oh, Mary, how lovely, how pure and noble a future lies before us. God only grant us strength to accomplish some of these beautiful aspirations through His holy power and love!" "Amen!" spoke Mary in a low, deep voice, and clasped her beloved with unutterable tenderness in her soft arms.

John Wetherly truly must have been born under a lucky star; for not only upon his return from his continental sojourn, enriched with study and purified by a profound mental struggle in which he had come forth nobly victorious, did he achieve an extraordinary success in his artistic life; but gradually had dawned in his breast a fresh love for sweet Mary Gaywood, who had been developed during his absence, by her sorrow over little Cuthbert's death, and by the gradual course of time, from the gentle, sweet young girl into the sweet, joyous-hearted, and intellectual woman. This love, virginal in its purity as his love of L'Allegro, elevated in its moral tone as his love of Honoria, yet differed from either through its blessedness in being returned, and that with a fullheartedness which at times fairly intoxicated John. Mary, if anything, grew graver and more thoughtful; but her gay, joyous nature lost nothing by the mellowed earnestness which this deep affection, with its beautiful but awe-inspiring responsibilities, cast over her.

And now, as we have seen, the wedding-day was rapidly approaching, and we find our friends located at the quaint little village where first we made John's acquaintance. John is staying with his good old grandmother, who yet lives, of course looking older, but hale and merry as ever, although we have lost sight of her these ten years past. She lived in the same little cottage, but which had, thanks to John's never-ceasing thoughts of the dear old woman's comfort, been enriched with many useful presents. She had a girl, too, who did whatever house-work was beyond the old body's

strength; and altogether old Sally Wetherley was regarded quite as a lady by her village acquaintance—not that she regarded herself as a lady; she would have been the first to ridicule the idea, and still hobbled about her work with a certain pride, although her dream of former days was strangely realised, and she "had a maid-of-all-work, and could live like a lady." Her greatest pride was "my grandson John." "He's a brave lad's my John, not a bit of pride, I assure you, Dolly," she had said some weeks before to her old gossip—"not a bit of it, and that you'll see when he comes down here next week to look out for lodgings for the lady as he's going to be married to, and as is coming down here to stay, as she must do, you know, she and her sister. John says in's letter they's made up their minds long ago only to be married by Mester Brewster, as had laughed at him for painting with 't powder-blue and mustard, when he was a bit of a chap, thou remembers, Dolly; and that he and Mary—that's th' lass's name—none of your fine fly-away names, you see—had rather be married in th' old Wilford chuch, than in St. Peter's at Rome, or in any o' th' fine chuches he'd seen in foreign parts. And it seems that the lass knows all about Wilford, and has a brother as lives in Nottingham; and she sends her affectionate love to me, thou sees, Dolly—nay, I forgot thou wast so blind, and could not see th' writing, though it is big;—my lad always writes big and black; for he knows my eyes is bad, though not so bad as thine yet, Dolly. And so thou sees it's no wonder I'm a bit in a flurry, and must help Bess to red up th' place. But I must say, Dolly, I'm a bit scared when I think a seeing my grand lady granddaughter as is to be! Not but that she'll be a good lass to my lad, I feel sure; but she mayn't like, thou knows, to find, as her husband was such a poor lad, thou sees, and has still such a poor old woman for a grandmother, as can't talk fine."

And terribly "*scared*" indeed was good old Sally the evening of Mary and Lucretia's arrival. "Now, grannie!" exclaimed John, bursting into his grandmother's cottage, his face radiant with joy,—"make haste and come across the green. Mary is come! I've just brought them from Nottingham; they are going to drink tea, and are a little weary after the journey, or would have come on directly with me—but I said I'd fetch you to drink tea with them—come along, come along. Mary's so impatient to see you," cried he, kissing the old woman, "I'll put your bonnet on—and there's your shawl!"

"But bless thee, lad, I can't, I tell thee; thou quite upsets a body—thou's rumpled my cap, and flustered me ever so, lad!" cried the old grandmother, a little bit ruffled in temper as well as in dress. "I can't go and see thy fine Lunnon acquaintance I tell thee, Johnny, thy fine ladies in this old rag; thou should'a a bit more respect for me—and you're come ever so much sooner than Bess and I expected—we've been redding up the hearthstone thou sees, and have been making some pikelets. I was just a-going to clean myself and be ready. Thou shouldn't be in such a hurry, lad!"

"But you'll do beautifully, grandmother,—that nice russet gown Mary will admire if she looks at it; but she'll only look at your dear old face that I've told her about so often," said John, laughing.

"Make me believe that, lad," interrupted his grandmother with a touch of her old hastiness of temper, "as if a young fellow like thee talked so much to his sweetheart about an old woman. I can't go i' this shabby rag, I tell thee; and my puce silk's laid out all ready up stairs to put on, and my best cap, and my beautiful reticule with thy pretty flower paintings upon it, as I use only on holidays—thou remembers it, John, Miss Emma Dale as was, made it up for thee: I've not forgotten it if thou has."

But John's laughter and his grandmother's oration were interrupted by a sun-beam gliding into the room and pausing beside them: it was dear Mary. "Have you quarrelled again about the comforter, then," said a merry voice, and in a moment more the old grandmother and Mary were folded in a warm embrace.

"Well, Johnny, and this is thy wife then, that is to be," said the old woman at length, sinking down upon a chair, and wiping her eyes which some way were full of tears, as were the eyes of John, and of Mary, and of Lucretia, who stood upon the threshold of the cottage. "Well, but she's a sweet lass, and looks as though she'd make thee a brave wife—and do thou, lad, make her a brave husband, which is a harder thing, John, than being ever such a brave grandson as thou's been to me. 'Who can find a virtuous woman? for her price is above rubies. The heart of her husband doth safely trust in her, so that he shall have no need of spoil. She will do him good and not evil all the days of her life. She openeth her mouth with wisdom, and in her tongue is the law of kindness. Her children arise up and call her blessed; her husband also praiseth her,'" added the old woman in the beautiful blessing of Scripture, and then fairly sobbed outright.

Surely a more beautiful prelude to a beautiful and holy married life could not well be imagined than were the quiet weeks spent by John and Mary at Wilford before their marriage. Mary and the old grandmother became very fond of each other, and could not outdo one another in singing his praises. Lucretia and Andrew and Ellis Stamboyse had many discussions leading to results equally rational as the one we have already recorded, and Mary and John spent days of almost celestial joy among the woods and fields, looking down into the depths of each other's being with an unreservedness such as could alone exist between two such loving, pure, and enlightened hearts, and mirroring each other in their souls, mutually to gain truth and strength. Not a spot hallowed to Mary by any incident of John's childhood but was visited by them; "for," said Mary, with her deep love welling up into her sweet eyes as she looked into her lover's face, "I must not alone belong to your present and to your future, but must be able to live with you in the past. To me it is so beautiful, John, that I also have childish associations with these dear fields and groves; for it would seem to me so sad and painful if ever there had been a time when no association bound us together. And that you knew and loved Cuthbert and poor Leonard, and love Lucretia only next to me, is indeed a great blessedness; but it could not be otherwise, for my soul acknowledges you as an old friend. I cannot imagine how I felt or lived before this deep emotion formed a portion of my life."

And a great deal more such love-making went on whilst John sate painting among the pleasant trees and blossoms, with Mary beside him, forgetful of the book which she had begun to read aloud to him; or when John, flinging aside his sketch, would throw himself at her feet in the grass, and gaze into her dear face with a nobler but not less intoxicating passion than had flamed up within him for his lost love.

"I do think my Johnny's nearly off 's head with love for that lass," had been Sally Wetherley's remark to old Dolly; "only think, I came the other evening upon the two whilst they was sitting down at the bottom of the garden—thou knows the turf-seat, where John's made the strawberry-bed as is so full o' fruit this season—and there, only think, if th' silly chap had not made her a crown o' flowers which he'd put upon her head, and was lying down 'mong the grass at her feet; and just when I and Miss Gaywood hobbled up—they'd been too throng in their talk to heed us—there was the lass a-laughing like a madcap because my silly big booby of a grandson—who, they say, is a mighty great man, and has his bits a paintings written about i' th' Lunnon papers—had just seized hold of her little foot and covered it with kisses—her *foot*, Dolly—if it had been her pretty white hand I should not have wondered, but her foot, in its little light-coloured, dandyfied boot, as these ladies wear. 'Johnny, Johnny, thou big booby!' I cried, laughing a'most as much as she did, 'a dozen years hence, think you, wilt te' be as fond and foolish as now?' 'Not quite so foolish, grandmother, I hope,' the dear lass replied, stopping her laughter, 'but quite as fond.' And if you had seen how proud and happy they both looked up toward me, thou'd a thought with me, Dolly—though we know what wedded life is—that mappen a dozen years hence he might be as fond of her, if not so foolish!"

THE DORIA PALACE AT GENOA.

THERE are few, if any, of the Italian cities which possess a greater number of attractions, both for the antiquarian and the artist, than Genoa. It stood amongst the foremost of three great republics of the fifteenth century, in which the wealth, liberty, art, and learning of the world were concentrated. To have produced Columbus and Doria was title enough to fame and admiration, if it had no other. But it was no less renowned for commercial enterprise and for daring hardihood by land and sea, than for the magnificent tastes of its great men. The mighty sailors who carried its flag triumphantly into every corner of the Mediterranean, and baffled the might of Mahomet II. in the straits of the Bosphorus, were as remarkable for the refinement of their tastes, in the retirement out picturing in his mind's eye that majestic figure, the lofty port, and the venerable gray hairs of Andrew Doria—the Father of his country, the rival of Gonzalvo de Cordova, the admiral of Francis I., the conqueror of Charles V. and of Barbarossa?

It would be well if the tourist in Italy could dwell upon these recollections solely, and shut out the present from his sight. The contrast is appalling. The liberty, wealth, learning, and genius which shed lustre round every wall and hillock in this classic land, have fled northward and westward; and here, in the birthplace of Petrarch, and of the Medicis, of Zeno, of Doria, of Titian and Michael Angelo, ruin and desolation and decay mark every yard we traverse. A race of

of their homes, as for their stern valour on the waves. In none was this combination so fully displayed as in Andrew Doria, the great admiral, whose virtues and exploits have formed the theme of so much eulogy, poetry, and romance. Amidst the wonderful ampitheatre of houses, temples, palaces, terraces, of which Genoa is composed, and which mirror themselves in the blue waves that dash their silvery foam on the strand beneath, his palace is the first object which strikes the eye and fixes the attention, with its colossal Neptune, its splendid gardens, and its ennobling memories. Who could look on it without being forcibly reminded of the great age in which it rose? How many noble and patriotic struggles, how many grand self-sacrifices, how much courage, constancy, and devotion, does the name of its founder alone call up? Who could gaze upon the white terrace in the gardens with-

slaves display their squalor and misery around the Ghiberti Gates at Florence—"those gates fit to form an entrance to Paradise;"* and at Genoa, those awful palaces, each a poem in stone, are mouldering to decay, as if blasted by a curse. The statue of Neptune, in the Doria gardens, is mutilated; the porticoes are falling into ruin. The sculptured trophies on the walls are hidden by lichens, and the sea roars over the grounds of him who so often baffled its fury. But even in desolation the palace is magnificent.

It was designed by Montoisoli, a Roman architect. The gates, statues, and arabesques are the work of Pierino del Vaga, the pupil of Raffaele. Many of his paintings still adorn the walls—"Children's Games," amongst others; and, as a contrast, "The War of the Giants."

* So said Michael Angelo.

HENRY CLAY.

Henry Clay has been styled the Canning of America, as Daniel Webster has been likened to Burke. Clay and Webster were for forty years the leading orators of their country, and although, at their outset in life, they were for a time opposed to each other, during the latter and best part of their career they stood together on the same side, contending for the lead of the whig or conservative party of the United States. Both were the sons of men who moved in a humble station of life; Webster's father was a small New England farmer, and Clay's was a poor clergyman of Virginia. Clay was born of English parents at a place called the Slashes, in the county of Hanover, Eastern Virginia, on the 12th of April, 1777, just after the Declaration of Independence, and while the country was still amidst the throes of the revolution. He was the seventh child of a numerous family, some branches of which still remain in England, and which includes among its members Sir William Clay, who has represented the Tower Hamlets ever since the passing of the Reform Bill. His ancestors were among the earliest settlers in the States. Before he was four years old his father died, leaving his mother with a large family of young children dependent upon her. Shortly afterwards she married again, having for her second husband Captain Henry Watkins, a man well worthy of her affections. His step-father and mother introduced him to the practical business of life at an early period; for even in his fourteenth year we find him an assistant at the store of Mr. Richard Denny, Richmond; his education, which was that of an ordinary private school, having been prematurely brought to a close rather than properly completed. But whatever deficiency there may have been in his early training was, as far as possible, supplied by the more effective discipline of *self*-education.

PORTRAIT OF HENRY CLAY.

It soon became evident that he was capable of much higher pursuits, and accordingly his step-father took him away from the store, and placed him in the office of his friend, Peter Tinley, Esq., who was at that time clerk to the court of chancery. Here, by his diligent attention to

his duties, he soon attracted attention, and made friends. It happened opportunely that Chancellor Wythe was just then in want of a private secretary, and young Clay entered into an engagement with him, which lasted four years, and proved the great turning-point in the future statesman's history. His employer, perceiving the singular ability and industry with which he performed his duties, soon became strongly attached to him, joined Governor Brooke in advising him to study for the bar, generously granted him the free use of his library, and himself undertook the task of superintending his studies. Accordingly, in 1796, he left Mr. Tilney's office and became a student at law. After a year's intense application, he qualified himself for admission, and obtained his diploma before he had fairly entered into manhood. But it was a matter of vital moment to him that he should commence practice forthwith, as his mother and sister were entirely dependent on his exertions for a living, and they accompanied him on his removal to Lexington, in Kentucky, where he began the practice of his profession. The same diligence characterised him throughout. His amenity, accessibility, close attention to business, and eloquence as an advocate, soon attracted suitors enough, and before many years were over, Henry Clay led the bar of his state. Alluding, years afterwards, to this period of his life, he said he was then "without patrons, without friends, and destitute of means;" and again, "I remember how comfortable I thought I should be, if I could make £100 Virginia money per annum, and with what delight I received the first fifteen shillings fee. My hopes were more than realised. I immediately rushed into a lucrative practice." As a not unnatural consequence of his success, he married; and it is gratifying to be able to add, that the union was a source of happiness to both parties. His wife was Lucretia, the daughter of Colonel Thomas Hart, of Lexington, whom he left a widow, and by whom he had eleven children, only two surviving him.

Henry Clay, as a youth and a man, was throughout life a diligent self-cultivator. He was an extensive reader, and he did not fail carefully to cultivate the art of speech, by which, indeed, he made his bread. On one occasion, when giving advice to young men, he described the secret of his success in life after the following manner: "I owe my success in life," said he, "chiefly to one singular fact, viz.—that at the age of twenty-seven I commenced, and continued for years, the process of daily reading and speaking upon the contents of some historical or scientific book. These off-hand efforts were made, sometimes in a corn-field, at others in the forest, and not unfrequently in some distant barn, with the horse and the ox for my auditors. It is to this early practice of the art of all arts that I am indebted for the primary and leading impulses that stimulated me forward, and have shaped and moulded my whole subsequent destiny."

From the bar the road to the legislature is comparatively easy in America, as it is in England. He was first returned to the legislature of his state in 1803, and immediately assumed a prominent position there. Three years after, he was returned to Congress as a member of the Senate, and chosen speaker the following year. Webster and Calhoun did not enter it until some years later. Coming from a new state of the west, Mr. Clay at first took the side of Mr. Madison and the democratic party, and was soon recognised as one of its leading members. He was once more returned to the Senate, in 1811, when there was some prospect of a war with Great Britain; but withdrew from it to the lower house, where he had a more commanding position, and a better field for the display of his oratorical powers. He took his seat at the opening of Congress, November 4, 1811, and was elected to the honourable post of speaker by a majority of 31 in a house of 128 members. This high distinction, which was the more marked from the circumstance that there were many much more experienced members of his party in the house, was continued—with a short interval during his absence in negotiating the treaty of Ghent in 1814—till the year 1825, when he received the appointment of Secretary of State. He was chosen speaker on six different occasions, viz., 1811, 1813, 1815, 1817, 1819, and 1823, and filled the chair about ten years altogether. He was Mr. Madison's most able supporter in Congress, in 1812, during the debates on the subject of foreign policy, especially as respected England, a war with which power Mr. Clay strongly urged. Indeed Mr. Madison attributed to Clay much of the success that attended his administration; and when congratulated on the successful conduct of the war, he said, "to the right arm of the administration, to Clay, all is due." Daniel Webster had by this time entered Congress, and was ranged with the moderate federalists on the side of peace. He represented the more pacific commercial character of New England, whereas Clay then represented the ardent and rather headstrong republicanism of the west. But though Webster was opposed to the war with England, he yet advocated such measures as were essential to the honour and safety of the country, and particularly an increase of the navy. "Even our party divisions cease," said he, "at the crater's edge. They are lost in attachment to the national character, where that national character is made respectable."

It is easy to understand the feelings which actuated Henry Clay, and the majority of his countrymen who sided with him at that time, in their eagerness for a war with Britain. While a child, war was raging about him, and the Americans were engaged in a deadly struggle to free their country from British power. The impressions then made sank deep into their hearts, and the long war with England left behind it, together with their independence, many traditions of oppression and of hate. These still survived, when, in 1812, the attack was made upon the Chesapeake; and the numerous petty indignities committed, and supposed to have been committed, by Britain upon its late revolted colony came to a head, and burst into open war. Clay was an enthusiastic nationalist; love of country was his controlling principle; and it is therefore easy to understand the part he took on the occasion. It was this which made him a protectionist. He desired to quicken the industry of his country, to establish the peaceful arts there, and to render it independent of foreign supplies, from which it might at any time be cut off by the superior power of the British at sea. Hence the imposition of high protective duties, which at length became so intolerable that they threatened the existence of the Union. That policy has, however, been changed; and now that the old traditions are dying out, we trust we may look forward to a peaceful and mutally beneficial intercourse between America and England.

When the war was brought to a close, Mr. Clay was appointed one of the deputies to meet the British negotiators at Ghent to settle the terms of a treaty of peace, which has not since been broken. On his return to the States, he resumed his extensive practice at the bar, and in the House of Representatives he was appointed to the honourable post of speaker. Mr. Clay's personal and political influence steadily increased, and in 1824 he mainly contributed to carry the election of John Quincy Adams, of whom Mr. Clay was afterwards the first adviser in the cabinet. He held the office of Secretary of State under Mr. Adams, and in this capacity negotiated many important treaties with foreign governments. He succeeded in striking a blow at the system under which armed vessels were formerly enabled to carry on piracy under what were called "letters of marque." He advocated the cause of the South American revolted colonies, and induced the government of the United States to recognise their independence. He somewhat departed from the line of policy of the older statesmen of the Union, in taking part in the polical affairs of Europe, having exerted himself to procure the intervention of Russia in establishing the independence of Greece.

When the high protectionist duties on British manufactures led to extreme agitation throughout the Union, and threatened the disruption of the northern and southern states, Mr. Clay projected and carried a compromise measure, which restored peace to the nation, and enabled it to adjust its financial policy after the excitement had subsided. But the anti-slavery movement soon threatened the States with new dangers,

the end of which, indeed, no one can yet very clearly see. Being a zealous unionist, and not at all a zealous abolitionist, Mr. Clay again stepped forward with a new compromise bill, which he succeeded in carrying, in the belief (though, as events may yet prove, a vain one) that the vexed question of slavery in the States would thereby be permanently settled. Mr. Clay's readiness to make compromises on all important questions, has led some to call in question his statesmanship; but others, who recognise in all legislation a system of compromises, where extreme views are sacrificed for the sake of a wise moderation, have been found equally ready to defend him.

Henry Clay owed much of his influence to his personal qualities. He gave one the impression of a thorough-bred gentleman. His ways were most winning—we might almost say fascinating. His voice was beautiful; and his action while speaking was graceful, and yet emphatic. To a friend or stranger he was kindness itself; yet to an opponent he would display a lordly imperiousness. He spoke with earnestness, too; often with fiery eloquence, though he could be sweet and gentle as a woman in his more subdued moods. He could play upon the heart-strings as upon an instrument, and he could also rouse the fiery passions of our nature. To understand the enthusiastic admiration with which Henry Clay was regarded throughout the States, one must have seen him and heard him speak. Merely to read his speeches in the book in which they are collected, fails to give any adequate idea of the man. Webster's speeches are different: there you see the orator in all his greatness; and the orations of Webster will be read and admired long after those of Clay have been forgotten. And yet there are few of Webster's speeches which had the immediate effect of the more fervid orations of Clay.

The Earl of Carlisle, when on his last visit to America, in 1841, met Mr. Clay more than once, and has given us an interesting account of his appearance at that time.

"I heard Mr. Clay in the Senate once," says he, "but every one told me that he was labouring under feebleness and exhaustion, so that I could only perceive the great charm in the tones of his voice. I think this most attractive quality was still more perceivable in private intercourse, as I certainly never met any public man, either in his country or in mine, always excepting Mr. Canning, who exercised such evident fascination over the minds and affections of his friends and followers as Henry Clay. I thought his society most attractive, easy, simple, and genial, with great natural dignity." His lordship had afterwards an opportunity of visiting Mr. Clay at his country residence at Ashland, in Kentucky. "The qualities," says he, "which rivet the Senate and captivate his adherents, seemed to me both heightened and softened by his frank, courteous, simple intercourse. He lives with his family in a modest house, among fields of deep red soil, and the most luxuriant grass growing under very thriving and varied timber, the oak, sycamore, locust tree, cedar, and that beautiful ornament of the American woods, the sugar maple. He likes showing some English cattle. His countrymen seem to be in the habit of calling upon him without any introduction. Slavery, generally mild in the pastoral state of Kentucky, was certainly seen here in its least repulsive guise. Mr. Clay's own negro servant, Charles, was much devoted to him; he took him with him on a tour into Canada, and when some abolitionists there wanted him to leave his master—'Not if you were to give me both your provinces,' was the reply."

Mr. Clay was several times a candidate for the presidency, but failed to achieve that highest ambition of American statesmen. He died at Washington, in June, 1852, and on the 1st of July his remains were conveyed from Washington to New York. His funeral took place on the 4th, with all due solemnity, when a vast crowd, composed of senators, friends, and other admirers, assembled to pay the last tribute of regard to the memory of one who had throughout life shown such an undeviating attachment to his country, and rendered it such essential service in several critical periods of its history. His personal graces and high intellectual qualities will long be remembered; and after these have been forgotten, the traces of his useful public career will be read in the legislation of half a century.

We cannot close this biographical account better than by quoting from the following warm eulogium pronounced upon the departed statesman by Mr. Breckenridge, in the House of Representatives. "As a leader in a deliberative body, Mr. Clay had no equal in America; in him intellect, person, eloquence, and courage, united to form a character fit to command. He fired with his own enthusiasm, and controlled with his amazing will, individuals and masses. No reverse could crush his spirit, nor defeat reduce him to despair—equally erect and dauntless in prosperity or adversity. When successful, he moved to the accomplishment of his purposes with severe resolution. When defeated, he rallied his broken bands around him, and from his eagle eye shot along their ranks the contagion of his own courage. Destined for a leader, he everywhere asserted his destiny. In his long and eventful life he came in contact with men of all ranks and professions, but he never felt that he was in the presence of a man superior to himself. In the assemblies of the people—at the bar—in the Senate—everywhere within the circle of his personal presence, he assumed and maintained a position of prominence. But the supremacy of Mr. Clay as a party leader was not his only nor highest title to renown—that title is to be found in the purely patriotic spirit which on great occasions always signalised his conduct. We have had no statesman who, in times of real imminent public peril, has exhibited a more genuine and enlarged patriotism than Henry Clay. Whenever a question presented itself actually threatening the existence of the Union, Mr. Clay, rising above the passions of the hour, always exerted his powers to solve it peacefully and honourably."

THE ART OF TURNING.

In a previous article on Turning, an intimation was given of an intention to recur to the subject on another occasion. The promise then made we now redeem. The lathe in its primitive and more complex but completer form we have already presented to the reader; the chucks and gouges we likewise exhibited; how to use the gouge, and how to work the lathe, we now proceed to tell.

For turning a cylinder, or anything of a cylindrical form, by the lathe, the piece of wood chosen should be first reduced to something resembling the shape intended, roughly hewn into the proposed form; the wood should then be attached to the centres or points of the puppets, being firmly wedged into its right place. The cord is then adjusted to the wheel, and the rest for the tool so arranged that the gouge may be easily employed. The workman then presses the treadle, communicating a regular rotary motion to the wood, and firmly holding the tool with both hands (fig. 1), commences the operation. Slowly moving the gouge upon the rest as the wood turns upon its axis, every part of the article is attacked; this must be done with the greatest care and attention. Various tools must be employed; now the circular gouge, now that with a straight edge, according as the nature of the work requires, finer and more delicate tools being used as the work approaches completion. The dimension of the article must be carefully tested, for which purpose callipers are used. The operation is completed by the workman's employing a chisel of a peculiar form, which removes the remaining imperfections. The article is polished sometimes with glass paper, sometimes with fine sawdust. The last application of the gouge is made by holding the tool either as A or B (fig. 2.) The latter position is generally considered the best. The whole process is remarkably simple, and no less remarkable for its accuracy; by no

VARIOUS SPECIMENS OF TURNERY.

other means could the manufacture of a circular article be so exactly and so easily effected (fig. 3).

The callipers, called by the French *maître à danser*, represented by fig. 4, are used for ascertaining the exact measurement of the article to be turned, and frequently applied during the process so as to prevent any error in the operation. In turning boxes, box-lids, and indeed in all the various departments of the art, they are peculiarly useful.

Boxes and box-lids are generally turned from one piece of wood; the exactness necessary is thus preserved with but little trouble. B B represents the lid of a box, C C the box itself, the accurate dimensions of each being carefully taken by the callipers.

The method of turning a ball is shown in figs. 5 and 6. A cylindrical piece of wood is taken, say two inches thick and three inches long, and placed in the lathe (fig. 5, A), or fixed to the ordinary mandril (B) or (C); the lathe is then set in motion, and, by the careful use of the gouge, the wood gradually assumes the varied forms seen in fig. 6, E, F, H. The utmost and closest attention is requisite during the process.

There are various modifications of this beautiful art, and to some of the varieties the name ornamental turning is applied. This includes spiral turning, eccentric turning, rosette turning, epicycloidal turning, and elliptic turning. Each of these requires certain peculiarities in the construction of the lathe. In eccentric turning, for instance, a solid circular plate is fixed to the mandril of the lathe. Two guides are fixed on the surface of the plate, forming a dove-tailed slide for another plate, which is moved by a screw connected with the under plate. The upper plate has on it a circular-toothed plate, which is capable of being revolved upon its centre, but is retained in any desired position by a catch which falls between the teeth, and is held by a spring. A screw, similar to that on the mandril, is fixed on the centre of this wheel, and to this is chucked the work which is to be turned. The result is obvious; the first plate moves concentrically with the spindle of the lathe; but the slide, with its circular plate, can be moved so that the work revolves with any degree of eccentricity required.

Rose-engine turning is beautifully adapted for ornamental purposes, and among workers in gold, silver, and gilt work it has been very generally in use. And yet, though so often applied, and used for so many purposes, there are few who thoroughly understand the machine by which it is effected. Who invented the rose-engine no one knows; the French lay claim to be its originators, and they were without doubt expert in the use of it before it was known in England. There was indeed a machine answering to the description of the rose-engine in England about the time of Sir Isaac Newton, yet it was but little known and scarcely appreciated. An unsteady lathe, which in revolving produces an irregular circle, is a rude approach to the rose-engine, and may very possibly have furnished the first hint for its invention.

A writer on this subject says, "In plain cylindrical turning, the motion of the slide is so adjusted in relation to the motion of the article operated upon, that the cutter carried by the slide shall not move over a space greater than the breadth of its point in the time that the article makes one revolution. In screw turning, the cutter is made again to travel over a space as much greater than the breadth of its point, during one revolution of the spindle, as the pitch of the screw requires. The requisite changes in the motion are effected by changing the wheels on the ends of the main spindle and the leading screw."

In geometric turning, the work revolves on the lathe, and the eccentric cutter, after the fashion of the drill-stock, is driven by a band in connexion with the mandril. An almost endless variety of curious and beautiful, and, in some instances, most complicated curves, may be produced by this means. The geometric chuck is described as an eccentric with the addition of an arrangement for giving motion to the work upon the chuck, and independent of the mandril; fixed to the head-stock, and concentric with the mandril, is a toothed wheel, which, as the chuck revolves, drives another and smaller wheel on its under surface; this latter is connected with another toothed wheel, which causes the click-plate and work to revolve.

A description of the various adaptations of the lathe, the useful machines and tools lately invented, and the simple and efficient methods of conducting the work, would require larger space than can be devoted to it here. We have endeavoured only to present some interesting engravings as specimens of what the art can effect, and by what means it accomplishes the beautiful result.

Group of Objects, figs. 7, 8, 9, and 10.—A, a mallet; B, a top; C, a cornice; D, a whip-top; F, a cup and ball; F, a pin-case; G, a ball; H, I, J, K, L, M, chess-men; N O, a pop-gun; P, an egg-cup; Q R, silk-winders; S, a candlestick; T U, a pencil-case; V, a box; X, a bed-room candlestick.

CAPRIFICATION.

In ancient writings upon agriculture we often find mention made of a process called caprification, the object of which is to hasten the ripening and increase the size of figs. The method appeared to those of modern times so strange and so little calculated to answer the desired end, that they did not hesitate to treat the whole as a ridiculous fable, till travellers worthy of credit had learnt that this operation is still carried on in our own day, and in the very places where it was customary two thousand years ago. Tournefort was the first who gave any information on the subject; but Godheu, a commander at Malta, entered more fully into detail.

The inhabitants of the islands of the Archipelago derive their chief subsistence from dried figs, which they eat with barley-bread. Hence it is an object of importance to them to promote the fructification of the fig-trees. They have two kinds, the cultivated and the wild fig-tree. The former bears fruit only once a year; but the figs grow in such abundance that they would injure each other, and never reach maturity, if art were not resorted to. The wild fig-tree bears three crops of fruit a year, the figs being unfit to eat, but useful for ripening the produce of the cultivated fig-tree, by the process of caprification. Wild fig-trees begin to bear their first or autumn crop in August. These figs continue till November without ripening. Little worms are engendered from eggs deposited by a species of very small ichneumon flies, of a glossy black colour, which fly round the tree for a long time. In the months of October and November these worms, having in their turn become flies, pierce the second or winter crop of figs which appear in September. The autumn figs fall a little after the flies come out; the winter figs remain on the tree till the month of May, containing the eggs deposited by the flies which have come out of the autumn figs. In the month of May the spring figs begin to appear. When they have attained to a certain size and the eye begins to open, they are pricked in that part by the flies reared in the winter figs.

In the months of June or July, when the worms which are engendered in the figs of the third or spring crop are about to change into flies, the peasants gather these wild figs, stick them upon a sort of skewers, and put them on the cultivated fig-trees which are then in blossom. The flies which come out of the wild fig-trees, after being thus transferred, enter the cultivated fig, carrying with them the pollen or fructifying dust which they collected in moving about among the stamens of the wild fig blossoms, and introduce it to the very centre of the fruit in which they are about to deposit their eggs. The entrance of these flies produces a double effect—first that of conveying to the cultivated fig the pollen of the wild fig; and next that of causing a sort of irritation which attracts the fluid to the part where they are, and where they lay their eggs, thus occasioning an abnormal enlargement. We see something analogous to this in pears, which, when they have been pierced by insects and contain worms inside, grow larger more quickly than the rest. It is a little surprising to see the Greeks taking so much trouble about figs, but we must bear in mind that they form a large part of their food, and that therefore quantity is of more consequence than quality.

POZZUOLI.

NEAR the entrance of the Bay of Naples is the town of Pozzuoli, situated within a creek of the same name. It was called by the ancients Dicearchia, and was first used as a port for which it was well calculated on account of its sheltered (yet accessible position) by the Greeks of Cumæ, who found it very convenient for facilitating their commerce with the towns on the shores of the Bay of Naples. The natural harbour afforded a refuge to their mariners, who, unskilled in the art of navigation, and unprovided with any but the rudest appliances for the guidance and government of their frail barks, were compelled to make short voyages, and to trust to chance, and the nearest shelter nature afforded them, in case of a storm.

Naples (which is now as much distinguished as a trading town as Pozzuoli was at the time of which we are speaking) was considered by the ancient mariners to be too far distant from the entrance of the bay for commercial purposes; besides which, it afforded but poor protection for their vessels, the coast being much exposed. Therefore, Dicearchia became the great dépôt of merchandise and the centre of commerce, leaving to Naples the encouragement of the fine arts, for which it has always been celebrated.

During the second Punic war, Dicearchia passed into the hands of the Romans. It was noted for its hot springs, celebrated for the cure of various diseases; within its limits there were thirty-five natural baths of different sorts of tepid water, and from these baths or pits, called in Latin "putei," the town is said to have taken its name of Puteoli, since modernised to Pozzuoli. Under the yoke of the Romans, Pozzuoli increased in importance, and received into its ports vessels from different parts of the world, laden with tributes of the riches of the conquered nations. In the first century, in the reign of Augustus, it reached the zenith of its prosperity. Ships, richly laden, touched at its ports to land their cargoes; the stuffs of Asia, the corn of Egypt, the various commodities and metals of the East, were brought to this town. Large manufactories now sprang up close to the harbour, and materials received in the raw state were again exported, after having undergone various processes of manufacture.

But the inhabitants of Pozzuoli did not give themselves up entirely to the pursuit of commerce; for the ruins of their magnificent public buildings and beautiful villas still bear evidence of superior taste. On the shore of the gulf, west of the town, was Cicero's villa, called Academia, where he wrote his book entitled "Academical Questions."

The cathedral church of Pozzuoli was built from an ancient temple, constructed of large stones without the aid of mortar or cement. This temple was dedicated to Augustus, under the name of Jupiter, by Calpurnius, a Roman knight, to which fact the inscription on the front bears evidence. It is related that St. Paul once preached there. Puteoli is mentioned in the 28th chapter of the Acts of the Apostles.

The amphitheatre, of which some of the arches and cells still remain, is supposed to be more ancient than that of Vespasian at Rome. A cell is shown in which it is said St. Januarius and many other martyrs were confined, before their exposure in the arena. An inscription tells us that this saint, being exposed to famished bears, they went down on their knees before him: he was afterwards beheaded.

At the village of Bacoli, between the castle of Baiæ, which is represented in our engraving, and the Cape of Miseno, is the Piscina Mirabile, constructed by Sucullus as a reservoir of water for the use of the Roman fleet. Forty-eight massive pillars supported the vaulted roof of this singular edifice: near it were large granaries which furnished the vessels with corn.

Augustus, being aware of the importance of its position, and wishing to add still more to the strength of Pozzuoli, undertook vast works of improvement. The Greeks had already built out an immense mole, in the form of a bridge, supported on huge piles, from the point on which the town stood; for the Cape of Miseno formed an insufficient barrier against the violence of the open sea. This was a bold work, but Augustus undertook one of far greater magnitude, in connecting the Lucrine lake with that of Avernus, and thus establishing a communication with the sea; so that there were three harbours, that of Pozzuoli, of Lucrine, and of Avernus, capable of receiving the Roman fleets. He gave to Agrippa the management of this great work. The lake of Avernus was surrounded by steep banks overgrown with wild masses of vegetation. The ancients described the fumes it emitted as being so malignant that even birds could not fly over it, but dropped down dead. This circumstance, joined with the depth and gloom of the lake, led the ancients to take it for the gate or entrance of hell; and, accordingly, Homer brings Ulysses to Avernus, as to the mouth of the infernal regions; and, in imitation of the great bard, Virgil makes Æneas descend this way to the same abodes:—

> "And here th' innavigable lake extends,
> O'er whose unhappy waters, void of light,
> No bird presumes to steer his airy flight;
> Such deadly stenches from the depth arise,
> And steaming sulphur, that infects the skies.
> From thence the Grecian bards their legends make,
> And give the name Avernus to the lake."
>
> *Æneid*, Book vi.

Agrippa had the forests levelled with the ground, and thus allowing the malignant effluvia to escape, dispelled the gloom of horror and superstition by which it had so long been beset

Pozzuoli was the scene of one of the mad acts of the monster Caligula. In imitation of Xerxes, he ordered a bridge of boats to be constructed, at an immense expense, across the bay, between Baiæ and Pozzuoli, for no other purpose than that he might be able to boast that he had walked over the sea as over dry land, because some astrologer had once declared that there was as little chance of Caligula succeeding to the throne, as there was of his walking across the bay. The road was paved and covered with sand, and had parapets on each side. The first day after its completion, he crossed it on horseback, crowned with oak, followed by an immense crowd; the second day he traversed it in a triumphal chariot, carrying on his head a crown of laurel given by the Parthians to Darius.

The remains of the temple of Serapis form the most striking monument in Pozzuoli. The three remaining columns, of fine coppolino marble, are seen in the engraving. It was erected, during the second century B. C., in honour of the Egyptian Jupiter; and, after remaining buried under the sea for several centuries, was covered by an eruption of the Solfatara, which dispersed the waters. On the excavation of this temple, in the year 1751, it was found to be almost perfect; and, though its preservation would have been very easy, was completely stripped, the columns, statues, and vases, by which it was adorned, being carried away. This building, although sacred, contained a number of baths to which the public were doubtless admitted. In ancient times the practice of medicine was generally connected with, and protected by, religion; this building was evidently planned to serve these two purposes. In the quadrangle was a portico supported by Corinthian columns; in the centre of this atrium four steps led up to the place upon which the antiquaries of the last century assert that a circular temple, the cupola of which was supported by sixteen pillars of red marble, was found standing, and within this round enclosure they discovered an octangular bath, which was doubtless used in the great ablutions. This is the form of the Christian baptistries of the fourth century, such as we find at Rome in the baptistry of Constantine. Those constructed at Aix, at Riez in Provence, and at Ravenna in Italy, were of the same form. The Christians evidently borrowed the design of their fonts from these octangular baths enclosed in circular colonnades, which were

used by the ancients for both medical and religious purposes. In the temple of Serapis, behind the quadrangular peristyle, are square apartments, which must have been used as private baths, and not, as it has been supposed, for the use of the priests.

Behind Pozzuoli rises the volcanic mountain of Solfatara, called by the ancients the Court of Vulcan. On its summit is an oval plain, surrounded by hills, which appears to have sunk to its present level by the falling in of the top of the mountain during some eruption. Some conjecture that the hollow beneath is connected with Mount Vesuvius. Mr. Swinburne says that the ground quaked and resounded under his feet, and by laying his ear close to the earth, he could distinguish the bubbling and hissing of boiling water; yet, upon part of this crust or floor, chestnut trees flourish in perfect vigour, and a variety of shrubs shoot up along its banks, where they find level ground into which to strike root, and are out of the blasting smoke. On the north side of the mountain the waters find vent, and pursue their way in a burning stream to the lake of Aquano, a circular lake nearly two miles in circumference, embosomed in hills, which has all the appearance of a volcanic crater. Its waters are filled with myriads of frogs. At Solfatara, manufactures of sulphur, alum, and vitriol are carried on.

The country around Pozzuoli is rich in interesting antiquities; between the town and Naples is the celebrated grotto of Posilippo, a gallery cut through a mountain of the same name. It is half a mile in length, and sufficiently broad for two carriages to pass. Various accounts are given of its origin; the common people ascribe it to the enchantment of Virgil, but it is thought to be much more ancient than Rome.

On the hill above is the tomb of Virgil. It is related by Ælius Donatus, a celebrated grammarian of the fourth century, in his life of Virgil, that his ashes were carried to Naples, by order of Augustus, and deposited on the road to Pozzuoli. Several authors describe the cinerary urn of Virgil, but nothing now remains but a square room with an arched roof, overgrown with briars and weeds, among which flourishes an ancient laurel, which tradition says planted itself upon the tomb of the poet. It is said that it is impossible to destroy the plant, for that if cut down it is sure to bud again; but, in spite of this, slips of the tree are planted around to preserve the species, and the plant itself does not appear more than sixty years old.

VIEW OF POZZUOLI, ON THE GULF OF NAPLES.

The shores of Pozzuoli, once the scene of Roman magnificence, luxury, and profligacy, are now deserted. Here and there, amid the luxuriant though neglected vegetation, decaying monuments meet the eye, forcibly reminding one of the former greatness and opulence of this town. In the month of June, the scene is rendered still more desolate by the terrible malaria which extends its sway over the vast and beautiful part of Italy lying along the coasts of the Mediterranean, driving away the principal inhabitants. The effects of the malaria, though differing according to the constitution and habits of its victims, are always most distressing. Sometimes the sufferers are carried off in a few days, but more frequently they are attacked by an intermittent fever, in which case they gradually lose strength, and sometimes linger for several years.

MRS. CAROLINE CHISHOLM.

The lady whose portrait adorns this number of our publication was born at Northampton, in May, 1808. Mr. Jones, her father, belonged to that respectable class of yeomen of whom England has for centuries had reason to be proud. At an early age the subject of this sketch had to deplore her father's loss, and thenceforth she was indebted to the example and energy of her maternal parent for many of those characteristics which have so singularly marked her career, and placed her in the first rank among the practical reformers of this enlightened age. Mrs. Jones is still living, enjoying more health and strength than falls to the lot of most people; and she doubtless feels an honest pride in witnessing the position which her daughter has so deservedly attained in the estimation of the British public.

When about twenty-five years of age, Caroline Jones was married to Captain Archibald Chisholm, a native of Scotland, in the East India Company's military service. It was for a long time imagined that Mrs. Chisholm's husband was connected with the navy, and even now that notion prevails very generally; but it is quite a mistake. This error has doubtless arisen from Mrs. Chisholm's name having so long been associated with ships.

PORTRAIT OF MRS. CHISHOLM.

Two years after their marriage, Mrs. Chisholm accompanied her husband to India, he being connected with the Madras Presidency. Here may be said to have commenced Mrs. Chisholm's first public efforts. She found the poor young girls and orphans of the soldiers in an alarming state of ignorance and vice. Seeing the evil, she lost little time in

uselessly deploring it, but immediately proposed a remedy. This was, to establish a school, and to teach the young girls domestic duties. After many disappointments and vexations, Mrs. Chisholm succeeded in firmly establishing the institution now known in Madras as the Orphanage.

In 1838 Captain Chisholm's health compelled him to remove his family to Van Diemen's Land, and he eventually settled at Sydney. In 1840 he rejoined his regiment, leaving Mrs. Chisholm and her family in Australia. Mrs. Chisholm soon found an ample field for her activity and philanthropy in endeavouring to improve the then infamous system of emigration, more especially with regard to the treatment of her own sex. Both want of space and disinclination to submit facts so unseemly to our readers, preclude us from detailing the sufferings and insults which hundreds of virtuous English girls had to endure, both during the Australian voyage and at its termination. Thanks to the subject of this sketch, those iniquities are at an end.

After a series of obstacles had been overcome—obstacles, too, that arose in quarters where they might have been least expected—Mrs. Chisholm succeeded in establishing at Sydney an Emigrants' Home. After she had procured them the shelter of the Home—brought them, as she termed it, "under her own roof," for she resided there herself, sending her children to the care of others elsewhere—her next object was to find them employment. Even now, when all the facts are so familiar to the public, it is almost difficult to conceive that we are not perusing some romance, so unusual and extraordinary was the course adopted to attain the much-desired end. Well knowing that Sydney was the last place where the girls could obtain respectable employment, although numerous "places" were vacant, Mrs. Chisholm resolved to take them into the bush. Journey after journey did Mrs. Chisholm take, at times accompanied by sixty or seventy girls, whom she left comfortably placed with the wives of respectable settlers. These "bush" excursions proved eminently successful for the female emigrants, and were productive of great good to the colony.

After Mrs. Chisholm had been employed in these arduous undertakings for more than eight years, she resolved upon returning to England, where she hoped still further to extend her sphere of usefulness. In February, 1846, the inhabitants of Sydney presented her with an address and testimonial, amounting to 150 guineas, all of which was collected on the eve of her departure. That money Mrs. Chisholm promised to devote to the service of the colony, by fulfilling two commissions with which she had been entrusted—one from the convicts, and another from the emigrant population of Sydney. And most nobly was that promise redeemed, under circumstances, too, that would have dismayed most persons, even of the sterner sex.

No sooner had Mrs. Chisholm landed in England than she commenced her work, which was nothing more nor less than laying siege to the Colonial Office! "Emigration and Transportation relatively Considered," a small pamphlet addressed to Earl Grey, was the first shot, which, of course, "fell short," and did not induce the besieged to exhibit any tokens of submission. But this was followed by such a continuous fire of petitions, statements, and appeals, from many hundreds of convicts (who, having long since paid the penalty of their faults in the colony, now called upon the home government to redeem the promises made to them, on condition of their good behaviour, and forward to them their wives and children), that "the enemy" capitulated, and government listened with an attentive ear to Mrs. Chisholm's plain and homely truths, and fulfilled the pledges they had broken at the suggestion of the "squatting interest," which had succeeded for a time in hindering a measure of both policy and justice. Thus was one of Mrs. Chisholm's colonial missions fulfilled.

The other commission was of a still more difficult kind to achieve, inasmuch as there was not the plea of injustice upon which to base her application at head-quarters. Among the emigrants at Sydney vast numbers had been compelled, by the then existing regulations of the government commissioners, to leave their children in England. These children numbered several hundreds, and were, in many cases, a burden upon their respective parishes. To get these children sent out to their parents was now Mrs. Chisholm's object. At first all attempts were utterly fruitless; but perseverance always has its reward, and in this case there was no exception to the general rule. After numerous attendances, both at the Emigration Commmissioners' and Colonial Offices—at both of which places Mrs. Chisholm presented herself almost daily, during the severest winter weather—success at last crowned her exertions, and government issued orders for the conveyance of the children to their parents in the colony, which orders were promptly carried out in the ensuing spring.

And now, Mrs. Chisholm having done with her colonial friends, thought there was something needed for the improvement of emigration and the protection of the emigrant at home. She imagined that the condition of emigrants, during a journey of sixteen thousand miles, was well worthy the attention of those who either felt, or professed to feel, an interest in the moral welfare of their fellow-creatures, but more especially of the tender sex, who, when once on board an emigrant ship—whether a "government" ship or not made little difference—were entirely at the mercy of men whose conduct was highly censurable. As Mrs. Chisholm truly observed, "these are trying situations for human nature, and a dangerous position for young women to find themselves in. The innocent and the helpless stand there exposed to the wiles of the snarer. Who has not been shocked by the frightful details we have read in the public papers; how orphan after orphan has been victimised on board emigrant ships by men calling themselves Christians; how modest maidens have been brutalised over and insulted by those whose peculiar duty it was to protect them during the long and tedious voyage?"

It was with a view to the suppression of these evils that Mrs. Chisholm resolved to establish the Family Colonisation Loan Society, through the medium of which she has of late years become so universally known in England. The aims and objects of that society have been made public through so many channels, that it is quite unnecessary here to recapitulate them. But too much importance should not be attached to this one result of Mrs. Chisholm's energy and perseverance. It is in the increased morality, the established propriety, the improved sanitary arrangements, and the better regulated dietary scales of every emigrant ship leaving a British port, that her beneficial exertions are universally acknowledged.

In 1851 Captain Chisholm sailed for Melbourne, where he has since been actively engaged in sending over remittances from parties in Australia who are desirous of seeing once more in this life those nearest and dearest to them. Right well has he seconded his wife's views; for since his arrival he has remitted upwards of ten thousand pounds, some of which has been expended in affording immediate relief to aged parents; but the great bulk of the amount has been disbursed as passage money for numerous relatives, who, but for these arrangements, would in all probability never again have met in this world. In less than two years, about eight hundred individuals have joined their relatives in Australia solely through the aid afforded them by the Family Colonisation Loan Society, in addition to the remittances sent through the medium of Captain Chisholm.

In connexion with Mrs. Chisholm's surprising career, we could state many facts alike creditable to that lady and new to the general reader; but our space compels us to refrain from their recital. It must not be thought for a moment, that when Mrs. Chisholm has seen her emigrants on board, she has done with them. Every matter connected with the emigrant's welfare and comfort has her hearty support. Thus the Colonial Postage Association has been favoured with her powerful assistance, and the Post-office authorities are at present engaged in making arrangements whereby the postage will be reduced to a uniform rate of fourpence to every British colony, instead of the present enormous charge. At the earnest request of Mrs. Chisholm, also, colonial money-orders

will shortly be adopted, for sums not exceeding five pounds. But for the example set by Captain Chisholm in forwarding remittances to this country, and the great success attending his efforts, this arrangement, would probably never have been entered into.

In this sketch of Mrs. Chisholm's labours, we have been obliged to limit ourselves to a mere glance at her numerous practical endeavours. To enter into details would fill a goodly volume. In the spring of next year, the subject of our sketch will embark for Australia, which may justly be termed the country of her adoption, and whose people will no doubt one day do homage to the genius and philanthropy of their foster-mother. But in proportion as Australia will be benefited by her presence, so will English emigrants of every grade (but working people's wives and daughters especially), find that they have lost the kindly aid of one whose place it will be difficult indeed to fill. The testimonial at present in course of subscription will doubtless prove that Englishmen can duly appreciate her worth, but English women can never sufficiently reward *their* champion in every position in which it has been Mrs. Chisholm's lot to find them placed. Thanks to that enterprising lady, English mothers can now safely trust their young and innocent daughters in ships for Australia, without any fear of their falling, as too many have before now, an easy prey to bad, designing men.

As many of our readers would doubtless deem this account incomplete without a sketch of Mrs. Chisholm "at home," we will very briefly describe our visit (accompanied by a female friend) in June of last year, just before the departure of the "Scindian," "Frances Walker," and "Nepaul," freighted with the society's emigrants. The exterior of Mrs. Chisholm's residence at Islington was as unprepossessing as bricks and mortar could possibly make it. Street architecture was evidently in its infancy when Charlton-crescent was thrown together — not built. An assemblage of humbly-clad but clean-looking persons saved us the trouble of seeking the particular house we wanted. It had no distinguishing feature from its neighbours, save that the street-door was adorned with a very small brass plate, inscribed "Captain Chisholm," which had evidently done years of good service in the East on some bullock-trunk or travelling-chest. Such an unpretending name-plate would be repudiated by most suburban residents of the present "fast" school, even for their carpet-bag during their annual week's vacation at Gravesend or Margate. The passage was crowded with intending emigrants, each more eager than the other for an interview with the object of our visit. After considerable jostling and squeezing, we, at length contrived to send up our name by a venerable female attendant, who expressed a fervent wish that we "might see her missus that night," but she was sure she didn't know *when!* Our fair companion's curiosity was, of course, awakened at this aspect of affairs, and she, at any rate, resolved not to be disappointed. "Patience *is* a virtue," and we had a tolerable lesson in its acquirement. At its termination we were ushered up the narrow uncarpeted stairs into the audience-chamber upon the first floor. We had been at many "receptions," but this was the strangest of them all. Mrs. Chisholm was seated behind a large sea-chest, raised upon a couple of benches. The chest was covered with writing materials and baggage-papers, which she was distributing to the various emigrants, whilst at the same time answering every possible inquiry, and endeavouring to satisfy almost every impossible complaint. After witnessing for five minutes what Mrs. Chisholm had to endure, we felt heartily ashamed at having lost our patience on the stairs. The room (but dimly lighted by two or three candles hung in tin candlesticks against the wall) was furnished with a model of the sleeping-berths allotted to emigrants on board the society's ships. Though doubtless very well adapted for the purpose intended, their appearance certainly did not imbue us with a desire immediately to seek

"A life on the ocean wave,"

but rather strengthened our determination

"To take our stand on solid land,"

and repose in our own time-honoured four-poster. Attached to the sides of these sleeping-berths were sundry utensils required by those indulging in a voyage to the antipodes, such as tin plates, hook-pots, and water-cans. These were evidently constructed by some one having most severe notions of economy, combined with a vast regard for durability. One of the bed-places was occupied by a filter, snugly ensconced in a wicker-basket of snowy whiteness, looking altogether so provokingly cozy and comfortable by comparison with its neighbours, that it almost seemed to say, "Won't you find *me* useful, my friends?" A model emigrants' medicine-chest, made of plain deal wood, unencumbered with all decoration save a printed label, together with a life-buoy, "capable of sustaining seven persons," completed alike the ornaments and utilities of the room.

The "group-meeting" over, and the emigrants dismissed, we were (at ten o'clock at night) favoured with a private interview by the Emigrants' Friend—for such, indeed, is Mrs. Chisholm. Most of our readers have doubtless seen many portraits of this lady. Beyond our own illustration, we have seen but one good likeness—poor Fairland's lithograph from Hayter's painting. To describe a lady's personal appearance is an ungracious task at best, and we will therefore not attempt it save in a negative manner. Those of our readers who have seen Mrs. Chisholm depicted (by a certain enthusiastic artist, as yet, happily, unknown to fame) as being mounted on a coal-black steed, attired in an elegant riding-habit (with the prescribed length and insufficiency of waist), and with her whip beckoning her emigrants across a colonial river, in a decidedly "Come on!" style of attitude, worthy of Astley's best tableaux,* may rest perfectly assured that they do not, from such a picture, form a very accurate notion of the Emigrants' Friend, as she really appears when rendering them assistance. Let them imagine a sedate, matronly lady, with eyes well set under a very capacious forehead—orbs that seem to "look you through" whilst addressing you—and withal a fascinating manner which at once seizes upon you, and induces you to prolong your stay, and they will have a tolerable portrait of Mrs. Chisholm.

After a very brief interview, we took our leave, convinced that we had seen by no means the least remarkable personage of these practical and wonder-working times.

Although future English emigrants will shortly be deprived of Mrs. Chisholm's counsel before they quit their native shores, still the results of her labours will remain. These results have been obtained in despite of an opposition such as few would be willing to contend against—an opposition that could only have been defeated by one who was prepared to bring into the contest the same amount of stern determination, unflinching industry, and disinterested philanthropy, as Mrs. Chisholm. But it is the women of England who should ever bless her name, for many indeed are the almost broken hearts of the gentler sex that have been healed by her. Mothers have been united to children whom they hardly dared to hope ever again to see in this life; wives have joined their husbands, after years of painful separation; and scores of British maidens, shielded alike from injury and insult during the long sea voyage, have been safely deposited at their brothers' Australian firesides. These facts should not, and we feel assured will not, be speedily forgotten. Whilst they are remembered, then also will the woman be borne in mind by whose undaunted energy such glorious results were achieved. Every English parent, for ages yet to come, whose children, either from necessity or inclination, may be induced to seek the Australian shores, will have good reason to bless the day when emigration was reformed, its glaring and infamous abuses remedied, and its difficulties and dangers lessened, by the energetic genius and daring moral courage of CAROLINE CHISHOLM.

* A picture recently published in a panoramic form, entitled, "Adventures of Mrs. Chisholm," contains the above portrait. This singular production has been sold by thousands both in the metropolis and the northern provincial towns.

THE ARABA, OR OMNIBUS OF CONSTANTINOPLE.

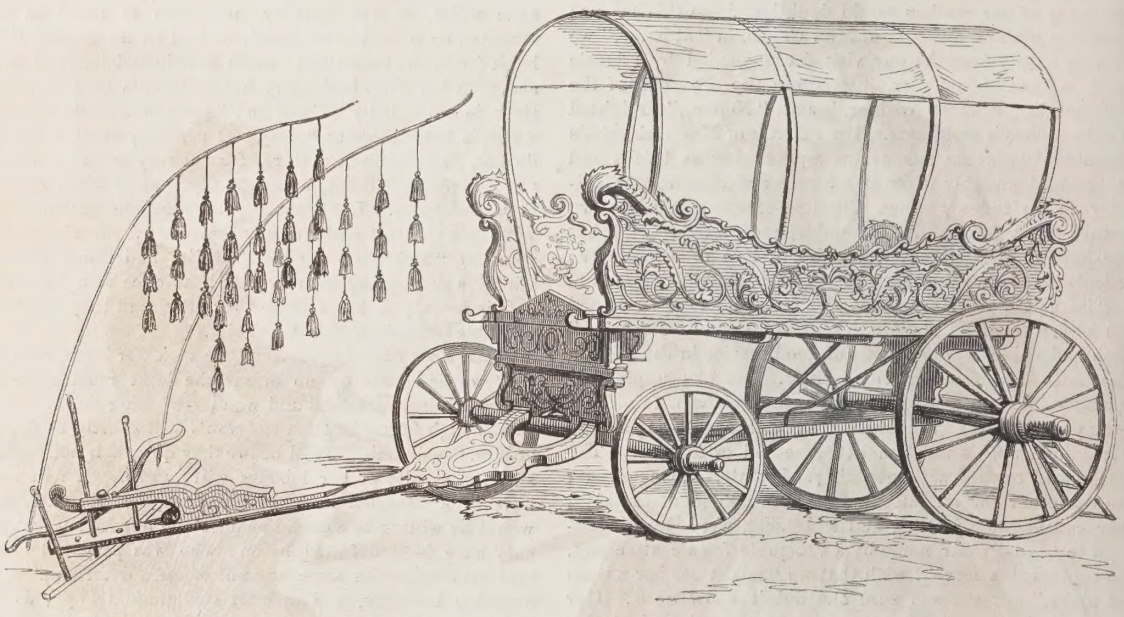
The first London omnibus which plied in metropolitan thoroughfares was started in 1829, by Mr. George Shillibeer, and on the 4th of June made its first journey from the residence of the old lady in Threadneedle-street, commonly called the Bank of England, to the Yorkshire Stingo, Paddington. The original omnibuses were vastly different from our modern vehicles bearing the same name; there was a heaviness about them not now to be tolerated; they were drawn by three horses abreast; fitted up, some of them at least, with a library of books for the entertainment of travellers, while the conductors wore velvet caps and uniform jackets. At present there are about three thousand 'buses, each travelling daily over sixty miles of ground, employing about eleven thousand men in the traffic, in which is invested a sum not less than £100,000. The omnibus conveyance is now popular all over England, and in many parts of the continent. The progress made in arts and manufactures has been equalled by that of locomotion, and while over the broad country, the metallic net-work of iron rails marks out the course of the steam-king, through city streets and out to pleasant suburbs plies the omnibus, affording at once cheap and rapid travelling, though the latter must be received with a grain of caution.

Turkey has its omnibuses as well as England. Strangely different, however, in every particular; unlike as turban and toga to wide-awake and gaiters. Through the kindness of a correspondent we are enabled to present a sketch of a Turkish conveyance which they call Araba, and we call 'bus.

This description of vehicle is constructed to carry ten or twelve persons. It is intended for the conveyance of the inhabitants of Constantinople; and plies to the various quarters of the city and its environs. It is covered with an arched canopy, such as those that were formerly used by the priests of Rome, and are depicted on ancient medals of the time of Nero: to this canopy curtains can be attached so as completely to conceal those who are within the vehicle, and when thus arrayed the Araba is employed to convey the women of the harem to the mosques or into the country, shutting them in effectually from the vulgar gaze. The sides of the carriages are richly ornamented, covered with the most beautiful sculptures, light and elegant in their design, and coloured with taste and delicacy. These decorations are reproduced within the carriage, and are, if possible, more graceful than those without, for the Turk loves the beautiful as well or better than the useful. There are no benches or seats, the passengers being accommodated after the oriental fashion with mats, while the flooring of the carriage is covered with a rich carpet. The omnibus is entered by a small strong ladder at the back.

The means which have been adopted for making the comfort of the passengers greater than it would otherwise be, are not at all complete, and in most instances, the deficiency of, or the clumsiness of the springs used, renders this mode of travelling very fatiguing. The streets of Constantinople are not the best in the world, and rumbling through them at a quick pace in a Turkish omnibus is not the most exhilarating or agreeable process. But the look of the carriages prepossesses one in their favour.

The pole of the team is attached to the first axle-tree and to the horizontal board which connects it with the second; it is richly ornamented with sculptured foliage, and tastefully painted after the style of the vehicle. The carriage is drawn by a pair of oxen, and from the front of the pole which separates them arise two slender pieces of iron, each bearing twenty-one silken tassels, which add considerably to the picturesque effect of the whole. These omnibuses are among the most interesting objects of the Turkish capital. Wandering through the busy streets, among the turbaned heads, and dark visages, and full-robed figures, dreamily thinking of the glories of its past history, of Mahomet with his new faith, of the idolatry of the Kaaba, of the battles, triumphs, and defeats of these ancient people, of the mysterious harems and wondrous mosques, the traveller is surprised by the approach of one of these arabas, with its stately oxen, their horns all hung with ribbons like sacrificial bulls, the gilded and painted carriage, a very marvel to behold, and the varicoloured costumes of the men and women within, as bright and variegated as a rainbow. An omnibus it may be, but it is so thoroughly Eastern, so much in keeping with the place and the people, that it seems to defy all modern notions, and might have conveyed the one-eyed cadi or been hailed by Sindbad the Sailor in the "good old time."



THE ARABA, OR OMNIBUS OF CONSTANTINOPLE.

THE SEWING MACHINE.

A MACHINE has at last been invented which promises to make the wrongs of distressed needlewomen a matter of historical record, instead of a living and painful reality. We have lately had the pleasure of seeing it at work at the office of the company which has purchased the patent, in Lawrence-lane, Cheapside, and were no less surprised at the simplicity of its mechanism, than at the speed and excellence with which it performs its work. In appearance it very much resembles the copying presses that one sees in a merchant's office, excepting that it is a little bulkier, and has a small wheel turned by the hand, for which, of course, the foot or steam can at any time be substituted. The turning of the wheel is effected by ordinary mechanism working across the shaft; a bar which passes from one side of the machine to the other, in the form of an arch, causes a needle fixed in a groove perpendicularly to ascend and descend through a hole in the platform underneath, with great rapidity. About the centre of this needle is its eye, through which the thread, wound off a reel fixed in the shaft, passes.

THE SEWING MACHINE.

Upon the platform, under this needle, over the oblong hole or cutting of which we have spoken, is placed the cloth or other substance to be operated upon, in such a position, of course, that the needle shall strike it in the right place. All being ready, the attendant turns the wheel, down darts the needle through the cloth, carrying the thread *with* it, but not *after* it, as in hand sewing. The consequence of this is, that when both get to the other side, the thread, by the mere impetus, hangs down in a loop, and has no hold on the cloth at all. Very imperfect mode of sewing, this, you will say. But wait a minute. Underneath the platform, cloth and all, and almost hidden from the eye of the spectator, is another needle, forming nearly a circle, and having a groove running along its back, like an eel that has had its spine removed. This needle is made to revolve with great rapidity *horizontally*, by the same wheel, only that in this instance it is moved by machinery passing under the platform, and it receives its ammunition from a reel fixed in the same place. It has its eye in the proper place—its head; and the thread, when placed in it, falls into the groove in its back when the machine begins to move. As soon as this needle, then, sees the loop hanging down from the other needle, it dashes at it with great rapidity, whirls itself through it, thread and all. The other needle immediately ascends, carries the loop with it, but there is no escape; the latter is fixed against the cloth, and a stitch is made. The cloth is kept in motion by the hand of the attendant, and thus the process is repeated along the line with intense rapidity, one needle jumping up and down with one thread, and the other traversing its loop horizontally with another thread below.

Every minute a yard of cloth is sewn in a style far superior to that of hand-sewing, and the invention can be applied to nearly every sort of work, except the stitching of button-holes and a few other things requiring great nicety. For sail-making, and such like, it will prove invaluable; and as it does the work of twenty hands, it will undoubtedly cheapen clothing of every kind greatly.

The invention is American, in which country the machine has, we believe, been at work for a considerable length of time; but the patent having been disposed of to a gentleman in England, a company has been formed to carry it out, which is now conducting operations on an extensive scale. Immense numbers of the sewing-machines are disposed of every week to tailors, clothiers, hosiers, sail-makers, &c., and some to private families. The price, £30, will, of course, for the present, place it out of the reach of most of the latter; but that it will one day be an essential article of furniture in every well-regulated household we have no doubt.

Many people are already beginning to exclaim—"What will become of the poor needlewomen? This will ruin them!" Nothing of the kind. Much misery may, no doubt, result from the suddenness of the change, but the result will, in the long run, be the overthrow of a system which disgraced our civilisation, and the rescue of thousands of suffering mortals from misery and degradation. Every triumph of machinery over manual labour is a gain to humanity.

LITERATURE IN RUSSIA.

Russian society is divided pretty much in this way:—first come the noblesse, made up partly of those who claim descent from the old boyards, or landholders, and stand on the high ground of ancient lineage, and partly of the parvenus, like our law lords, who have been ennobled for years of faithful performance of their duty in the public service. Between these and the serfs, however, there comes a large class, which we altogether lose sight of in thinking and speaking about Russia, composed of government officials, toiling desperately in the hope of one day obtaining a patent of nobility, and cheating and taking bribes in order to accumulate a fortune sufficient to support the looked-for honour; of the merchants and traders who are daily advancing in wealth and importance, and who, under the present emperor, have been placed in possession of many new privileges; and, last of all, the shopkeepers, whose interests are almost identified with those of the merchants. Below all these, at the very base of the social system lie the serfs; and even here we find many shades of distinction, which, in a paper like this, it would be impossible to enumerate. But, despite the petty rivalries, prejudices, and antipathies by which the various classes are naturally animated, one idea has of late years pervaded the whole mass, and now exercises a powerful influence upon the foreign politics of the state—the idea of Muscovite nationality, as something original in itself, separate and distinct from all the other nationalities of Europe. It is this sentiment which has always lived in the heart of the great body of the people, notwithstanding the efforts of the sovereign to assimilate them to the rest of Europe, and which has produced Russian literature such as we now find it.

Before the time of Peter the Great, it is hardly necessary to say that no literature, any more than art, or science, or manufacture, or in fact anything beyond the very rudiments of civilisation, existed in Russia. He found the whole nation in a state of barbarism; but he found them in possession of a noble language, rich but simple, pompous but energetic, passionate but dignified, containing a splendid family of verbs, which have the singular power, unknown to any other modern language, of expressing by a single word, and without the help of any auxiliary, the nicest shades of distinction in either state or action,—of changing the substantives into verbs, and of heightening or lowering infinitesimally the force of all expressions by a whole army of augmentative or diminutive particles. Its origin is lost in the mists of antiquity. It is the eldest daughter of the old Sclavonic, and the one which has most faithfully adhered to the original type. In the tenth century, John, the exarch of Bulgaria, applied the Greek method of John Damascenus to its grammatical organisation. Some of the Russians, however, claim for their idiom a still more remote origin, and state that the two monks Cyrillus and Methodius invented the Sclave alphabet in the seventh century of the Christian era. This agrees with the opinion of the great Sclave scholar, Safarjik, who ascribes the origin of the principal Sclavonic dialects to the period comprised between the end of the fifth and the commencement of the tenth century. The oldest written monument of the Russian language is the testament of Vladimir Monomachus; after him comes a monk named Nestor, the most ancient chronicler of Russia; the only traces of literature to be found between his time and that of the Czar Peter are the popular songs and ballads, and some fragments of an epic poem, entitled "The Exploits of the Army of Jegor II., the Son of Oleg." It was out of these that the Russian language, such as it exists at the present day, and such as we have described it, arose. It was spoken over a larger extent of territory than any other, whether of ancient or modern times. It was the tongue of the boyard as well as of his serfs,—was heard in the castle halls, as well as in the rude *isba* or cabin of the ploughman.

In Peter's time nothing that was of home growth received much encouragement. Foreign manners, foreign manufactures, foreign costume, foreign houses, were sedulously copied under his direction. He was the architect of the first European city which had appeared in his dominions. His great aim was to bring Russia within the pale of civilisation, and entitle her to take rank amongst the great powers of the continent. We know with what success his efforts were crowned. But in one department they were near doing Russia a fatal and all but irretrievable injury. They struck a deadly blow at her literature. Foreign artificers may promote industry and teach the arts of civilisation, and foreign discipline might organise an effective army; but nothing save native efforts and native genius can create a literature. This must assuredly be an indigenous plant. Its growth must be from within, not outwards. Any attempts to engraft upon it the productions of other climes and races destroy its vigour, and produce sickly deformity. France, as the nation which then, as now, possessed the largest influence and most extended relations upon the continent, stepped into the sphere which was now opened up to her, and under Catherine the Great, particularly, all the productions of Russian intellect were cast in a Parisian mould. Every mark of nationality disappeared from them. Except Lomonossoff, the poor fisherman of Archangel, and the Prince Cantemir, celebrated for his satires, no Muscovite author of the eighteenth century published anything racy of his native soil, which was not spoiled by French airs and graces. The literary circle which Catherine the Great gathered round her at the Hermitage was made up of foreigners, or denationalised natives, who sought to hide their origin, and forget the barbarism out of which they had just emerged, by close imitation of French customs, the adoption of the French language, and the discussion of all the questions of literature or philosophy which then agitated the Parisian *salons*. Any books which appeared were feeble imitations of French authors, the court wits cracked French jokes, sang French songs, and read French novels and memoirs, and abandoned their native language to the lower orders and the country gentry. A poem, recounting the glories of Peter the Great, by Keraskoff, entitled the "Petreid," appeared during this period, but it bore an unmistakeable resemblance to Voltaire's "Henriade." No traces of Muscovite literature were to be found, save in the old songs and romances, which the peasants sang or recited during the long nights of winter around the firesides in their cabins.

This state of things subsisted without change until the campaign of 1812 led the Russian army into the heart of France. Thousands of the youth of all classes served in the ranks or bore commissions in it, for the war against Napoleon had become a holy war; and thousands more followed in the wake of the conquerors. Once in Paris, a new world was opened up to them. The prodigious intellectual activity, the freedom, the excitement, the enterprise, the bustle and unfaltering energy, and, above all, the bold and prominent outlines of character which marked the nations of the west, surprised and astonished them. Their sovereign, Alexander, was not the man to put a curb on their inquiries, or check their aspirations. On the contrary, he rather encouraged them. He was enthusiastic, high-souled, and magnanimous beyond the measure usually allotted to sovereigns, and it was well known that he dreamt of a state of things in Russia in which the rights of humanity should be duly respected, and the principle of equality before the law be fully recognised. As a natural consequence of all this, the peace was the commencement in Russia of an era of prodigious intellectual activity. The various social and political questions which then occupied the attention of statesmen in France and England, were discussed with almost equal freedom at St. Petersburg. Unhappily, this excitement bore bitter fruits. Alexander died in November, 1825, and in the following month a conspiracy, which had been long organised, and had for its object the establishment of a constitutional monarchy, or a republic, broke out and was promptly suppressed. The Emperor Nicholas inaugurated his reign by hanging five of the ringleaders, and sending the rest to Siberia or the mines. Beyond this, the affair seemed to have little effect upon the mass of the people; but the youth, who had imbibed the new doctrines, saw at once the error

their chiefs had committed in resorting to brute force, and that the true course for the progressionist party to follow was to create and foster a national literature, and make it racy of the soil, as the first step towards the civilisation and elevation of the masses, and the diffusion of sound notions of liberty and government. For this they, as a matter of course, threw aside German and French—then the language of the court and of polite society—and went straight to the old Russ. They found it divided into two branches; one pure, but spoken by the common people, preserving all its imagery, its metaphorical forms of expression and stately dignity; the other gallicised and germanised, clipped and pruned and debased by foreign intermixture, in order to adopt it to the requirements of town gossip and of trade. The former they at once selected as their weapon, and fortunately for them they were not debarred from the perusal of such works as appeared upon various questions of social and political interest in France, and Germany, and England. Russia has, in the matter of books, always been in advance of Italy and even of some parts of Germany. There was no "Index Expurgatorius" at St. Petersburg; most books that might be read in London might have been read there also. The national language and literature about this time, thanks to the efforts of a few gifted individuals, began to occupy the attention of the nobility, and became subjects of interest in the *salons* of the capital. The movement had eventually set in in the right direction. All that was wanted was a man of genius to represent it, to watch over and direct it, who should in short be the gauge to test its rapidity and strength. This man appeared in the person of Paul Pouchkina, a scion of one of the oldest families of the empire. While a pupil at the military school, he devoted every hour he could snatch from severe studies to the secret and enraptured perusal of Voltaire and Goethe. While yet a boy his poetical effusions had excited attention in St. Petersburg, and intercourse with some of the literary men of the day who frequented his father's house developed his talent into precocious activity. He entered upon life, proud, fiercely independent, impetuous to the verge of ferocity, gloomy in temperament, and almost barbaric in his passions. His productions, after the assumption of the virile robe, were chiefly lyrical odes upon the triumphs of the Russian arms, and upon the ancient glories of the nation. His fierceness and independence growing with his strength, he at last launched forth into an impassioned eulogy upon liberty, and a fervid appeal to the emperor to lead the people to its destiny along the paths of freedom. The great military Colossus was not the man to be moved by appeals of this sort. Pouchkina was ordered to the Caucasus. This, which his friends looked upon as a severe blow, was, in reality, the very thing needed for the full development of his genius. The splendid scenes of nature amongst which he now found himself, the grandeur of the mountains, the awful solitude of the valleys, the wild rocky glens, the gloomy forests, and the foaming waterfalls of the ancient Chersonese, and the perfection of physical beauty, the native freedom and picturesqueness of manners which he found prevailing amongst the tribes against whom his sword was drawn, were sources of rich and varied inspiration. Some of his poems written here have a charming air of local originality, if we may use the phrase. "The Fountain of Baktchisarai," suggested by seeing the palace of one of the old Tartar Khans in ruins; "The Prisoner of the Caucasus," founded upon one of those romantic episodes which the Russian war in that region is ever displaying; "The Gipsies," portraying life amongst some of these wild tribes upon the plains of Eastern Asia—all contain a rich vein of poetry, are full of pictures of passing beauty, and yet they only give us a glimpse of the materials which in that land of wonders wait but the poet's or the painter's hand to rise into gems of art.

He returned to St. Petersburg from exile in 1824, and was employed by the Emperor Nicholas to write a history of Peter the Great. This work he never executed; but the researches which he undertook in the national records when preparing for it led him to a mine of romantic incident, from which he drew materials for some novels, portraying the national manners and modes of thought with a master hand. They were as striking and as original as his poems. Unhappily, Pouchkina's unbridled temper led him to resort frequently to duelling as a means of deciding his quarrels; and in one of these combats, carried on in a spirit of barbaric ferocity on his part, he was killed at the early age of thirty-eight years.

He was the creator of Russian literature. He marked out its course; he gave it an aim and a standing; he infused originality into it; he showed the youth of the country what a rich, boundless store of materials, of energy, genius, and ambition to work upon, lay in the manners of their countrymen, in the scenery of their native land, in the incidents of their every-day life, and in the national archives. He did not labour in vain. If his death revealed the full height of his greatness, it revealed also the extent to which he had provided for filling up the void left by his departure. At the period when he entered upon his career, literature was exclusively the domain of the higher classes; but before he died, it had worked its way lower down in the social scale, and by the side of this aristocratic literature there grew up another, the chiefs and prophets of which belonged to the middle classes, the government officials, and professional men. All it wanted to enable it to swamp, or rather absorb, the other was, a little encouragement and support. This, luckily, it was enabled to secure. The minister of public instruction in Russia at that time, Count Ouvaroff, an able and enlightened man, gave the plebeian students every facility for competing with their more fortunate rivals. Very soon the whole energies of the rising band of young writers who began to spring up were directed towards one object—the production of a Russian Encyclopædia—which was, in every sense of the word, a great national work, civilising in its tendencies and influence. The volumes, as they appeared, had a wider circulation than any literary work which before appeared in Russia. They reached the old Muscovite towns of the interior, and made them for the first time participators in the movement which was going on in the capital. Unhappily, owing to the misunderstandings between the conductors, it was never carried to a completion. Previously to the appearance of the "Encyclopædia," a "Literary Gazette" had been carried on, exclusively devoted to literature and art, but this being confined to a very small circle of readers, the "Reading Library" was started upon a more popular basis, and although at first ably conducted, rapidly degenerated into a mere collection of translations from French and English. The best of all these literary periodicals, and one which exists in full vigour at the present moment, is the "Contemporary," edited by Peter Pletneff, the rector of the University of St. Petersburg, and member of the Russian Academy. It is the leading organ of the *Panslavist* party, whose war cry is the union of all peoples of Sclavonic origin under one head, meaning of course the czar for the time being. Many of its contributors belong to the highest class of nobles.

Political literature, such as we see in our newspapers and reviews, we need hardly say, does not exist in Russia, as no observations upon any act of the government are ever for a moment permitted. Anything, however, which asserts the claims of Russia to a wider dominion, and advocates the policy of aggression, is winked at by the authorities. Historical essays, written to show the right of Russia to the possession of Poland and other countries, have at various times appeared; and very recently a drama, entitled the "Revisor," ridiculing the follies and stupidity of the provincial administration, received the direct sanction of the emperor. The latest production of the Russian press is a poem by Apollo Maïkoff entitled "The Two Destinies," which paints in glowing colours the glories of the future still in store for Russia, and points out the duties of her youth with great energy and freedom of language; and to the surprise of every one, the censure has met no objection. This would be a good sign if this zeal pointed to any nobler aim than armed aggression. Still, if the seeds of free thought are once sown, wisdom is sure, in the long run, to grow out of them.

THE VALLEY OF MEYRINGEN.

THE Valley of Meyringen, in the canton of Berne, is completely shut in by some of the grandest and most picturesque mountain scenery in Switzerland. The Alps rise in rugged magnificence on every side, their snow-capped summits contrasting strangely with the verdant, flowery valley, dotted here and there with rustic *châlets*, and watered by the river Aar, which is crossed by wooden bridges, similar to the one represented in our sketch (p. 185). This river is fed by the neighbouring mountain torrents, which, when swollen by rain or snow, have several times threatened the village of Meyringen with destruction. In the year 1762, it was buried twenty feet in *débris* in one hour. The church was filled with sand and gravel to the height of eighteen feet. This catastrophe was caused by a swollen torrent, descending from the mountains behind the village; carrying with it quantities of sand and rubbish, together with uprooted fir-trees and masses of rock. From this disaster the village has scarcely yet recovered. In the year 1733, many houses were carried away by an inundation.

In this valley are to be seen some of the most celebrated falls of Switzerland—those of the Reichenbach—the principal of which is 200 feet in height, and its column of water nearly thirty feet in diameter. If visited in the morning, when the rays of the sun are upon it, a triple bow or iris is to be seen on the spray, which has a very beautiful effect.

The wealth of the inhabitants of this valley consists chiefly in cattle, for which the mountains yield plentiful pasturage during the summer, and in the autumn the herdsman, anticipating the severity of the coming winter, descends with his flocks to seek shelter in the valley; for the weather is such during the winter months as to render it dangerous to expose the cattle in the long cold nights. These herdsmen lead a migratory life, moving about from place to place with their flocks.

THE SWISS HERDSMAN.

As spring approaches, the cattle, lying upon the grass, or perched upon the rocks and bridges, as the artist has represented them in the accompanying illustration (p. 185), throw longing glances towards their mountain home. Then, also, the herdsman, who loves his mountain life as the sailor loves the sea, joyously prepares to leave the valley. But when, like the man of whom we give a sketch above, he begins to re-ascend the mountain, he casts an affectionate glance on the *châlet*

where he has just left his family. He can still see the smoke issuing from the roof, and thinks how they will miss him at the frugal meal. But he proceeds on his way, and now the projections of the rocks shutting out these cherished objects from his view, he finds himself alone with his flocks among the grand and towering Alps.

The athletic man, represented on the opposite page, carries upon his broad shoulders his household furniture, holding in one hand his milk-pail, in the other a thick staff, pointed with iron, upon which he leans, and which would be a formidable weapon in his powerful hand. A large basket on his back contains his milk-strainer, some straw, a one-legged milking-stool, a cheese mould, the stand on which the cheeses are placed to drain, and the great kettle in which the milk is collected, heated, and made into curds.

The Swiss herdsman's is, in reality, not so idle a life as it is often described to be; he has to collect eighty or ninety cows twice a day to be milked, many of which have often strayed away in different directions. Besides this he has to make the cheese, and keep all his utensils scrupulously clean. Hardy, robust, and indefatigable, inured to exposure from earliest childhood, his weather-beaten frame is indifferent to the vicissitudes of climate. He is wild, uncultivated, and ignorant of the usages of other people, but simple and uncontaminated by the vices, unfortunately, too common among the labouring population of most other districts.

PASTURES OF THE VALLEY OF MEYRINGEN.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER XII.

King Henry. What tumult's this?
Warwick. An uproar, I dare warrant,
Begun through malice.
Shakespeare.

And how passed the days with Bianca and Giulio while we have been occupied with the war at Palestrina? You remember—so at least would we hope—how that at the end of Spring-tide we left them in Venice. After the sudden departure of the Sieur de la Mole, the intercourse between the maiden and her old playmate was renewed very much upon its former footing of by-gone days. The girl analysed her feelings, and pondered upon them, and so she knew and acknowledged to her own heart that she loved. The young man took not his heart to task; he cared not to define the nature of his feelings, happy in this, that he felt they were ministering to him delights, stronger, and tenderer, and fresher than the converse of woman had ever brought to him before. Daily his thoughts turned to the same object; daily his feet led him to the same presence. Enjoying the present, unheeding the future, the relations which had so long subsisted between him and his father's ward justified his warmest words and acts, while they caused him not to consider, perhaps not even to suspect, how far he was tampering with the most precious affections of another. Alas! this is a passage in the heart-history of our species too common to excite surprise. How often are the warm aspirations of human love drawn out from the heart and upwards to the beloved one by a warmth bright indeed, but yet not enduring—the admiration which is mistaken for passion—and then the light and the heat pass away, and the evening comes, and those aspirations exhaled from the heart fall back again upon it, like cold dew upon the earth, and turn into tears. "Amor che a nullo amato amar perdona," wrote the great Florentine—and he puts the sentiment into the mouth of woman;—with her we believe the proverbial paraphrase of the Italian sentiment, "Love begets love," is oftener a truth than with man.

Well, be this as it may, after a few weeks of such intercourse, a message from the Count Polani summoned the young man to join him at Palestrina. It aroused Giulio from his pleasant dream, somewhat as suddenly as a plash of cold water awakes a heavy sleeper. Perhaps, too, the shock was as good for him. He began to reflect that it was scarce becoming his manhood or his noble name to linger in the city, while so many of his peers were with the troops elsewhere. And so with a blush for his past neglect of duty, and a sigh over the pleasant hours that were now to be brought to a close, he communicated to Bianca that the next day he was to leave Venice and join his father. And that day passed as the other days had lately passed, marked, it might be, by a sense of sadness that cast its shadow over Bianca's brow, and left not Giulio's face undarkened. But it passed, and passed quickly, too; and the young man has bidden his last farewell, and touched the lips of his sister-friend, and they have parted. He to mingle again in the stirring scenes of life, and give his heart and his thoughts to things that energise and brace the spirit. She to the solitude and contemplation of that habitual seclusion which had been disturbed for a short space—even as a lake is troubled by the passing breeze, and then smooths its surface that it may reflect all the more faithfully the image of the heaven that has looked down upon it.

And thus did these young people part for the second time in their lives, each loving the other, yet neither having sought or made an avowal of that love to the beloved. We believe that this is more frequently the case in real life, especially amongst the young, than writers of romance are disposed to allow. In the earlier days of such intercourse, the heart is too much engrossed with feeling to need that the lips should avow what it feels. Love seeks to enjoy its own passion, rather than to declare that enjoyment in the formality of words. And yet when the hour of parting came, a strong desire impelled Giulio to declare all he felt, and to learn from Bianca how far his own feelings were reciprocated; but an indefinable feeling, half fear, half reserve, repressed the words that were trembling on his lips, and he went forth as the shadows of evening were falling around, with his secret still undivulged, and the strong hope that a few short months, perhaps weeks, would restore him to the same happy intercourse which was now interrupted. With the morning's light Giulio was on his way to Palestrina, very much to the dissatisfaction of his mercurial valet, Tomaso, who contrived to make himself especially happy in the discharge of those gallantries which he had learnt to consider as at once the duty and the privilege of a travelled servitor such as he was. It must, however, be admitted that good old Guidetta felt by no means a corresponding discontent at the departure of the man as of the master, inasmuch as she had found it no easy matter to maintain of late that sobriety of demeanour amongst the young serving maidens of the establishment which an old woman is somehow usually disposed to exact from the younger of her own sex.

Meantime no tidings whatever of his friend Jacques de la Mole reached Giulio. At first he awaited with anxiety for some letter, or other explanation of his sudden disappearance, but none came. By degrees the engrossment of other thoughts superseded the recollection of their brief meeting, and after a few months Giulio had almost forgotten that it had taken place.

Let us now return to the camp at Palestrina, and follow the progress of the war.

The disastrous issue of the desperate attempt to escape from Chioggia made by the Genoese but aggravated the sufferings of the besieged. The hope of an honourable escape, which hitherto had sustained them, was now utterly annihilated, and to their despair was added the horrors of famine. All their supplies of food were exhausted,—then came a want more terrible still than even that of food, the water failed them. Within Chioggia itself there were no wells or springs of fresh water; the salt lagunes flowed all around, and access to the Brenta and the mainland, from which supplies were ordinarily procured, was entirely intercepted. And thus it is related by faithworthy historians, that after all their stock of grain and animal provision was consumed, and their scanty allowance of fresh water was exhausted, the soldiers were reduced to the necessity of boiling down, in brackish water, skins and even such pieces of old leather as they could procure, for the purpose of sustaining life.

Zeno foresaw all this with his usual penetration: he saw, too, that such a state of things could not possibly last, and that ere long the Genoese would be forced to surrender unconditionally, and thus justify to the world the wisdom and success of the general's plan of operation.

And so indeed it turned out. In a few days after the engagement which we detailed in the preceding chapter, a flag of truce was seen approaching the western redoubt, accompanied by deputies from the Genoese. These latter were conducted to the fortress of Palestrina, and were received by the Venetian general, who had hastily summoned the doge and the principal senators to receive them. When they were brought into the presence of the council of state, the deputies laid before the assembly the terms which they were commissioned to make on the part of the besieged. The condition of the Genoese was indeed sadly changed from that which they exhibited when as conquerors, scarce a year before, they approached the city of Venice, and haughtily refused all terms of accommodation from the republic, and threatened to bridle the horses of St. Mark.

"Noble Seignori of Venice," said the spokesman of the deputation; "we come as honourable enemies, and sue for peace from an honourable foe. If Genoa has warred with Venice, she has ever done so without violating the laws of war or of humanity. If we have struggled with you for empire, we have never sought to exterminate your people. We have, with a bravery which a generous enemy should appreciate, maintained the defence of Chioggia during many months, and we claim now at your hands that instead of vengeance you should recognise our devotion to the interests of our own republic, and esteem us as the citizens of so renowned and warlike a state as Venice should esteem a brave enemy. Reduced by famine, we seek to terminate a contest which we can no longer sustain. Let us hope to find in Venice that moderation in success which the memory of her own sufferings and of the inconstancy of fortune should induce. It is no longer a question of riches or booty; we abandon our stores, our armament, all, to our conquerors—we ask but to leave Chioggia—as soldiers, with our arms; as men, with our liberties and our lives."

It was an affecting scene, and the generous heart of Zeno was not untouched by the appeal of soldiers to a soldier. But whatever might be his own disposition, he felt it would be imprudent to give expression to it. The doge Contarini for a few moments held consultation with the principal senators in low and earnest tones, and Zeno sought not to control or influence their deliberations, satisfied that he had heretofore, in all the weightier concernments of the war, exercised his authority as generalissimo, when the interests of the state required that he should oppose those whose authority was never to be thwarted on light grounds. At length the doge replied to the Genoese ambassadors.

"The Republic of Venice have considered the request of the deputies from the Genoese beseiged in Chioggia. They who have unjustly invaded the territory of Saint Mark, have little claim to her mercy when they have failed in their unjust aggression. Tell those who have sent you hither that we make no terms with the vanquished. Let them surrender at discretion and unconditionally, and the serene Republic will then deliberate upon the question of life or death with the wisdom and the generosity which ever govern her councils."

The doge then waved his hand, and the deputies were led from the council chamber.

No sooner had they passed from without the walls of the fort, than Zeno left the chamber, and passing speedily to his own apartment, found two persons already there, as if awaiting him.

"Ah! my faithful knight, thou hast had my summons, though the time was somewhat scant for apprising thee. Who have we here?"

"So please your excellency, he is an acquaintance. Roger Harrington, one of my archers—the same who attended you on a former occasion."

"Nay, I remember it well, and am right glad thou hast brought him, Sir William. I have good reason to suspect that the ambassadors of Genoa, who have failed in their mission to the republic, will attempt to enlist the mercenaries in their favour. If my secret information be not incorrect, they meant to offer them possession of Chioggia, with the entire of the stores, treasures, and even their arms, provided they are guaranteed their lives and a safe conduct to their fleet, which lies waiting out at sea. You will, therefore, speedily assemble your archers, and see the deputies beyond the entrenchments. And take good heed that they communicate with no one on their way. If force be necessary to insure this, you must even do so by force; but if possible I would avoid extremities. Should any unforeseen emergency arise, thou wilt apprise me of it without a moment's delay. This stout yeoman will find me here in readiness. Take this ring, good fellow, 'twill procure thee access to me at all times."

The burly archer took the ring which the general handed to him, and the knight and Hodge o' the Hill saluted Zeno, and hastened away upon the duty confided to them.

Hastily repairing to his quarters, Sir William Cheke put himself at the head of a company of his archers, and came up in a few moments with the deputies from Chioggia. At the end of the redoubt, of which we have so often spoken, Cheke perceived that considerable bodies of the different mercenaries were collected, but whether merely to gratify their curiosity upon the subject of the recent interview of the ambassadors with the senate, or for other purposes, the English knight knew not. Interposing, however, his own band between the deputies and the troops, he signified to the former briefly, but peremptorily, that it was the order of the republic that he should see them safely beyond the precincts. The communication, though couched in terms of courtesy and respect, was too plainly a mandate to be declined, and accordingly the English company formed a guard of honour around the Genoese, and left them not till they were far on their way in the vessel that had brought them from Chioggia.

As Sir William Cheke and his company of archers were on their return, they again found the mercenaries standing in groups along the redoubt. It was evident from the earnest gesticulations of the men, that some exciting topic was at present under discussion amongst them. He was now within hearing of a knot of some dozen of men gathered around two speakers who were apparently in dispute. "Der Teufel," said a huge man-at-arms, whom Sir William at once recognised as the German who had been plundered by the Italians, "Der Teufel? How dost thou know that? Where is thy proof?"

"Proof! proof," retorted the other, an Italian lancer. "Oh dio! che sei pazzarello! What proof dost thou want, fool that thou art? Would'st expect that the senate or the general would proclaim their intrigues by a herald. I tell thee there is enough to convince any man with an eye in his face or an ear on his head, that the Lion of San Marco is determined to have, as usual, the lion's share, and to leave us, brave companions, who have fought their battles and served their city, just the dog's share. Ha! ha! after the noble beast has lapped up the blood, and devoured the flesh, he will leave us curs the bare bones to satisfy our hunger. What think ye of that, comrades?"

"Un ingiustizia? un infamita!" cried several voices, in answer to the appeal of their companion in arms.

"Aye," continued the other, "it is a wrong and a disgrace, which is not to be submitted to, brothers. Vi fanno il diavolo a quatro. I tell thee they are going to play the very devil *there* yonder," and he pointed to the fort where the council had been sitting. "These deputies have made their terms with the doge. The Genoese are to surrender up Chioggia by night to the Venetian admiral, who is secretly to convey away in his galleys all the treasure and spoil; and then the gates are to be thrown open, and the empty houses are to be our share of the booty."

Again the voices of his auditors were raised in loud and angry comments, but the German seemed not yet convinced.

"Thou must vouch thy tale, comrade, by something more than thy own tongue before I'll believe it. I tell thee more, the noble Zeno is not the one to go back of his promise or defraud the soldiery of their lawful booty."

"Siete un benedetto uomo! Thou art a blessed fellow truly! What, dost think because he made a poor rogue restore thee thy zecchini, that he can stop rich rogues, like yon senators, from defrauding us of florins and crown pieces?"

"Giusto! giustamente hai regione!" cried out his abettors in responsive chorus.

"Well," said the German, "here comes one who should know more of this matter than thou or I, comrade. Let us ask the English capitano who came from the council with the deputies."

"Aye, per bacco," said another of the lancers, "that's a shrewd thought of thine, Wilhelm. Aye, by all means let us ask the English capitano."

By this time Sir William Cheke stood amongst the group of soldiers, and looking towards the principal speaker, with a cheery voice he said—

"How now, my masters, what news to-day? Che nuove?"

"Che nuove, capitano," said the lancer, taking up the question. "I'faith that's just what we want to be certified of. Will you be pleased to enlighten us?"

"On what point, comrade?"

"Marry, upon this point, signore. Whether the council of state yonder have made terms with the Genoese, without the knowledge of the leaders of the free companies?"

"My good friend," replied the knight, "I was not of the council, and so I cannot know what they have decided upon."

"That is true, sir capitano. But though you were not of the council, yet you may have heard of their decision, doubtless."

"By St. George, friend," retorted Cheke, somewhat sharply, "I pry not into matters that concern me not. When the state whose pay we receive, and whom we are bound as honourable soldiers to serve, thinks fit to disclose their councils, they will, I suppose, do so. Meantime, as I am but an indifferent gossip, I have not even heard what common rumour may say; and if I had, I should not be disposed to give much heed to it."

"Well, then, signore, if there be any truth in the rumour, it behoves us all to take good heed to it. Cospetto, it will be too late when the Republic has out-witted us."

"How dost thou mean?" asked the Englishman.

"Why, marry, I mean this," replied the soldier, and he forthwith proceeded to repeat the report with sundry exciting comments to the soldiery around him, the number of whom was greatly increased when it was perceived that the band of Sir William Cheke had stopped amongst them, and that some communication was going on between them. And, in truth, the words of the soldier fell amongst hearers as excitable and explosive as could be well imagined—men, who were already prepared by the rumours that Recanati, through his agents, of whom this soldier of his own band was one, had insidiously and industriously spread far and wide through the camp. The spark was now applied, and as the flame runs along dry stubble, so the word spread all through the free companies that Chioggia was about to be surrendered to the Venetians, and the Genoese treasure to be protected from the army. It was to no purpose that Sir William Cheke endeavoured to check the growing tumult. In vain he assured the troops that they had no just ground for believing the reports, and exhorted them to seek from the general or the senators the confirmation or refutation of the story before they committed any act of violence or insubordination. A cry, with whom originating no one could say, ran through the now dense masses of men—"To arms, to arms!" In a moment those who were not accoutred rushed to their barracks and snatched up their

weapons, while such of them as had arms remained on the spot. In an incredibly short time the bands were re-assembled, and now several of the leaders might be seen amongst them.

"To Chioggia! to Chioggia!" was now heard amid the tumult of voices and the rush of feet; and forward the mass hurried, heedless how they were to effect a landing at that port.

Meantime the English knight had not forgotten his duty to the republic or his promise to Zeno. When the cry to arms was first raised, he spoke in a hurried whisper to our old friend Hodge o' the Hill, whereupon that trusty bowman slipt away and disappeared from the company.

All this time the band of English archers were true to their allegiance, and stood firmly and unmoving. And now the various bands of condottieri, Italians, Germans, French, and Gascons, swept past them, cleared the redoubt, and were hasting forward to the edge of the lagune that flowed between them and Chioggia. Now, however, they paused to consider for the first time, by what means they were to proceed. Some counselled that they should wade through the lagune, alleging that it was easily fordable now that the tide chanced to be low; others hesitated, and proposed that the troops should sieze upon some boats that lay near, and by degrees pass over in them. While they were thus deliberating and inactive, a cheer was heard from behind them, and Zeno, accompanied by the principal senators, were seen hurrying forward. In a moment the general threw himself amongst the insurgents with that reckless daring which formed so remarkable a trait of his character.

"Soldiers," cried he, "why do I see you thus in arms without my orders? Whither are you going? What are you doing?"

The promptness and energy of Zeno surprised and checked the soldiers in the very critical moment. The foremost and loudest shrank back instinctively reverencing the bravery of a man who seemed to bear a charmed life, whose spirit seemed to control the haughtiest and the proudest.

"Who are they who lead this movement?" he continued, taking advantage of the momentary calm. "I call upon them to come forward."

One or two of the captains now advanced.

"Noble general," said the foremost. "We are in arms to assert our own rights which your state has neglected. We go to share the spoil, which, by the right of warfare, is ours as well as the republic's."

"Who denies your right to share it?" asked Zeno.

"The council of your senators who have capitulated with the deputies that have just left the camp."

"Who dares assert that? Where is his proof? Let him come forward."

"Ah! Der Teufel!" muttered the German man-at-arms to his neighbour, "that's just what I wanted to know too. Aha! the proofs, mein camarad."

As might be expected, no one could do more than rely upon the general rumour.

"It is in every man's mouth—let the council contradict it if they can."

An angry reply was rising to the lips of Zeno, but one of the Council of Ten—the member whom we already made acquaintance with—stood beside him and plucked his sleeve. The admonition was not lost on Zeno.

"It is false," said he, "no matter whose the mouth that utters it. Eccellenza," he added, turning to the senator, "thou canst answer for the council."

"I can, assuredly," said the member of the *Neri*. "His highness the doge, with the advice of myself and the others of his council, have rejected all terms offered by the deputies from Chioggia."

The effect of this announcement was manifest amongst the soldiers. Zeno followed it up:—

"Soldiers, you have been betrayed and duped by some base agents and for base purposes. Think you, when the besieged are in the last extremity, we should be the fools to discuss terms with them. Return to your duty, and await the hour, not far distant, when Chioggia shall fall into our hands without a blow. I promise on the part of the most serene republic, I promise on the faith of a soldier, which never yet have I broken, that the troops, without distinction, shall be allowed three days' pillage of the town, and shall receive one month's additional pay."

The senators present with one voice confirmed the promise of the general. The mercenaries once again seemed contented. Gradually the bands dispersed to their respective quarters. The senators betook themselves again to their schemes of policy, their intrigues, and their jealous vigilance of Zeno; and the general pondered bitterly as he threw himself on a seat for a short repose after the exciting scene.

"Alas!"—such were his musings—"how deplorable is the position of a general whose soldiers are mercenaries, such as those I command. Never for a moment safe from the plots or the defection of his own troops no more than he is from the enemy without. He is environed with as many perils in his own camp as he is in the midst of the battle-field. He knows not the hour that his treacherous friends will range themselves amongst his enemies. Well, well, it cannot last long. Patienza! a few weeks—nay, most likely a few days—will secure the prize for which I have been working and watching day and night for many a weary month. And then, aye, and then, I shall be strong enough to grapple with secret foe as with open enemy. Meantime, patienza!"

INGENIOUS FABRICATION.

A LITERARY forgery, supposed to have been grafted on those of Annius, involved the Inghirami family. It was by digging in their grounds that a number of Etruscan antiquities were discovered, consisting of inscriptions, and also fragments of a chronicle, pretended to have been composed sixty years before the vulgar era. The characters on the marbles were the ancient Etruscan, and the historical work tended to confirm the pretended discoveries of Annius. They were collected and enshrined in a magnificent folio by Curtius Inghirami, who, a few years after, published a quarto volume exceeding one thousand pages to support their authenticity. Notwithstanding the erudition of the forger, these monuments of antiquity betrayed their modern condiment. There were uncial letters which no one knew; but these were said to be undiscovered ancient Etruscan characters; it was more difficult to defend the small Italic letters, for they were not used in the age assigned to them; besides this, there were dots on the letter *i*, a custom not practised till the eleventh century. The style was copied from the Latin of the Psalms and the Breviary; but Inghirami discovered that there had been an intercourse between the Etruscans and the Hebrews, and that David had imitated the writings of Noah and his descendants.

The Romans, who have preserved so much of the Etruscans, had not, however, noticed a single fact recorded in these Etruscan antiquities. Inghirami replied that the manuscript was the work of the secretary of the college of Etrurian augurs. It was urged, in favour of the authenticity of these Etruscan monuments, that Inghirami was so young an antiquary at the time of the discovery, that he could not even explain them; and that when fresh researches were made on the spot, other similar monuments were also disinterred, where evidently they had long lain; the whole affair, however contrived, was confined to the *Inghirami family*. One of them, half a century before, had been the librarian of the Vatican, and to him is ascribed the honour of the forgeries, which he buried where he was sure they would be found. This, however, is a mere conjecture. Inghirami, who published and defended their authenticity, was not concerned in their fabrication; the design was probably merely to raise the antiquity of Volaterra, the family estate of the Inghirami; and for this purpose one of its learned branches had bequeathed to his descendants a collection of spurious historical monuments, which tended to overturn all received ideas on the first ages of history.

THE JAVANESE AND THE SHARK.

Sir John Barrow, who accompanied Sir George Staunton on his embassy to China, published a volume, in 1806, giving an account of his observations in Cochin China, which is full of interesting details regarding that as well as other countries of the southern hemisphere. Gifted, as he was, with nearly all the qualities which fit a man for travelling with profit to himself and the world at large, his descriptions of men and things could hardly fail to be interesting. The volume has been, however, so long out of print, that, in all probability, few of the young generation of readers are familiar with it. His statements respecting the Spice Islands of the Pacific, under Dutch sway, are particularly deserving attention. We have selected for engraving an incident which he describes as having occurred while lying off Java, and we shall let him describe it in his own words:—

THE JAVANESE AND THE SHARK.

"In no other part of the world do I recollect to have observed such shoals of sharks as are constantly prowling near the shore at Anjerie, attracted, no doubt, by the offals that float down the river, or are thrown upon the beach. When on board the "Hindostan" at this anchorage, I hooked one of these voracious animals from the stern gallery, in doing which, however, I had a very narrow escape from being dragged by it into the sea. No sooner did the fish put the hook in its jaw, than, plunging towards the bottom, he drew his line to its full stretch, which, being entangled in the railing of the gallery, swept away at once a great part of the balustrade. In the rapidity with which the rope ran out, a coil of it got round my arm; but just as I was forced among the wreck, the shark, by darting back to the surface, slackened the rope sufficiently to enable me to disengage my arm and get clear. Greatly as I was alarmed at this accident, a poor Javanese appeared to be still more so, who happened at that moment to be astern of the ship, paddling his canoe, with a load of fruit and vegetables. His apprehension lest the wounded shark, in rolling and plunging, and lashing the water with its fins and tail, should overturn his little skiff, which was not much larger than the animal itself, his exertions to get out of its reach, and the marks of terror that were visible on his countenance, struck our fellow-traveller, Alexander, so forcibly, that, though of momentary duration, he caught with his pencil a spirited sketch, which, having the merit at least of being a true representation of a Javanese canoe, with its paddle and bamboo outrigger, was considered as not unworthy of being put into the engraver's hands. The shark, being killed with a harpoon, was then hoisted on deck and opened. The contents of its stomach formed a mass of such magnitude and variety as can scarcely be conceived. It consisted, among other articles, of the complete head of a female buffalo, a whole calf, a quantity of entrails and of bones, and large fragments of the upper and under shells of a considerable-sized turtle. The length of the shark was ten feet eight inches."* Sir John gives a horrible account of the treatment of the Chinese settlers in Java by the Dutch colonists who ruled them. Finding it impossible to induce them to consume opium and other foreign products in quantities sufficiently large to fill the coffers of the importers, a pretended conspiracy was trumped up; in 1740, the Chinese chiefs were horribly tortured, and the whole of the Chinese population, including the women and children, to the number of twelve thousand, were massacred in cold blood.

* "A Voyage to Cochin China, in the years 1792 and 1793," pp. 162-3.

THE LADY OF TOULOUSE.

THERE is, in the ancient city of Toulouse, a church, which, although not so old as the city itself, is still old enough to put many a mouldering cathedral to the blush, for it was founded by Runsahilda, the queen of the Goths, called by the Romans *pedanqua*, or wetfooted, because she was so fond of the baths. In the centre of the aisle the visitor may perceive a large round stone, to the centre of which a large iron ring is attached. If he lay hold of this ring, raise the stone, and peer down into the aperture, it is probable he will see nothing, inasmuch as the vault is pitch dark. But if he enter into conversation with any of the old hangers-on in the neighbourhood, he will be put in possession of a very curious occurrence, of which this vault was the scene. It took place about the year of grace 1770, when France was still divided into provinces, and when parliaments sat in the provincial capitals, and wrangled, and played at ecarté, and trictrac, and fought duels, at which the whole population "assisted." In the parliament of Toulouse, there was at this time a very worthy gentleman, who rejoiced in the possession of a wife of extraordinary beauty of person, singular excellence of disposition, and extraordinary vigour of mind. With one failing only, or rather weakness, was she afflicted, and this was a passionate fondness for fish. She mused upon it by day; she dreamed of it by night; the consumption of it was her beau ideal of enjoyment, and her love of it made her as famous in the neighbourhood as the sparkle of her eye, the grace of her vigour, or the raven tresses on her alabaster brow. She was one of those natures that seek either to love or be loved. She sought love, and loved fish.

Did her husband, a councillor of the parliament by the by, love her the less for this singular taste? I trow not; on the contrary, this formed a new tie between them. To minister to her wants was the great object of his ambition, and to keep up a regular and constant supply of the dainty so dear to her, was the object to which his whole energies were directed. But this was no easy matter. Special couriers daily went to and returned from the shores of the Mediterranean and the Atlantic with choice parcels. One day, however, not long after Easter, the councillor, all radiant with smiles, entered the apartment of his spouse, bearing on a plate a monstrous, magnificent carp, which Monsieur le Président de la Cour des Aides de Montauban had himself caught at Beausolert, and which he had forwarded as a present to Madame, with his respects. The lady put the note in her pocket without as much as opening it, but ordered the fish to be cooked instantly.

Tradition states that the carp was delicious, and that the lady ate of it so voraciously that she choked herself and died. Great was the lamentation of her lord. He sent forthwith for the barber-surgeon, who lived at the corner of the street, and for the Regius Professor of medicine; but both these worthies felt her pulse, shook their perukes, and declared she was stone dead; but at the same time, in order to ease his mind, offered, if he liked, to open her body, and ascertain the cause of her sudden dissolution. Whereupon the enraged councillor kicked them both out, and buried his wife that same evening in the vault aforesaid.

It was a custom amongst the rich at that time to bury the dead in the gayest dress they had ever worn in life, with all their ornaments and jewellery. The lady was accordingly attired in her ball-dress. The gold chain was placed round her neck; her brow was decked with a wreath of diamonds, and on her arms hung bracelets of gold set with the costliest jewels. The servants were brought in to take a last look at their mistress, as she lay in this ghastly state. They all wept most piteously, but none so loudly as her own maid and the house steward. They not only cried, but bellowed.

Seven hours afterwards, just as the clock of St. Antony's was tolling the midnight hour, the said house steward and lady's maid entered the church, wrapped up in cloaks, and carrying a lantern and a crowbar. They were evidently shaking in every limb with fear. The time, the solemnity of the place, the awful gloom of the cloisters, had a powerfu effect upon their nerves. They stopped at the mouth of th vault. The woman laid down the lantern, and said in a ver tremulous voice:

"Now you're sure you'll keep your promise."

"*Ma foi*, to be sure I will; when I'm rich I'll marry you.'

"Swear then!"

"What—now?" said the man, looking very uncomfortable

"Yes—now, over this spot."

He swore. They raised the stone and entered the vault The air was thick, heavy, and noisome. A bat flew agains the light and nearly extinguished it, and they could hear th buzz of its wings in the church above while they stood endea vouring to get a view of the place. The coffins were range around in the order of their interment; the coffins of th young and of the old, of maidens and wives, of young gal lants, and aged councillors, and magistrates; of soldiers wh had fallen in fight, and priests who had died in prayer; of al the scions of the great family of La Caloune, from the da when their ancestor crossed the sea to spread confusio amongst the Saracens,—there they were, of all sizes, an the newest, most gorgeous, and glittering of them all, with th damp of the tomb yet fresh upon it, was that of the fish-lovin mistress of the impious despoiler, who had now followed he to her last abode. They worked their courage up to th sticking point; tore off the lid, and dragged the body ou on the floor; pulled off all the ornaments, the rings fro the fingers, and the ear-rings from the ears, the costly lac from her dress, and tied them in a bag.

"Let us be off now," said the steward.

"Wait a minute," said the maid: "I must pay the wrete off for all she made me suffer while she was alive."

Whereupon she seized the lady by the hair, and gave her few very hearty slaps on the face.

"There, take that!" said she. This example roused th ardour of the steward. He remembered all the indignities h had suffered at the hands of his mistress—how she used t scold him, and harass him whenever he had not a supply fish in the house. So he gave her a smart blow on the nap of the neck, and to his horror and astonishment a hollo groan issued from the body. The maid dropped the ligh and up the ladder they scrambled, in an agony of terror, an rushed out of the church. The blow had loosened the bon which was stuck in the lady's gullet, and she slowly revive from her trance. When she looked around her upon th vault and coffins, and her own disordered dress, the whol dimly lighted by the lantern which the fugitives had le behind, she swooned away, and three hours had elapsed befo she summoned up sufficient strength to sally forth and mak her escape from the scene of horrors. She found the churc doors open. It was a fine clear starlight night. The stree were empty, and not a sound was to be heard except the long drawn cry of the watchman, "Gentle and simple, pray for th souls of the dead!" He met the lady, and fainted with terro She reached her own house, and knocked loudly. The mai looked out of the window, saw the white garments and th well-known face, and immediately went into fits, shrieking "Madame, madame!"

Another knock, louder than before. The steward wen down and opened the door, shouted "Madame!" and swoone away. The councillor left his room, where all night long h had been praying and weeping, and weeping and praying, an would not be comforted—in order to learn the cause of th tumult. He came into the hall, and there stood his wif pale, indeed, and haggard, but alive and well. We mus leave the joy and rejoicing attendant upon this unexpecte meeting to the reader's imagination. The steward and th maid confessed their crime, but in consideration of thei having been instrumental in dislodging the bone from th lady's throat, they were pardoned. As to their mistress, sh renounced fish from that day forward and for ever, an within six months after her burial she presented her fon husband with a charming boy, who was baptized in the churc of St. Antony à la Daurade.

CRIPPLEGATE, AND THE NEIGHBOURHOOD.

THERE is scarcely a street in the city of London but has its tory, for those who care to seek it out. For the literary ntiquary especially, the dim by-ways and no-thoroughfares resent peculiar attractions, for in them once dwelt the poets nd great historical personages of past times. Many a wide, rambling building now devoted to the purposes of trade, as, years since, a noble mansion; and in the dark, dusty ooms, and up the wide stairs, where the gold-work on the eilings and the walls has become black with age, and the arvings on high chimney-pieces have long since been built in nd hidden by high piles of merchandise, children once ported, young people flirted, and those of more advanced ears enjoyed all the sweets of domestic life.

The neighbourhood between Finsbury and Saint Paul's is ch in interesting associations. Out of Cheapside on the orth side, nearly opposite to Bow Church, there is a thorough- re called Wood-street. It is a busy place enough, full of arehouses and counting-houses. At the Cheapside end— the yard of St. Peter-le-Cheap, destroyed by the great re—there is an old elm, inhabited by a colony of rooks; and n the street itself is the church of St. Michael, in which the ead of James the Fourth, who fell at Flodden Field, was nally deposited. This Wood-street—which was formerly mous for its wedding-cakes, and at the end of which stood he Cheapside Cross, commemorated in the Cross Keys Inn— ads directly into the district called Cripplegate, one of the wenty-six wards of the City of London.

The neighbourhood is historical. Long before the Conquest, e are told by Stow, it was known by this name, on account f cripples begging there. The gate itself, which formed one f the northern boundaries of the city, was taken down in 762; and part of the ward is now known as Cripplegate Vithout—that is, outside the walls. "I read," says tow, "that Alfune built the parish church of Giles, nigh a ate of the City, called Porta Contractorum, or Cripplegate, bout the year 1099." This church was destroyed by fire, and he present church erected about the year 1545. The round, ower-like portion of the church has remained unchanged, but he square steeple, with its fanciful spires and cupola, is the ork of a later period. It is a quiet, old-fashioned, little- requented church, surrounded by houses, with a high wall eparating the graveyard from the street. The living, how- ver, is one of the richest in the city, being worth at least 2,600 a year. It was once held, we are told by Cunningham, y Lancelot Andrews, Bishop of Manchester.

In the church-yard have been buried many well-known istorical personages, and the parish register records the mar- iage of Oliver Cromwell and Elizabeth Bowchier, on the 0th of August, 1620. The future Protector of the Com- onwealth of England was at that time in his twenty-first ear.

On the south wall of the church there is a plain monument John Fox, the author of the "Book of Martyrs," who died this parish in the year 1587; and in the south aisle there a tablet to the memory of "skilful Robert Glover," as Stow lls him, who held, during his lifetime, the office of Somerset erald. He died in 1588.

Monuments also exist, either in the church or the church- ard, to the "bold mariner," Sir Martin Frobisher, who, after ircumnavigating the globe with Drake, and assisting in the estruction of the "Invincible Armada" in 1588, died on his omeward passage from Brest, in 1595; John Speed, the topo- rapher, who died in 1629; the father of John Milton, who ied in 1646; and the great epic poet himself, who, in 1674, as "buried in the same grave with his parent," in the upper nd of the chancel at the right hand. The bones of John Iilton have been more than once disturbed. Abrey, in his Lives," tells us (vol. iii., p. 450), that "his stone is now emoved. About two years since (1681), the two steppes to he communion-table were raysed. I ghesse Jo Speed and he e together." In the year 1790 also, the grave of the poet as disturbed, and "many indecent liberties" taken with his remains. Most of our readers will remember Cowper's lines "on the indecent liberties taken with the remains of Milton in 1790," commencing

> "Me, too, perchance, in future days,
> The sculptured stone shall show,
> With Paphian marble or with bays
> Parnassian on my brow;"

and ending

> "Oh, ill-requited bard! neglect
> Thy living worth repaid;
> And blind idolatrous respect
> As much affronts thee dead!"

The bust, erected in Cripplegate Church to the memory of the great poet Milton, was sculptured by Bacon, in 1793, at the expense of Samuel Whitbread.

Several other monuments to historical personages exist in this church; among them are, that to Margaret Lucy, second daughter of Shakspeare's Sir Thomas Lucy, of Charlcote, and that to the memory of Constance Whitney, whose mother was the fourth daughter to the said Sir Thomas Lucy.

Close at hand is the debtors' prison of Whitecross-street, celebrated as still continuing poor Nell Gwynne's bounty; being the "request of Nelly, made in her will, to her natural son, the Duke of St. Albans, that his grace would be pleased to lay out twenty pounds yearly for the release of poor debtors out of prison every Christmas-day." In Whitecross-street, says Stow, "King Henry V. built one fair house, and founded there a brotherhood of St. Giles; but the said brotherhood was suppressed by Henry VIII., since which time Sir John Gresham, Mayor, purchased the lands, and gave part thereof to the maintenance of a free school which he had founded at Holt, a market-town in Norfolk." The present prison, appertaining to the sheriffs of London and Middlesex, was built in the years 1813—15.

In Fore-street, Moorfields ("a fen or moor without the walls of the city to the north, first drained in 1527, laid out into walks in 1606, and built upon in the reign of Charles the First"), is the noted Grub-street, "much inhabited," says Johnson in the first edition of his Dictionary, "by writers of small histories, dictionaries, and temporary poems; whence any mean production is called Grub-street:" near to which John Milton had one of his numerous London residences. It is now called Milton-street, and leads directly from the city to Islington. Pope, in the Dunciad, says—

> "Let Budgell charge low Grub-street on his quill,
> And write whate'er he please, except my will!"

Close at hand is Jewin-street, so called from having contained a Jews' burial-place. In it Milton lived when he married his third wife; and here Dunton, the bookseller, at the sign of the Raven, corner of Bull-head-court, published his "Athenian Mercury." In the chapel in this street is preserved John Bunyan's pulpit.

In Redcross-street, within a stone's throw almost of Cripplegate church, is preserved the excellent theological and general library formed by the eminent protestant dissenting divine, Dr. Williams, in 1680—1705. The library, according to the catalogue published in 1841, consists of upwards of 20,000 volumes. Admission is accorded to any respectable person, to whom the books are lent, under some restrictions, on the first five days of the week throughout the year, except during Christmas and Whitsuntide and the month of August, from ten till four. The room will accommodate fifty or sixty readers. In the library is a fine copy of the first folio edition of Shakspeare, and an original portrait of Richard Baxter, the distinguished nonconformist.

The Fortune theatre—built by Peter Strut, the carpenter, for Phillip Henslowe and Edward Alleyn, the founder of God's Gift College, at Dulwich—stood on the east side of Golden-lane, in the parish of St. Giles, Cripplegate. The original

building was a square construction of lath and plaster and timber, with a picture or sign of Fortune in the front. Here were performed the immortal plays of Shakspeare, and here it was that Alleyn derived the funds with which to found the college and his other numerous charities in London. Another theatre, called the Nursery, from the fact that in it children were instructed in the art of acting, was afterwards erected in this same narrow street, a passage in which is still called Playhouse-yard.

We have by no means exhausted the interest of the neighbourhood, though it may happen that we tire the patience of the reader by these dry antiquarian remarks. Finsbury-square (properly *Fens*bury, from the fenny or marshy nature of the ground originally) at no great distance, was once a favourite walk for the citizens of London in the reigns of Elizabeth and

CRIPPLEGATE CHURCH.

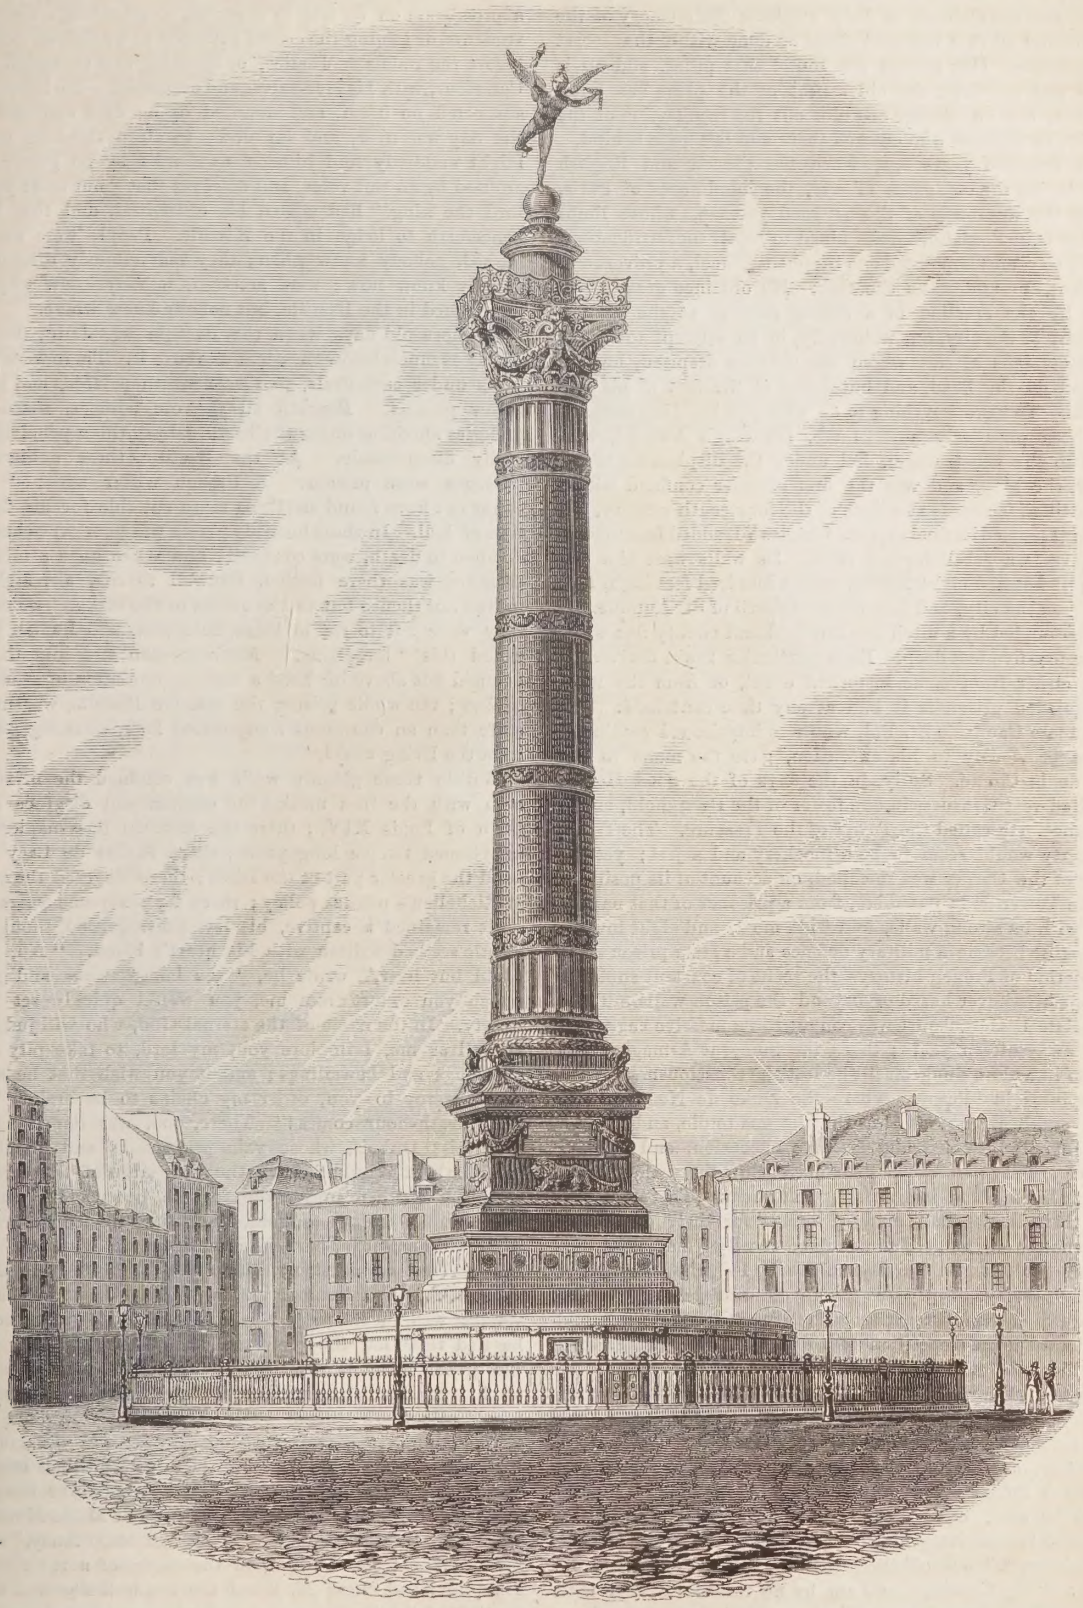
James the First. Shakspeare alludes to it in the first part of "Henry IV.," in Hotspur's reference to Lady Percy:—

> "And gro'st thou such sarcenet surely for thy oaths,
> As if thou never walk'st further than Fensbury."

The square was built in 1789. It is now principally inhabited by medical and professional men. In the "Circus" is the famous London Institution, containing upwards of 60,000 volumes, among which are some of the most curious pamphlets and broadsides in existence. The first librarian of the Institution was no less a person than the celebrated Richard Porson, Regius Professor of Greek in the university of Cambridge, who earned such great renown among continental scholars by his masterly editing of Greek plays, and who died in the year 1808. The following amusing anecdote is told of this eminent scholar. He was once travelling in a stage-coach, where a young Oxonian, fresh from college, was amusing the ladies with a variety of talk, and, amongst other things, with a quotation, as he said, from Sophocles. A Greek quotation, and in a coach too, roused the slumbering professor from a kind of dog sleep, in a snug corner of the vehicle. Shaking his ears and rubbing his eyes, 'I think, young gentleman,' said he, 'you favoured us just now with a quotation from Sophocles; I do not happen to recollect it.' 'O, sir,' replied the tyro, 'the quotation is word for word as I have repeated it, and from Sophocles, too; but I suspect, sir, it is some time since you were at college.' The professor, applying his hand to his great-coat pocket, and taking out a small pocket edition of Sophocles, quietly asked him if he could be kind enough to show him the passage in question in that little book. After rummaging the pages for some time, he replied, 'Upon second thoughts, I now recollect that the passage is in Euripides.' 'Then perhaps, sir,' said the professor, putting his hand again into his pocket, and handing him a similar edition of Euripides, 'you will be so good as to find it for me in that little book. The young Oxonian again returned to his task, but with no better success, muttering, however, to himself, a vow never again to quote Greek in a stage-coach. The tittering of the ladies informed him plainly that he had got into a hobble. At last, 'Why, sir,' said he 'how dull I am! I recollect now; yes, now I perfectly remember that the passage is in Æschylus.' The inexorable professor returned to his inexhaustible pocket, and was in the act of handing him an Æschylus, when our astonished fresh man vociferated, 'Coachman! holloa, coachman! let me out I say instantly let me out! There's a fellow here has the whole Bodleian library in his pocket.'

The first stone of the present fine building—erected from the designs of William Brooke, the architect—was laid on May the 15th, 1815; and the Institution itself opened within less than four years after.

THE COLUMN OF JULY.



The column of July occupies the site of the bastion of the Bastille. It was erected shortly after the accession of Louis Philippe to the French throne, and at its foot were buried the remains of those who fell in the struggle for freedom during the three days of July. The pillar is covered with the gilded names of those who perished, and is surmounted by a statue in commemoration of the triumph of their cause.

The chief interest attaching to the column arises from its

locality, and as we cross the broad open square where it is situated, in the way to Père la Chaise, thoughts of the strong fortress, which once arose upon that spot, are naturally suggested, and the Column of July awakens the memory of the Bastille and all that was said about or done within that secret prison-house. Gay groups are round that pillar, and all is bustle and activity; the old aspect of the place has quite departed, but no change can blot out the recollection of the Bastille, or of those who entered there and left hope behind.

Five hundred years ago, when the French and English were playing the old game of war, the inhabitants of Paris, fearing the approach of those "good yeomen, whose limbs were made in England," determined to repair the fortifications of their city, and appointed one Stephen Marcel, a provost and merchant, to undertake the task. He obtained great popularity by the erection of a strong fortress at the eastern extremity of the city, but unhappily, in an attempt to favour the pretensions of one whom the citizens despised, he was knocked on the head, and butchered at the foot of his own Bastille. To have anything to do with this building seems to have been peculiarly unfortunate, for Hugh Aubriot, who added to the construction, fell under the displeasure of his master, the king, and was the first offender confined within the Bastille. Towards the close of the fourteenth century, the building assumed its final aspect. Charles VI. added four towers, and gave it a parallelogram form. Its walls were nine feet thick; it boasted eight towers, each a hundred feet high, four looking on the city, and four on the suburb of St. Antoine. It was surrounded by a ditch one hundred and twenty feet wide, and twenty-five feet deep. Each particular tower derived its name, either from some historical event, or from the most distinguished prisoners it had at any time contained. The unfortunate Count de St. Pol, who was imprisoned within the fortress previously to his execution, gave the name to the Tour de la Comté. Sully, in the days of the good Henry, deposited vast treasures in one tower of the stronghold, and it was henceforth called the Tower of the Treasure. The Tower of Liberty would seem to be a mockery and a jest; yet the Tower of the Corner was so called, on account of its position; and the Tower de la Bazinière, from a prisoner of that name.

So, with its strong walls, and wide moat, and eight towers, the Bastille became a military defence and a state prison at an early period of French history—the scene of constant suffering and injustice never heard of beyond the prison walls. There the prelate D'Harancourt was confined in a massive cage, and pined away fifteen years; there the innocent Armagnac was shut up in a close dungeon till he lost the consciousness of his unhappiness in idiotcy. There the Duke de Nemours lingered, and heard no news but that he was to die, and saw not the light till they led him forth to execution, and in their wanton cruelty placed his little ones below the scaffold, that their father's blood might fall upon them. There, hunted from their homes and made prisoners for their creed, the Huguenots were lodged, and suffered cruelly from the caprice of their gaolers. In the days of Henry IV., the Bastille was well nigh empty. Sully was the governor of the fortress, and his natural clemency, together with that of the king, prevented for the time the repetition of those enormities which had given the castle so terrible a renown.

The period which followed saw the Bastille once more crowded. A tyrannical method of capture made it one of the most thronged of prison-houses. A *lettre de cachet* was easily obtainable, and during the reign of Louis XV. no less than 150,000 or 200,000 were annually issued. Sometimes a letter would be sent, commanding the person to whom it was addressed to constitute himself a prisoner. When Louis the "well-beloved" was offended with the Prince of Monaco, he wrote:—"My Cousin,—As I am by no means satisfied with your conduct, I send you this letter to inform you of my intention, which is, that as soon as you receive it you shall proceed to my castle of the Bastille, there to remain till you have my further orders. On which, my cousin, I pray God to have you in his holy keeping." Generally, however, the officers of justice were sent to the dwelling of the intended prisoner, commonly in the night, and while all Paris slept, hurried him away to his new lodgings. Thus the idle loiterer, who had been leisurely sauntering through the busy streets, looking at a procession on its way to a shrine, or attending a meeting of students, or joining the crowd gathered to witness an execution before the Palais de Justice, or listening to a charlatan on the Carrefour, with his love-salves and cosmetics,—the loiterer who suspected no harm, and mounted up his dark staircase when the day was over, and lay down to sleep thinking no evil, might suddenly find himself awakened by no gentle hand, aroused by no soft voice, and discover that "our most puissant lord the king" had signed his committal, and that he was henceforth to lodge in the Bastille. People were suddenly missed, nobody knew when; they marvellously disappeared, nobody knew how; were arrested, nobody knew why; and imprisoned in the Bastille, but nobody knew where.

In those old days when the Bastille was built, there was nearly as much below the earth as above it. There were cathedrals under cathedrals, palaces beneath palaces, and prisons below prisons. Beneath all the old edifices, there were galleries shooting under the earth, labyrinthian penetralia not easily discoverable. At the Bastille these subterranean passages were prisons. A French writer says:—"Dante could not have found anything more suitable for his description of hell. In these horrible places the poor wretches, condemned to death, were confined; and when once a miserable creature was there buried, farewell to life, air, light; he moved not thence but to the gibbet or the stake. Sometimes they were left to rot in these dungeons, and human justice called this 'forgetting.' Between man and him the condemned felt above his head a vast accumulation of stones and gaolers; the whole prison, the massive Bastille, was nothing more than an enormous complicated lock, shutting him out from the living world."

Within those gloomy walls was confined the mysterious man with the iron mask—the enigma and disgrace of the reign of Louis XIV.; there the Marshal Bassonapierre was imprisoned twelve long years; there Maitre de Lacy translated the greater part of the Bible; there lingered the victims of Richelieu's pitiless policy; there for sixty-one years Dussault remained a captive, his letter disregarded, though that epistle seemed written with his heart's blood. "Ah, if you could but hear," wrote he, "the lamentations and groans which you extort from me, you would quickly set me at liberty. In the name of the eternal God, who will judge you as well as me, I implore you, my lord, to take pity on my sufferings and bewailings; and if you wish that he should show mercy to you, order my chains to be broken before your death-hour comes!" There, too, was imprisoned the alchymist Dubois, whose vain pretensions and inability to realise them brought down the vengeance of the cardinal; there he writhed under the torture, because he could not turn leaden bullets to gold, and from thence he was led to the scaffold. There the unfortunate Fouquet tasted the reverse of fortune; there the Chevalier de Rohan suffered for high treason, and a young student of the University was incarcerated for one and thirty years because he had ridiculed the professors in a Latin distich. There the grocer Niceron was shut up for many a year on account of having protested against the government monopoly of whale oil; there Citizen Poignant suffered "durance vile" for grumbling at the taxes; there Massat and Catalan were long detained in captivity for refusing to lend their money to the State. There father St. Severin expiated the imaginary crime of sorcery by a long detention, and M. de Montespan was left to "chew the cud of sweet and bitter fancy," simply for differing from the king in the choice of a tutor for the Dauphin; and there M. Burai the counsellor passed a long captivity for defending a treasurer prosecuted by government. Sometimes, indeed, people who well deserved it wore "the stone doublet." There St. Croix was imprisoned, became acquainted with Exili, and learned from him the art of poisoning; and there, too, when the report of the poisoners had filled all Paris, was lodged the beautiful Madame de Brèn-

villiers, and thence she was carried forth to execution. Years afterwards La Voison and forty accomplices were thrown into the Bastille on a charge of poisoning, and their leader was burnt to death on the Grève. Terrible were the doings during the time of Louis XV., and although less abuses existed in the beginning of the reign of his successor, yet when the revolution broke out the first efforts of the people were directed against the Bastille. The 14th of July, 1789, saw its destruction. Eighty invalids, or pensioners, and about thirty Swiss soldiers garrisoned the place; it was gallantly defended; but the people were at last victorious, and the fortress was taken, those within it massacred, and with it passed away the power and influence of the old régime.

The Bastille was finally demolished by order of the local authorities, a grand ball given on the place which it had occupied, and the anniversary of its destruction appointed as a festival throughout all France. So the Bastille, after nearly five centuries, was swept away—not a stone left—and a canal flows deeper than the deepest *oubliette*. None can regret its fall. When the revolutionists marched in, they found only a few prisoners, and those chiefly for debt; still it was the dungeon of despotic power, and they who destroyed it did good service to the land.

The struggle of 1830 gave new interest to the Place de la Bastille, and the column represented in our engraving was erected to perpetuate the memory of the second revolution. M. Duc, whose name is so honourably connected with the structure, was the first who originated the idea, and who designed and superintended the erection of the pillar. It is of bronze, carefully and delicately finished; the total cost was about £50,000. The symbolical portions of the building are peculiarly appropriate. The lion is at once the zodiacal sign for the month of July, and a fit emblem of the majesty of the people. The three divisions which are seen upon the shaft of the column indicate the three days of the revolution. On these compartments the names of the victims which fell in the struggle are inscribed: there are 504. Upon two faces of the pedestal are crowns and palms; on the four corners the Gallic cock. A well-executed figure of Mercury surmounts the pillar; and the simplicity and excellency of the ornamental portion, as well as the grand outline of the whole, combine to produce a solemn and striking effect.

NEW ZEALAND BIRDS.

That the frightful and disgusting habit of cannibalism should have been prevalent amongst so fine a race as the New Zealanders, has often formed the subject of wonder to the ethnologist. We think the circumstance may be attributable to the almost total absence in New Zealand of indigenous quadrupeds, and the scarcity of native vegetable productions. The only native quadruped whose existence is well attested, is a sort of rat; though Mr. Walter Mantell, Government Commissioner for the settlement of native claims, is inclined to believe in the existence of another, a sort of badger. At any rate, this animal, if not extinct, must be very rare, seeing that a large reward, offered by Mr. Mantell, failed to bring a specimen of this animal (termed by the natives Kaureke) to light.

But, if nature was sparing in her allotment of quadrupeds to New Zealand, she lavished on that far-distant isle a variety of extraordinary birds. Occasionally their bones turn up, startling the naturalist by their extraordinary size, or curious conformation. Most of these birds were, in one respect, like the ostrich; that is to say, their wings were only rudimentary—very useful as sails to catch the breezes, and assist the animal in running, but totally unavailable for the purpose of flying. Although the only evidence we possess of the former existence of all these birds, save one, is the discovery of their bones, yet circumstances favour the idea that they were not exterminated until comparatively recent periods. Popular native tradition still hands down their characteristics; the various native languages give them a name; which would scarcely have been the case if these animals had ceased for many centuries to exist.

The largest of these wingless birds is termed in native language the *Moa;* it must have been considerably larger than the ostrich; of this there can be no doubt, although the entire skeleton of the Moa has not yet been found.

Our drawing and present remarks do not relate to the Moa, but to an individual of a species, contemporary as is supposed with that gigantic bird, and for the discovery of which we are indebted to the son of that eminent naturalist, unhappily now no more, the late Dr. Mantell. Mr. Walter Mantell imbibed much of his father's love of natural history, and very soon after his appointment to an official capacity in New Zealand, applied himself to the collection of fossil bones of birds in which New Zealand is so rich. At length a fortunate chance enabled him to send to England the skin of a bird supposed to be extinct; and had it not been for the gluttony of a crew of sailors, the bird itself, alive and well, might probably have figured in our Zoological Society's gardens.

Before stating how this capture was made, it is necessary to premise that, according to native tradition, there lived, contemporary with the gigantic *Moa*, a bird also wingless, but far smaller, termed by the inhabitants of the northern island *Moho*, and by those of the southern island *Takahé*. All the natives who mentioned this bird concurred in stating, that formerly it existed in such numbers that their ancestors derived from the species their chief sustenance; the natives, moreover, were all unanimous in stating the bird to have been already for some time extinct. The species was not extinct four years ago, as we shall presently discover; but whether the species be *now* extinct—whether we are now about to describe the last of these birds—is more than can be averred.

To show how extremely rare the *Moho* must have been, it is sufficient to mention, that none of the natives with whom Mr. Mantell conversed on the subject had ever seen it; moreover, the Rev. Richard Taylor, who has so long resided in the islands, had never heard of a bird of this kind being seen. In his "leaf" from the Natural History of New Zealand, under the head of Moho, is the following note:—"*Rail*, colour black, said to be a wingless bird as large as a fowl, having a long bill, and red beak and legs; it is nearly exterminated by the cat; its cry was '*keo, keo.*'"

Let us now inform the reader how a living specimen of the Moho came to light, was caught, killed, and eaten in the year 1849. A party of seal hunters, who were pursuing their avocations in Dusky Bay, having observed the trail of a large bird in the snow with which the ground was then covered, determined to give chase. Proceeding in the direction of the footsteps, they at last caught sight of the *Moa* or *Noturnis*, as naturalists have since denominated it. Their dogs at once gave chase, and finally after a long hunt the bird was captured alive, in the gully of a sound behind Resolution Island. It ran with great speed, uttered loud cries, and violently attacked the dogs. But, notwithstanding the long struggle, it was caught uninjured and taken on board ship, where, after having been kept alive for three days, it was at length killed and eaten, the sailors who partook of the meal describing the bird as most delicious food. Fortunately, these nautical epicures, who certainly were no great naturalists, did not pluck their bird, but skinned it, and Mr. Walter Mantell having secured the skin, confirmation of the correctness of native accounts was at length obtained.

It is a great pity that the seal catchers, having once determined to preserve a memento of their capture, did not set aside the bones as well as the skin. The external lineaments of a stuffed bird are sufficiently attractive to the general observer, but the skeleton is of infinitely greater value to the naturalist.

Our accompanying illustration represents the *Moho*, or Noturnis Mantelli. Its form is not very prepossessing, and its plump, well-rounded contour is so strongly suggestive of a delicate *bonne bouche*, that we do not wonder that the race is so nearly extinct; if, indeed, its extinction be not already consummated. The colours of the plumage are exceedingly fine. The beak and legs are of a deep crimson, the head, throat, and abdomen, purple, and the tail white.

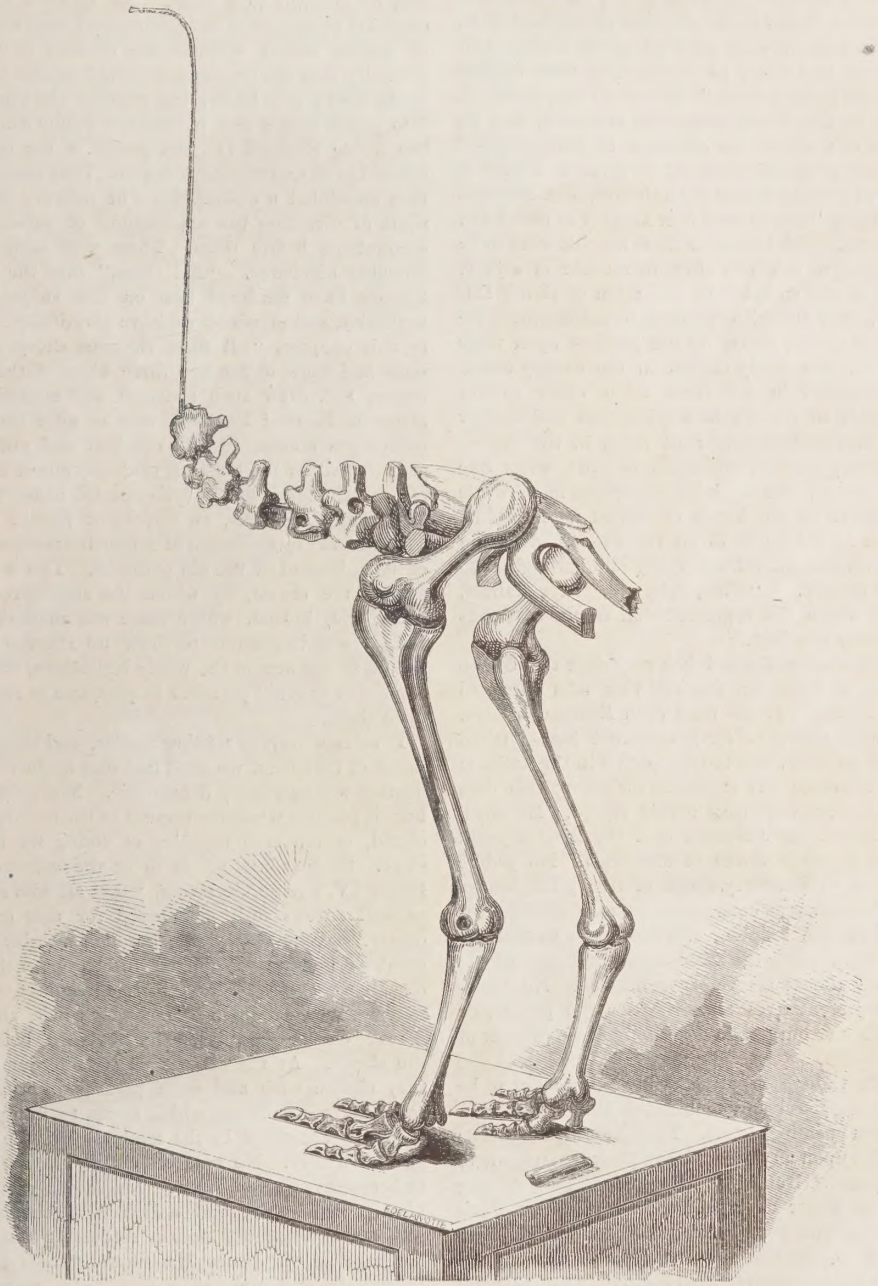
We regret our inability to do by the larger as we have done by the smaller bird—present the reader with a perfect representation of it. However, in default of this, we append a

NOTURNIS MANTELLI.

representation of so much of its skeleton as may serve to convey an impression of its general configuration and enormous size. Our sketch has been copied from an anatomical preparation now to be seen in the College of Surgeons' Museum—that unequalled collection, for the first germ of which we are indebted to our illustrious countryman, John Hunter. Connected with this skeleton, there is a very interesting tale, of which we will give an outline, as it serves very forcibly to demonstrate the wonderful degree of perfection to which the science of comparative anatomy has now arrived.

When digging deep into the bowels of the earth, separating strata, and bringing to light the fossilised traces of animals now extinct, the naturalist refers them to this or that genus; when confidently asserting that such or such a bone belonged to an enormous lizard to which the modern crocodile is but a pigmy; when proclaiming that in such a region there formerly existed dragon-like beings with wings, or scaly monsters with webbed feet, and necks like those of swans—or, in short, some of the marvellous creatures which we are told roamed this world of ours long long before the advent of man,—we are sometimes inclined, notwithstanding our confidence in the power of induction, to think philosophers a little too wild; but the tale we shall now relate concerning our bird-skeleton goes far to abolish our doubts on this head, and to vindicate the assertions of geologists. The tale is this:—Some years ago, a traveller, returning from New Zealand, brought with him a few inches of bone. Not a very inviting freight one would think, nor likely to arrest a traveller's attention: but Australian gold had not been discovered at the period to which our remarks apply, and travellers were content to fill their sea-trunks with curiosities less fascinating than nuggets. The traveller in this case was an intelligent man. He had heard

of gigantic New Zealand birds now extinct: he had heard of Professor Owen, to whom, accordingly, he presented his few inches of bone—that precious bone which now lies at the feet of the skeleton-bird, and which our artist has depicted. The Professor examined the bone attentively. It was big enough to have been the bone of an ox;—an observer less acute than the Professor would probably have regarded it as such, and have thrown it into his dust-bin. Not so Mr. Owen: he in all that philosophers had written about iguanodons, ichthyosauri, and megatheriums, could not believe in the former existence of this New Zealand bird. Professor Owen waited his time. Causing inquiries to be made in New Zealand, his emissaries at length succeeded in collecting some disjointed bones. Forthwith they were packed off in a trunk directed to the man of bones in Lincoln's-inn-fields. Arrived at their destination, the bones were put together on wires, and formed



SKELETON OF A NEW ZEALAND BIRD, IN THE MUSEUM OF THE ROYAL COLLEGE OF SURGEONS.—DRAWN BY PERMISSION OF THE COUNCIL.

oticed a peculiar cancellated structure in the bone; an appearance only noticeable in the bone of a bird; but how could here have been a bird so large? It must have been almost vice the size of the largest existing ostrich. This startling onsideration did not deter the philosopher. A bird's bone this emnant must be, he proclaimed, and, at once setting to work, e figured the bird as it must have been. The announcement, owever, was too startling. Even people who had put faith the very skeleton which our artist has depicted. Some of the vertebræ of the neck are yet wanting, as the reader will observe, but there stands the wire representative of the length to which they should extend. Let us hope, as gold-hunting has now commenced in New Zealand, that some nugget-hunter will turn up amongst his more ignoble treasure these missing bones, and thus enable the worthy anatomist to complete his bird.

PEERS AND M.P.'S;
OR,
LORDS AND COMMONS.

III.
THE COMMONS.

WHATEVER may have been the original purport of the lower house, in our day it has come to be the great battle-ground of party. "The first instance of actual representation which occurs in our history," says Hallam, "is only four years after the Conquest, when William—if we may rely on Hoveden—caused twelve persons skilled in the customs of England to be chosen from each county, who were sworn to inform him rightly of their laws, and these, so ascertained, were ratified by the consent of the great council." No stress can, however, be laid upon this insulated and anomalous assembly, and we find nothing that can arrest our attention in searching out the origin of county representation, till we come to a writ in the fifteenth year of John, directed to all sheriffs, and, amongst other things, charging them to send four knights of the shire; and it remains problematical whether these knights were to be elected by the county or returned after the manner of a jury, at the discretion of the sheriff. In the reign of Henry III. one fact is clear, that subsidies granted in parliament were assessed, not as in former times, by the justices upon their circuits, but by knights freely chosen in the county court. At a subsequent period in the same reign every county elected four knights to inquire into grievances and deliver their inquisition into parliament. Still later, in the thirty-eighth year of Henry's reign, and again in 1261, writs like summonses were issued; and at length, four years later, while Henry was a captive in the hands of Simon de Montfort, writs were issued in his name to all the sheriffs, directing them to return two knights for every city and borough contained within the county. "This, therefore," says Hallam, "is the epoch at which the representation of the commons becomes indisputably manifest."

So far as the towns are concerned, it is very clear that Simon de Montfort, Earl of Leicester, was the first who extended the franchise to them. Till his time even London, a town rich, powerful, with thirty or forty thousand high-spirited inhabitants within its walls, was unrepresented in the national councils. By Mr. Hallam the argument for giving this date to popular representation is very briefly stated. He says, "We find from innumerable records that the king imposed tollages upon his demesne towns at discretion. No public instrument previous to the forty-ninth of Henry III. names the citizens and burgesses as constituent parts of parliament, though prelates, barons, knights, and sometimes freeholders are enumerated, while since the undoubted admission of the commons they are almost invariably mentioned. No historian speaks of representatives appearing for the people, or uses the word citizen or burgess in describing those present in parliament."

Such convincing though negative evidences are not to be invalidated by some general and ambiguous phrases, whether in writs and records or in historians. Those monkish annalists are poor authorities upon any point where their language is to be delicately measured. But it is hardly possible that, writing circumstantially as Roger de Hoveden and Matthew Paris sometimes did concerning proceedings in parliament, they could have failed to mention the commons in unequivocal expressions if any representatives from that order had actually formed part of the assembly. In the reign of Edward I. the borough representatives were finally engrafted upon parliament; then commerce enriched the kingdom, and government saw it would not do to neglect the towns.

There is no reason to believe that the lords and commons ever voted together. They might have met in the same chamber till the time of Edward III., but that they ever intermingled in voting is, in the language of Mr. Hallam, inconsistent with likelihood and authority. But, in fact, there is abundant proof of their separate existence long before Edward III.'s reign. "It may be inferred," says the same authority, "that the houses were divided as they are at present in the eighth, ninth, and nineteenth years of Edward II."

Early it became decided that the proper business of the House of Commons was to petition for redress of grievances, as much as to provide for the necessities of the crown. This privilege the commons never abandoned, and hence it is they have grown and become strong. It was ordained in the fifth of Edward II., that the king should hold a parliament once, or, if necessary, twice every year, "that the pleas which have been thus delayed, and those where the justices have differed, may be brought to a close." In Edward III.'s time, three essential principles of our government were won: the illegality of raising money without the consent of parliament; the necessity that the two houses should concur for any alteration in the laws; and lastly, the right of the commons to inquire into public abuses and to impeach public councillors. Under the feeble Richard II., the power of the commons was increased in an extraordinary degree. They impeached ministers; they appointed a commissioner of reform; they acquired the right of directing the applications of subsidies, and calling accountants before them. These were additional engines of immense efficiency. "All these," says the historian whose labours have rendered him on this subject a pre-eminent authority, and of which we have plentifully availed ourselves in this chapter, "all these vigorous shoots of liberty throve more and more under the three kings of the House of Lancaster, and drew such strength and nourishment from the generous heart of England, that in after times and in a less prosperous season, though checked and obstructed in their growth, neither the blasts of arbitrary power could break them off, nor the mildew of servile opinion cause them to wither." In Henry VI.'s time, an important change was introduced. This was the introduction of complete statutes under the name of bills, instead of the old petitions. This was done to guard against the crown, by whom the statute-roll was tampered with; and, indeed, where there was no design to falsify the roll, it was impossible to draw up statutes which in truth should be the acts of the whole legislature, so long as the king continued to grant petitions in part, and to engraft new matter upon them.

If we now turn to another matter, and inquire into the character of the voters, we shall find that in the counties the qualification was extremely democratic. Not only all freeholders, but all persons whatever present at the county court, were declared, or rendered capable, of voting for the knight of the shire. Such at least seems to be the inference from an act of Henry IV.'s reign, declaring, "that all who are there present, as well suitors duly summoned for that cause, as well as others." Who elected the borough members is a question of greater difficulty. It appears to have been the common practice for a very few of the principal members of the corporation to make the election in the county court, and their names as actual electors are generally returned before the writ by the sheriff. At the same time it is frequently stated, that they choose such and such persons by the consent of the community—a phrase which seems to imply, that the freemen were consulted in the matter. But the subject is one of great difficulty. No one can clearly state what the franchise in boroughs originally was. The inquirer into the past finds himself continually surrounded with clouds and darkness. We can say nothing certain respecting parliament. In the language of Sir James Macintosh, "most of its parts were irregularly and unequally unfolded; some attained their vigour before others, and the growth of some appeared for a time to be too rudely checked for recovery;" yet to its early rise and progress an undying interest attaches; for it grew with England's growth, and strengthened with her strength. Born of the people, more or less, it has been true to them.

We hasten gladly from these dull inquiries. We shall find more entertaining matter as we proceed. The darkness becomes less—the path more plain. Still, even down to our own time, the history of the house is locked up in voluminous journals, state trials, parliamentary debates, and ancient pre-

cedents; yet even a lover of light reading will find much to interest, and a real student of human progress will find much to richly reward his patient research. "How much interest," remarks Mr. Townshend, "may be found in a review of its former privileges, some obsolete or retrenched, and some forgotten; of those hard-won rights to personal and deliberative freedom which the progress of constitutional principles has sanctioned and matured; of its large powers both to reward and punish; of its power of impeachments, that ponderous instrument of the vengeance of the commons, blunted by frequent and injudicious use; of its former vindictive expulsion of members, and tyrannical sentences on offenders kneeling at the bar."

A grand lesson is taught by the House of Commons. It has been snubbed by counties—frowned on by kings. It has gone through every extreme. At one time base as baseness itself. At another time proud in its integrity as the champion of the right. It has been bought and sold over and over again. Yet it lives. What a proof of the inherent virtue of the representative system. What a proof that, so long as you have that, you have politically every thing. That working even imperfectly is a guarantee that the machine of the state will go right.

THE SPEAKER.

The student of etymology in general, and Horne Tooke in particular, will not be surprised to learn that the Speaker of the House of Commons is, in reality, almost the only member who never speaks. Everywhere around you oratory drops like dew, and very heavy dew, from all parts of the House, with the exception of that one particular spot—the oasis in the desert—where stands the richly carved and ornamented Speaker's chair, and where the Speaker sits. You hear him name the different actors on the busy scene. If honourable members cluster too thickly at the bar—if old fogies or young bucks, instead of the quiet tones in which you should discuss the last new tie, or the points of a woman or a horse, speak in tones so loud as actually to drown the voice of Mr. Humdrum, who is in possession of the chair, then "Order! Order!" is cried by the Speaker, deeply, loudly, grandly, and for a time the tumult subsides. Or if a bill is to be put, you again hear the Speaker's voice, thus, "The Middlesex Grand Junction Railway bill, that it be read again this day six months; as many as are of that opinion say Aye, on the contrary, No—the Noes have it." When you have heard thus much, you have, generally, heard all that the Speaker has got to say. Silent, watchful, he sits all night in his chair of state. If the sight of a good man struggling with adversity—a sight which philosophers have pretty often an opportunity of witnessing—be a sight dear to them, what must those excellent personages think of the Speaker of the House of Commons, in a stormy debate or a row—the latter, of course, principally an entertainment got up and conducted for the amusement of the house by the Irish members? And really an ordinary mortal at such a time may feel pleasure in witnessing the conduct of the Speaker, in attempting to keep order under difficulties. Scarcely is the house awed by his majestic appearance, or his vehement tones; often the confusion lasts some time. In ordinary seasons, while the debate drags on smoothly, the Speaker hardly seems to belong to the house at all, as calm, dignified, silent, he sits apart—a witness of the scene, but rarely an actor in it.

"The first Speakers of the House of Commons were chosen," says Mr. Townshend in his History of the House of Commons, "from belted knights and commoners of distinction, but in accordance with the previous nomination of the king. Sir Thomas Hungerford, 51 Henry III., in the year 1376, is the first named as Speaker in the parliament roll, and termed *parleur*, or mouth of the house. But as the ancient parliament rolls recorded only the acts that passed between both houses, and the laws that were made, omitting all matters of form and ceremony, it may be conjectured that the antiquity of the office is coeval with the sitting of the commons apart from the lords. In the forty-fourth year of Henry III.'s reign, their refusal to suffer the recall of Adomar the Bishop of Winchester elect, from banishment, is signed. "Petrus de Mounteforti Vice Communitatis." In the olden time, when the commons were of little importance, the post of Speaker was not always one of honour alone. Sir Peter de la Mere was committed close prisoner to Nottingham castle for having spoken too freely of the royal favourite Alice Pierce. The poor Speaker was browbeaten, contradicted, and buffetted at the royal will. One was committed to the Fleet, and ultimately beheaded, though the whole house petitioned to have him restored, urging his privilege "by common custom time out of memory of man, and even afore these times used in every of the parliaments of the king's noble progenitors."

We cannot be much surprised then if we find that, in the time of Richard II., a custom grew up on the part of the speaker elect of praying to be excused from office. Sometimes the addresses of these gentlemen were of the most fulsome character. Richard Rich compared Henry VIII. upon one occasion, "for justice and prudence to Solomon, for strength and fortitude to Samson, for beauty and comeliness to Absalom." Sir Edward Coke, the second great Speaker—that far nobler man Sir Thomas More having been the first—in his address to Queen Elizabeth, said, "Although as in the heavens a star is but *opacum corpus* until it receive light from the sun, so stand I *corpus opacum* until your highness's bright shining wisdom hath looked upon me and allured me. In this house are many grave, many learned, many deep, wise men, and those of ripe judgments; but I am untimely fruit not yet ripe, but a bud scarcely blossomed, so as I fear me your Majesty will say amongst so many fair fruit ye have plucked a shaken leaf." In the same reign we have another illustration of the mode in which the house conducted its affairs. The house having met for the choice of a speaker, the Comptroller of the Household, Sir William Knoles, said, "I will deliver my opinion unto you, who is most fit for this place, being a member of this house, and those good abilities which I know to be in him (here he made a little pause and *the house hawked and spat*, and after silence made he proceeded) —unto this place of dignity and calling, in my opinion (here he stayed a little), Mr. Sergeant Yelverton (looking upon him) is the fittest man to be preferred (after which words Mr. Yelverton blushed and put off his hat, and after sat bareheaded); for I know him to be a man wise and learned, secret and circumspect, religious and faithful, no way disable, but every way able, to supply this place." He then sat down, hoping for a general consent. The whole house cried, "Aye, aye, aye, let him be;" and the master-comptroller made a low reverence, and sat down. Up then rose modest, blushing Sergeant Yelverton. He could not account for the choice—he lacked merit, ability, and wealth. He was a poor man with a large family. Nor was he of a sufficiently portly presence. "He that supplieth this place," said the sergeant, "ought to be a man big and comely, stately and well spoken, his voice great, his carriage majestical, his nature haughty, and his purse plentiful and heavy; but, contrarily, the stature of my body is small, myself not so well spoken, my voice low, my carriage lawyer-like and of the common fashion, my nature soft and bashful, my purse thin, light, and never yet plentiful." This modesty, real or affected, of course enraptured the house, and Sergeant Yelverton was elected *nem. con.* The Speaker is nominated by the government; and if party feeling runs high, it is generally in the choice of a Speaker that the first trial of strength takes place. The most recent instance of this sort took place in the year 1835, when, on the death of Earl Spencer, and the consequent elevation of Lord Althorp, Chancellor of the Exchequer and Leader of the House of Commons, to the peerage, King William IV. rather unceremoniously dismissed his whig ministers. Sir Robert Peel, who was appointed Premier while on a tour in Italy, had so strong an opposition to contend with, that he dissolved the parliament, and the first of the defeats, which shortly afterwards led to his retirement, was upon the election of Mr. Abercrombie as Speaker, in opposition to Mr. Goulburn, the ministerial candidate.

KHOSROVAH.

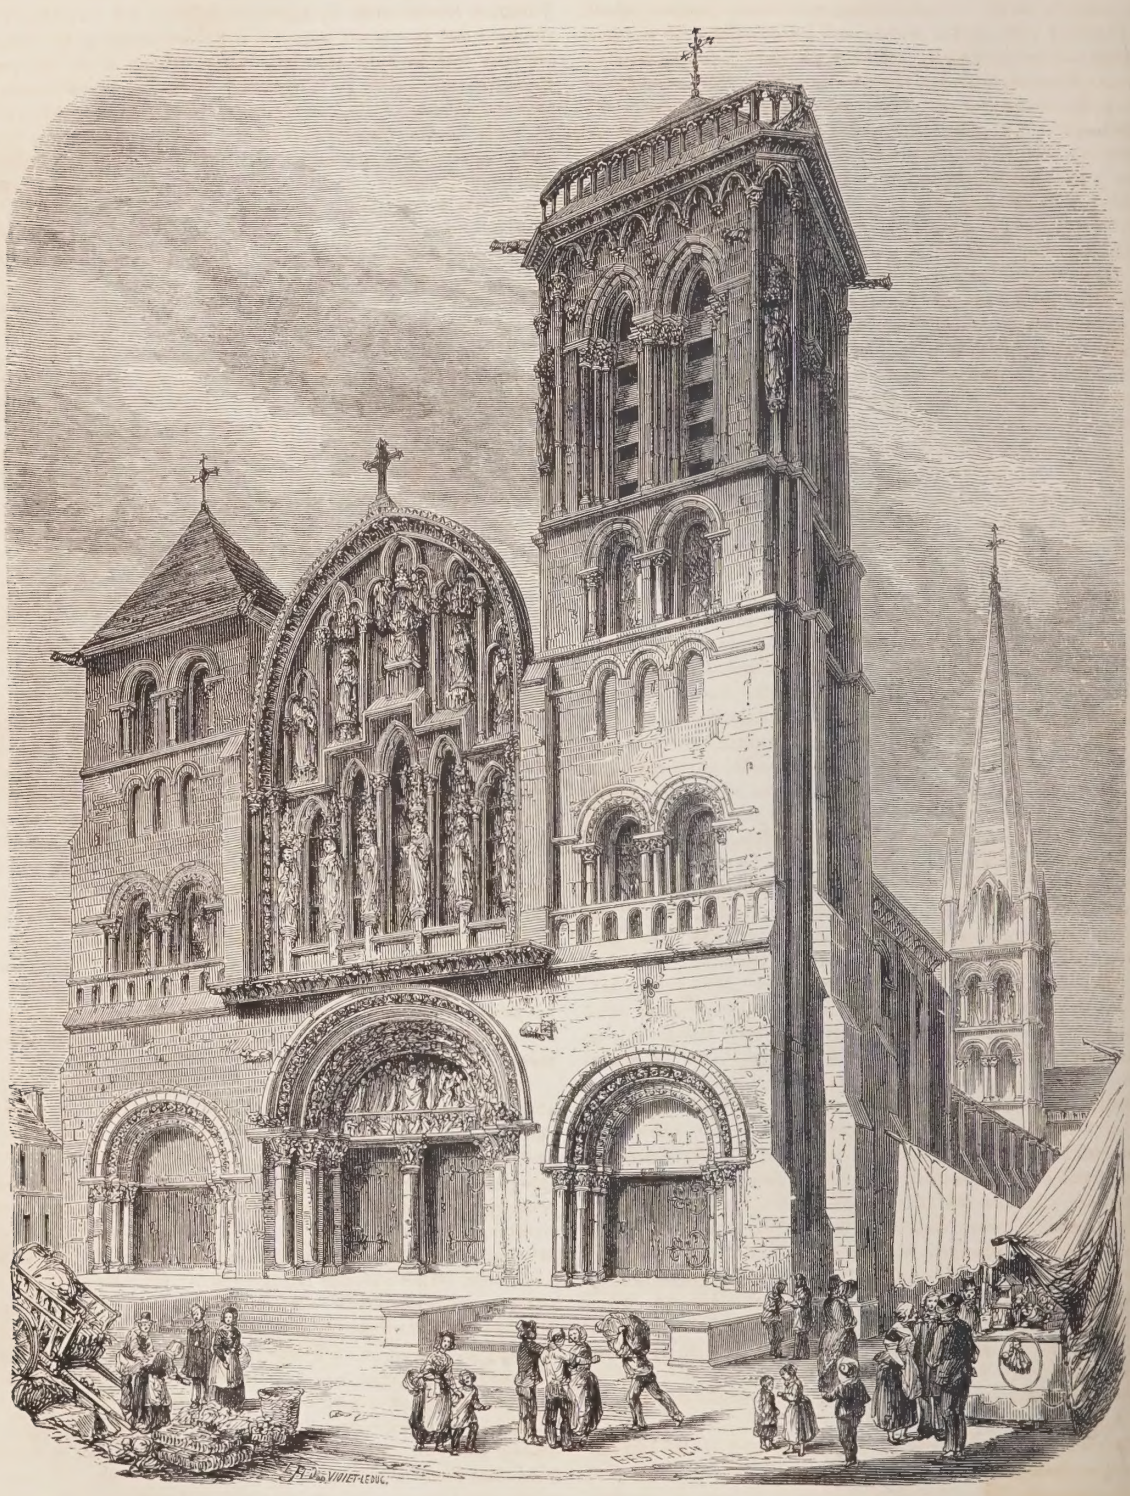
KHOSROVAH is a town situated in the middle of a beautiful plain near the lake of Ommyah, within three days' journey of Tabriz, the capital of Azbaidjan, one of the ten provinces of Persia. The inhabitants number nearly twelve hundred, and are of Chaldean origin. They were formerly Nestorians, but have lately adopted the Roman Catholic faith. At Khosrovah the houses are large, convenient, and well built, many of them have very beautiful gardens attached, but the cultivation of the earth does not say much for their owners' knowledge of agriculture; and in this they are not distinguished from their neighbours, who are but indifferent husbandmen. A recent traveller says that when he for the first time saw Khosrovah, the peasants who used carts, employed a team of buffaloes; from a sketch which he then made our engraving is taken. At a short distance from the town an ancient bas-relief is found upon a rock, representing two horsemen attended by champions on foot: it is very large, and after a remote style of art, probably sculptured during the monarchial period of the Sassanides.

Persian villages generally resemble each other in nearly every particular; there is the same earthen wall, and row of trees, and breaches in the wall, occasioned by some trivial accident, for the Persian builds but slightly, and his fortification is a merely imaginary defence, that a fox might break down—the same mud hovels, and here and there picturesque old houses, with gilded cupolas of different heights; together with the same extensive caravansaries—simple as of old. If the village is rich and populous, the houses of the principal inhabitants are garnished with various carvings and coloured glass; some of the dwellings are built of brick. From any other habitations, by its peculiarity of material or architectural decoration, may be recognised the dwelling of the Ket Khoda, chief of the village. The Mosque is generally indicated by a brick dome, upon the point of which a plume of stork's feathers is exposed, or sometimes the point is surmounted by a nest.

The peasants for the most part erect their own dwellings, and manufacture their own materials for the building. Collecting a great quantity of earth in a trough, they moisten gradually by adding water till the whole is reduced to a thick paste, they then press this moistened earth into the wooden brick-mould, with rapidity and exactness. One man may thus produce a prodigious quantity of bricks in one day, generally between two and three thousand. The bricks having taken the desired form are hardened in the sun, and are then considered fit for use. Nearly all the houses are built of these materials.

In Persia, as well as in Europe, agriculture sustains the chief part of the public expenses, and is a source of considerable revenue. The state claims a certain duty upon all products; but money being extremely rare in the villages and country districts, most of the peasants pay the greater part of the government imposts in grain or cattle. This is a great alleviation to the husbandmen, who are generally poor. Agriculture in Persia, is the same now as it has been for many centuries. They have a stereotyped system of husbandry—a good old way—from which it would be difficult to induce them to depart. In the labours of the fields, as we have before remarked, bullocks or buffaloes are employed. Everything in Persia reminds the traveller of the old time—there things seem to have remained as they were from the beginning; the Persian makes his bricks and builds his house as of yore, the ox-drawn cart rumbles over the marshy soil; but while every social arrangement maintains its old character, one looks in vain for the glory and power of the country, the bygone magnificence buried in unaccountable oblivion even by their own historians. Scattered fragments here and there give indication of the condition of ancient Persia, and the caves in the rocks still remain where the Persian kings are buried.

CART OF A HUSBANDMAN, KHOSROVAH, IN PERSIA.



CHURCH OF THE MADELEINE, VEZELAY, FRANCE.

THE CHURCH OF THE MADELEINE AT VEZELAY.

Vezelay, a French town in the department of L'Yonne, is on rather a lofty mountain. The access to it is difficult on every side but the west. Neighbouring and distant heights, which are crowned with tufted woods, and intersected with winding streams and fertile valleys, afford a pleasant prospect from it. The mountain on which it stands was chosen in the middle of the ninth century as an abode for a colony of children connected with the order of St. Benedict. Count Gerard de Roussillon, the fierce antagonist of Charles the Bald, and his pious wife, Bertha, were the founders of the monastery at Vezelay. They occupied a strong castle on this mountain, and there provided an asylum for monks, when the convent which they had built in honour of St. Peter was destroyed by the Normans. Vezelay, placed by its founder under the immediate protection of the Holy See, soon ranked among the great religious establishments of France, and all attempts to make it subordinate to bishops or abbés proved unavailing. In the tenth century, relics of Mary Magdalene were supposed to have been conveyed to it, which naturally gave rise to many pilgrimages thither. The population increased, and the place soon became renowned. Its inhabitants grew rich by commerce, and in the twelfth and thirteenth centuries we find them mixed up with all sorts of transactions, either as witnesses or judges. They could not be unaffected by the general movement which was at that time going on in the north and centre of France. No less turbulent than the *bourgeois* of other towns, they killed their feudal lord, the Abbé Artaud, who wished to impose a new tax upon them, burnt the monastery, and involved many in the general destruction. This was only the prelude to other disturbances in the city, which led to an appeal to the Pope. The second crusade, which was proclaimed at Vezelay in 1146, summoned the *élite* of the French barons to arms, and St. Bernard blessed Louis the Young, with a vast crowd of his vassals, on the hill to the north of Vezelay, where a church was afterwards built, under the name of the Holy Cross. In the year 1155, the disputes between the inhabitants of Vezelay and their ecclesiastical superiors were brought to an end, by the payment of a large fine to the abbé, and the demolition of the towers and fortifications of the town. But during the latter half of the twelfth century the repose of the monastery was again disturbed, till at length the monks were constrained to retire. In these commotions the inhabitants once more took part, hoping to recover their independence, but were again condemned to pay a heavy fine. The monastery was for a long time afterwards frequented by pious pilgrims, some of whom were royal personages, as St. Louis, who came in 1267, to celebrate the translation of the relics of the Madeleine. In the sixteenth century Vezelay gave birth to the celebrated Theodore Beza, one of the great lights of the Reformation. One of the abbés, Cardinal Odet de Coligny, embraced protestantism, and saw the Huguenots seize upon the monastery in 1569, after a brave resistance on the part of the inhabitants. The destruction of the abbey followed, and the church, which had been already neglected, was seriously damaged. The monks, who were secularised by Pope Paul III. in the middle of the sixteenth century, no longer possessed the means of keeping the ancient edifice in repair. Their abbés, the lords superior, spent all the revenues at Paris, without troubling themselves at all about the state of the building.

The church of Vezelay is no less celebrated in the estimation of archæologists than the town in that of the historians of the middle ages. The building, which is as large as a cathedral, being nearly four hundred feet long, occupies a great part of the summit of the mountain on which it is erected. From whichever side the town is approached, it commands attention by its imposing magnitude. Its towers, from their unequal size, look as if they had been more than once struck by lightning. Various opinions have at different times been entertained with regard to the origin and age of the church of Vezelay. The learned of the place gave it at least a thousand years' existence, and attributed it to the Saracens. Without going so far back, and without believing that the good Countess Bertha rose by night to go with her attendants to the sand and stones set apart for the construction of the fabric, we may feel assured that the nave, which is in the pure Romanic style, belongs to the end of the eleventh century; that the church of the catechumens, that is to say, the porch, which is in the transition Romanic style, and not less than sixty-eight feet in breadth, dates from the twelfth century; and that the choir, which is in a pointed, bold, and slender style, must be referred to the beginning of the thirteenth century, or somewhat later. The large front, represented in the accompanying engraving, itself exhibits a mixture of several styles. In the lower part may easily be recognised that of the twelfth century, characterised by the Romanic arcades; the two towers belong to the same age, except the upper story of that on the right, which is pointed, and of the thirteenth century; the too slender balustrade which surmounts it is modern. At a later period the sculptures which adorned the tympanum of the principal door were destroyed.

If we could open the doors and show the admirable sculptures which adorned the tympanum of the inner entrance, and that of the capitals of the columns in the porch; then the beautiful and simple arrangement of the long triforiums of the three naves, perfectly restored to their original condition, which are most sumptuously decorated from the base of the four-columned pillars to the arches of the vaulting and triforiums, and even to the cordons which separate the three stories of the building; we should be surprised at what the monks of the middle ages could accomplish in the way of adorning their churches. Together with the rose-work, so rich, and so vigorously executed, must be reckoned, though inferior in point of art, the thousand subjects of statuary which cover the capitals of all the Romanic part of the church and the vast tympan of the porch. This last is occupied by Christ sitting in his glory, surrounded by the apostles, and blessing the world. The statue of John the Baptist stands on the central pier of the entrance. The zodiac, a usual accompaniment of Romanic portals, surrounds this tympanum. On the side-doors are represented the principal scenes in the life of our Saviour. By the sculptures of the Romanic capitals in the naves, in which Satan, under various very ugly forms, plays an important part, the struggle of man against evil, and his triumph through the assistance of angels, are symbolically represented. There are also many biblical subjects found there.

The choir of the church, which is decorated in the pointed style, has no sculptures of persons. The columns of the chancel, consisting of one stone, are ornamented with frescoes and even incrustations in mosaic. The tympanum of the exterior portal is an addition made by some abbé of the fourteenth century, who wished to throw more light into the nave of the porch than was afforded by the Romanic bays that were originally there, by making open arcades in the centre of the fore-front. This part has lately been carefully repaired. The subjects are arranged in the following manner:—The Eternal Father is seated on the summit of the tympanum; two angels support his crown on each side, but a little below are statues, the one of the Virgin, who is crowned, and the other of Mary Magdalene. In the lower story may still be discerned the statues of St. Peter and St. John; three others represent a bishop and two martyrs. The style of these works is a little hard, and bears marks of the age of their execution. It is surprising that we do not here see the founder of the monastery.

For twelve years the French government has made great sacrifices to save the church of Vezelay from ruin. Thanks to the attention of M. Viollet-Leduc, who superintended its total restoration, it has resumed an air of youth and life quite reassuring, and which does not at all interfere with its original character. When this architectural monument is completely restored, it will be one of the most beautiful, as it is one of the largest, Romanic edifices in France.

THE SCHOOL OF LIFE.—BY ANNA MARY HOWITT.

But we must hasten over to the conclusion of our story, tempting as it is to linger among such pleasant scenes and such hearty people—tempting as it is to elaborate with loving pen pictures of that rare beauty in the world—a deep, pure, earnest, and devoted love between two equally noble beings.

We can but glance at the golden bridal morning, when Mary, awakening from a refreshing and deep sleep, found Lucretia already dressed watching her, as she so calmly slumbered on, with surprise and deep love; for now that the eventful morning had arrived, Lucretia was by far the most agitated of the sisters. As for John, he had never slept a wink all that night, so agitated and intoxicated was he with joy and awe. He had been strolling through the woods and fields, living over his past life; and, in the transient darkness of the balmy June night, offering up fervent prayers to the Creator of this beautiful universe for strength to perform the duties of the new life stretching out before him, and this, too, in such a manner that his own life, and the lives bound up in his, might be in harmony with the beauty and glory pervading all nature; that he and Mary, as an Adam and Eve standing amidst the garden of Eden of nature, though having eaten of the Tree of the Knowledge of Good and Evil, should cleave to the good, and listen unfearingly to the voice of the Almighty, wandering through the garden, serving Him, though unseen, hourly with obedient and adoring hearts, until that blessed day when they should eat of the Tree of Life, and enter into the glory of their Lord.

When the sun rose redly up, and sent his slant beams quivering through the tangled underwood of a coppice where John had flung himself down upon the mossy ground, and when the happy birds burst into their morning anthem, and the dew-drops showered down from the thickly-blossoming may-trees, and the corn-crake was heard uttering his shrill note with his quiet voice through the deep mowing-grass, John came forth from his meditations, and gathering trails of lovely wild creepers and flowers, slowly sauntered towards the village. Two milk-maids, going out to their cows, passed him as he walked along, his agitated face half concealed by his sheaf of greenary, and, looking back after him, observed to each other, "Why that's Mr. Wetherly, isn't it?—old Sally's grandson; and to-day's to be his wedding-day—bless the young man! But, depend upon it, he's so full of joy he's not been able to sleep all this blessed night!"

And when Mary was about to array herself in a lovely white silk dress—a present from Honoria which had arrived the previous day—Lucretia opened the door of their chamber, and led Mary, much surprised, to a table in a little ante-room, where, most tastefully festooned with wild creepers and flowers, stood a quaint little old looking-glass. "See what John has been doing whilst you have been fast asleep! He has been wandering about all night, I fancy, from the look of his face, too happy to sleep, and came ever so early, begging me to let him adorn the old looking-glass with flowers; for he says the image of you, darling, in your bridal dress must be encircled by a worthy and appropriate frame. See how lovely it is! And he would not take any of the exquisite flowers sent last night from the Hellings' hothouses, but brought these simple wild flowers. Oh, Mary, he loves you dearly, tenderly; but can he love you as I do, as I have done for these long years, ever since you were the little motherless child?" And the sisters clung together in a tight embrace, and it was now Mary's turn to cheer her sister, and to call again bright smiles forth from amidst her loving tears.

We must not dwell upon the marriage blessing pronounced by Mr. Brewster over the lovers in the quaint little church, where Mary knelt before the altar in her pure white dress, with a ray of sunshine falling upon her, till, like Keats's lady, she looked "a splendid angel newly dressed, save wings, for heaven." Nor yet may we dilate upon the grandeur of dear old Sally Wetherley, who stood during the ceremony, big reticule in hand, between Lucretia and Mrs. Brewster; nor how the three tender-hearted women shed tears, and inwardly besought blessings upon the united lovers,—this we leave, also, to the imagination of the reader. One little ray of sunshine we must, however, notice, as being present at the marriage ceremony, beside the ray which glanced over and kissed sweet Mary's bridal garment; and this was a tall figure robed in a white muslin morning-dress, gleaming forth, like a fresh morning cloud, from a distant pew in the church. It was Honoria; but before the little bridal party had recovered from the emotion of the solemn ceremony, the beautiful white figure had floated, cloud-like, out of the church, and was nowhere to be seen, either in the churchyard or upon the road. Upon the wedding breakfast-table lay, however, a little note, with the most fragrant of orange-blossom bouquets, which, opened by Mary's trembling fingers, and read by her and John's eyes half blinded by happy tears, ran thus:—

"Beloved friends,—All happiness, all peace to you! I was at your wedding, you see, though you believed me still with Agnes at *Kaiserswerth*—but I could not lose a true moment of happiness in witnessing the solemnisation of such a marriage as I believe yours will be. I am not going to disturb you now, dear John, dear Mary, do not fear; such moments in life ought to be sacred even from the dearest of friends. But I shall await you with the warmest welcome and congratulations upon your return from the Peak. Drive immediately, when you return to Nottingham, to Pierrpoint House. I shall be there, and will command even our poplars to *shiver* you a *warm* welcome!

"Your affectionate friend,

"Honoria Pierrpoint.

"P.S.—Mary must not trouble herself in bidding her sister adieu with the thought of how lonely she will be. I and the Hellings shall look after that."

And in Pierrpoint House, standing within that stately dining-room, which long years before had sent such a chill into John's heart, did Honoria welcome her friends; and beneath that portrait of the stately Lady de Callis, who no longer chilled him with her enigmatical eyes and proud smile, did Honoria pronounce their marriage homily with the same eyes and lips as were pictured in the portrait of her grandmother.

"Welcome, dear friends," cried she, stepping forth with her gracious, yet majestic air, and taking a hand of each wedded lover. "Welcome! It is seldom a marriage gives me any satisfaction, any hope; but yours does. You must not fail in the fulfilment of your dreams of an ideally beautiful marriage; such marriages becoming realities, are the great educators of the world, the sole regenerators of society—such married pairs as you may, perhaps, become, are the only reformers of our great social evils in whom I place much faith. John, through your beautiful Art, ennoble your own soul and your wife's soul; and, Mary, through your life, ennoble your husband's Art. And your children—oh! I have much joy in the thoughts of your children, for they will be worthy denizens of this beautiful world—strong mind and body—healthy to the core. And we—for I shall love them as *my* children, John—*we* must rear them up so that they may become worthy denizens of a yet more beautiful, more perfect world. We must always treat them as little angels; and as they sit upon their little benches far down in the lowest forms of the Great School of Life, let us seek—we the elder scholars—so to teach and train their innocent hearts, that in later years the Great Schoolmaster may not have to whip and buffet them as He has had to do with us, His disobedient scholars! Dear friends, dear brother and dear sister, do you associate me with you in this holy labour!" Their answer was spoken rather by warm pressure of the hands, and by the united looks of love in the faces of the married pair, than by words.

And now, in conclusion, we must just remark that the Wetherleys' marriage has in no wise disappointed Honoria. The other night, driving away with Agnes from John Wetherley's beautiful house at Brompton, Honoria suddenly broke the silence in which the two friends were sunk by saying:—

"Agnes, if I felt proud of John's first picture in the Exhibition, how much more proud do I feel of John's beautiful life! What so exquisitely beautiful, so sublime, as moral excellence! Does not such an evening as this refresh our souls? Will not the memory of those two pure and loving beings standing in perfected union before John's noble picture, within that lofty and quiet studio, and Mary's full voice mingling with and leading the shriller voices of her children, as they sang that lovely anthem, revisit us again and again as glimpses of living poetry? You, dear Agnes, the type of a class of woman each day becoming less rare—the woman of intellect, who, self-absorbed, offers up as a willing sacrifice her heart's blood as well as her brain to the life of the intellect; and I, the woman of wealth, who offer up all the vast power of this wealth to the furtherance of what appears to me justice and truth,—we two women, who have chosen our portion in the world, and consider it a good and wise portion; and who, struggling to benefit our sex, and indignant at the injustice it has suffered through long ages from ignorant man, at times inveigh against marriage as a yoke of all bitterness,—let us recall this marriage with joy, and acknowledge that among the women-workers for the enlightenment of the world, such a wife and mother as Mary is one of the most efficient; but she is efficient alone, Agnes, because she has followed in all simplicity the bent of her nature, and all her duties thus flow forth easily from her—they are her radiations. To her, to guide and to cherish those beautiful children is as natural and easy as it is for you to pour out your soul in eloquent words, which arouse to deeds of noble action thousands of men, women, and children,—as it is for me to plan schemes for education and for the alleviation of misery. Agnes, each of us, sister-workers, have we not, in listening to the secret voice of our hearts, disentangled the skein of our destinies? and may we not thank our beneficent Father for the clear and noble path of duty stretching forth before us boldly into the future? To learn how to discern our duty, is not that the first great lesson of life? and that lesson now surely, dear friend, we have conned thoroughly."

THE END.

WODIN AND HIS RELIGION.

The authors who have hitherto written upon Wodin and his religion are far from inspiring confidence in the reader. We cannot pretend to give more than a brief sketch of some of their statements, which, though not free from error, deserve attention on account of having been long current. It is supposed that this mysterious personage was originally king of a tribe on the borders of the Caspian sea. A contemporary of Mithridates, he was on the point of entering into an alliance with him against Rome; but the death of the King of Pontus disarranged his plans, and henceforward he thought only of giving scope to the warlike tendencies of his people by attempting the conquest of Germany. Aided by the counsels of the philosopher Mimer and his wife Frigga, or Freya, he managed during this expedition to give his people the religion on which he had long been meditating, and of which he was destined to be the principal hero. Its fundamental principle was the consecration of suicide. Whoever died a natural death bore the reproach of a coward, and incurred the penalty of future punishment.

As the believers in this creed regarded life as a burden from which they were bound to seek release, they boldly faced the storms and ice of the ocean around Iceland where they established their colonies. One division of this nation, known by the generic name of Northmen, went and settled, in the ninth and tenth centuries, in Normandy, to which they gave their name; and by their invasion they completely changed the political aspect of the whole of France. But Wodin pursued his conquests in the north, and apportioned immense empires to his sons Bagded and Segded, after subduing Sweden and Denmark at the head of his hordes. Having reposed for some time from the toils of war, he invaded Norway, and gave it as a heritage to his son Sæmungua. It is supposed that about this time the followers of Wodin took the name of Scandinavians.

Thus the life of this hero was spent in victories; and, it may be added, that he died as he had lived. For seeing his end was near, and not wishing to belie what he had advanced, he assembled his people, and after delivering a speech in which he summed up the principles of his religion, he stabbed himself and his wife with his poniard; upon which the aged who were present melted to tears, and fell upon their swords; and the young, inflamed with ardour, rushed to new exploits.

Among a people so enthusiastic as the Scandinavians the recollection of Wodin could not but produce a lasting impression. His death, accompanied by such striking circumstances, naturally tended to increase their veneration for him, and before long they came to regard him as a god, though he had only proclaimed himself a prophet of the divinity. According to the poets, Wodin combined an invincible courage with such a remarkable eloquence, that he improvised verse in the course of his speeches. Some idea of the religion of Wodin may be gathered from the description of it contained in the "Edda," a poem said to have been composed in the eleventh and twelfth centuries by various authors. The first part of the "Edda" explains the doctrines relating to worship, the creation and the battles of the giants, the second treats only of the quarrels of the gods. There are twelve gods; Wodin is their chief; and he has one hundred and twenty-six attributes of his own. Frigga, his wife, is the goddess of pleasures. Thor, his son, is the god of thunder, corresponding to Zeus among the Greeks and Jupiter among the Romans. Loke is the god of evil; he is the Beelzebub of the Scandinavians; he never ceases—says a writer, with great simplicity—from playing tricks with the gods. Niflheim is their lower world; Hela, the goddess of death, and daughter of Loke, presides there; her body is half stone and half flesh, to indicate the principle of life and destruction. Adulterers, perjured persons, and cowards, lie weltering in a green lake, formed by the poison of serpents, in which they are incessantly swallowed up and thrown back again by frightful monsters. Walhalla is their paradise; a bridge composed of a rainbow is the only entrance to it; Heimdall is the keeper. This giant has teeth of pure gold; he sees as well in the night as in the day, and hears the wool grow on the back of sheep! There in the midst of clouds warriors partake of banquets, served up by nymphs, called Walkiries. Their most agreeable pastime is that of renewing in heaven the combats in which they engaged upon earth, and challenging even Wodin himself to fight them. Surrounded by scalds—*i. e.* poets occupying much the same position among the Scandinavians as the bards among the Scots—who celebrate their exploits in song, they never grow old. To give our readers some idea of the character of these tribes, we here quote from the death-song of Reyner Lodbrog, King of Denmark, which ends thus:—

"We fought sword in hand. But I am full of joy at the thought that a banquet is preparing for me in the palace of the gods. Soon, seated in the splendid abode of Wodin, we shall drink out of the skulls of our enemies. A brave man fears not death; I will not pronounce words of terror on entering Wodin's hall.

"We fought sword in hand, Ah! if my sons knew the torments I endure; if they knew that venomous serpents gnaw my bosom, how ardently would they desire to engage in fierce conflicts; for their mother has given them a valiant heart.

"We fought sword in hand. But it is time to finish. Wodin sends me goddesses to conduct me to his palace. I am going to the regions above to drink beer with the gods. My life is at its end, I shall die with joy."

KING RENE'S GARDEN.

René, called the Good, Duke of Anjou, King of Naples and Sicily, and Count of Provençe, was born at Angers, on the sixth of January, 1408. He was the son of Louis II., King of Naples, and Yolande, daughter of John I. of Arragon. He received at his baptism the title of Count of Guise. But few particulars are known of his early life, except that he was educated under the eye of his mother, and in his youth acquired that taste for the study of the beautiful which distinguished him in after days. While still young he obtained the hand of Isabella of Lorraine, and at the age of thirty succeeded to the title and estates of that dukedom. His right to this high dignity was disputed, and the question referred to a council of peers, who, however, decided in favour of René. From the council the new claimant appealed to the sword. Civil war devastated the land, but without the desired result. Soon after René proceeded to Naples, as lieutenant-general, to take possession of the throne on behalf of his wife, vacant by the death of Joan II. There fresh troubles assailed him; a competitor was ready to dispute with him for the crown, backed by the Duke of Milan and the Pope himself. He struggled hard, but the fortune of war was against him: for six years he remained a close prisoner, and then had to pay a heavy ransom before he was permitted to return to his own domains.

Forced by the troops of Alphonso of Arragon to abandon the kingdom of Naples, René returned to his own duchy of Lorraine. There, surrounded by a brilliant court, he passed his time in the midst of the utmost magnificence, fêtes and tournaments being matters of daily occurrence. Knights and troubadours gathered around the monarch, his court became the centre of all grace and beauty, and the fame thereof spread over the face of all fair France. But this ceaseless round of pleasure was but ill adapted for the failing health of Isabella: the bloom had passed from her cheek, and the brightness from her eyes; time and trouble had marked her brow. With her René took many a solitary ramble, and together they traversed the quiet hills and valleys about the old town of Angers. In one of their rambles they remarked an elevated spot, a rock about sixty feet high, formerly called the Camp of Cæsar; at the summit they discovered a grotto, once the abode of a saintly recluse. The situation delighted Isabella; there was an air of quietness and of romance about the place that afforded a charming contrast to the noise, bustle, and excitement of the court. René occupied himself in attempts to render this spot, so wild and so uncultivated, a pleasant and agreeable retirement, by making its barren steeps bloom and flourish with all the glories of floriculture. Great obstacles had to be overcome, but patience works wonders, and patience overcame them all. The ground was clothed with the richest verdure, cool and shady arbours were picturesquely arranged, flowers shed their fragrance, and the locality soon presented an entirely new aspect. Nothing was talked of but the glories of King René's garden, and all praised his assiduity and love.

When René had completed his work, a chapel was erected on the rock, richly ornamented with frescoes and pictures and poetical devices. Adjoining the chapel was a small hermitage, where he often tarried with his beloved queen. From this spot a stupendous and noble panorama was to be seen. To this hermitage the monarch gave the name of *La Beaumette*.

VIEW OF THE GARDEN OF KING RENE, NEAR AIX.

Surrounded by all that could charm the fancy or elevate the taste, the poor queen lingered out her few remaining days, and when René was left alone, the garden, the chapel, and the hermitage, became doubly dear to him, suggestive as was every spot of her who was in very truth his second self. Afterwards, indeed, by the advice of his vassals, he again married, but never loved with the same deep earnest tenderness as he had loved before.

He devoted himself almost entirely to agricultural pursuits. When driven from his beloved Anjou by political intrigue, and forced to take refuge in Provençe, he there made most extensive and admirable alterations. His memory was long cherished, and the melancholy which overhung his life added fresh interest to his history.

MONACO ON THE MEDITERRANEAN.

It has been remarked of certain names, as of certain countenances, that it is difficult to believe them to be in earnest. So it is with Monaco. While the name recalls the idea of monastic life, the bright country itself rather brings before us the jovial faces of our ancestors; and, perhaps, the best introduction to a description of it would be the famous burden of the song, "La Monaco."

Historically considered, Monaco is one of the most interesting places upon the Mediterranean. Upon this rock, now so little known, Greek civilisation was first planted in Europe. Ancient tradition relates, that Hercules, before his return to Spain, landed here, and vanquishing the mountain robbers, opened a passage through the Alps, and consecrated to himself the rock and the natural port which distinguish it. "Monœci similiter arcem et portum ad perennem sui memoriam consecravit," says Ammianus Marcellinus ("He consecrated both the citadel and the port to a lasting remembrance of himself"). Hence, down to the first ages of Christianity the port of Monaco retained the glorious name of Portus Herculis. This is a settlement much more ancient than those made by the Greeks and Romans on this shore, for it belongs to the mythological period. Even five hundred years before the Christian era, Hecatœus of Miletus made mention of Monaco as a celebrated colony.

Its great antiquity is especially proved by the etymology of its name. As this colony, or rather this monument of the first navigators, dedicated by its founders to Hercules, formed an isolated point on the wild shore, the god received from it the surname of Monoikos (isolated habitation), of which the Latins made Monœcus. Hence the city was called Portus Herculis Monœci, or Portus Monœci. Thus the guardian divinity of the place was Hercules the Solitary, or Hercules the Monk. An heraldic device, still extant, represents a monk of noble form, as the god of strength, with short, thick beard, of fierce countenance, and sword in hand.

The most ancient mention of this singular transformation is to be found in the "Annals of Genoa," by Oggerius Panis; where, speaking of the rebuilding of the citadel, in the tenth century, after its destruction by the Saracens in the ninth, he simply calls it Podium Monachi, the manor of the monks. They appear to have forgotten Hercules, or only retained his surname, and the god was metamorphosed into a monk. Be that as it may, from the middle ages we date the name of Monaco, or the substitution of the idea of a cell for the more poetic one of the solitary Hercules.

Monaco and Nice are separated by a barrier of mountains, which must be scaled, for as they descend perpendicularly to the sea, there is no passage at their base. For the pedestrian

VIEW OF THE MEDITERRANEAN BETWEEN NICE AND MONACO.

the journey from one town to the other hardly occupies four hours, while by carriage it is nearly two hours longer, from the circuitous route necessary to avoid the ruggedness of the declivity. Between the two modes one could not long remain undecided; for, by Hercules! who would choose to travel otherwise than did the god himself to whom we go to pay tribute? Apollo has his horses; Diana her hinds; Amphitrite has her dolphins; Venus her doves; the swift Mercury his winged sandals; but Hercules, who traversed the world, receives nothing from the poets but the strength of his limbs.

On leaving the city, you at once ascend the massive barrier between Nice and Monaco, which forms a most valuable natural shelter to this part of the world, so renowned for the delightful mildness of its winters. The ascent commences through a grove of olive trees, and between their light foliage

the eye roams over one of the most smiling, happy prospects in the world. The plain covered with gardens of orange-trees, diversified here and there by black pyramids of cypress, and the stately palm-tree. The hills rise one above another, covered with olive-trees and terraces to their summits. Around the picturesque rock, upon which formerly stood the castle, but now stand only the ruins, the city lies in the form of a horse-shoe, its two extremities abutting upon the sea; and its circumference so thickly studded with houses extending into the country, that it loses itself, so to speak, in this wondrous valley, which is terminated on the north by the jagged and snowy tops of the maritime Alps, and on the south by the azure gulf, which is bordered throughout its whole extent by a fringe of white spray.

After half an hour's walk, this magnificent spectacle suddenly vanishes by a turn in the heights, and you must say "adieu!" until you see it again from a greater altitude. You then reach the summit of the rock which separates Nice from Villa-Franca, looking down almost perpendicularly upon the latter town and its glorious bay. Imagine a basin about two miles in length, and a third of a mile in breadth, situate between two hills, which advance in promontories southwards, and an abrupt recess reuniting with the highest pinnacles of the rock, and you have the bay of Villa-Franca. One could easily fancy it to be the impression left upon the shore by a blow from the club of the demigod; and, if learning were guided by poetic instincts, this might be thought the reason why some have endeavoured to prove that this fine bay, rather than Monaco, was the ancient port of Hercules. Their chief argument is founded on a passage of Strabo, which seems to imply a distinction between the port of Hercules and the port of Monœcus, inasmuch as it speaks of the trophy of Augustus as placed between the two; but the passage reads differently in different manuscripts, and that from Ammianus Marcellinus, which has been cited literally on account of its importance, leaves little room to doubt that it is in accordance with other evidence into the details of which we need not enter at length. Perhaps the most conclusive evidence may be found in the places themselves. In proportion as the rock of Monaco, rising from the sea, would appear eligible for the seat of a colony in so isolated a condition, to the same extent would the situation of Villa-Franca, upon a declivity which might be swept away, so to speak, by rolling stones down the mountain, appear unfavourable; and although the roadstead of Villa-Franca would afford admirable anchorage for a squadron, and even for a fleet, we must not forget that the ancient ideas of navigation, so different from our own, would find every convenience in the more confined port of Monaco.

Hence, after a careful consideration of the subject, and an attentive observation of the locality, we have no hesitation in siding with those who deny this bay so great an antiquity. It is sufficient for the roadstead of Villa-Franca to form one of the most important features of the Mediterranean, and to take rank, if not as a rival, at least as an accessory to that of Toulon. We do not mean to assert that the Greek colony of Marseilles may not have had a settlement there; but the Phocæans, who founded that colony, had no occasion for the assistance of Hercules to enable them to discover and appreciate so remarkable a position. After being destroyed by the barbarians, and afterwards by the Saracens, it was not until the end of the eleventh century that the city could again raise its head. The castle, which still overlooks the city and the bay, historically dates from the end of the tenth century; but the primitive structure has yielded to the more modern, and it now consists of a bastioned fort, retaining, however, its rude and picturesque appearance. The town, which enjoyed great commercial prosperity under the House of Anjou, who changed its primitive name, "Port of the Olive," for that of Cieutat Franca—in French, Villefranche—is now little more than a large village, commerce having found a better home at Nice.

The promontory which forms the eastern boundary of the bay of Villa-Franca is connected with a second promontory still more rugged, which, diverging at right angles from the former, has an extraordinary appearance. It is called the peninsula of Saint Hospice, covered, except at its head, with a magnificent grove of olive trees; it is chiefly remarkable fo its lighthouse, which, with that of Antibes, warns the mariner of this dangerous coast. Ruins appear in this desert landscape, and heighten the contrast between it and the fertile plain of Nice. Here in the primitive ages of Christianity stood a monastery of Benedictines, connected with that of Lérins, which is still to be seen in the distance. It was destroyed by the Lombards in the sixth century, and there remained only a tower, in which the Abbé Hospitius, who alone escaped being massacred like his brethren, secluded himself during the remainder of his life. The renown of his austerities, and his lamentations, struck the lively imagination of the people, and the gulf from hence took the name of Sant-Souspir. Nothing now remains of this remote period but the ruins of a chapel, which are still held in veneration by the fishermen.

Many ruins of a later date are heaped around. Upon their site the Saracens founded a maritime settlement, which they long maintained, to the injury of the commercial interests of these shores. This settlement is called by historians Fraxinetum, the etymology of which is purely Arabic, and signifies fortress. Having been destroyed by the Genoese, these ruins were restored under the House of Anjou to form a new citadel similar to that of Villa-Franca. But this structure shared the lot of those which preceded it; rased in 1692 by Catinat, it mingles with the ruins which cover this spot.

The scenes around are in harmony with these vestiges of the barbarous Saracen. On leaving Villa-Franca, the mountain is stripped of its olive-trees. The rough, barren rock appears, with here and there a few bushes of myrtle, some cactuses, and aloes. The ascent becomes much more rugged; for this is the ancient road of the giants. As no pains are taken to keep it in repair, seeing that there is a post-road which, by a winding of about three miles, rejoins this road at an altitude of about a quarter of a mile, nature is fast reclaiming her own. After an hour's walk over these stony declivities, we come upon a true city of Africa, Esa. Built on the summit of a rocky pyramid, inaccessible on all sides except by a narrow path cut in the rock, this was formerly the principal Saracen station on this coast. With such means of attack as the middle ages afforded, such a position must have been impregnable except by famine. A stone hurled from the platform would roll violently down to the waves which, sixteen hundred feet below, wash the foot of the cliff. It is enough to make one giddy to look down into the abyss. There is also a complete desert all round the mountain. This ancient city, reduced now to the insignificance of a most miserable village, is the only habitable spot between Villa-Franca and the other extremity of the rocky height. From this extreme seclusion and unfavourableness of natural position, there results a certain savageness of disposition in the inhabitants, which is now, indeed, daily yielding to civilising influences, but before the opening of the new road rendered the brigands of Esa almost as notorious and as formidable as the pirates formerly were.

This part of the route from Genoa, of which we give a view (p. 205), is, perhaps, the finest. The rugged canton of Esa occupies only a small space in the view. On turning to review the road traversed from Nice, the principal points are again discerned, while the horizon spreads out beyond. A portion of France is seen before you, and no less than half a dozen gulfs are visible. First, the peninsula of Saint-Hospice, and the bay of Villa-Franca; then the town of Nice in a semicircle round its monumental rock; the mouths of the Var, and the long peninsula of Garoupe, at the base of which Antibes and its fortress stand out clearly; behind, the gulf of Juan, celebrated for the disembarkation of Napoleon; the island Sainte Marguerite; the gulf of Napoul, washing the charming town of Cannes; above, the porphyry chain of Esterel; below, the gulf of Grimaud, bordering on the town of Saint Tropez, which is bounded by the granite chain of Mavres, still bearing the name of the barbarians who were

so long in possession of it; the most prominent point, Cap Camard, covering the island of Hyères.

On the Italian side, the view is as limited as it is extended towards France. The mountain which rises above Monaco eclipses the less elevated regions beyond it. In the pass between the top of this mountain and the jagged crests beyond, are found the remains of the gigantic monument erected by Augustus to commemorate his victory over the people of these countries; and from thence you descend upon Italy. And now where are you? Are you still in France, or are you already in Italy? It is easy to reply, with a geographical treatise in hand, which indicates as a frontier line the bed of the rivulet, lost in the sands, called the river Var. But comparing a chart of the Republic with one of the Empire, we see that the Var is one of those undetermined frontiers which change with every treaty, and not one of those immutable boundaries such as the Rhine or the Alps. To turn to history, where did Gaul commence under the Romans? The Itinerary of Antonius leaves no doubt on the subject. Between Cemenelo (now Cimiés) and Lumone (now Menton) the geographer mentions, by the name of *Alpes summæ*, an intermediate station, which, reckoning according to the distances, coincides with the village of Turbie; and on the mention of this station he adds: "Usque huc Italia, hinc Gallia" ("Up to this point is Italy, beyond it is Gaul).

The acts of St. Pons, the first apostle of Nice, leave no doubt that in the first ages of Christianity this decision was always respected. "Passing beyond the frontiers of Italy he reached a town, situated far from the crest of the Alps, named Cimella." This is the same village, Turbie, which formed the separation between Provençe and Liguria in the middle ages; as it appears, in a treaty of 1125, between the Count of Toulouse and the Count of Barcelona: "Ipse mons per fines Italiæ descendit ad ipsam Turbiam in mare ("The mountain forming the frontiers of Italy descends at Turbie to the sea"). It may be added, that the monument erected by Augustus on this spot forms a strong proof that Turbie was a boundary point between Italy and Gaul. Pompey had raised one of the kind upon the crest of the Pyrenees on the limits of Spain and Gaul. Augustus, who, after having imitated this great general in his war against an independent people, wished to imitate him in his glory, would be likely to erect his trophy on the limits of Gaul and Italy.

To conclude with a proof more appropriate to the traveller: in a kind of inn, near Esa, whither a French writer had been driven by the heat of the road, he heard nothing spoken around him but French and Provençal; and the hostess, whom he questioned, knew no more of Italian than is known at Quimper Corentin. "It is below, beyond the mountains," said she, "that they speak that language."

SCARRON'S "COMIC ROMANCE."

As one of the French writers who contributed, in some measure, to the formation of that clear and lively style of composition which Pascal, Voltaire, and Lesage carried to such a high degree of perfection, Paul Scarron deserves honourable mention. He was born at Paris in the year 1610, and was intended for the church—indeed a canonry at Mans was actually obtained for him; but having been stricken with the palsy, and thus deprived of the use of his limbs, at the age of twenty-six, he was compelled to forego all prospects of clerical distinction. In spite, however, of this drawback, he managed, by his brilliant talents, to win for his father the favour of Cardinal Richelieu—who was the means of procuring him a handsome pension from the crown, though he had previously been offended with him—and to obtain for himself the hand of the witty and beautiful Mademoiselle d'Aubigné, whose splendid accomplishments, combined with his own, attracted around them all the *élite* of that period, and whom he left a widow in the year 1660. She afterwards became more remarkable under the name of Madame de Maintenon.

Of all Scarron's works, the "Comic Romance" is certainly the most distinguished. Even Boileau, who said to Racine the younger, "Your father sometimes was weak enough to read Scarron's verses, but he took care to conceal it from me" —even Boileau himself saw some merit in this work. And, indeed, there are in it, notwithstanding its frequent traits of burlesque, many proofs of observation, well-drawn portraits, and a certain lively and natural eloquence rarely found in the prose writers who preceded Scarron. Besides its other merits, it is noticeable as the first serious attempt at a portraiture of manners in fiction. Previous writers of romance had confined themselves to great adventures, fabulous passions, and feats of gallantry. Every one is familiar with those strange recitals in ten or twenty volumes, in which the greatest men of antiquity were transformed into courtiers and gentlemen of the time of the magnificent Louis Quatorze. The "Comic Romance" of Scarron tended to counteract this ridiculous species of literature, much in the same way as Cervantes' "Don Quixote" had the books of chivalry. Thus, in spite of the vast difference between the Spanish and the French writers, Scarron has the honour of having contributed in his measure to render the cause of good sense and truth predominant.

It must not, however, be supposed that the work of Scarron is completely free from all tinge of romance. A Spanish influence is perceptible in the sentimental details with which the author has interspersed his narrative, as Lesage himself did afterwards in his "Gil Blas." These false ornaments, stuck rather awkwardly in the comic story, are evidently a concession to the vitiated taste of the time. Obliged to intermingle recitals of lofty gallantry with his public-house adventures, the author has some trouble to preserve a serious tone, and sometimes heedlessly abandons himself to satirical sallies.

Stripping the "Comic Romance" of useless episodes, we find that it consists mainly of the adventures of a set of country players, roaming about from place to place to obtain a precarious subsistence. Our engraving (p. 208) represents the arrival of a part of the company in the town of Mans. To give the reader a better insight into its meaning, we will here quote from Scarron the passage which our artist has rather freely rendered.

"The sun had accomplished more than half his journey, and his chariot, having reached the descent in the heavens, was rolling along more quickly than he liked. Had his horses chosen to take advantage of the downward tendency of the road, they would have completed what remained of the day in less than half a quarter of an hour; but instead of pulling with all their force, they amused themselves by curvetting and snuffing up the briny air, which made them neigh, and warned them of their approach to the ocean, in which their master is said to rest every night. Humanly and more intelligibly speaking, it was between five and six in the afternoon, when a cart entered the market-place of Mans. This vehicle was drawn by two very lean oxen, headed by a mare, whose foal kept running round the cart like a silly creature as it was. The cart was full of boxes, trunks, large packages, and painted coverings, which formed a complete pyramid, on the top of which sat a young woman, dressed half in city and half in country fashion. A young man, as poor in clothes as he was plump in the face, was walking by the side of the cart. He had a great plaster on his face, which covered one eye and half the cheek; and carried on his shoulder a large gun, with which he had killed several magpies, jays, and ravens, that formed a sort of belt, from beneath which peeped out the feet of a fowl and a gosling, which looked very much as if they had fallen a prey to this kind of warfare. Instead of a hat, he had nothing but a nightcap, twisted round with garters of various colours, forming a sort of turban in the rough. He had on a gray doublet, with a strap, to which was fastened his long

sword. He wore a sort of knee-breeches, such as actors put on when they have to represent any great hero of antiquity, and instead of shoes he had buskins, after the ancient fashion, which were well worn and dirty. An old man, dressed rather more tidily, though far from well, was walking by his side. He carried a bass-viol on his shoulder, and as he stooped a little in walking, he appeared at a distance like a large tortoise going along on his hind legs. The company passed the principal public-house, at the door of which many of the chief inhabitants of the town were assembled. The novelty of the paraphernalia, and the noise of the rabble who crowded round the cart, had attracted the notice of the worthy burgomasters to these strangers. Among others, a provost, named La Rapinière (the Pilferer), went up to them, and with an air of magisterial authority demanded to know who they were. The young man, of whom I have just spoken, replied that they were Frenchmen by birth, and actors by profession; that his drawn from life. The character of the old player, called Malice, deserves to be cited as an example of the happy manner of the romancist. "Malice was one of those misanthropists who hate every body, and do not love themselves—I have known many such, who were never seen to laugh. He had some little talent, and wrote satirical verses indifferently well. He was also destitute of every feeling of honour, malicious as an old ape, and envious as a cur. He had something to find fault with in every member of his profession. One was too affected, another too uncouth, another too cold, and so of the rest: and he would fain have one believe he was the only actor without fault; and yet the fact was, he would not have been allowed to continue in the company, but for his having grown old in the service. Latterly he had been reduced to perform the part of nurses and old women, in a mask. In his better days he represented a head-porter, confidant, messenger, or bailiff's follower, when a king was to be

ARRIVAL OF COMEDIANS AT MANS (SCARRON'S "COMIC ROMANCE").

theatrical name was Destiny, and that of his aged companion Malice, and that of the young woman perched on the top of the baggage, Cavern. The conversation was suddenly brought to a close by sundry blows of the fist and dreadful oaths which were heard in front of the cart. It was the waiter of the inn, who had belaboured the driver with blows without warning, because his oxen had made too free with a heap of hay in front of the door."

This troop, according to Scarron, formed only a part of the whole. Our author draws a lively picture of the characters of the remainder. He also describes, with much spirit, certain subordinate personages, such as La Rapinière, an officer of the police, as ready to commit crimes on his own account as to prosecute them in others.

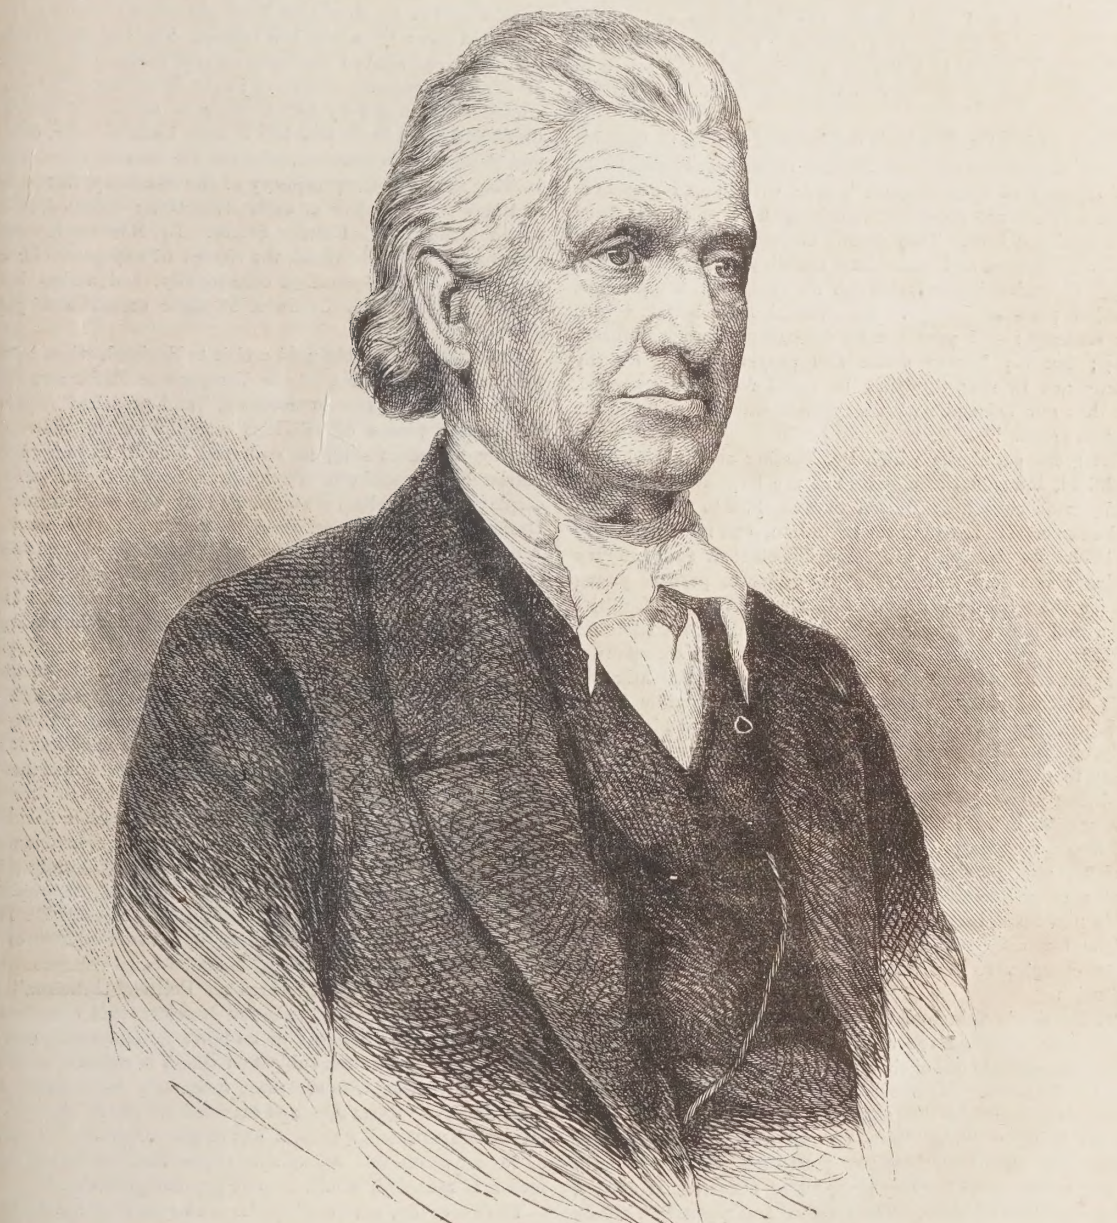
The adventures of these various persons are not well connected together. We find nothing but mystification, quarrels at public-houses, and misfortunes in travelling; but the narrative is generally rapid and gay, and the portraits are escorted, or any one was to be assassinated, or a battle was to be fought. He sang villanously in a trio, and afterwards powdered himself for a farce. On the strength of these brilliant accomplishments, he supported an intolerable amount of vanity, which was combined with incessant raillery, an inexhaustible fund of slander, and a quarrelsome humour, backed, it must be confessed, by some valour. All this made his companions regard him with a sort of terror. Towards Destiny alone he was mild as a lamb, and appeared as reasonable as his nature would allow. It was said he had once been thrashed by him, but this rumour did not last long, any more than that of his liking for other people's property, which he was strongly suspected of having made too free with. Yet with all this, he was the best fellow in the world."

The "Comic Romance" also contains details indicative of the manners of the lower classes of society at that period. There are to be found in the conversations, certain thoughts on art, more striking than have been thrown out for many years.

REV. LYMAN BEECHER, D.D.

This eminent man is the head of a large family, most of the members of which have distinguished themselves by the energy of their character, and by the prominent part they have taken in philanthropic and religious movements. Lyman Beecher was born in New Haven, Connecticut, October 12th, 1775, in a dwelling still standing on the corner of George and College-streets. His immediate ancestors were men of exemplary character, enjoying a serene and cheerful old age. His mother having died four days after his birth, Lyman was confided to the care of her sister, Mrs. Lot Benton, of North Guilford, who kept him in her family until it was judged advisable to send him to college, which was when he was in his seventeenth year. He had previously been engaged, partly in following his father's occupation, that of a blacksmith, and partly in agricultural pursuits with his uncle Benton. He was fond of reading and study, and his uncle having proposed his going to college, Lyman, after spending about twelve months in preparation, entered Yale college, under the able presidency of Dr. Dwight, in September, 1793. Here he pursued his collegiate studies for several years.

Being called to assume the pastorate of a church at Litchfield, he soon established his fame as a preacher of more than ordinary talent. Here, according to his own account, he passed the most laborious portion of his life, carefully maintaining the vigour of his constitution by frequently engaging in house labour and field exercises, as well as in visits to the people of his charge, with whose condition, character, and conduct he felt bound to make himself well acquainted.



PORTRAIT OF THE REV. LYMAN BEECHER, D.D.

While at Litchfield the mind of Dr. Beecher was deeply distressed in consequence of the havoc made by the use of

intoxicating liquors among the inhabitants of that place, including some of his own congregation and friends. In 1811 an association was formed, and a committee appointed, to ascertain and report what could be done to stay the progress of intemperance. That report was made; but though the wide spread of the *evil* was lamented, it was discouragingly said that there seemed no possible *remedy*. This did not, by any means, suit the vigorous and practical mind of Dr. Beecher. He, therefore, immediately moved that the committee be discharged, and that another be appointed, to report, *instanter*, an appropriate remedy for intemperance. He was made chairman, and reported resolutions at once, recommending to all Christians and good men, the immediate and entire abandonment of intoxicating drinks. The resolution was carried; and this, it is believed, was the first step taken in the great history of total abstinence from intoxicating drinks.

It was during Dr. Beecher's residence at Litchfield that his famous six sermons on the "Nature, Occasions, Signs, Evils, and Remedy of Intemperance" were written and preached. These sermons are the evident gushings forth of a heart filled with grief and love. They greatly extended his reputation in the United States, and made him favourably known in England and its dependencies, and, through the medium of translations, in other parts of Europe. He concludes the sermons with this sentence:—"I pant not for fame or posthumous immortality; but my heart's desire and prayer to God for my countrymen is, that they may be saved from intemperance, and that our beloved nation may continue free, and become great and good."

The great popularity which Dr. Beecher acquired while at Litchfield, induced the members of the large and influential Presbyterian church at Boston to invite him to take the pastoral charge. He accepted the invitation, and remained there till 1832. In that year the Lane Theological and Literary Seminary was founded. Its object being to prepare young men for the ministry of the Christian religion, such facilities for manual labour were offered by it, as to make it possible for any industrious young man to defray, by his own exertions, a large part of the expenses of his education. The philanthropic spirit which Dr. Beecher had throughout his public career displayed, together with his known habits, pointed him out to the projectors of this new institution as the man most competent to undertake its direction. It was confidently anticipated that he would be able to demonstrate the practicability of educating mind and body at the same time, as well as to infuse new energy into the work of domestic and foreign missions, and revolutionise the Presbyterian church. A number of professors were elected to aid him. He removed to his new home in the immediate neighbourhood of Cincinnati, and remained there until the year 1830, devoting his whole energies to the promotion of the prosperity of the institution.

Dr. Beecher's principal coadjutor was the Rev. Calvin E. Stowe, who occupied the situation of Professor of Biblical Literature, and was one of the most distinguished ecclesiastical *savans* in America. He married Harriet Beecher, the doctor's second daughter, the distinguished authoress of that most popular book, "Uncle Tom's Cabin," and other interesting books. For some time these two gentlemen laboured to build up the seminary with every prospect of success. It started under excellent auspices. The number and reputation of the professors had drawn together several hundred students from all parts of the United States; the majority hardy and intelligent men, fired with the noble ambition of doing good on a large scale, and diligently working their way, through privation and toil, to educational and ministerial orders. For a short time all went on well, and Lane Seminary was the pride and hope of the church and the world.

About this time, however, the French revolution of 1830, the agitation in England for reform and against colonial slavery, and some other circumstances, had begun to direct the attention of a few American philanthropists to the evils of slavery. Agitation commenced. The subject was set up for discussion among the students, and the feeble flame soon becam a conflagration. Societies were organised for aiding fugitiv slaves on their way to Canada, and a number of other scheme were devised for promoting the cause of abolition. At first th discussions were encouraged by the president and professors but when they saw it swallowing up everything like regula study, they thought it high time to stop. But the current wa too strong to be arrested. Commercial interests took th alarm. Public sentiment exacted the suppression of th discussion and excitement. Slaveholders came over fro Kentucky and urged the mob on to violence. For severa weeks there was imminent danger that Lane Seminary and th houses of Dr. Beecher and Professor Stowe would be burn or pulled down by a drunken rabble. The Board of Trustee interfered, and allayed the excitement of the mob by forbiddin all further discussion of slavery in the Seminary. To this th students responded by withdrawing *en masse*. Where hun dreds had been, there was left a mere handful. Dr. Beeche and Professor Stowe remained there for several years, endea vouring to revive the prosperity of the Seminary, but in vain and this great project of their lives being defeated, in 185 they returned to the Eastern States. Dr. Beecher has not a present, as we understand, the charge of any particular con gregation, but he preaches occasionally, and assists in th deliberations of his brethren at their stated and publi gatherings.

In 1846, Dr. Beecher paid a visit to England, when he took part in the deliberation of the Temperance Reformers in th "World's Temperance Convention," and preached in some o the largest places of religious worship in the metropolis During his short stay, he endeared himself to many by th patriarchal simplicity of his manners, by the vigour which he displayed on public occasions, and by the gentlemanly and Christian tenor of his whole deportment. On his return to America in the "Great Western," in September, 1846, in company with Mrs. Beecher and several of his brethren and friends, the vessel was assailed by a fearful hurricane. Many hours passed in most dreadful suspense, amidst the roaring o the tempest, the crashing of timbers, and the drenchings o the waves. But during the terrible conflict of the elements which raged around, our venerable friend engaged with his companions in religious exercises; and when, after thirty-six hours exposure to accumulated dangers, they were mercifully delivered, he called upon them to unite in solemn thanksgivings to Almighty God.

As a preacher, the style of Dr. Beecher is rather peculiar; it is racy and pungent, bearing, perhaps, some resemblance to that of the "witty South" of the English church. His sermons abound with original and striking thoughts, amplified by numerous ideas and appropriate illustrations. He is at present engaged in superintending a uniform edition of his whole works, which will occupy six good-sized volumes. One of his larger works, "Lectures on Political Atheism," has been republished in England, and has attracted considerable attention, both on account of its powerful eloquence, and the great importance of the subject on which it treats. After all, it is said by those who are most intimately acquainted with him, that the "finest effects of his mind are not in his writings, but are unexpectedly thrown out in the inspiration of speech or in conversation. Many apothegms and condensed sentiments, if recorded, would become popular proverbs."

The engraving presented to the reader may be considered a good likeness. His figure is small, but well knit, close, and compact. The head is large in proportion, and abundantly covered with hair of an iron-gray colour. The features are striking. The eyes of light blue, with a grayish tint. The nose large, long, and rather prominent; the mouth wide, and well marked with the lines of decision; the forehead high and broad; the complexion florid; and the whole expression that of a man of vast energy, determination, and perseverance. Though nearly eighty years of age, he is still hale and hearty; and, to use the language of one who knows him well, "he does not fail to justify his claim to the title of 'the old man eloquent.'"

AMERICAN ANTIQUITIES AT THE LOUVRE.

On a former occasion,* we presented our readers with an account of some of the objects of curious interest in the Museum of American Antiquities at the Louvre, accompanied by numerous illustrations. As the subject was not then by any means exhausted, we now recur to it for the purpose of further elucidation.

Art, among the Peruvians, was not confined, as was the case in Mexico, with one or two exceptions, to the reproduction of sacred effigies; it enriched the country with real statues destined to perpetuate the recollection of historical personages, and free from the excess of awkward ornament which is observable in the productions of the Mexicans. We find that even the foundation of museums, which seems to be reserved for the most civilised nations of Europe, was not altogether foreign to the Peruvians. As early as the fifteenth century, Yasca, the general of the armies of Guayna Capac, had ordered each of the tribes composing the empire to bring the great *guaca* of their country, that is to say, the most venerated idol; and when these statues had been collected, he formed a sort of pantheon out of them.

However numerous these idols were, the remains of Peruvian statuary are less numerous than those which have been preserved of ancient Mexico, for this simple reason, in our opinion, that though the statuaries of Anahuac were well acquainted with the various processes of founding, they preferred working their gods in granite or basalt, to casting them in gold or silver. The reverse of this took place among the Peruvians, and it was the intrinsic value of the statues or vases delivered by the Inca to the conquerors that caused their destruction. It is not surprising, therefore, that our museums are so poor in statuettes of the precious metals, or even silver vases. The only articles of this sort exhibited in the museum at the Louvre are the cylindrical bell-mouthed vase, presented in fig 5, and the two silver statuettes represented figs. 4 and 11. The vase exhibits two heads, back to back, the form of a Janus, above which is a flowing headband. Although the size of this species of goblet, which was reserved, it is said, exclusively for the Incas, is larger than usual, it dwindles to insignificance in comparison with the accounts of the same sort of wealth possessed by Atahualpa.

However indisposed we may be to put undoubting faith in what is told of those famous gardens of the Inca, in which flocks of alpacas (animals of the Llama tribe) in gold were guarded by herdsmen of the same metal, who stood near strange animals, all combining intrinsic value of material with exquisite finish of workmanship; it is not the same with the works in gold which Pizarro sent off to Seville immediately after the conquest, and which were intended for Charles the Fifth, as an addition to the impost levied by the crown. Francisco Xeres, the private secretary of the conqueror, had abundant leisure to examine and admire them, for it was on board one of his vessels that they were conveyed to Europe; and he thus describes them: "On board the Sancta Maria del Campo, which arrived on the 9th of January, 1534, were thirty-eight golden, and forty-eight silver vases, among which was a silver jugle, containing upwards of two gallons of water. Two immense pans, one golden and the other silver, capable of containing a whole ox cut in pieces, recalled to the recollection of the devout conquerors the sea of brass in the temple of Jerusalem." We will spare the reader any account of the bars of gold, weighing altogether 53,000 ounces, and the 5,480 silver marks thrown carelessly in the middle of this splendid gold work of the Inca; we will only speak of a golden idol of the size of a child four years old, and the dimensions of which are given by Xeres without any other remark of importance. But it is quite certain that, if the vases and the idol had been subjected to the simple process of moulding on their arrival at Seville, the American museums in Europe would have presented much more curious specimens of Mexican art than are now found in them. France, no less than Spain, has failed to profit by the opportunities afforded her of enriching her collections at a moderate cost. Her conduct, in reference to the remarkable productions of Aztec art, is an illustration of our remark. These productions, consisting of vases, statues, and even gems (including an emerald of almost fabulous dimensions), were seized by Captain Florin near the Azores, when he spoiled Antonio de Quinones of the presents which the conqueror of Mexico was sending to Charles the Fifth. They were sent to Fontainbleau; but the crown jeweller or the Italian goldsmiths were the only persons who saw them in their primitive form; and it is suspected, not without reason, that perhaps the beautiful works of the Renaissance in the Museum at the Louvre, which are so much admired, have a closer relationship than is commonly supposed with the grotesque idols of the ancient Americans.

The art of working in gold as applied to ornamental vases or dress, and the various productions of pottery, are the principal sources from which a knowledge of Peruvian art can be obtained in the present day. The costliness of the materials employed by the artists of Cuzco has been fatal to statuary productions. On the contrary, in the guacas of Peru, as in the hypogæa of Etruria, vases are still to be met with, made of extremely fine clay, not, however, without a certain degree of solidity, in consequence of which they have greatly multiplied in cabinets of curiosities for some years past. The ornamentation of these vases, which is almost always borrowed from the animal kingdom, affords evidence, not only of a remarkable richness of invention in the semi-barbarous artist who produced them, but also of a delicate taste, reminding one in some measure of that elegance of form so prominent in Grecian antiquity. Thanks to the generosity of some travellers, the Museum at the Louvre possesses several valuable specimens of this class. Such, for example, is the vase in red clay (fig. 21); the arybals, conical at the bottom (figs. 17, 18, and 20), discovered at Yucay, near Cuzco; and the object represented by fig. 19, which was found in a child's tomb at Arica, and is equal, in the paintings with which it is adorned, to any other in the collection.

The guacas from the neighbourhood of Truxillo have enriched the Museum at the Louvre with several specimens of pottery, which were presented by M. Angrand, and which, if they exhibit no great elegance of appearance, give, by the very grotesqueness of their assemblage, a good idea of those fanciful forms which astonished the first conquerors, and made them discern the dreaded influence of demons even in the most simple articles of domestic use among the people with whom they were found. From man down to reptiles and fishes—in fact, all the strange objects in the animal kingdom—have been turned to account by Peruvian artists. If fig. 9, which represents an ape seated, whose tail forms a handle, was not at all out of place in the collection of grotesque demons furnished by Delancre, figs. 14 and 15 enable us to understand what the statuary of these countries could accomplish when it attempted to reproduce the regular features of man, and recognised its true mission, so to speak. The first of these objects, which is in red clay, was found at Cuzco; the hair and beard are painted black. The two others, which are heads joined together, and placed upon a conical pedestal, are in black clay; but there is no doubt as to their Peruvian origin. This vase, however, we are told, presents such an analogy with those found in Etruria, that M. Durand, though a very skilful connoisseur, has been deceived by it.

The vase in black clay, exhibited in fig. 7, simply has the form of a duck, with a little ape in relief on the neck; fig. 13 represents a wild boar. The human form appears in fig. 10 on the vase found at Borja; it is still perceptible in the grotesque vessel at the side (fig. 11). Fig. 8 represents an object sent from Quilca, on the top of which is seen a man's head; while on the body, made of black clay, are figured two arms in relief. Fig. 12 carries us back again to the neighbourhood of Truxillo; it is a truncated cone reversed, the neck of which,

* Vol. i. p. 59.

divided into two parts, serves as a handle; the small human figure on one side has a vase at its mouth. The object represented by fig. 16 comes from the same country; it is made of red clay, and presents one of those numerous specimens of double vases so often met with in American pottery, and especially in that of Peru.

rises a straight tube, at the foot of which is placed a smal figure of a bird in relief." The vase is made of black clay and presents a complete analogy with a specimen of the sam kind found at Lima, and deposited at Sèvres. Figure 29 which is also in black clay, was taken from the ruins nea Truxillo, bearing the name of Great Tchimu: it is a fish, th

Among the beautiful specimens in the collection must be placed fig. 28, which has borrowed its principal ornament from Peruvian ornithology: two birds, which may be supposed to be two doves, serve as the basis for two portions of a tubular quadrilateral handle, "upon each face of which are carved ten small birds in relief; in the middle of this handle

species of which would be difficult to name precisely, and t neck, which answers the purpose of a handle, is surmount by a small ape in relief. If fig. 27 was found at Borja, proves that this site was in no way inferior to other Peruvi towns in pottery. The figure of a man seated, which cons tutes the handle, and has a vase in the right hand, is adorn

with a head-dress; large gold earrings remind one of the strange custom of those celebrated *orejones*, whom the Spaniards (from the Spanish word *oreja*, an ear), designated by a name significative of the custom of wearing earrings. The spherical vase (fig. 26) has the head of an ape for its ornament, and comes, as is supposed, from Quilca.

All the historians of the conquest of Peru have mentioned with satisfaction the numerous utensils for changing the courses at table, employed in the two great empires of the New World. Among the Incas, these objects were made of the precious metals; among the Aztec princes, clay, painted with elegance, was often employed, and the articles which had been once brought to table could never be used again. Figs. 22, 23, and 24 represent dishes made in the empire of Peru, in the middle of which an Aztec dish is drawn. From their nature, being made of clay, and rather coarsely painted, these dishes could not have appeared at the splendid banquets which historians have described. Fig. 25 carries us back to some curious trifles, the products of Mexican art: it represents an infant asleep in a cradle.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER XIII.

Lord. "He can come no other way but by this hedge corner—
Couch low—here he comes. * * *
Sold. The general is content to spare thee yet;
And, hood-winked as thou art, will lead thee on
To gather from thee, haply thou may'st inform
Something to save thy life.
Par. O let me live,
And all the secrets of our camp I'll show,
Their force, their purposes. Nay, I'll speak that
Which you will wonder at
Sold. But wilt thou faithfully?
Par. If I do not, damn me."

All's Well that Ends Well.

THE long twilight of the summer day was growing deeper and deeper, and the shadows of bastion and tower were disappearing in the thickening darkness of night, when two soldiers stood somewhat apart from their comrades who formed the night-watch at the western redoubt.

"This should be the spot designated, if my instructions be accurate," said one of the two in a low voice, "and I think too, it must be pretty near the hour."

"Aye captain," replied the other, "I know the spot well. Of a dark night one might steal all along yonder marshy ground up to the very walls of the fort, unless they who were on guard had the eyes of owls or the ears of foxes."

"Thou sayest truly, good Hodge," replied Cheke, for he it was, "and, therefore, we have need to be both watchful and wary. Down Hodge, down man," he whispered suddenly—"Remember your old woodcraft—Hist! I hear footsteps."

The two crouched down stealthily under cover of the raised ground—as stealthily as if they were watching in their own island forests beside the run of the deer at midnight. The sounds were at first so faint that none but a practised ear could detect them, and a long interval elapsed between each light foot-fall, indicating that he who thus approached was exercising the utmost caution. Nearer and nearer came the steps, while the two Englishmen held in their breath. At last the steps were heard upon the ditch, and then the person who mounted slid gently down into the dyke, almost into the arms of those who were watching for him. A heavy hand griped the right arm of the intruder, while at the same time the blade of a poignard glimmered even in the darkness across his eyes, and a voice whispered strongly in his ear—

"Silence or you die."

The capture was so speedy and so sudden that the captive submitted without a struggle. His arms were unresistingly drawn backwards, and a thong of leather passed tightly round each wrist, which was then drawn together behind.

"Now then, Hodge," said his superior, "move on carefully to the place I told thee of, and take good heed that none see thee. And hark!" and this he added so that the prisoner could hear him, "if this fellow utter one word, just slit his weasand with your dagger, as you would a buck's."

"Aye," replied the archer in a hissing whisper close to the ear of his prisoner; "if the cur should bark or even whine above his breath, he shall have a dog's death." And so saying, he griped the man by the arm and led him on his way unresistingly, while the English captain returned to visit the night-watch and see that his men were vigilant.

Meantime the archer sped on as quickly and as stealthily as the nature of the ground and the darkness of the night permitted, urging onward his prisoner, who did not venture to break silence. Once, indeed, he stopped short, as if either about to parley or with the dogged determination of going on no further, but a touch of the cold steel in the region of the neck brought him quickly to submission. Thus they passed on skirting the whole side of the fortifications till at length they stood beside a small but massive postern door in the wall, which was concealed by one of the bastions of the rampart. Pausing a moment to take breath, Hodge once more addressed his companion.

"Now, good fellow, take heed to what I say. When you pass this door, look neither to the right nor to the left, and let not your tongue as much as move in your mouth. A step out of your course or a word from your lips, and by the blessed Saint Hubert thou shalt get the dog's death I promised thee. I'll dash out thy brains with my maule." Having delivered himself of this very emphatic injunction, Hodge Harrington smote with the handle of his mallet two smart strokes upon the door, and, after an interval, two more. After a little time a voice at the inner side of the door demanded in a low tone—

"Chi sta la?"

"Un amico," was the reply.

"Che segno si da?"

"Patienza."

"Bene: si puo passar."

The noise of shooting back bolts was now heard from within, and in a moment the door was opened, just sufficiently wide to admit the two individuals, and closed and bolted immediately after entrance.

Roger Harrington and his captive crossed the large enclosure into which they were thus admitted till they reached the opposite side, and then passing along a range of buildings, at length stopped before the open door of a small guard-room, within which was seen, by the glimmer of a few smouldering billets of wood, a soldier keeping a half-drowsy watch, as he sat on a bench and leaned his head against the wall. Hodge looked into the room, and ascertaining that the guard was alone, he pushed his prisoner before him and entered.

"How now, comrade!" said the man, rising to his legs "what's your business?"

"I must see his excellency the general."

"That can't be."

"Nay, but I must see him!"

"Impossible. He has given strict orders that none shal be admitted except the bearer of a certain token; and you ar not he, I trow."

"Who knows?" replied Hodge, recollecting himself, an he showed the soldier the ring which Zeno had given him.

"Giusto, Giusto!" said the other; "Cospetto, man! wh didst not show me the token at first? Wait a moment here."

The guard knocked at a door at the further end of the room which was speedily opened by the Greek youth, Alexis.

"Here is one that would see his excellency, and hath war rant for so doing," and he pointed to Hodge.

"Admit him instantly," said the boy, recognising Hodg and the signet which he held up to his view.

Hodge again tightened his grasp of his prisoner, and push ing him before him, they both entered the inner apartment and the door was closed behind them.

The room into which we must now introduce our reader was one with which they are already familiar. At the furthe end from that at which the men entered sat a figure, leanin over a table, apparently busied with papers. The light of large lamp was so managed, that while it illumined all th room in front, it left the man in deep shade. The rays no fell strongly upon those who stood before him. Our burl friend Hodge o' the Hill, drawn up to his full height, with hi bluff, ruddy, honest face in respectful repose, as of on who knew he had done his duty, awaited till he was interro gated. The other, who now stood beside him, presented striking contrast. He was scarcely of the middle height, an looked even less as he hung down his head, and shrank as were from observation. A figure slight and wiry, looke more so from the maceration that was visible both in h limbs and features. He had no armour upon his body, bu was clothed in a tight-fitting buff leathern jerkin, with hose o the same material, and his head was covered with a bonne of cloth.

Zeno gazed upon the two men for some time in silenc Perchance he might have been occupied in making the contra between them which we have just noticed; perchance he wa deliberating on the course which he should pursue. At lengt he said,—

"Well, goodman Harrington, thou hast snared the gam like a true forester as thou art."

Hodge's blue eye twinkled gleefully at the allusion to hi youthful woodcraft, as he replied—

"By Saint Hubert, even so please your excellency; but b my halidome I am bound to say that he who found out hi run and set the snare is as true a woodsman as Hodge o' th Hill; the fellow sprang right into the springes, and we ha little to do save to draw them tight about him. So here h is, signore."

"Come hither, fellow," said the general; "lead him fo ward a little, good archer."

Hodge did as he was required, and Zeno proceeded.

"Thy name, sirrah?"

The man still kept his head down, and made no answer.

"What was thy purport in seeking the camp?"

But the interrogatory like the former was unanswered.

"So! is this thy mood? Well, we shall find the means o making thee speak by and by. Meantime, good yeoman, se if he have not that about him which will give us som information."

The archer forthwith commenced to search the person o the prisoner, a task which seemed comparatively easy fro the scantiness of his garb. In vain, however, did he thrust h hand into pouch and opening of the dress, and even remov the bonnet from his head: nothing was found upon him.

"Come," said Zeno, "we must have a cast of thy o trade. Slit me up the fellow's doublet as thou would'st stag's hide."

Hodge drew forth his dagger in a trice, and commencing at the man's breast he inserted the point of the blade with one hand and with the other holding out the buff coat, he made a smart rip upwards, as a huntsman would do when flaying a deer. The man gave a shriek and started backwards, struggling with his bound arms as much as he was able. In truth, the archer had gone to work a little too dashingly, and cut not only the coat but the skin beneath it. At this moment Alexis sprang forward. His keen eye had discovered a small slit in the arm-pit of the coat, which the twisting of the arm had exposed. In a moment he plunged his hand into the spot, drew forth a small folded paper from a concealed pocket and handed it to his master.

Zeno took the paper, opened it, read it slowly and thoughtfully, and then quietly folded it up again.

"Knave," said he, "eyeing the prisoner fixedly as he rose and stept into the light, and his voice was cold and stern while he spoke, "Knave, I have now learned thine errand in despite of thee. Thou art a spy, and comest to plot with traitors. Mark me, then, thy sentence is, that by to-morrow's light thou shalt hang like a dog from the next parapet. Nothing can avert thy doom, unless that thou shalt truly inform me upon such subjects as I shall interrogate thee."

This speech, and the glare of the speaker's eye, were not without their effect on him for whom they were intended. The fellow looked up and said doggedly,

"Well then, signore, unbind my wrists, for they are nearly cut through with the thongs, and I shall answer your question so far as I can."

"Loosen the bands somewhat, but do not release his hands altogether," said Zeno. "There, that will do. Now, fellow, tell me what provisions have ye in Chioggia."

"Scarce a day's food—not as much as a rat left."

"Have you had any communication with the Genoese fleet of late?"

"Not since the last sally."

"Then you are without hope in that quarter?"

"Utterly."

"Well, and if the notable scheme that thou wotest of"—and here he pointed to the paper—"if it should fail, what then is proposed to be done?"

"To throw the gates open and surrender unconditionally."

"Good. What may be the number of souls in Chioggia?"

"About four thousand, including those on board the vessels."

"And how many galleys remain?"

"Nineteen."

Zeno proceeded to put a great many further questions, to which the man replied; he then said,

"Thou hast answered me truly on some points, I know, and it may be that thou hast spoken truth on all. This we shall know hereafter. Meantime, thou shalt be kept in safety, and receive good treatment, to abide the issue. Take him hence, Alexis, and let him be secured in a safe place and strongly guarded."

The Greek motioned silently to the Genoese, who followed him out of the apartment, leaving Roger Harrington alone with the generalissimo of the Venetian army.

"Good fellow," said Zeno, "thou hast served me with skill and fidelity, and thy services shall not go unrequited. But as yet thou hast done but a part of the work that I design for thee. Say, art thou ready to proceed in it?"

"Noble general!" said Hodge. "My own captain, Sir William Cheke, hath told me that I may in all things do thy will. I have served long under him and know him well, and, by our blessed St. George, I shall ever do his behest; for he would not that I should do aught that an honest soldier should shrink from."

"It is well said, good fellow," said Zeno admiringly. "Now listen to me, for I have much to disclose to thee, and much wherein to instruct thee. Sit down, man, sit down; and give good heed to what I say."

Hodge, thus invited, sat down on a low bench in a manner at once respectful but manly. Then Zeno proceeded to detail to him matters of great and pressing import. What the nature of these communications was we shall not at present disclose. Suffice it to say, that the night was somewhat advanced before the English yeoman passed out from the apartment of the Venetian general.

When Roger Harrington departed from the presence of Zeno, he hastened through the fort till he reached the quarters of the English archers. Here he found Sir William Cheke awaiting his return, and he forthwith craved a private audience with his captain. The result of their deliberations was, that the archer divested himself of his arms and even of some of his ordinary habiliments, and arrayed himself, as nearly as possible, in a style that did not betoken either his particular nation or military calling. Retaining only his dagger, he threw over his person a large cloak, and placed upon his head a bonnet of Genoa velvet, which he drew down over his brows. Thus equipped, he again sallied forth as stealthily as he had entered, and made his way in the darkness of the night till he reached the place where the mercenaries under the command of Roberto di Recanati were located. One of the Italian lances who kept the guard arrested his steps, whereupon Hodge required to be conducted to the condottiere on urgent business, whispering at the same time in the ear of the soldier some secret word. Apparently his coming was not altogether unexpected, and he was without further delay conducted into the presence of Recanati, who had not yet retired to rest. The condottiere looked keenly at his visitor, and then demanded,

"Your business?"

"This will inform you, signore," was the reply, as Hodge handed him the cartel which had been previously taken from the captured emissary.

Recanati perused the missive with deep attention, and pondered long upon its import. At length he broke silence again,

"He who writes certifies for thee, that thou art trustworthy and may be freely spoken with."

The soldier replied merely by an inclination of his head.

"Well, then, it is an onerous undertaking and full of peril."

"Doubtless, signore," was the reply, "it will need caution as well as courage; nevertheless, if the matter be kept secret, success seems almost certain."

"And suppose it be so, who is to certify to me that I shall receive the money?"

"Here is your security, noble capitano. The name signed to this document guarantees it to you, which I am authorised to give to you, upon your signing the stipulations in the paper which I have given to you, and which I am to bear back to those who sent me."

The document which Recanati now examined was apparently satisfactory, he accordingly signed the paper and returned it to his visitor, observing—

"Well then, be it so; but take heed, good friend, how thou guardest this packet, and see that you make your way hence speedily."

"Aye, Signore, fear not for me. I shall find my way as safely back as I found it hither. Let me, too, warn you to put yonder writing in the safest place about your person—let it not for a moment out of your own keeping. Buona notte, signor capitano; it is time that I were on my return."

Having said this, Roger Harrington once more bent his steps towards the quarters of the general.

"By my faith, good Roger Harrington,"—'twas thus the honest yeoman soliloquised—"thou art rising in the world since thou leftest the green fields by the pleasant Trent. Thou wert not content with shooting a fat buck in the forest, but thou shouldst take to the wild life of soldiering, and let fly thy shafts at thine own kind. And now, God wot, thou art turning to higher game, and taking counsel with thy betters, and joining in their schemes that are well nigh too subtle for thy simple head. By Saint Hubert, I don't altogether like such matters, though, nor understand them over well. It seems like trapping foxes or such like vermin, and not like true woodcraft. Well, well, I have got safely through it so far; but, by my halidome, I would rather fight two hours by daylight than plot or scheme one hour by night."

MOLDAVIA AND WALLACHIA.
